

Flow diagram of landfilling designated wastes at the final disposal site

1. Receive wastes

Determine quantity of the packaged wastes received at the site using a weighing scale or other devices. Wastes may be packaged in flexible containers.

2. Transfer the wastes to the landfill area

Transfer the packaged wastes using transfer trucks to the landfill area.

3. Unload wastes using a crane

Unload and place the packaged wastes into the landfill pit.

4. Cover with soil

Cover the packages with soil at the end of each day's work to prevent waste dispersion. When landfilling is completed in one compartment, apply additional cover soil and then landfill the next compartment.
