Note: ND - no data

Therefore, the main sources of exposure were the radioactive clouds coming over the populated areas. The influence of the "old radioactive tracks" was not so important in determining the total dose.

During the period of nuclear bomb explosions, the short-living radionuclides, i.e. Zr-95, Ru-103, Nb-95, Ru-106, Po-106, Ce-141, Ce-144 and others, were detected in the fallout (table 1.20) and vegetations (table 1.21).

Table 1. 20. Radioactive fallout in Semipalatinsk in 1981-1984 (Bq/m² per month)

Years	Monthes												Total
	1	2	3	4	5	6	7	8	9	10	11	12
