To not less than 5 Clarithromycin Tablets add diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 3) so that each mL contains about 8 mg (potency) of clarithromycin (C$_{78}$H$_{33}$NO$_{13}$), disperse to fine particles by sonicating, add exactly 1 mL of the internal standard solution (1) per 100 mg (potency) of clarithromycin, then add acetonitrile for liquid chromatography so that each mL contains about 5 mg (potency) of clarithromycin (C$_{78}$H$_{33}$NO$_{13}$), and disperse to fine particles by sonicating for 10 minutes while occasional vigorous shaking. Centrifuge of this solution at 4000 rpm for 15 minutes, and filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, to 2 mL of the subsequent filtrate add the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Clarithromycin RS, equivalent to about 50 mg (potency), and dissolve in the mobile phase to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution (2) and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography C2.25$^{+}$ according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of clarithromycin to that of the internal standard.

Amount [mg (potency)] of clarithromycin (C$_{78}$H$_{33}$NO$_{13}$)

$$M_5 = M_6 \times Q_T/Q_S \times 1/5$$

$M_5$: Amount [mg (potency)] of Clarithromycin RS taken

**Internal standard solution (1)—** A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

**Internal standard solution (2)—** To exactly 1 mL of the internal standard solution (1) add the mobile phase to make exactly 20 mL.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 3) and acetonitrile for liquid chromatography (13:7).

Flow rate: Adjust so that the retention time of clarithromycin is about 8 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, clarithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of clarithromycin to that of the internal standard is not more than 2.0%.

**Containers and storage**

Containers—Well-closed containers.

---

**Clebopride Malate**

クレボプリドリン酸塩

C$_{38}$H$_{33}$ClN$_{2}$O$_{5}$·C$_{2}$H$_{3}$O$_{2}$·H$_{2}$O·$\cdot$HCl: 507.96

4-Amino-N-(1-benzylpiperidin-4-yl)-5-chloro-2-methoxybenzamide mono-(2RS)-malate

[57645-91-7]

Clebopride Malate, when dried, contains not less than 98.5% and not more than 101.0% of clebopride malate (C$_{38}$H$_{33}$ClN$_{2}$O$_{5}$·C$_{2}$H$_{3}$O$_{2}$).

**Description**

Clebopride Malate occurs as a white crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in water, and slightly soluble in ethanol (99.5).

A solution of Clebopride Malate in methanol (1 in 25) shows no optical rotation.

**Identification (1)**

Determine the absorption spectrum of a solution of Clebopride Malate in methanol (1 in 80000) as directed under Ultraviolet-visible Spectrophotometry C2.25$^{+}$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clebopride Malate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry C2.25$^{+}$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Clebopride Malate under Flame Coloration Test C1.04$^{+}$ (2): a green color appears.

**Purity (1)**

Chloride C1.03$^{+}$—Dissolve 1.0 g of Clebopride Malate in 20 mL of acetic acid (100), add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS by adding 20 mL of acetic acid (100), 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.009%).
(2) Heavy metals: Proceed with 2.0 g of Clemastine Fumarate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Clemastine Fumarate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 0.2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than clemastine obtained from the sample solution is not larger than the peak area of clemastine from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysilanized silica gel for liquid chromatography (7 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 3.85 g of ammonium acetate in water to make 500 mL, and filter through a membrane filter with a pore size not exceeding 0.5 μm. To 400 mL of the filtrate, add 600 mL of methanol.
Flow rate: Adjust so that the retention time of clemastine is about 15 minutes.
Time span of measurement: About 2 times as long as the retention time of clemastine.
System suitability—
Test for required detectability: Pipet 10 mL of the standard solution, and add water to make exactly 100 mL. Confirm that the peak area of clemastine obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.
System performance: Dissolve 30 mg Clemastine Fumarate and 5 mg of propyl parahydroxybenzoate in the mobile phase to make 100 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, propyl parahydroxybenzoate and clemastine are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clemastine is not more than 2.5%.

Loss on drying: Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition: Not more than 0.1% (1 g).

Assay—Weigh accurately about 0.5 g of Clemastine Fumarate, previously dried, dissolve in 30 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 50.80 mg of C_{23}H_{28}ClNO.4C_{2}H_{2}O_{5}

Containers and storage—Containers—Tight containers.

Clemastine Fumarate
クレマスチンフマル酸塩

C_{23}H_{28}ClNO.4C_{2}H_{2}O_{5}: 459.96
(2R)-2-[[1(R)-1-(4-Chlorophenyl)-1-
phenethyl]oxyethyl]-1-methylpyrrolidine monofumarate [14976-57-9]

Clemastine Fumarate, when dried, contains not less than 98.5% of clemastine fumarate (C_{23}H_{28}ClNO.4C_{2}H_{2}O_{5}).

Description—Clemastine Fumarate occurs as a white, crystalline powder. It is odorless.

It is sparingly soluble in methanol and in acetic acid (100), slightly soluble in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

Identification—
(1) To 5 mg of Clemastine Fumarate add 5 mL of sulfuric acid, and shake to dissolve: a yellow color develops. Slowly drop this solution into 10 mL of water: the yellow color immediately disappears.

(2) To 0.01 g of Clemastine Fumarate add 1 mL of fuming nitric acid, and evaporate on a water bath to dryness. Then add 2 mL of diluted hydrochloric acid (1 in 2) and 0.2 g of zinc powder, heat for 10 minutes on a water bath, cool, and filter. Add 20 mL of water to the filtrate. The solution responds to Qualitative Tests (1.09) for primary aromatic amines.

(3) To 5 mL of a solution of Clemastine Fumarate (1 in 50,000), add 5 mL of 4-dimethylaminobenzaldehyde TS, and warm for 10 minutes: a red-purple color develops.

(4) Perform the test with Clemastine Fumarate as directed under Flame Coloration Test (1.04) (2): a green color appears.

(5) Dissolve 0.04 g of Clemastine Fumarate and 0.01 g of fumaric acid for thin-layer chromatography in 2 mL each of a mixture of ethanol (95) and water (4:1) by gentle warming, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography (2.60). Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl ether, formic acid and water (90:7:3) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spot with larger RF value from the sample solution has the same RF value as the spot from the standard solution.

Optical rotation—[α]_{D}^{20}: +16 ~ +18° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Melting point—176 ~ 180°C (with decomposition).

Purity—
(1) Clarity and color of solution—Dissolve 0.5 g of Clemastine Fumarate in 10 mL of methanol by warming: the solution is clear and colorless.

(2) Heavy metals: Perform the test with 1.0 g of Clemastine Fumarate according to Method 2. Prepare the control solution with 2.0 mL of Standard Lead Solution (not...
more than 20 ppm).

(3) Arsenic $<1.12>$—Take 1.0 g of Clemastine Fumarate, prepare the test solution according to Method 3, and perform the test (not more than 2 ppm).

(4) Related Substances—Dissolve 0.10 g of Clemastine Fumarate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 5 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography $<2.05>$. Spot 5 $\mu$L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (90:10:1) to a distance of about 15 cm, and air-dry the plate. After spraying evenly Dragendorff’s TS on the plate, immediately spray evenly hydrogen peroxide TS: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution (1), and not more than 2 spots from the sample solution are more intense than the spot from the standard solution (2).

**Loss on drying $<2.41>$** Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition $<2.44>$** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.4 g of Clemastine Fumarate, previously dried, dissolved in 50 mL of acetic acid (100), and titrate $<2.30>$ with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 46.00 mg of C$_8$H$_{16}$ClN$_2$O$_8$C$_4$H$_8$O$_4$

**Containers and storage** Containers—Tight containers.

**Clindamycin Hydrochloride**

クリンダマイシン塩酸塩

\[
\text{C$_9$H$_{13}$ClN$_2$O$_8$S HCl: 461.44}
\]

Methyl 7-chloro-6,7,8-trideoxy-6-[(2S,4R)-1-methyl-4-propylpyrrolidine-2-carboxamido]-1-thio-3-threo-$\alpha$D-galacto-octopyranoside monohydrochloride [21462-39-5]

Clindamycin Hydrochloride is the hydrochloride of a derivative of lincomycin.

It contains not less than 838 μg (potency) and not more than 940 μg (potency) per mg, calculated on the anhydrous basis. The potency of Clindamycin Hydrochloride is expressed as mass (potency) of clindamycin (C$_{18}$H$_{23}$ClN$_2$O$_8$S: 424.98).

**Description** Clindamycin Hydrochloride occurs as white to grayish white, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification (1)** Determine the infrared absorption spectrum of Clindamycin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum or the spectrum of Clindamycin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Clindamycin Hydrochloride (1 in 100) responds to Qualitative Tests $<1.09>(2)$ for chloride.

**Optical rotation $<2.49>$** $[\alpha]_D^2$: +135° to +150° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**Purity (1)** Heavy metals $<1.07>$—Proceed with 2.0 g of Clindamycin Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $<2.07>$ according to the following conditions, and determine each peak area by the automatic integration method: the peak area of clindamycin B, having the relative retention time of about 0.7 to clindamycin, and that of 7-epiclindamycin, having the relative retention time of about 0.8, obtained from the sample solution are not larger than 2 times the peak area of clindamycin from the standard solution, the area of the peak other than clindamycin and the peaks mentioned above from the sample solution is not larger than the peak area of clindamycin from the standard solution, and the total area of the peaks other than clindamycin from the sample solution is not larger than 4 times the peak area of clindamycin from the standard solution.

**Operating conditions—**

- Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
- Time span of measurement: About 2 times as long as the retention time of clindamycin, beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of clindamycin obtained with 20 $\mu$L of this solution is equivalent to 7 to 13% of that with 20 $\mu$L of the standard solution.

System performance: When the procedure is run with 20 $\mu$L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 2.0%.

**Water $<2.48>$** Not more than 6.0% (0.3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Clindamycin Hydrochloride and Clindamycin Hydrochloride RS, equivalent to about 20 mg (potency), dissolve each in the mobile phase to make exactly 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the
Clindamycin Hydrochloride Capsules

Clindamycin Hydrochloride Capsules contain not less than 93.0% and not more than 107.0% of the labeled potency of clindamycin (C_{18}H_{23}ClN_{2}O_{5}S: 424.98).

Method of preparation Prepare as directed under Cap-sules, with Clindamycin Hydrochloride.

Identification To an amount of the contents of Clindamy-cin Hydrochloride Capsules, equivalent to 10 mg (potency) of Clindamycin Hydrochloride, add 2 mL of methanol, shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Clindamycin Hydrochloride RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test under the following operating conditions: it meets the requirement of the System suitability test.

System suitability—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysilsanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: To 0.05 mol/L potassium dihydrogen phosphate TS add 8 mol/L potassium hydroxide TS to adjust the pH to 7.5. To 550 mL of this solution add 450 mL of acetonitrile for liquid chromatography.
Flow rate: Adjust so that the retention time of clindamycin is about 10 minutes.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 1.0%.

Containers and storage Containers—Tight containers.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Clindamycin Hydrochloride Capsules add a suitable amount of the mobile phase, shake for 30 minutes, and add the mobile phase to make exactly V mL so that each mL contains 0.75 mg (potency) of Clindamycin Hydrochloride. Centrifuge this solution, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate of a 75-mg capsule in 15 minutes and that of a 150-mg capsule in 30 minutes are not less than 80%, respectively.

Start the test with 1 capsule of Clindamycin Hydrochloride Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ so that each mL contains about 83 μg (potency) of Clindamycin Hydrochloride, and use this solution as the sample solution. Separately, weigh accurately an amount of Clindamycin Hydrochloride RS, equivalent to about 17 mg (potency), dissolve in water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>., and determine the peak areas, A_T and A_S, of clindamycin in each solution.

Dissolution rate (%) with respect to the labeled amount of clindamycin (C_{18}H_{23}ClN_{2}O_{5}S) = \frac{M_S \times A_T}{A_S \times V' / V \times 1/C \times 450} \times 100

M_S: Amount [mg (potency)] of Clindamycin Hydrochloride RS taken
C: Labeled amount [mg (potency)] of clindamycin (C_{18}H_{23}ClN_{2}O_{5}S) in 1 tablet

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilsanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate TS to 7.5 with 8 mol/L potassium hydrogen phosphate TS. To 550 mL of this solution add 450 mL of acetonitrile.
Flow rate: Adjust so that the retention time of clindamycin is about 7 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times
Determine the infrared absorption spectrum of Clindamycin Phosphate occurs as a white to pale yellow-white crystalline powder. Weigh accurately a portion of the powder, equivalent to about 75 mg (potency) of Clindamycin Hydrochloride, add the mobile phase, shake for 30 minutes, and add the mobile phase to make exactly 100 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately an amount of Clindamycin Hydrochloride RS, equivalent to about 75 mg (potency), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_3 \), of clindamycin in each solution.

\[
M_S = \frac{M_A}{A_1/A_3}
\]

\( M_S \): Amount [mg (potency)] of Clindamycin \((C_{18}H_{27}ClN_2O_5S)\)

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 0.05 mol/L of potassium dihydrogen phosphate TS add 8 mol/L potassium hydroxide TS to adjust the pH to 7.5. To 550 mL of this solution add 450 mL of acetonitrile for liquid chromatography.
Flow rate: Adjust so that the retention time of clindamycin is about 7 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 3000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 1.0%.

Containers and storage—Containers—Tight containers.

Clindamycin Phosphate

クリンダマイシンリン酸エステル

\[
\text{C}_{30}\text{H}_{33}\text{ClN}_2\text{O}_7\text{PS}: 504.96
\]

Methyl 7-chloro-6,7,8-trideoxy-6-{[2S,4R]-1-methyl-4-propylpyrroolidine-2-carboxamido}-1-thio-\( \alpha \)-D-galacto-octopyranoside 2-dihydrogen phosphate [24729-96-2]

Clindamycin Phosphate is a derivative of clindamycin.

It contains not less than 800 μg (potency) and not more than 846 μg (potency) per mg, calculated on the anhydrous basis. The potency of Clindamycin Phosphate is expressed as mass (potency) of clindamycin \((C_{18}H_{27}ClN_2O_5S): 424.98\).

Description—Clindamycin Phosphate occurs as a white to pale yellow-white crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (95).

Identification—Determine the infrared absorption spectrum of Clindamycin Phosphate, previously dried at 100°C for 2 hours, as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clindamycin Phosphate RS previously dried at 100°C for 2 hours: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation—\( <2.49> \) \([\alpha]_D^2 +115 \sim +130° \) (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH—\( <2.54> \) Dissolve 0.10 g of Clindamycin Phosphate in 10 mL of water. The pH of the solution is between 3.5 and 4.5.

Purity (1)—Clarity and color of solution—Dissolve 1.0 g of Clindamycin Phosphate in 10 mL of freshly boiled and cooled water: the solution is clear and colorless.

(2)—Heavy metals—\( <1.07> \)—Proceed with 2.0 g of Clindamycin Phosphate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 5 ppm).

(3)—Arsenic—\( <1.11> \)—Prepare the test solution with 1.0 g of Clindamycin Phosphate according to Method 4, and perform the test (not more than 2 ppm).

(4)—Related substances—Dissolve 0.1 g of Clindamycin Phosphate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01> \) according to the following conditions, and determine each peak area by the automatic integration method: the peak area of clindamycin, having the relative retention time of about 1.8 to clindamycin phosphate, obtained from the sample solution is not larger than 1/2.5 times the peak area of clindamycin phosphate from the standard solution, and the total...
area of the peaks other than clindamycin phosphate from the sample solution is not larger than 4 times the peak area of clindamycin phosphate from the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of clindamycin phosphate, beginning after the solvent peak.

**System suitability—**

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of clindamycin phosphate obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

**Water** Not more than 6.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Clindamycin Phosphate and Clindamycin Phosphate RS, equivalent to about 20 mg (potency), add exactly 25 mL of the internal standard solution and the mobile phase to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of clindamycin phosphate to that of the internal standard.

\[
\text{Amount [mg (potency)] of clindamycin (C_{18}H_{33}ClN_{2}O_{5}S)} = M_3 \times \frac{Q_1}{Q_3} \times 1000
\]

\[
M_3: \text{Amount [mg (potency)] of Clindamycin Phosphate RS taken}
\]

**Internal standard solution—** A solution of methyl parahydroxybenzoate in the mobile phase (3 in 50,000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: Adjust so that the retention time of clindamycin phosphate is about 8 minutes.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, clindamycin phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of clindamycin phosphate to that of the internal standard is not more than 2.5%.

**Containers and storage** Containers—Tight containers.

---

**Clindamycin Phosphate Injection**

クリンダマイシンリン酸エステル注射液

Clindamycin Phosphate Injection is an aqueous injection.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of clindamycin phosphate (C_{18}H_{33}ClN_{2}O_{5}PS: 504.96).

**Method of preparation** Prepare as directed under Injections, with Clindamycin Phosphate.

**Description** Clindamycin Phosphate Injection is a clear, colorless or light yellow liquid.

**Identification** To a volume of Clindamycin Phosphate Injection, equivalent to 0.15 g (potency) of Clindamycin Phosphate, add 4 mL of water, 2 mL of 8 mol/L sodium hydroxide TS and 0.1 mL of sodium pentacyanonitrosylferrate (III) TS, mix, heat in a water bath for 10 minutes, and add 2 mL of hydrochloric acid: a blue-green color develops.

**Osmotic pressure ratio** Being specified separately when the drug is granted approval based on the Law.

**pH** 6.0 – 7.0

**Bacterial endotoxins** Less than 0.1 EU/mg (potency).

**Extractable volume** It meets the requirement.

**Foreign insoluble matter** Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter**  It meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Measure exactly a volume of Clindamycin Phosphate Injection, equivalent to about 0.3 g (potency) of Clindamycin Phosphate, and add the mobile phase to make exactly 100 mL. Pipet 7 mL of this solution, add exactly 25 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Clindamycin Phosphate RS, equivalent to about 20 mg (potency), dissolve in exactly 25 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Clindamycin Phosphate.

\[
\text{Amount [mg (potency)] of clindamycin (C_{18}H_{33}ClN_{2}O_{5}PS)} = M_3 \times \frac{Q_1}{Q_3} \times 1000
\]

\[
M_3: \text{Amount [mg (potency)] of Clindamycin Phosphate RS taken}
\]

**Internal standard solution—** A solution of methyl parahydroxybenzoate in the mobile phase (3 in 50,000).

**Containers and storage** Containers—Hermetic containers.
Clobetasol Propionate
クロベタゾールプロピオン酸エステル

\[ C_{25}H_{32}ClFO_7 \] 466.97
21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propionate

[C25H32ClFO7] [25122-46-7]

Clobetasol Propionate, when dried, contains not less than 97.0% and not more than 102.0% of clobetasol propionate (C25H32ClFO7).

Description Clobetasol Propionate occurs as a white to pale yellow-white crystalline powder.

Isomer ratio To 50 mg of Clobetasol add 0.4 mL of thionyl chloride, stopper tightly, heat on a water bath at 60°C for 5 minutes with occasional shaking, and evaporate the excess thionyl chloride at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 2 mL of toluene previously dried with synthetic zeolite for drying, add 2 mL of a solution of d(+)-α-methylbenzylamine in toluene previously dried with synthetic zeolite for drying (3 in 100), mix gently, allow to stand for 10 minutes, and evaporate the toluene at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 5 mL of chloroform, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area, \( A_2 \), \( A_3 \), and \( A_4 \), of three peaks appear in order near the retention time of 40 minutes: a value, \( A_2/(A_2 + A_3 + A_4) \times 100 \), is between 40 and 70.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 20°C.
Mobile phase: A mixture of hexane and 2-propanol (500:3).
Flow rate: Adjust so that the retention time of the peak appearing first is about 35 minutes.
Selection of column: Proceed with 5 mL of the sample solution under the above operating conditions. Use a column giving a complete separation of the three peaks.

Assay Weigh accurately about 0.45 g of Clobetasol, previously dried, dissolve in 40 mL of ethanol (99.5), add 30 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 23.43 mg of C25H32ClFO7

Containers and storage Containers—Tight containers.
It is soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Melting point: about 196°C (with decomposition).

**Identification** Determine the infrared absorption spectra of Clobetasol Propionate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clobetasol Propionate RS: both spectra exhibit similar intensities of absorbance at the same wave numbers.

**Optical rotation** &gt;2.99 [α]D: +109° – +115° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity** (1) Heavy metals &lt;1.07—Proceed with 1.0 g of Clobetasol Propionate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 10 mg of Clobetasol Propionate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 5 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography &lt;2.01&gt; according to the following conditions, and determine each peak area of these solutions by the automatic integration method: the area of the peak other than clobetasol propionate obtained from the sample solution is not larger than 2/5 times the peak area of clobetasol propionate from the standard solution. Furthermore, the total area of the peaks other than clobetasol propionate from the sample solution is not larger than the peak area of clobetasol propionate from the standard solution.

**System suitability**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of clobetasol propionate, beginning after the solvent peak.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wave-length: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 7.80 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 2.5 with phosphoric acid, and then add water to make 1000 mL. To 425 mL of this solution add 475 mL of acetonitrile and 100 mL of methanol.

Flow rate: Adjust so that the retention time of clobetasol propionate is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above conditions, clobetasol propionate and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above conditions, the relative standard deviation of the ratio of the peak area of clobetasol propionate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

---

**Clocapramine Hydrochloride Hydrate**

クロカプラミン塩酸塩水和物

C₃₇H₄₇ClN₃O₂HCl.H₂O: 572.01

![Chemical Structure](image)

1’-3-(3-Chloro-10,11-dihydro-5H-dibenz[b,f]azepin-5-yl)propyl-1,4’-bipiperidine-4’-carboxamide dihydrochloride monohydrate

C₃₇H₄₇ClN₃O₂HCl.H₂O: 572.01

1’-3-(3-Chloro-10,11-dihydro-5H-dibenz[b,f]azepin-5-yl)propyl-1,4’-bipiperidine-4’-carboxamide dihydrochloride monohydrate

60789-62-0
Clozapamine Hydrochloride Hydrate, when dried, contains not less than 98.0% of clozapamine hydrochloride (C₂₉H₂₅ClN₂O₂·2HCl: 553.99).

**Description** Clozapamine Hydrochloride Hydrate occurs as white, crystals or crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), in chloroform and in isopropanol, and practically insoluble in acetic anhydride and in diethyl ether. It is gradually colored by light.

Melting point: about 260°C (with decomposition, after drying).

**Identification (1)** To 5 mL of a solution of Clozapamine Hydrochloride Hydrate (1 in 2500) add 1 mL of nitric acid: a blue color develops at first, and rapidly changes to deep blue, and then changes to green to yellow-green.

(2) Determine the absorption spectrum of a solution of Clozapamine Hydrochloride Hydrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clozapamine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Dissolve 0.1 g of Clozapamine Hydrochloride Hydrate in 10 mL of water by warming, and after cooling, add 2 mL of ammonia TS, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Sulfate <1.14>—Dissolve 0.5 g of Clozapamine Hydrochloride Hydrate in 40 mL of water by warming, after cooling, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clozapamine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 0.10 g of Clozapamine Hydrochloride Hydrate in 10 mL of a mixture of chloroform and isopropanol (99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and isopropanol (99:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.63>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, ethyl acetate, methanol and ammonium solution (28) (100:70:40:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41>—2.0 to 3.5% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 105°C, 4 hours).

**Residue on ignition** <2.44>—Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clozapamine Hydrochloride Hydrate, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100:1) and titrate <2.30> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 27.70 mg of C₂₉H₂₅ClN₂O₂·2HCl

**Containers and storage** Containers—Light-resistant. Storage—Light-resistant.

**Clofedanol Hydrochloride**

クロフェダノール塩酸塩

\[
\text{C}_{17}\text{H}_{20}\text{CINO.HCl}: 326.26
\]

(1RS)-1-(2-Chlorophenyl)-3-dimethylamino-1-phenylpropan-1-ol monohydrochloride

[511-13-7]

Clofedanol Hydrochloride, when dried, contains not less than 98.5% of clofedanol hydrochloride (C₁₇H₂₀CINO.HCl).

**Description** Clofedanol Hydrochloride occurs as white, crystals or crystalline powder.

It is freely soluble in methanol, in ethanol (95) and in acetic acid (100), sparingly soluble in water, and practically insoluble in diethyl ether.

A solution of Clofedanol Hydrochloride in methanol (1 in 20) does not show optical rotation.

Melting point: about 190°C (after drying, with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Clofedanol Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Clofedanol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying** <2.41>—2.0 to 3.5% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 105°C, 4 hours).

**Residue on ignition** <2.44>—Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clofedanol Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100:6:1), and titrate <2.30> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 27.70 mg of C₁₇H₂₀CINO.2HCl

**Containers and storage** Containers—Light-resistant.

Storage—Light-resistant.
Clofibrate / Official Monographs

was each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than clofederol obtained from the sample solution is not larger than the peak area of clofederol from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.34 g of potassium methanesulfonate in diluted phosphoric acid (1 in 1000) to make 1000 mL, and to 650 mL of this solution add 350 mL of methanol.

Flow rate: Adjust so that the retention time of clofederol is about 9 minutes.

Selection of column: Dissolve 0.01 g each of Clofedanol Hydrochloride and ethyl parahydroxybenzoate in methanol to make 100 mL. Proceed with 3 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofederol and ethyl parahydroxybenzoate in this order with the resolution of these peaks being not less than 4.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of clofederol obtained from 3 μL of the standard solution comprises between 20% and 50% of the full scale.

Time span of measurement: About three times as long as the retention time of clofederol, beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, silica gel, 80°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clofedanol Hydrochloride, previously dried, dissolve in 15 mL of acetic acid (100), add 35 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.63 mg of C17H23ClNO.HCl

**Containers and storage** Containers—Tight containers.

**Clofibrate**

クロフィブラート

C12H20ClO3; 242.70

Ethyl 2-(4-chlorophenoxy)-2-methylpropanoate [637-07-0]

Clofibrate contains not less than 98.0% of clofibrate (C12H20ClO3), calculated on the anhydrous basis.

**Description** Clofibrate occurs as a colorless or light yellow, clear, oily liquid. It has a characteristic odor and taste, which is bitter at first, and subsequently sweet.

It is miscible with methanol, with ethanol (95), with ethanol (99.5), with diethyl ether and with hexane, and practically insoluble in water.

It is gradually decomposed by light.

**Identification** (1) Determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1 or the spectrum of a solution of Clofibrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

Separately, determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2 or the spectrum of a solution of Clofibrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clofibrate as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clofibrate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45> nD15 = 1.500 to 1.505

**Specific gravity** <2.50> dD15 = 1.137 to 1.144

**Purity** (1) Acidity—Dissolve 2.0 g of Clofibrate in 100 mL of neutralized ethanol, and add 1 drop of phenolphthalein TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS: the solution is red in color.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clofibrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—To 5.0 g of Clofibrate add 20 mL of nitric acid and 5 mL of sulfuric acid, and heat until white fumes are evolved. After cooling, if necessary, add further 5 mL of nitric acid, heat until white fumes are evolved, and repeat this procedure until the solution is colorless to light yellow. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat again until white fumes are evolved. Cool, add water to 25 mL, use 5 mL of this solution as the test solution, and perform the test.

Color standard: Prepare a solution according to the above procedure without using Clofibrate as the blank. Transfer 5 mL of the solution to a generator bottle, add 2.0 mL of Standard Arsenic Solution, and then proceed as directed in the test solution (not more than 20 ppm).

(4) p-Chlorophenol—To 1.0 g of Clofibrate add exactly 1 mL of the internal standard solution, then add the mobile phase to make 5 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of 4-chlorophenol in a mixture of hexane and 2-propanol (9:1) to make exactly 100 mL. Pipet 10 mL of this solution, and add a mixture of hexane and 2-propanol (9:1) to make exactly 50 mL. Pipet 6 mL of this solution, add exactly 4 mL of the internal standard solution, then add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according
to the following conditions, and calculate the ratios, Q₁ and Q₃, of the peak area of 4-chlorophenol to that of the internal standard: Q₁ is not greater than Q₃.

**Internal standard solution**—A solution of 4-ethoxyphenol in the mobile phase (1 in 30,000).

**Operating conditions**—
- **Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).
- **Column:** A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with cyanopropyl-silanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.
- **Mobile phase:** A mixture of hexane, 2-propanol and acetic acid (100) (1970:30:1).
- **Flow rate:** Adjust so that the retention time of clofibrate is about 2 minutes.
- **Selection of column:** Dissolve 10.0 g of Clofibrate, 6 mg of 4-chlorophenol and 6 mg of 4-ethoxyphenol in 1000 mL of hexane. Proceed with 20 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofibrate, 4-chlorophenol and 4-ethoxyphenol in this order, with the resolution between the peaks of clofibrate and 4-chlorophenol is not less than 5, and with the resolution between the peaks of 4-chlorophenol and 4-ethoxyphenol is not less than 2.0.

**Water**<2.48≥Not more than 0.2% (5 g, volumetric titration, direct titration).

**Residue on ignition**<2.48≥Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clofibrate, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol VS, and heat in a water bath under a reflux condenser with a carbon dioxide absorbing tube (soda-lime) for 2 hours with frequent shaking. Cool, and titrate ≤2.50≥immediately the excess potassium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 24.27 mg of C₁₅H₁₀₂ClO₃

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Clofibrate Capsules**

クロフィブラートカプセル

Clofibrate Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of clofibrate (C₁₅H₁₀₂ClO₃: 242.70).

**Method of preparation** Prepare as directed under Capsules, with Clofibrate.

**Identification** Cut and open Clofibrate Capsules, and use the contents as the sample. Determine the absorption spectrum of a solution of the sample in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry ≤2.24≥: it exhibits a maximum between 278 nm and 282 nm, and it exhibits a maximum between 224 nm and 228 nm after diluting this solution 10 times with ethanol (99.5).

**Purity** p-Chlorophenol—Cut and open not less than 20 Clofibrate Capsules, and proceed with 1.0 g of the well-

**Assay** Weigh accurately not less than 20 Clofibrate Capsules, cut and open the capsules, rinse the inside of the capsules with a small amount of diethyl ether after taking out the contents, evaporate the diethyl ether by allowing the capsules to stand at room temperature, and weigh the capsules accurately. Weigh accurately an amount of the contents, equivalent to about 0.1 g of clofibrate (C₁₅H₁₀₂ClO₃), dissolve in acetonitrile to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Clofibrate RS, proceed in the same manner as directed for the sample solution, and use the solution so obtained as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography ≤2.01≥ according to the following conditions, and calculate the ratios, Q₁ and Q₃, of the peak area of clofibrate to that of the internal standard.

Amount (mg) of clofibrate (C₁₅H₁₀₂ClO₃)

\[ M_S = Q_1 \times Q_3/Q_2 \]

M₃: Amount (mg) of Clofibrate RS taken

**Internal standard solution**—A solution of ibuprofen in the mobile phase (1 in 100).

**Operating conditions**—
- **Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).
- **Column:** A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 to 10 μm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.
- **Mobile phase:** A mixture of acetonitrile and diluted phosphoric acid (1 in 1000) (3:2).
- **Flow rate:** Adjust so that the retention time of clofibrate is about 10 minutes.
- **Selection of column:** Dissolve 0.05 g of clofibrate and 0.3 g of ibuprofen in 50 mL of acetonitrile. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of ibuprofen and clofibrate in this order with the resolution between these peaks being not less than 6.

**Containers and storage** Containers—Well-closed containers. Storage—Light-resistant.
Clomifene Citrate

クロミフェンクエン酸塩

Clomifene Citrate, when dried, contains not less than 98.0% of clomifene citrate (C₂₆H₃₅ClNO₆). Description

Clomifene Citrate occurs as a white to pale yellow-white powder. It is odorless.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

It gradually changes in color by light.

Melting point: about 115°C

Identification

(1) To 2 mL of a solution of Clomifene Citrate in methanol (1 in 200) add 2 mL of Reinecke salt TS: a light red precipitate is produced.

(2) Determine the absorption spectrum of a solution of Clomifene Citrate in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2,24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Clomifene Citrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Clomifene Citrate in methanol (1 in 200) responds to Qualitative Tests <1,09> (1) and (2) for citrate salt.

Purity

(1) Clarity and color of solution—A solution of 1.0 g of Clomifene Citrate in 30 mL of methanol is clear and colorless.

(2) Heavy metals <1,07>—Proceed with 2.0 g of Clomifene Citrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

Loss on drying <2,41>—Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

Residue on ignition <2,44>—Not more than 0.1% (1 g).

Isomer ratio

To 10 mg of Clomifene Citrate add 10 mL of water and 1 mL of sodium hydroxide TS, and shake to uniformly disperse. Add 10 mL of ethyl acetate, shake vigorously for 5 minutes, allow to stand for 5 minutes, and use the upper layer as the sample solution. Perform the test with 1 μL of the sample solution as directed under Gas Chromatography <2,07> according to the following conditions. Determine the areas of two adjacent peaks, Aₐ and Aᵦ, having the retention time of about 8 minutes, where Aₐ is the peak area of shorter retention time and Aᵦ is the peak area of longer retention time: Aᵦ/(Aₐ + Aᵦ) is between 0.3 and 0.5.

Operating conditions—

Detector: A hydrogen flame-ionization detector.
Column: A fused silica column 0.25 mm in inside diameter and 15 m in length, coated the inside surface with a layer about 0.1 μm thick of dimethylpolysiloxane for gas chromatography.

Column temperature: A constant temperature of about 230°C.

Injection port temperature: A constant temperature of about 270°C.

Detector temperature: A constant temperature of about 300°C.

Carrier gas: Helium.

Flow rate: Adjust so that the retention time of the first peak of clomifene citrate is about 7.5 minutes.

Split ratio: 1:50.

System suitability—

System performance: When the procedure is run with 1 μL of the sample solution under the above operating conditions, the resolution between the two adjacent peaks having the retention time of about 8 minutes is not less than 5.

System repeatability: When the test is repeated 6 times with 1 μL of the sample solution under the above operating conditions, the relative standard deviation of the result of Aᵦ/(Aₐ + Aᵦ) is not more than 1.0%.

Assay

Weigh accurately about 1 g of Clomifene Citrate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2,50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 59.81 mg of C₂₆H₃₄ClNO₆C₇H₄O₇.

Containers and storage

Containers—Tight containers.
Storage—Light-resistant.

Clomifene Citrate Tablets

クロミフェンクエン酸塩錠

Clomifene Citrate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of the clomifene citrate (C₂₆H₃₅ClNO₆.C₇H₄O₇: 598.08).

Method of preparation

Prepare as directed under Tablets, with Clomifene Citrate.

Identification

Weigh a portion of powdered Clomifene Citrate Tablets, equivalent to 50 mg of Clomifene Citrate, shake vigorously with 50 mL of methanol for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Clomifene Citrate RS in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2,08>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, toluene and diethylamine (10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and standard solution show the same Rf value.

Uniformity of dosage units <6,02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clomifene Citrate Tablets add 10 mL of water, and shake until the tablets are disintegrated. To this...
solution add 50 mL of methanol, shake for 10 minutes, and add methanol to make exactly 100 mL. Centrifuge this solution, pipet 4 mL of the supernatant liquid, add methanol to make exactly V mL, so that each mL contains about 20 μg of clomifene citrate (C18H23ClNO.C2H3O), and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of clomifene citrate (C18H23ClNO.C2H3O) = M5 × A4/A5 × V/100

M5: Amount (mg) of Clomifene Citrate RS taken

Dissolution 6.10 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Clomifene Citrate Tablets is not less than 80%.

Start the test with 1 tablet of Clomifene Citrate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 28 μg of clomifene citrate (C18H23ClNO.C2H3O), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of Clomifene Citrate RS, previously dried in vacuum using phosphorus (V) oxide as a desiccant for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A4 and A5, at 295 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of clomifene citrate (C18H23ClNO.C2H3O) = M5 × A4/A5 × V/V × 1/C × 90

C: Labeled amount (mg) of clomifene citrate (C18H23ClNO.C2H3O) in 1 tablet

Assay Weigh accurately, and powder not less than 20 Clomifene Citrate Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of clomifene citrate (C18H23ClNO.C2H3O), add 50 mL of methanol, shake for 10 minutes, and add methanol to make exactly 100 mL. Centrifuge a portion of this solution, pipet 4 mL of the supernatant liquid, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Clomifene Citrate RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, and dilute with methanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A4 and A5, of the sample solution and the standard solution, respectively, at 295 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.

Amount (mg) of clomifene citrate (C18H23ClNO.C2H3O) = M5 × A4/A5

M5: Amount (mg) of Clomifene Citrate RS taken

Containers and storage Containers—Tight containers.

Clomipramine Hydrochloride
クロミプラミン塩酸塩

Clomipramine Hydrochloride, when dried, contains not less than 98.5% of clomipramine hydrochloride (C16H23ClNO.HCl).

Description Clomipramine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless. It is very soluble in acetic acid (100), freely soluble in water, in methanol and in chloroform, soluble in ethanol (95), sparingly soluble in acetic anhydride, slightly soluble in acetone, and practically insoluble in ethyl acetate and in diethyl ether.

Identification (1) Dissolve 3 mg of Clomipramine Hydrochloride in 1 mL of nitric acid: a deep blue color develops.
(2) Determine the absorption spectrum of a solution of Clomipramine Hydrochloride in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
(3) Take 1 g of Clomipramine Hydrochloride in a separator, dissolve in 10 mL of water, add 5 mL of sodium hydroxide TS, and extract with two 30-mL portions of diethyl ether [the water layer is used for Identification (4)]. Combine the diethyl ether extracts, add 20 mL of water, and shake. Take diethyl ether layer, dry with a small portion of anhydrous sodium sulfate, and filter. Evaporate the combined extracts by warming on a water bath, and proceed the test with the residue as directed under Flame Coloration Test 1.64 (2): a green color appears.
(4) The solution neutralized by adding dilute nitric acid to the water layer obtained in (3) responds to Qualitative Tests 1.09 for chloride.

pH 2.54 Dissolve 1.0 g of Clomipramine Hydrochloride in 10 mL of water: the pH of this solution is between 3.5 and 5.0.

Melting point 2.6.0 192 – 196 °C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Clomipramine Hydrochloride in 10 mL of water: the solution is clear and colorless to pale yellow.
(2) Heavy metals 1.077—Proceed with 2.0 g of Clomipramine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
(3) Arsenic 1.11—Prepare the test solution with 1.0 g of Clomipramine Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).
(4) Related substances—Dissolve 0.20 g of Clomipramine Hydrochloride in 10 mL of methanol, and use this so-
lution as the sample solution. Separately, weigh 20 mg of Imipramine Hydrochloride, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution (1). Then pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 5 mL of the solution, add methanol to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetone and ammonia solution (28:15:5:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate: the spot obtained from the sample solution, corresponding to that from the standard solution (1), is not more intense than the spot from the standard solution (1). Each of the spots other than the principal spot and the spot mentioned above from the sample solution is not more intense than the spot from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clomipramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100:7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.13 mg of C₁₀H₁₉ClN₃.HCl

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

---

**Clomipramine Hydrochloride Tablets**

クロミプラミン塩酸塩錠

Clomipramine Hydrochloride Tablets contain not less than 92.0% and not more than 108.0% of the labeled amount of clomipramine hydrochloride (C₁₀H₁₉ClN₃.HCl: 351.31).

**Method of preparation** Prepare as directed under Tablets, with Clomipramine Hydrochloride.

**Identification** To a portion of powdered Clomipramine Hydrochloride Tablets, equivalent to 50 mg of Clomipramine Hydrochloride, add a suitable amount of 0.1 mol/L hydrochloric acid TS, shake thoroughly, and add 0.1 mol/L hydrochloric acid TS to make 250 mL. Centrifuge this solution, and to 10 mL of the supernatant liquid add 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 250 nm and 254 nm.

**Uniformity of dosage unit** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clomipramine Hydrochloride Tablets add V/5 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1), sonicate to disintegrate the tablet, and shake thoroughly for 30 minutes. To this solution add 3f/5 mL of methanol, shake for 15 minutes, and add methanol to make exactly V mL so that each mL contains about 0.1 mg of clomipramine hydrochloride (C₁₀H₁₉ClN₃.HCl). Centrifuge this solution, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

**Amount (mg) of clomipramine hydrochloride**

\[
M₅ = \frac{A₅}{A₇} \times \frac{V}{250}
\]

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rates in 45 minutes of 10-mg tablet and in 90 minutes of 25-mg tablet are not less than 80%, respectively.

Start the test with 1 tablet of Clomipramine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 11 μg of clomipramine hydrochloride (C₁₀H₁₉ClN₃.HCl), and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₇ and A₅, of the sample solution and standard solution at 252 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

**Assay** Weigh accurately the mass of not less than 20 Clomipramine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg of clomipramine hydrochloride (C₁₀H₁₉ClN₃.HCl), add 50 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1), sonicate, and shake thoroughly for 30 minutes. To this solution add 150 mL of methanol, shake for 15 minutes, and add methanol to make exactly 250 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of clomipramine hydrochloride for assay, previously dried at 105°C for 3 hours, and add 50 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1), sonicate, and shake thoroughly for 30 minutes. To this solution add 250 mL of methanol, shake for 15 minutes, and add methanol to make exactly 250 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of clomipramine hydrochloride for assay, previously dried at 105°C for 3 hours, and add 50 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1), sonicate, and shake thoroughly for 30 minutes. To this solution add 250 mL of methanol, shake for 15 minutes, and add methanol to make exactly 250 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₇ and A₅, of clomipramine in each solution.

**Amount (mg) of clomipramine hydrochloride**

\[
M₅ = \frac{A₅}{A₇} \times \frac{V}{250}
\]
assay taken

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2 g of sodium 1-octanesulfonate in 300 mL of water, and add 450 mL of methanol, 250 mL of acetonitrile and 1 mL of 0.5 mol/L sulfuric acid TS.

Flow rate: Adjust so that the retention time of clomipramine is about 13 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clomipramine are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clomipramine is not more than 1.0%.

Containers and storage
Containers—Tight containers.

Clonazepam

クロナゼパム

\[
\text{Cl}_3\text{H}_9\text{ClN}_5\text{O}_3; \quad 315.71
\]
5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one
[1622-61-3]

Clonazepam, when dried, contains not less than 99.0% of clonazepam (C\(_3\)H\(_9\)ClN\(_5\)O\(_3\)).

Description Clonazepam occurs as white to light yellow, crystals or crystalline powder.

It is sparingly soluble in acetic anhydride and in acetone, slightly soluble in methanol and in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

It is gradually colored by light.

Melting point: about 240°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Clonazepam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clonazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Clonazepam as directed under Flame Coloration Test \(<1.04\rangle\) (2): a green color appears.

Purity (1) Chloride \(<1.05\rangle\)—To 1.0 g of Clonazepam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Discard the first 20 mL portion of the filtrate, take the subsequent 20 mL portion of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution, and perform the test.

Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.022%).

(2) Heavy metals \(<1.07\rangle\)—Proceed with 1.0 g of Clonazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.25 g of Clonazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, then pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07\rangle\). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of nitromethane and acetone (10:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying \(<2.4\rangle\) Not more than 0.30% (1 g, 105°C, 4 hours).

Residue on ignition \(<2.44\rangle\) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clonazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate \(<2.50\rangle\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.57 mg of Cl\(_3\)H\(_9\)ClN\(_5\)O\(_3\).

Containers and storage
Containers—Well-closed containers.

Storage—Light-resistant.

Clonazepam Fine Granules

クロナゼパム細粒

Clonazepam Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of clonazepam (C\(_3\)H\(_9\)ClN\(_5\)O\(_3\); 315.71).

Method of preparation Prepare as directed under Granules, with Clonazepam.

Identification Powder Clonazepam Fine Granules. To a portion of the powder, equivalent to 1 mg of Clonazepam, add an appropriate volume of methanol and shake for 10 minutes, add methanol to make 100 mL, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\); it exhibits a maximum between 307 nm and 311 nm.

Dissolution Being specified separately when the drug is granted approval based on the Law.
Clonazepam Tablets / Official Monographs

Assay Powder Clonazepam Fine Granules. Weigh accurately a portion of the powder, equivalent to about 2.4 mg of clonazepam (C₁₅H₂₂ClN₂O₃), add exactly 30 mL of a mixture of methanol and water (7:3), and shake for 15 minutes. Centrifuge this solution, pipet 5 mL of the supernatant liquid, add a mixture of methanol and water (7:3) to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of clonazepam for assay, previously dried at 105°C for 4 hours, dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of methanol and water (7:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 15 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.2.1D) according to the following conditions, and determine the peak areas, A₁ and A₅, of clonazepam in each solution.

Amount (mg) of clonazepam (C₁₅H₂₂ClN₂O₃) = $M_S \times A₁/A₅ \times 3/25$

$M_S$: Amount (mg) of clonazepam for assay taken

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 310 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and methanol (4:3:3).

Flow rate: Adjust so that the retention time of clonazepam is about 5 minutes.

System suitability—

System performance: When the procedure is run with 15 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clonazepam are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 15 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clonazepam is not more than 1.0%.

Containers and storage—

Containers—Tight containers.

Storage—Light-resistant.

Clonazepam Tablets

Clonazepam Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of clonazepam (C₁₅H₂₂ClN₂O₃: 315.71).

Method of preparation—Prepare as directed under Tablets, with Clonazepam.

Identification—

Powder Clonazepam Tablets. To a portion of the powder, equivalent to 1 mg of Clonazepam, add an appropriate volume of methanol and shake for 10 minutes, then add methanol to make 100 mL, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry (2.2.2A) it exhibits a maximum between 307 nm and 311 nm.

Uniformity of dosage units—

Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clonazepam Tablets, add V/10 mL of methanol, shake for 15 minutes, add 2-propanol to make exactly V mL so that each mL contains about 10 µg of clonazepam (C₁₅H₂₂ClN₂O₃). Filter this solution through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of clonazepam for assay, previously dried at 105°C for 4 hours, dissolve in methanol to make exactly 200 mL. Pipet 10 mL of this solution, add 2-propanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₅, at 312 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry (2.2.2A) using a mixture of 2-propanol and methanol (9:1) as the control.

Amount (mg) of clonazepam (C₁₅H₂₂ClN₂O₃) = $M_S \times A₁/A₅ \times V/1000$

$M_S$: Amount (mg) of clonazepam for assay taken

Dissolution—When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of 0.5-mg tablet and 1-mg tablet is not less than 80%, and that of 2-mg tablet is not less than 75%.

Start the test with 1 tablet of Clonazepam Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less then 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 0.56 µg of clonazepam (C₁₅H₂₂ClN₂O₃), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of clonazepam for assay, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution and add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 100 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.2.1D) according to the following conditions, and determine the peak areas, A₁ and A₅, of clonazepam in each solution.

Dissolution rate (%) with respect to the labeled amount of clonazepam (C₁₅H₂₂ClN₂O₃) = $M_S \times A₁/A₅ \times V/V' \times 1/C \times 9/4$

$M_S$: Labeled amount (mg) of clonazepam for assay taken

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 100 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clonazepam are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 100 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clonazepam is not more than 2.0%.

Assay—Weigh accurately the mass of not less than 20
Clonazepam Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 2.5 mg of clonazepam (C8H7ClN2O3), add exactly 50 mL of a mixture of methanol and water (7:3), and shake for 15 minutes. Centrifuge this solution, and use the supernatant as the sample solution. Separately, weigh accurately about 25 mg of clonazepam for assay, previously dried at 105°C for 4 hours, dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, add a mixture of methanol and water (7:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and determine the peak areas, A1 and A5, of clonazepam in each solution.

Amount (mg) of clonazepam (C8H7ClN2O3) = M5 × A1/A5 × 1/10

M5: Amount (mg) of clonazepam for assay taken

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 310 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water, acetonitrile and methanol (4:3:3).
Flow rate: Adjust so that the retention time of clonazepam is about 5 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clonazepam are not less than 3000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clonazepam is not more than 1.0%.

Containers and storage  Containers—Tight containers.
Storage—Light-resistant.

Clonidine Hydrochloride
クロニジン塩酸塩

Clonidine Hydrochloride, when dried, contains not less than 99.0% of clonidine hydrochloride (C8H7ClN2O3·HCl).

Description  Clonidine Hydrochloride occurs as white, crystalline powder.
It is freely soluble in methanol, soluble in water and in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

Identification  (1) To 5 mL of a solution of Clonidine Hydrochloride (1 in 1000) add 6 drops of Dragendorff’s TS: an orange precipitate is formed.
(2) Determine the absorption spectrum of a solution of Clonidine Hydrochloride in 0.01 mol/L hydrochloric acid TS (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
(3) Determine the infrared absorption spectrum of Clonidine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.
(4) A solution of Clonidine Hydrochloride (1 in 50) responds to Qualitative Tests 1.09 for chloride.

pH 2.54—Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the pH of this solution is between 4.0 and 5.5.

Purity  (1) Clarity and color of solution—Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the solution is clear and colorless.
(2) Heavy metals 1.07—Proceed with 2.0 g of Clonidine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
(3) Arsenic 1.11—Prepare the test solution with 0.5 g of Clonidine Hydrochloride according to Method 3, and perform the test (not more than 4 ppm).
(4) Related substances—Dissolve 0.20 g of Clonidine Hydrochloride in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL and 2 mL of this solution, to each add methanol to make exactly 20 mL, and use these solutions as the standard solution (1) and the standard solution (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 2 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, 1,4-dioxane, ethanol (99.5) and ammonia solution (28) (19:8:2:1) to a distance of about 12 cm, air-dry the plate, and then dry at 100°C for 1 hour. Spray evenly sodium hypochlorite TS on the plate, air-dry the plate for 15 minutes, and then spray evenly potassium iodide starch TS on the plate: the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution (2), and the numbers of spots other than the principal spot and the spot of the starting point, which are more intense than the spot from the standard solution (1), are not more than 3.

Loss on drying 2.41—Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition 2.44—Not more than 0.1% (1 g).

Assay  Weigh accurately about 0.4 g of Clonidine Hydrochloride, previously dried, and dissolve in 30 mL of acetic acid (100) by warming. After cooling, add 70 mL of acetic anhydride, and titrate 2.50 with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Cloperastine Fendizoate

Each mL of 0.1 mol/L perchloric acid VS 
$= 26.66$ mg of C$_{20}$H$_{24}$ClN$_2$O$_4$HCl

Containers and storage Containers—Tight containers.

Cloperastine Fendizoate

クロペラスチンフェンジゾ酸塩

C$_{20}$H$_{24}$ClNO$_4$.C$_{20}$H$_{18}$O$_4$: 648.19
1-[2-[(RS)-(4-Chlorophenyl)(phenyl)methoxy]ethyl]piperidine mono1-[6-hydroxybiphenyl-3-yl]carbonyl]benzoate
[85187-37-7]

Cloperastine Fendizoate, when dried, contains not less than 99.0% and not more than 101.0% of cloperastine fendizoate (C$_{20}$H$_{24}$ClNO$_4$.C$_{20}$H$_{18}$O$_4$).

Description Cloperastine Fendizoate occurs as white, crystals or crystalline powder.

It is freely soluble in isopropylamine, slightly soluble in methanol, in ethanol (99.5) and in acetic acid (100), and practically insoluble in water.

A solution of Cloperastine Fendizoate in isopropylamine (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Cloperastine Fendizoate in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloperastine Fendizoate as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point $<2.60>$ 186 – 190°C

Purity (1) Chloride $<1.03>$—To 2.0 g of Cloperastine Fendizoate add 50 mL of water, warm at 70°C for 5 minutes, cool, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals $<1.07>$—Proceed with 1.0 g of Cloperastine Fendizoate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) 4-Chlorobenzophenone—Dissolve exactly 25 mg of Cloperastine Fendizoate in the mobile phase A to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve exactly 25 mg of 4-chlorobenzophenone in the mobile phase A to make exactly 200 mL. Pipet 1 mL of this solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions, and determine the peak areas of 4-chlorobenzophenone by the automatic integration method: the peak area of 4-chlorobenzophenone obtained from the sample solution is not larger than that from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 226 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: A mixture of 0.1 mol/L potassium dihydrogen phosphate TS, acetonitrile for liquid chromatography and perchloric acid (400:320:1).
Mobile phase B: A mixture of acetonitrile for liquid chromatography, 0.1 mol/L potassium dihydrogen phosphate TS and perchloric acid (1050:450:1).
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 12</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>12 – 22</td>
<td>100 → 0</td>
<td>0 → 100</td>
</tr>
</tbody>
</table>

Flow rate: 1.2 mL per minute.

System suitability—
Test for required detectability: Pipet 2 mL of the standard solution, and add the mobile phase A to make exactly 10 mL. Confirm that the peak area of 4-chlorobenzophenone obtained with 20 µL of this solution is equivalent to 14 to 26% of that with 20 µL of the standard solution.

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of 4-chlorobenzophenone are not less than 10,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 4-chlorobenzophenone is not more than 2.0%.

Loss on drying $<2.41>$ Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition $<2.44>$ Not more than 0.1% (1 g).

Assay Weigh accurately about 1 g of dried Cloperastine Fendizoate, add 100 mL of acetic acid (100), warm to dissolve, cool, and titrate $<2.50>$ with 0.40 mL/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS $= 64.82$ mg of C$_{20}$H$_{24}$ClNO$_4$.C$_{20}$H$_{18}$O$_4$.

Containers and storage Containers—Well-closed containers.
Cloperastine Fendizoate Tablets

クロベラスタンチンフェンジオ/酸塩

Cloperastine Fendizoate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$: 648.19).

Method of preparation  Prepare as directed under Tablets, with Cloperastine Fendizoate.

Identification  To a quantity of powdered Cloperastine Fendizoate Tablets, equivalent to 1.5 mg of Cloperastine Fendizoate, add methanol, shake thoroughly, add methanol to make 100 mL, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry $\lambda_{\text{max}}$: it exhibits maxima between 248 nm and 252 nm, and between 282 nm and 286 nm.

Uniformity of dosage units  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cloperastine Fendizoate Tablets add exactly 10 mL of the internal standard solution, add the mobile phase, shake vigorously until the tablet is disintegrated, add the mobile phase to make 50 mL so that each mL contains about 88 $\mu$g of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$), and filter through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$) = $M_5 \times Q_1/Q_2 \times V/250$

$M_5$: Amount (mg) of cloperastine fendizoate for assay taken

Internal standard solution—A solution of ethyl parahydroxybenzoate in the mobile phase (3 in 2000).

Dissolution  Perform the test with exactly 20 tablets of Cloperastine Fendizoate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 4.4 mg of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$), add exactly 5 mL of the internal standard solution, add 20 mL of the mobile phase, shake vigorously for 10 minutes, then add the mobile phase to make 50 mL, and filter through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard the first 10 mL of the filtrate and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 22 mg of cloperastine fendizoate for assay, previously dried at 105°C for 3 hours, and dissolve in the mobile phase to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $\lambda_{\text{max}}$, and calculate the ratios, $Q_1$ and $Q_5$, of the peak area of cloperastine to that of the internal standard.

Amount (mg) of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$) = $M_5 \times Q_1/Q_5 \times 1/5$

$M_5$: Amount (mg) of cloperastine fendizoate for assay taken

Internal standard solution—A solution of ethyl parahydroxybenzoate in the mobile phase (3 in 2000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 226 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 0.1 mol/L potassium dihydrogen phosphate TS, acetonitrile for liquid chromatography and perchloric acid (400:320:1).
Flow rate: Adjust so that the retention time of cloperastine is about 8 minutes.

System suitability—
System performance: When the procedure is run with 10 $\mu$L of the standard solution under the above operating conditions, fendizoic acid and cloperastine are eluted in this order with the resolution between these peaks being not less than 6.

Dissolution rate (% with respect to the labeled amount of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$)) = $M_5 \times A_1/A_S \times V'/V \times 1/C \times 18$

$M_5$: Amount (mg) of cloperastine fendizoate for assay taken

C: Labeled amount (mg) of cloperastine fendizoate (C$_{20}$H$_{20}$ClNO.C$_{20}$H$_{14}$O$_2$) in 1 tablet

Operating conditions—
Proced as directed in the operating conditions in the Assay.

System suitability—
System performance: When the procedure is run with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cloperastine is not more than 2.0%.
astine are eluted in this order, and each resolution between these peaks is not less than 5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cloperastine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Cloperastine Hydrochloride
クロペラスチン塩酸塩

\[
\text{C}_9\text{H}_9\text{ClNO.HCl: 366.32}
\]

\[
1-[(RS)-(4-Chlorophenyl)(phenylmethoxy)ethyl]piperidine monohydrochloride \quad [14984-68-0]
\]

Cloperastine Hydrochloride, when dried, contains not less than 98.5% of cloperastine hydrochloride (C₉H₉ClNO.HCl).

Description Cloperastine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (95) and in acetic acid (100), and soluble in acetic anhydride.

A solution of Cloperastine Hydrochloride (1 in 10) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloperastine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectroscopy <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Shake 10 mL of a solution of Cloperastine Hydrochloride (1 in 100) with 2 mL of ammonia TS and 20 mL of diethyl ether, separate the water layer, wash the water layer with 20 mL of diethyl ether, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to Qualitative Tests <1.09> for chloride.

Melting point <2.60> 149 – 153°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Cloperastine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Cloperastine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peaks, having the relative retention times of about 0.8 and about 3.0 to cloperastine obtained from the sample solution are not larger than the peak area of cloperastine from the standard solution, and the area of the peak having the relative retention time about 2.0 from the sample solution is not larger than 5/3 times the peak area of cloperastine from the standard solution. The area of the peak other than cloperastine and the peaks mentioned above from the sample solution are not larger than 3/5 times the peak area of cloperastine from the standard solution, and the total area of these peaks is not larger than 2 times the peak area of cloperastine from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 222 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol, 0.1 mol/L potassium dihydrogen phosphate TS and perchloric acid (500:250:1).

Flow rate: Adjust so that the retention time of cloperastine is about 7 minutes.

Time span of measurement: About 4 times as long as the retention time of cloperastine, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 20 mL. Confirm that the peak area of cloperastine obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: Dissolve 30 mg of Cloperastine Hydrochloride and 40 mg of benzophenone in 100 mL of the mobile phase. To 2 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, cloperastine and benzophenone are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cloperastine is not more than 2.0%.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cloperastine Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100:7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 36.63 mg of C₉H₉ClNO.HCl

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
**Containers and storage**  Containers—Tight containers.  
Storage—Light-resistant.

**Clopidogrel Sulfate**  
クロピドグレル硫酸塩

Clopidogrel Sulfate contains not less than 97.0% and not more than 101.5% of clopidogrel sulfate (C_{16}H_{18}ClNO_{5}S·H_{2}SO_{4}), calculated on the anhydrous basis.

**Description**  Clopidogrel Sulfate occurs as a white to pale yellow-white, crystalline powder or powder.  
It is freely soluble in water and in methanol, and soluble in ethanol (99.5).  
It gradually develops a brown color on exposure to light.  
Melting point: about 177°C (with decomposition).

**Identification**  
(1) Determine the absorption spectrum of a solution of Clopidogrel Sulfate in methanol (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \(2,25,26\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Clopidogrel Sulfate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clopidogrel Sulfate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2,25\), and compare the spectrum with the Reference Spectrum or the spectrum of Clopidogrel Sulfate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.  
If any difference appears between the spectra, dissolve Clopidogrel Sulfate, or each of Clopidogrel Sulfate and Clopidogrel Sulfate RS in ethanol (99.5), respectively. Then evaporate the ethanol to dryness, and repeat the test on the residues dried in vacuum.

(3) Perform the test with Clopidogrel Sulfate as directed under Flame Coloration Test \(1.04\) (2): a green color appears.

(4) A solution of Clopidogrel Sulfate in a mixture of water and methanol (1:1) (1 in 100) responds to Qualitative Tests \(1.09\) (1) for sulfate.

**Purity**  
(1) Heavy metals \(1.07\) —Proceed with 1.0 g of Clopidogrel Sulfate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 65 mg of Clopidogrel Sulfate in 10 mL of a mixture of acetonitrile for liquid chromatography and mobile phase A (3:2), and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add a mixture of acetonitrile for liquid chromatography and the mobile phase A (3:2) to make exactly 100 mL. Pipet 2.5 mL of this solution, add a mixture of acetonitrile for liquid chromatography and the mobile phase A (3:2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(2,07\) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peaks, having the relative retention time of about 0.5 and about 1.1 to clopidogrel, obtained from the sample solution is not larger than 2 times the peak area of clopidogrel from the standard solution, the area of the peak other than clopidogrel and the peaks mentioned above from the sample solution is not larger than the peak area of clopidogrel from the standard solution, and the total area of the peaks other than clopidogrel from the sample solution is not larger than 5 times the peak area of clopidogrel from the standard solution.

**Operating conditions**  
Detector, column and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase A: Dissolve 0.87 g of sodium 1-pentanesulfonate in 1000 mL of water, and adjust to pH 2.5 with phosphoric acid. To 950 mL of this solution add 50 mL of methanol.

Mobile phase B: A mixture of acetonitrile for liquid chromatography and methanol (19:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 3</td>
<td>89.5</td>
<td>10.5</td>
</tr>
<tr>
<td>3 – 48</td>
<td>31.5 → 31.5</td>
<td>68.5 → 68.5</td>
</tr>
<tr>
<td>48 – 68</td>
<td>31.5</td>
<td>68.5</td>
</tr>
</tbody>
</table>

Flow rate: 1.0 mL per minute.  
Time span of measurement: For 68 minutes after injection, beginning after the solvent peak.

**System suitability**  
Test for required detectability: To exactly 2 mL of the standard solution add a mixture of acetonitrile for liquid chromatography and the mobile phase A (3:2) to make exactly 20 mL. Confirm that the peak area of clopidogrel obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clopidogrel are not less than 60,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clopidogrel is not more than 2.0%.

(3) Enantiomer—Dissolve 0.10 g of Clopidogrel Sulfate in 25 mL of ethanol (99.5) for liquid chromatography, add heptane for liquid chromatography to make 50 mL, and use this solution as the sample solution. Pipet 2.5 mL of the sample solution, and add a mixture of ethanol (99.5) for liquid chromatography and heptane for liquid chromatography (1:1) to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of ethanol (99.5) for liquid chromatography and heptane for liquid chromatography (1:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution
and standard solution as directed under Liquid Chromatography <2:01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of the enantiomer, having the relative retention time of about 0.6 to clopidogrel, obtained from the sample solution is not larger than the peak area of clopidogrel from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with cellulose derivative-coated silica gel for liquid chromatography (10 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of heptane for liquid chromatography and ethanol (99.5) for liquid chromatography (17:3).

**Flow rate:** Adjust so that the retention time of clopidogrel is about 18 minutes.

**System suitability—**

**System performance:** When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clopidogrel are not less than 3500 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clopidogrel is not more than 2.0%.

**Water 2.48** Not more than 0.5% (1 g, coulometric titration).

**Residue on ignition 2.44** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 45 mg each of Clopidogrel Sulfate and Clopidogrel Sulfate Tablets (separately, determine the water 2.48 in the same manner as Clopidogrel Sulfate), and dissolve them separately in the mobile phase to make exactly 50 mL. Take exactly 7 mL of each solution, add separately the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2:01> according to the following conditions, and determine the peak areas, A₁ and Aₛ, of clopidogrel in each solution.

Amount (mg) of clopidogrel sulfate (C₁₆H₁₆ClNO₄S.H₂SO₄)

\[ M₃ = M₅ \times \frac{A₁}{Aₛ} \]

Not more than 2.0% of the peak area of clopidogrel from the standard solution is not larger than 2.0%.

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant.

---

**Clopidogrel Sulfate Tablets**

クロピドグレル硫酸塩錠

Clopidogrel Sulfate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of clopidogrel (C₁₆H₁₆ClNO₄S: 321.82).

**Identification** To a quantity of powdered Clopidogrel Sulfate Tablets, equivalent to 75 mg of clopidogrel (C₁₆H₁₆ClNO₄S), add 50 mL of methanol, and after sonicating with ultrasonic waves with occasional shaking, add methanol to make 100 mL. To 10 mL of this solution add methanol to make 30 mL, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits maxima between 269 nm and 273 nm, and between 276 nm and 280 nm.

**Purity** Related substances—Keep the sample solution and the standard solution at 5°C or below and use within 24 hours. Take a quantity of Clopidogrel Sulfate Tablets equivalent to 0.15 g of clopidogrel (C₁₆H₁₆ClNO₄S), add 120 mL of the mobile phase, sonicate with occasional shaking until the tablets are disintegrated, and add the mobile phase to make 200 mL. Centrifuge this solution, to 10 mL of the supernatant liquid add the mobile phase to make 30 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2:01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peaks, having the relative retention times of about 0.3, about 0.5 and about 0.9 to clopidogrel, obtained from the sample solution is not larger than 3/10 times the peak area of clopidogrel from the standard solution. The area of the peak having the relative retention time of about 2.0 from the sample solution is not larger than 1.2 times the peak area of clopidogrel from the standard solution. The area of the peak other than clopidogrel and the peaks mentioned above from the sample solution is not larger than 1/10 times the peak area of clopidogrel from the standard solution. The total area of the peaks other than clopidogrel from the sample solution is not larger than 1.7 times the peak area of clopidogrel from the standard solution.

---

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column of 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized amino silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in 1000 mL of water, and to 750 mL of this solution add 250 mL of acetonitrile for liquid chromatography.
Flow rate: Adjust so that the retention time of clopidogrel is about 6 minutes.
Time span of measurement: About 2.5 times as long as the retention time of clopidogrel, beginning after the solvent peak.

System suitability—
Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of clopidogrel obtained with 10 µL of this solution is equivalent to 3.5 to 6.5% of that with 10 µL of the standard solution.
System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clopidogrel are not less than 2500 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clopidogrel is not more than 2.0%.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.
To 1 tablet of Clopidogrel Sulfate Tablets add a suitable amount of the mobile phase, sonicate with occasional shaking until the tablet is disintegrated, and add the mobile phase to make exactly 50 mL. Filter the solution through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add exactly V/5 mL of the internal standard solution, and add the mobile phase to make V mL so that each mL contains about 0.1 mg of clopidogrel (C₁₆H₁₄ClNO₅S). Use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of clopidogrel (C₁₆H₁₄ClNO₅S) = Mₛ × V/Qₗ × V/10 × 0.766

Mₛ: Amount (mg) of Clopidogrel Sulfate RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of isopropyl parahydroxybenzoate in the mobile phase (1 in 1500).

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate of 25-mg tablet in 30 minutes is not less than 70%, and that of 75-mg tablet in 45 minutes is not less than 80%.
Start the test with 1 tablet of Clopidogrel Sulfate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 28 µg of clopidogrel (C₁₆H₁₄ClNO₅S), and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Clopidogrel Sulfate RS (separately determine the water <2.48> in the same manner as Clopidogrel Sulfate), dissolve in 5 mL of methanol, and add water to make exactly 100 mL. Pipet 6 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, Aₜ and Aₛ, at 240 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.2>, using water as a blank.

Dissolution rate (%) with respect to the labeled amount of clopidogrel (C₁₆H₁₄ClNO₅S)
= Mₛ × V/10 × V/V × 1/C × 108 × 0.766

Mₛ: Amount (mg) of Clopidogrel Sulfate RS taken, calculated on the anhydrous basis
C: Labeled amount (mg) of clopidogrel (C₁₆H₁₄ClNO₅S) in 1 tablet

Assay To 20 tablets of Clopidogrel Sulfate Tablets add 400 mL of the mobile phase, sonicate with occasional shaking until the tablets are disintegrated, add the mobile phase to make exactly 500 mL, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the mobile phase to make exactly V mL so that each mL contains about 0.5 mg of clopidogrel (C₁₆H₁₄ClNO₅S). Pipet 4 mL of this solution, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 33 mg of Clopidogrel Sulfate RS (separately determine the water <2.48> in the same manner as Clopidogrel Sulfate), and dissolve in the mobile phase to make exactly 50 mL. Pipet 4 mL of this solution, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₂ and Q₃, of the peak area of clopidogrel to that of the internal standard.

Amount (mg) of clopidogrel (C₁₆H₁₄ClNO₅S) in 1 tablet of Clopidogrel Sulfate Tablets
= Mₛ × Q₂/Q₃ × V/10 × 0.766

Mₛ: Amount (mg) of Clopidogrel Sulfate RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of isopropyl parahydroxybenzoate in the mobile phase (1 in 1500).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column of 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized amino silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: Dissolve 0.87 g of sodium 1-pentanesulfonate in 1000 mL of water, and adjust to pH 2.5 with phosphoric acid. To 950 mL of this solution add 50 mL of methanol. To 600 mL of this solution add 400 mL of a mixture of acetonitrile for liquid chromatography and methanol (9:1).
Flow rate: Adjust so that the retention time of clopidogrel is about 8 minutes.

System suitability—
System performance: When the procedure is run with 10
μL of the standard solution under the above operating conditions, the internal standard and clopidogrel are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of clopidogrel to that of the internal standard is not more than 1.0%.

**Containers and storage**
Containers—Tight containers.

**Clorazepate Dipotassium**

クリラゼプレ酸ニカリウム

\[
\text{C}_1_{9}\text{H}_{1}_{6}\text{ClKN}_2\text{O}_4: \text{KOH: 408.92}
\]

Monopotassium 7-chloro-2-oxo-5-phenyl-2,3-dihydro-1H-1,4-benzodiazepine-3-carboxylate mono (potassium hydroxide) [57109-90-7]

Clorazepate Dipotassium, when dried, contains not less than 98.5% and not more than 101.0% of clorazepate dipotassium (C_{19}H_{16}ClKN_2O_4.KOH).

**Description**
Clorazepate Dipotassium occurs as white to light yellow, crystals or crystalline powder.
It is freely soluble in water, and very slightly soluble in ethanol (99.5).
It dissolves in acetic acid (100).
The pH of a solution obtained by dissolving 1 g of Clorazepate Dipotassium in 100 mL of water is between 11.5 and 12.5.
It gradually turns yellow on exposure to light.

**Identification (1)**
Carefully and gradually ignite to redness 30 mg of Clorazepate Dipotassium with 50 mg of sodium. After cooling, add 3 drops of ethanol (99.5) and 5 mL of water, mix well, and filter: the filtrate responds to Qualitative Tests <1.09> for chloride.

(2) Determine the absorption spectrum of a solution of Clorazepate Dipotassium (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clorazepate Dipotassium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Clorazepate Dipotassium responds to Qualitative Tests <1.09> (1) for potassium salt.

**Purity (1)**
Chloride <1.09>—Dissolve 1.0 g of Clorazepate Dipotassium in 20 mL of water, add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: To 0.40 mL of 0.01 mol/L hydrochloric acid VS add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Clorazepate Dipotassium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.17>—Prepare the test solution with 1.0 g of Clorazepate Dipotassium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 15 mg of Clorazepate Dipotassium in 25 mL of a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make exactly 200 mL, and use this solution as the standard solution. Prepare these solutions quickly and perform the test within 3 minutes. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of nordiazepam, having the relative retention time of about 3.0 to clorazepic acid, obtained from the sample solution is not larger than the peak area of clorazepic acid from the standard solution, the area of the peak other than clorazepic acid and nordiazepam is not larger than 1/5 times the peak area of clorazepic acid from the standard solution, and the total area of the peaks other than clorazepic acid is not larger than 2 times the peak area of clorazepic acid from the standard solution. For the area of the peak of nordiazepam, multiply the correction factor, 0.64.

**Operating conditions**

- **Detector**: An ultraviolet absorption photometer (wavelength: 232 nm).
- **Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature**: A constant temperature of about 25°C.
- **Mobile phase**: Dissolve 13.8 g of sodium dihydrogen phosphate dihydrate in 500 mL of water, and adjust to pH 8.0 with sodium hydroxide TS. To 100 mL of this solution add 400 mL of acetonitrile and 300 mL of water.
- **Flow rate**: Adjust so that the retention time of clorazepic acid is about 1.3 minutes.
- **Time span of measurement**: About 10 times as long as the retention time of clorazepic acid, beginning after the solvent peak.

**System suitability**
Test for required detectability: To exactly 5 mL of the standard solution add the mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make exactly 25 mL. Confirm that the peak area of clorazepic acid obtained with 5 μL of this solution is equivalent to 15 to 25% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clorazepic acid are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clorazepic acid is not more than 1.5%.

**Loss on drying <2.41>**
Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 5 hours).
**Assay** Weigh accurately about 0.15 g of Clorazepate Dipotassium, previously dried, dissolve in 100 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS until the color of solution changes from violet to blue-green through blue (indicator: 3 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 13.63 mg of C₁₀H₁₆ClK₂N₂O₅.KOH

**Containers and storage** Containers—Tight containers.

**Clorazepate Dipotassium Capsules**

クロラゼプ酸二カリウムカプセル

Clorazepate Dipotassium Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH; 408.92).

**Method of preparation** Prepare as directed under Capsules, with Clorazepate Dipotassium.

**Identification** To 10 mL of the sample solution obtained in the Assay add water to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 228 nm and 232 nm.

**Purity** Related substances—Take the contents of Clorazepate Dipotassium Capsules, and powder. To a portion of the powder, equivalent to 15 mg of Clorazepate Dipotassium, add a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make 25 mL, and shake for 10 minutes. Filter the solution through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make exactly 200 mL, and use this solution as the standard solution. Then, proceed as directed in the Purity (4) under Clorazepate Dipotassium: the peak area of nordiazepam, having the relative retention time of about 3.0 to clorazepic acid, obtained from the sample solution is not larger than 3 times the peak area of clorazepic acid from the standard solution, and the total area of the peaks other than clorazepic acid and nordiazepam is not larger than the peak area of clorazepic acid from the standard solution. For the peak area of nordiazepam, multiply the correction factor, 0.64.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Clorazepate Dipotassium Capsules add 70 mL of water, shake for 15 minutes, and add water to make exactly 100 mL. Centrifuge the solution, pipet V mL of the supernatant liquid, add water to make exactly V mL so that each mL contains about 12 μg of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of clorazepate dipotassium

(C₁₀H₁₆ClK₂N₂O₅.KOH) = Mᵢ × Aᵢ/Aₛ × V'/V × 2/25

Mᵢ: Amount (mg) of clorazepate dipotassium for assay taken

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Clorazepate Dipotassium Capsules is not less than 80%.

Start the test with 1 capsule of Clorazepate Dipotassium Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 8.3 μg of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH), and use this solution as the sample solution. Separately, weigh accurately about 21 mg of clorazepate dipotassium for assay, previously dried in vacuum over phosphorus (V) oxide at 60°C for 5 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, Aᵢ and Aₛ, at 252 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 228 nm and 232 nm.

Dissolution rate (%) with respect to the labeled amount of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH) = Mᵢ × Aᵢ/Aₛ × V'/V × 1/C × 36

Mᵢ: Amount (mg) of clorazepate dipotassium for assay taken

C: Labeled amount (mg) of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH) in 1 capsule

**Assay** Carefully take out the contents of not less than 20 Clorazepate Dipotassium Capsules, weigh accurately the mass of the contents, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg of clorazepate dipotassium (C₁₀H₁₆ClK₂N₂O₅.KOH), add 70 mL of water, shake for 15 minutes, and add water to make exactly 100 mL. Centrifuge the solution, pipet 4 mL of the supernatant liquid, add water to make exactly 50 mL, and use this solution as the standard solution. Separately, weigh accurately about 15 mg of clorazepate dipotassium for assay, previously dried in vacuum over phosphorus (V) oxide at 60°C for 5 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 228 nm and 232 nm.

Amount (mg) of clorazepate dipotassium

(C₁₀H₁₆ClK₂N₂O₅.KOH) = Mᵢ × Aᵢ/Aₛ

Mᵢ: Amount (mg) of clorazepate dipotassium for assay taken

**Containers and storage** Containers—Tight containers.
Clotiazepam

クロチアゼパム

Clotiazepam, when dried, contains not less than 98.5% of clotiazepam (C\textsubscript{16}H\textsubscript{18}ClN\textsubscript{2}OS). 

**Description** Clotiazepam occurs as white to light yellowish-white, crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetic acid (100) and in ethyl acetate, soluble in diethyl ether, and practically insoluble in water.

It dissolves in 0.1 mol/L hydrochloric acid TS.

It is gradually colored by light.

**Identification** (1) Dissolve 0.01 g of Clotiazepam in 3 mL of sulfuric acid: the solution shows a light yellow fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Determine the absorption spectrum of a solution of Clotiazepam in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Prepare the test solution with 0.01 g of Clotiazepam as directed under Oxygen Flask Combustion Method \(1.06\), using 10 mL of diluted hydrogen peroxide (30) (1 in 5) as the absorbing liquid. Apply a small amount of water to the upper part of the Apparatus A, pull out C carefully, wash C, B and the inner side of A with 15 mL of methanol, and use the obtained solution as the test solution. Add 0.5 mL of dilute nitric acid to 15 mL of the test solution: this solution responds to Qualitative Tests \(1.09\) (2) for chloride. The remaining test solution responds to Qualitative Tests \(1.09\) (1) for sulfate.

**Melting point** \(2.60\) 106 - 109°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Clotiazepam in 10 mL of ethanol (95): the solution is clear and is not more colored than the following control solution.

Control solution: To 5 mL of Matching Fluid C add 0.01 mol/L hydrochloric acid TS to make 10 mL.

(2) Chloride \(1.06\)—To 1.0 g of Clotiazepam add 50 mL of water, shake for 30 minutes, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.015%).

(3) Heavy metals \(1.07\)—Proceed with 2.0 g of Clotiazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic \(1.11\)—Prepare the test solution with 1.0 g of Clotiazepam, according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.25 g of Clotiazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 20 mL, pipet 2 mL of this solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(2.60\).

**Uniformity of dosage unit** \(6.02\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Clotiazepam Tablets**

クロチアゼパム錠

Clotiazepam Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of clotiazepam (C\textsubscript{16}H\textsubscript{18}ClN\textsubscript{2}OS: 318.82).

**Method of preparation** Prepare as directed under Tablets, with Clotiazepam.

**Identification** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry \(2.24\): it exhibits a maximum between 260 nm and 264 nm.

**Dissolution** \(6.10\) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900
mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 45 minutes of Clotiazepam Tablets is not less than 80%.

Start the test with 1 tablet of Clotiazepam Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 5.6 μg of clotiazepam (C_{16}H_{12}ClN_{2}O_{5}), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of clotiazepam for assay, previously dried at 80°C for 3 hours, and dissolve in ethanol (95) to make exactly 25 mL. Pipet 5 mL of this solution, and add the dissolution medium to make exactly 100 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_{T} and A_{S}, of the sample solution and standard solution at 262 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of clotiazepam (C_{16}H_{12}ClN_{2}O_{5})

\[
M_{S} = M_{S} \times \frac{A_{T}}{A_{S}} \times \frac{V'}{V} / (1 / C \times 18)
\]

M_{S}: Amount (mg) of clotiazepam for assay taken
C: Labeled amount (mg) of clotiazepam (C_{16}H_{12}ClN_{2}O_{5}) in 1 tablet

Assay To 20 Clotiazepam Tablets add 350 mL of 0.1 mol/L hydrochloric acid TS, stir until the tablets are completely disintegrated, stir for a further 10 minutes, and add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL. Centrifuge this solution, pipet V mL of the supernatant liquid, add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 10 μg of clotiazepam (C_{16}H_{12}ClN_{2}O_{5}), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of clotiazepam for assay, previously dried at 80°C for 3 hours, and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_{T} and A_{S}, of the sample solution and standard solution at 261 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of clotiazepam (C_{16}H_{12}ClN_{2}O_{5}) in 1 tablet

\[
M_{S} = M_{S} \times \frac{A_{T}}{A_{S}} \times \frac{V'}{V} / (1 / 100)
\]

M_{S}: Amount (mg) of clotiazepam for assay taken

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Clotrimazole

クロトリマゾール

C_{12}H_{13}ClN_{2}: 344.84
1-[(2-Chlorophenyl)(diphenyl)methyl]-1H-imidazole [23593-75-1]

Clotrimazole, when dried, contains not less than 98.0% of clotiazepam (C_{12}H_{13}ClN_{2}).

Description Clotrimazole occurs as a white, crystalline powder. It is odorless and tasteless. It is freely soluble in dichloromethane and in acetic acid (100), soluble in N,N-dimethylformamide, in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

Identification (1) To 0.1 g of Clotiazepam add 10 mL of 5 mol/L hydrochloric acid TS, dissolve by heating, and cool. To this solution add 3 drops of Reinecke salt TS: a light red precipitate is produced.

(2) Determine the absorption spectrum of a solution of Clotiazepam in methanol (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clotiazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Clotiazepam as directed under Flame Coloration Test <1.04> (2); a green color appears.

Melting point <2.60> 142 – 145°C

Purity (1) Clarity and color of solution—Dissolve 0.5 g of Clotiazepam in 10 mL of dichloromethane: the solution is clear and colorless.

(2) Chloride <1.02>—Dissolve 1.0 g of Clotiazepam in 40 mL of N,N-dimethylformamide, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.60 mL of 0.01 mol/L hydrochloric acid VS, 40 mL of N,N-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.5 g of Clotiazepam in 10 mL of methanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.05 mL of 0.005 mol/L sulfuric acid VS, 10 mL of methanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Clotiazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.17>—Prepare the test solution with 1.0 g of Clotiazomal according to Method 3, and perform the test.
(not more than 0.2 ppm).

(6) Imidazole—Dissolve 0.10 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 25 mg of imidazole for thin-layer chromatography in dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution, add dichloromethane to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and chloroform (3:2) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium hypochlorite TS on the plate, and air-dry the plate for 15 minutes, then spray evenly potassium iodide-starch TS on the plate: the spot obtained from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

(7) (2-Chlorophenyl)-diphenylmethanol—Dissolve 0.20 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 10 mg of (2-chlorophenyl)-diphenylmethanol for thin-layer chromatography in dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia solution (28) (50:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot obtained from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

**Loss on drying** <2.47> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Clotrimazole, previously dried, and dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.48 mg of C_{19}H_{18}ClN_{2}

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

**Cloxacillin Sodium Hydrate**

クロキサシリンナトリウム水和物

C_{19}H_{19}ClN_{2}NaO_{5}S·H_{2}O: 475.88

Monosodium (2S,5S,6R)-6-[[3-(2-chlorophenyl)-5-methylisoxazole-4-carboxyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate

[7081-44-9]

Cloxacillin Sodium Hydrate contains not less than 900 µg (potency) and not more than 960 µg (potency) per mg, calculated on the anhydrous basis. The potency of Cloxacillin Sodium Hydrate is expressed as mass (potency) of cloxacillin (C_{19}H_{18}ClN_{2}O_{5}S: 435.88).

**Description** Cloxacillin Sodium Hydrate occurs as white to light yellow-white, crystals or crystalline powder.

It is freely soluble in water, in N,N-dimethylformamide and in methanol, and sparingly soluble in ethanol (95).

**Identification** (1) Determine the absorption spectrum of a solution of Cloxacillin Sodium Hydrate in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cloxacillin Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cloxacillin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Cloxacillin Sodium Hydrate responds to Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]_D^{20}: +163 – +171° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water: the pH of the solution is between 5.0 and 7.5.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water is clear, and its absorbance at 430 nm, determined as directed under Ultraviolet-visible Spectrophotometry <2.24>, is not more than 0.04.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cloxacillin Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Cloxacillin Sodium Hydrate according to Method 5, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Cloxacillin Sodium Hydrate in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test
with exactly 10 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cloxacillin obtained from the sample solution is not larger than the peak area of cloxacillin from the standard solution, and the total area of the peaks other than cloxacillin from the sample solution is not larger than 3 times the peak area of cloxacillin from the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cloxacillin.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cloxacillin obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cloxacillin are not less than 5000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cloxacillin is not more than 1.0%.

**Water <2.48>** 3.0 - 4.5% (0.2 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cloxacillin Sodium Hydrate and Cloxacillin Sodium RS, equivalent to about 50 mg (potency), dissolve each in a suitable amount of the mobile phase, add exactly 5 mL of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of cloxacillin to that of the internal standard.

\[
\text{Amount [μg (potency)] of cloxacillin (C_{30}H_{33}ClN_2O_5S)} = M_2 \times Q_1 / Q_2 \times 1000
\]

\[M_2: \text{Amount [mg (potency)] of Cloxacillin Sodium RS taken}\]

**Internal standard solution—** A solution of guaifenesin (C_{16}H_{18}ClN_2O_5S) taken

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 4.95 g of diammonium hydrogen phosphate in 700 mL of water, add 250 mL of acetonitrile, adjust to pH 4.0 with phosphoric acid, and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of cloxacillin is about 24 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, guaifenesin and cloxacillin are eluted in this order with the resolution between these peaks being not less than 25.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cloxacillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

**Cloxazolam**

クロキサンゾラム

\[
\text{C}_{17} \text{H}_{11} \text{Cl}_2 \text{N}_2 \text{O}_5: 349.21
\]

(11bR5)-10-Chloro-11b-(2-chlorophenyl)-2,3,7,11b-tetraydro[1,3]oxazolo[3,2-d][1,4]benzodiazepin-6(5H)-one

[24166-13-0]

Cloxazolam, when dried, contains not less than 99.0% of cloxazolam (C_{17}H_{11}Cl_2N_2O_5).

**Description** Cloxazolam occurs as white, crystals or crystalline powder. It is odorless and tasteless.

It is freely soluble in acetic acid (100), sparingly soluble in dichloromethane, slightly soluble in ethanol (99.5) and in diethyl ether, very slightly soluble in ethanol (95), and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

It is gradually colored by light.

Melting point: about 200°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Cloxazolam in 10 mL of ethanol (99.5) by heating, and add 1 drop of hydrochloric acid: the solution shows a light yellow color and a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm). Add 1 mL of sodium hydroxide TS to this solution: the color and fluorescence of this solution disappear immediately.

(2) Dissolve 0.01 g of Cloxazolam in 5 mL of dilute hydrochloric acid by heating in a water bath for 10 minutes. After cooling, 1 mL of this solution responds to Qualitative Tests <1.09> for primary aromatic amines.

(3) Place 2 g of Cloxazolam in a 200-mL flask, add 50 mL of ethanol (95) and 25 mL of sodium hydroxide TS, and boil under a reflux condenser for 4 hours. After cooling, neutralize with dilute hydrochloric acid, and extract with 30 mL of dichloromethane. Dehydrate with 3 g of anhydrous sodium sulfate, filter, and evaporate the dichloromethane of the filtrate. Dissolve the residue in 5 mL of methanol by heating on a water bath, and cool immediately in an ice bath. Collect the crystals, and dry the crystals is vacuum at 60°C for 1 hour: it melts <2.60> between 87°C and 91°C.

(4) Determine the absorption spectrum of a solution of Cloxazolam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare...
the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Proceed with Cloxazolam as directed under Flame Coloration Test <1.00> (2), and perform the test: a green color appears.

**Absorbance** <2.24> \( E_{1\%}^{10} \) (244 nm): 390 – 410 (after drying, 1 mg, ethanol (99.5), 100 mL).

**Purity** (1) Chloride <1.07>—To 1.0 g of Cloxazolam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of this filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cloxazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.17>—Place 1.0 g of Cloxazolam in a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and heat gently. Repeat the addition of 2 to 3 mL of nitric acid at times, and continue heating until a colorless to light yellow solution is obtained. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat the solution until dense white fumes are evolved, and evaporate to a volume of 2 to 3 mL. After cooling, dilute with water to 10 mL, and perform the test with this solution as the test solution (not more than 2 ppm).

(4) Related substances—Dissolve 0.05 g of Cloxazolam in 10 mL of dichloromethane, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Immediately after air-drying, develop the plate with a mixture of toluene and acetone (5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than that from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cloxazolam, previously dried, and dissolve in 50 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.92 mg of C₇H₁₄Cl₂N₂O₂

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Cocaine Hydrochloride**

Cocaine Hydrochloride, when dried, contains not less than 98.0% of cocaine hydrochloride (C₁₇H₂₁NO₄·HCl).

**Description** Cocaine Hydrochloride occurs as colorless crystals or a white crystalline powder.

It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

**Identification** (1) Determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cocaine Hydrochloride, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Cocaine Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49> \([\alpha]_D^25\) = −70 – −73° (after drying, 0.5 g, water, 20 mL, 100 mm).

**Purity** (1) Acidity—Dissolve 0.5 g of Cocaine Hydrochloride in 10 mL of water, add 1 drop of methyl red TS, and neutralize with 0.01 mol/L sodium hydroxide VS: the consumed volume is not more than 1.0 mL.

(2) Cinnamyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 5 mL of water, and add 0.3 mL of diluted sulfuric acid (1 in 20) and 0.10 mL of 0.02 mol/L potassium permanganate VS: the red color does not disappear within 30 minutes.

(3) Isoatropyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 30 mL of water in a beaker. Transfer 5 mL of this solution to a test tube, add 1 drop of ammonia TS, and mix. After the precipitate is coagulated, add 10 mL of water, and transfer the mixture to the former beaker, to which 30 mL of water has been added previously. Wash the test tube with 10 mL of water, combine the washings with the mixture in the beaker, add 3 drops of ammonia TS to the combined mixture, and mix gently: a crystalline precipitate is produced. Allow to stand for 1 hour: the supernatant liquid is...

**Cod Liver Oil**

肝油

Cod Liver Oil is the fatty oils obtained from fresh livers and pyloric appendages of *Gadus macrocephalus* Tilesius or *Theragra chalcogramma* Pallas (*Gadidae*). Cod Liver Oil contains not less than 2000 Vitamin A Units and not more than 5000 Vitamin A Units per g.

**Description**

Cod Liver Oil is a yellow to orange oily liquid. It has a characteristic, slightly fishy odor and a mild taste. It is miscible with chloroform. It is slightly soluble in ethanol (95), and practically insoluble in water.

It is decomposed by air or by light.

**Identification**

Dissolve 0.1 g of Cod Liver Oil in 10 mL of chloroform, and to 1 mL of this solution add 3 mL of antimony (III) chloride TS: a blue color develops immediately, but the color fades rapidly.

**Specific gravity** 1.13  $d_{20}^{20}$: 0.918 – 0.928

**Acid value** 1.13 Not more than 1.7.

**Saponification value** 1.13 180 – 192

**Unsaponifiable matter** 1.13 Not more than 3.0%.

**Iodine value** 1.13 130 – 170

**Purity**

Rancidity—No unpleasant odor of rancid oil is perceptible on warming Cod Liver Oil.

**Assay**

Proceed with about 0.5 g of Cod Liver Oil, accurately weighed, as directed in Method 2 under the Vitamin A Determination 2.25, and perform the test.

**Containers and storage**

Containers—Light-resistant, air-tight containers.

Storage—Light-resistant, anhydrous.

---

**Codeine Phosphate Hydrate**

コーディリン酸塩水和物

\[
\text{C}_{18}H_{21}NO_{3} \cdot H_2PO_4 \cdot \frac{1}{2} \text{H}_2\text{O}: 406.37
\]

\[(5R,6S)-4,5\text{-Epox}-3\text{-methoxy} \cdot 17\text{-methyl} \cdot 7,8\text{-didehydrodormorphinan-6-ol monophosphate hemihydrate}
\]

Codeine Phosphate Hydrate contains not less than 98.0% of codeine phosphate ($\text{C}_{18}\text{H}_{21}\text{NO}_{3} \cdot \text{H}_2\text{PO}_4$: 397.36), calculated on the anhydrous basis.

**Description**

Codeine Phosphate Hydrate occurs as white to yellowish white, crystals or crystalline powder.

It is freely soluble in water and in acetic acid (100), slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of 1.0 g of Codeine Phosphate Hydrate in 10 mL of water is between 3.0 and 5.0.

It is affected by light.

**Identification (1)**

Determine the absorption spectrum of a solution of Codeine Phosphate Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Codeine Phosphate Hydrate, previously dried at 105°C for 4 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Codeine Phosphate Hydrate (1 in 20) responds to Qualitative Tests 1.09 (1) for phosphate.

**Optical rotation**

\[\alpha_{D}^{20}: -98 \text{ to } -102^\circ\text{ (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm)}\]

**Purity** (1) Chloride 1.03—Perform the test with 0.5 g of Codeine Phosphate Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(2) Sulfate 1.14—Perform the test with 0.20 g of Codeine Phosphate Hydrate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.240%).

(3) Related substances—Dissolve 0.20 g of Codeine Phosphate Hydrate in 10 mL of a mixture of 0.01 mol/L hydrochloric acid TS and ethanol (99.5) (4:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of 0.01 mol/L hydrochloric acid TS and ethanol (99.5) (4:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28:14:14:7:1) to a distance of about 10 cm, and air-dry the...
plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Water** 〈2.48〉 1.5 - 3.0% (0.5 g, volumetric titration, direct titration).

**Assay** Dissolve about 0.5 g of Codeine Phosphate Hydrate, accurately weighed, in 70 mL of acetic acid (100), and titrate 〈2.50〉 with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple blue to greenish blue (indicator: 3 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 39.74 mg of \( C_{18}H_{21}NO_3.H_3PO_4 \)

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant.

### 1% Codeine Phosphate Powder

**コードインリン酸塩散 1%**

1% Codeine Phosphate Powder contains not less than 0.90% and not more than 1.10% of codeine phosphate hydrate (\( C_{18}H_{21}NO_3.H_3PO_4.\frac{1}{2}H_2O \): 406.37).

**Method of preparation**

<table>
<thead>
<tr>
<th>Codeine Phosphate Hydrate</th>
<th>Lactose Hydrate</th>
<th>a sufficient quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10 g</td>
<td></td>
</tr>
</tbody>
</table>

Prepare as directed under Granules or Powders, with the above ingredients.

**Identification** Determine the absorption spectrum of a solution of 1% Codeine Phosphate Powder (1 in 100) as directed under Ultraviolet-visible Spectrophotometry 〈2.24〉: it exhibits a maximum between 283 nm and 287 nm.

**Dissolution** 〈6.10〉 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of 1% Codeine Phosphate Powder is not less than 85%.

Start the test with about 2 g of 1% Codeine Phosphate Powder, accurately weighed, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg of codeine phosphate hydrate for assay (separately determine the water 〈2.48〉 in the same manner as Codeine Phosphate Hydrate), and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 50 \( \mu \)L of the sample solution and standard solution as directed under Liquid Chromatography 〈2.01〉 according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of codeine in each solution.

\[
\text{Dissolution rate (％)} = \frac{M_S}{M_T} \times \frac{A_T}{A_S} \times \frac{1}{30} \times 1.023
\]

\( M_S \): Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis

\( M_T \): Amount (g) of 1% Codeine Phosphate Powder taken

**Operating conditions**—Proceed as directed in the operating conditions in the Assay.

**System suitability**—

System performance: When the procedure is run with 50 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of codeine are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of codeine is not more than 2.0%.

**Assay** Weigh accurately about 5 g of 1% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, and pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate hydrate for assay (previously determine the water 〈2.48〉 in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, and pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography 〈2.01〉 according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of codeine to that of the internal standard.

\[
\text{Amount (mg) of codeine phosphate hydrate} = M_S \times \frac{Q_T}{Q_S} \times 1.023
\]

\( M_S \): Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of etilefrine hydrochloride (3 in 10,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

Flow rate: Adjust so that the retention time of codeine is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 5 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of codeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
10% Codeine Phosphate Powder

コデインリン酸塩 10%

10% Codeine Phosphate Powder contains not less than 9.3% and not more than 10.7% of codeine phosphate hydrate (C₁₈H₂₆NO₄.H₂PO₄.½H₂O: 406.37).

Method of preparation

<table>
<thead>

<th>Codeine Phosphate Hydrate</th>
<th>100 g</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lactose Hydrate</td>
<td>a sufficient quantity</td>
</tr>
</tbody>
</table>

To make 1000 g

Prepare as directed under Powders, with the above ingredients.

Identification

Determine the absorption spectrum of a solution of 10% Codeine Phosphate Powder (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

Dissolution <6.10b>

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of 10% Codeine Phosphate Powder is not less than 85%.

Start the test with about 0.2 g of 10% Codeine Phosphate Powder, accurately weighed, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg of codeine phosphate hydrate for assay (separately determine the water content), and determine the peak area of codeine to that of the internal standard:

\[
M_5 = \frac{M_6 \times Q_r}{Q_S} 
\]

where:
- \(M_5\): Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis
- \(M_6\): Amount (mg) of codeine phosphate hydrate
- \(Q_r\): Area of codeine
- \(Q_S\): Area of codeine phosphate hydrate (C₁₈H₂₆NO₄.H₂PO₄.½H₂O)

Internal standard solution—A solution of etilefrine hydrochloride (3 in 10,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

Flow rate: Adjust so that the retention time of codeine is about 10 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of codeine to that of the internal standard is not more than 1.0%.

Containers and storage

Containers—Tight containers.

Codeine Phosphate Tablets

コデインリン酸塩錠

Codeine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of codeine phosphate hydrate (C₁₈H₂₆NO₄.H₂PO₄.½H₂O: 406.37). For assay:

<table>

To make 1000 g

Prepare as directed under Tablets, with Codeine Phosphate Hydrate.

Identification

Prepared as directed under Tablets, with Codeine Phosphate Hydrate.

Method of preparation

Prepared as directed under Tablets, with Codeine Phosphate Hydrate.
283 nm and 287 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Codeine Phosphate Tablets add 3V/25 mL of water to disintegrate, add 2V/25 mL of diluted dilute sulfuric acid (1 in 20), and sonicate for 10 minutes. To this solution add exactly 2V/25 mL of the internal standard solution, add water to make V mL so that each mL contains about 0.2 mg of codeine phosphate hydrate (C_{18}H_{23}NO_{3}.H_{3}PO_{4}.1/2 H_{2}O), filter, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate hydrate for assay (separately, determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution, add water to make 25 mL, and use this solution as the standard solution. Proceed as directed in the Assay.

Amount (mg) of codeine phosphate hydrate

\[ M_5 = \frac{M}{Q_5} \times \frac{Q_1}{Q_3} \times \frac{V}{250} \times 1.023 \]

M₅: Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of ethylefurin hydrochloride (3 in 2000).

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Codeine Phosphate Tablets is not less than 80%.

Start the test with 1 tablet of Codeine Phosphate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 5.6 μg of codeine phosphate hydrate (C_{18}H_{23}NO_{3}.H_{3}PO_{4}.1/2 H_{2}O), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of codeine phosphate hydrate for assay (separately, determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, Aₜ and Aₜₛ, of codeine in each solution.

Dissolution rate (%) with respect to the labeled amount of codeine phosphate hydrate (C_{18}H_{23}NO_{3}.H_{3}PO_{4}.1/2 H_{2}O)

\[ M_5 = \frac{A_t}{A_{t,s}} \times \frac{V}{V} \times \frac{1}{C} \times 18 \times 1.023 \]

M₅: Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis

C: Labeled amount (mg) of codeine phosphate hydrate (C_{18}H_{23}NO_{3}.H_{3}PO_{4}.1/2 H_{2}O) in 1 tablet

**Operating conditions**—Proceed as directed in the operating conditions in the Assay.

**System suitability**—

System performance: When the procedure is run with 100 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of codeine are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of codeine is not more than 2.0%.

**Assay** Weigh accurately and powder not less than 20 Codeine Phosphate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of codeine phosphate hydrate (C_{18}H_{23}NO_{3}.H_{3}PO_{4}.1/2 H_{2}O), add 30 mL of water, shake, add 20 mL of diluted dilute sulfuric acid (1 in 20), sonicate the mixture for 10 minutes, and add water to make exactly 100 mL. Filter the solution, then pipet 5 mL of the filtrate, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate hydrate for assay (previously determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Qₜ and Qₜₛ, of the peak area of codeine to that of the internal standard.

Amount (mg) of codeine phosphate hydrate

\[ M_5 = \frac{M}{Q_5} \times \frac{Q_1}{Q_3} \times 2 \times 1.023 \]

M₅: Amount (mg) of codeine phosphate hydrate for assay taken, calculated on the anhydrous basis

Colchicine

コルヒチン

\[
\text{C}_{22}\text{H}_{33}\text{NO}_6: 399.44 \\
\text{N}-\{75\}-\{1,2,3,10-\text{Tetramethoxy}-9-\text{oxo}-5,6,7-\text{tetrahydrobenzo[}e\text{heptalen}-7-\text{yl}\}\text{acetamide} \\
[64-86-8]
\]

Colchicine contains not less than 97.0% and not more than 102.0% of colchicine (\(\text{C}_{22}\text{H}_{33}\text{NO}_6\)), calculated on the anhydrous and residual ethyl acetate-free basis.

**Description**  
Colchicine occurs as a yellowish white powder.

It is very soluble in methanol, freely soluble in \(N,N\)-dimethylformamide, in ethanol (95), and in acetic anhydride, and sparingly soluble in water.

It is colored by light.

**Identification (1)**  
Determine the absorption spectrum of a solution of Colchicine in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(\leq 2.5\%\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) To 1 g of potassium bromide for infrared absorption spectrum add 0.5 mL of a solution of Colchicine in methanol (1 in 50), grind thoroughly, and dry in vacuum at 80°C for 1 hour. Determine the infrared absorption spectrum of this powder as directed in the potassium bromide disk method under Infrared Spectrophotometry \(\leq 2.5\%\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \(\leq 2.49\%\)  
[\(\alpha\) \(D\) \(70^\circ\): \(-235 \rightarrow -250^\circ\) \((0.1 \text{ g calculated on the anhydrous basis and corrected by the amount of ethyl acetate, ethanol (95), 10 mL, 100 mm).}

**Purity (1)**  
Colchicine—Dissolve 0.10 g of Colchicine in 10 mL of water, and to 5 mL of this solution add 2 drops of iron (III) chloride TS: no definite green color develops.

(2) Chloroform and ethyl acetate—Weigh accurately about 0.6 g of Colchicine, dissolve in exactly 2 mL of the internal standard solution, add \(N,N\)-dimethylformamide to make 10 mL, and use this solution as the sample solution. Separately, weigh 0.30 g of chloroform using a 100-mL volumetric flask containing about 20 mL of \(N,N\)-dimethylformamide, and add \(N,N\)-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add \(N,N\)-dimethylformamide to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 1.8 g of ethyl acetate using a 100-mL volumetric flask containing about 20 mL of \(N,N\)-dimethylformamide, and add \(N,N\)-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution and \(N,N\)-dimethylformamide to make 10 mL, and use this solution as the standard solution (2). Perform the test with exactly 2 \(\mu\)L each of the sample solution and standard solutions (1) and (2) as directed under Gas Chromatography \(\leq 2.0\%\) according to the following conditions:

the peak area of chloroform obtained from sample solution is not larger than that from the standard solution (1). Calculate the ratios of the peak area of ethyl acetate to that of the internal standard, \(Q_1\) and \(Q_2\), of the sample solution and standard solution (2), and calculate the amount of ethyl acetate by the following formula: the amount of ethyl acetate is not more than 6.0%.

\[
\text{Amount (\% of ethyl acetate (}C_{27}H_{32}O_8) = \frac{M_2}{M_1} \times \frac{Q_1}{Q_2} \times 2
\]

\(M_2\): Amount (g) of ethyl acetate taken

\(M_1\): Amount (g) of Colchicine taken

**Internal standard solution**—A solution of 1-propanol in \(N,N\)-dimethylformamide (3 in 200).

**Operating conditions**—  
Detector: A hydrogen flame-ionization detector.

Column: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated inside surface with polyethylene glycol 20 M for gas chromatography 1.0 \(\mu\)m in thickness.

Column temperature: 60°C for 7 minutes, then up to 100°C at a rate of 40°C per minute if necessary, and hold at 100°C for 10 minutes.

Injection port temperature: A constant temperature of about 130°C.

Detector temperature: A constant temperature of about 200°C.

Carrier gas: Helium.

Flow rate: Adjust so that the retention time of ethyl acetate is about 3 minutes.

**System suitability**—  
Test for required detectability: Pipet 2 mL of the standard solution (2), and add \(N,N\)-dimethylformamide to make exactly 25 mL. Pipet 1 mL of this solution, and add \(N,N\)-dimethylformamide to make exactly 50 mL. Confirm that the peak area of ethyl acetate obtained with 2 \(\mu\)L of this solution is equivalent to 0.11 to 0.21% of that with 2 \(\mu\)L of the standard solution (2).

System performance: To 1 mL of chloroform add \(N,N\)-dimethylformamide to make 10 mL. To 1 mL of this solution add 2 mL of ethyl acetate and \(N,N\)-dimethylformamide to make 100 mL. To 2 mL of this solution add 2 mL of the internal standard solution and \(N,N\)-dimethylformamide to make 10 mL. When the procedure is run with 2 \(\mu\)L of this solution under the above operating conditions, ethyl acetate, chloroform and the internal standard are eluted in this order with the resolution between the peaks of chloroform and the internal standard being not less than 2.0.

System repeatability: When the test is repeated 3 times with 2 \(\mu\)L of the standard solution (2) under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl acetate to that of the internal standard is not more than 3.0%.

(3) Related substances—Dissolve 60 mg of Colchicine in 100 mL of diluted methanol (1 in 2). To 1 mL of this solution, add diluted methanol (1 in 2) to make 100 mL, and use this solution as the sample solution. Perform the test with 20 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(\leq 2.0\%\) according to the following conditions, and determine each peak area by the automatic integration method. Calculate the total amount of the peaks other than colchicine by the area percentage method: not more than 5.0%.

**Operating conditions**—  
Detector: An ultraviolet absorption photometer (wave-length: 254 nm).
Colestimide / Official Monographs

808

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 450 mL of 0.05 mol/L potassium dihydrogen phosphate TS add methanol to make 1000 mL. Adjust the pH to 5.5 with diluted phosphoric acid (7 in 200).

Flow rate: Adjust so that the retention time of colchicine is about 7 minutes.

Time span of measurement: About 2 times as long as the retention time of colchicine, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 1 mL of the sample solution, and add diluted methanol (1 in 2) to make exactly 50 mL. Confirm that the peak area of colchicine obtained from 20 μL of this solution is equivalent to 1.4 to 2.6% of that obtained from 20 μL of the sample solution.

System performance: When the procedure is run with 20 μL of the sample solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of colchicine are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of colchicine is not more than 2.0%.

Water <2.48> Not more than 2.0% (0.5 g, volumetric titration, back titration).

Assay Weigh accurately about 0.4 g of Colchicine, dissolve in 25 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 19.97 mg of C₂₂H₂₅NO₆

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Colestimide

コレステチミド

[95522-45-5]

Colestimide is an anion exchange resin, composed of a copolymer of 2-methylimidazole and 1-chloro-2,3-epoxypropane.

It contains not less than 18.0% and not more than 20.0% of chlorine (Cl: 35.45), calculated on the dried basis.

Each g of Colestimide, calculated on the dried basis, exchanges with not less than 2.0 g and not more than 2.4 g of cholic acid (C₅₃H₇₀O₃: 407.56).

Description Colestimide occurs as a white to pale yellow-white powder.

It is practically insoluble in water and in ethanol (99.5).

It is hygroscopic.

Identification Determine the infrared absorption spectrum of Colestimide, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Heavy metals <1.07>—Take 2.0 g of Colestimide in a porcelain or platinum crucible, and carbonize by weakly heating. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) and 5 mL of hydrogen peroxide (30), and ignite the ethanol. After cooling, add 1 mL of sulfuric acid, then, proceed according to Method 4, and perform the test. Prepare the control solution as follows: To 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) add 5 mL of hydrogen peroxide (30), and ignite the ethanol. After cooling, add 1 mL of sulfuric acid, then, proceed in the same manner as for the test solution, and calculate 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 10 ppm).

(2) Related substances—To exactly 0.50 g of Colestimide add exactly 20 mL of water, shake for 1 hour, centrifuge, and use the supernatant liquid as the sample solution. Determine the absorbance of the sample solution at 210 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance is not more than 0.50.

Loss on drying <2.41> Not more than 10.0% (1 g, in vacuum, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Degree of swelling Weigh accurately about 1 g of Colestimide, put in a 25-mL glass stoppered measuring cylinder (about 11 mm in inside diameter), add 23 mL of water, shake for 2 minutes, and add water to make 25 mL. After standing for 2 hours, measure the volume of the resin layer, and determine the volume per g, calculated on the dried basis: the volume is 12–18 mL/g.

Assay (1) Chlorine—Weigh accurately about 0.2 g of Colestimide, add 50 mL of water, and shake. Add 1 mL of nitric acid and 25 mg of potassium nitrate, shake, and titrate <2.50> with 0.1 mol/L silver nitrate VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS = 3.545 mg of Cl

(2) Exchange capacity—Weigh accurately about 0.45 g of sodium cholate hydrate (separately determine the water), dissolve in water to make exactly 100 mL, and use this solution as the sodium cholate standard stock solution. Separately, weigh accurately about 30 mg of Colestimide, add exactly 30 mL of the sodium cholate standard stock solution, shake for 1 hour, and centrifuge or filter through a membrane filter with a pore size not exceeding 0.8 μm. Pipet 5 mL of the supernatant liquid or the filtrate, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, pipet 5 mL of the sodium cholate standard stock solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_s$ and $Q_v$, of the peak area of cholic acid to that of the internal standard.

Exchanged amount (g) of cholic acid per g of Colestimide, calculated on the dried basis

$$M_C = \frac{M_v}{M_T} \times (Q_s - Q_v) / Q_v \times 3/10 \times 0.947$$

$M_C$: Amount (mg) of sodium cholate hydrate taken, calcu-
Colestimide Tablets

Colestimide Tablets contain not less than 87.0% and not more than 113.0% of the labeled amount of colestimide.

Method of preparation  Prepare as directed under Tablets, with Colestimide.

Identification  Powder Colestimide Tablets. Determine the infrared absorption spectrum of a portion of the powder as directed in the potassium chloride disk method under Infrared Spectrophotometry.\(^{2.25}\): It exhibits absorption at the wave numbers of about 1587 cm\(^{-1}\), 1528 cm\(^{-1}\), 1262 cm\(^{-1}\), 1102 cm\(^{-1}\) and 1035 cm\(^{-1}\).

Uniformity of dosage units  It meets the requirement of the Mass variation test.

Disintegration  When carried out the test for 10 minutes, it meets the requirement.

Assay  Weigh accurately about 0.45 g of sodium cholate hydrate (separately determine the water), dissolve in water to make exactly 100 mL, and use this solution as the sodium cholate standard stock solution. Separately, weigh accurately the mass of not less than 20 Colestimide Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 30 mg of colestimide, add exactly 30 mL of the sodium cholate standard stock solution, shake for 1 hour, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography.\(^{2.01}\) according to the following conditions, and calculate the ratios, \(Q_S\) and \(Q_T\), of the peak area of cholic acid to that of the internal standard.

\[
\text{Amount (mg) of sodium cholate hydrate} = M_S \times \left( Q_S - Q_T \right) / Q_S \times 1/5 \times 1/2.2 \times 0.947 \\
M_S: \text{Amount (mg) of sodium cholate hydrate taken, calculated on the anhydrous basis}
\]

Internal standard solution—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 80,000).

Containers and storage  Containers—Tight containers.
gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (1:1).
Flow rate: Adjust so that the retention time of cholic acid is about 7 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cholic acid and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cholic acid to that of the internal standard is not more than 1.0%.

Containers and storage — Containers—Tight containers.

Colistin Sodium Methanesulfonate
コリスチンメタンスルホン酸ナトリウム

Colistin Sodium Methanesulfonate is the sodium salt of colistin derivatives.
It is a mixture of colistin A sodium methanesulfonate and colistin B sodium methanesulfonate.
It, when dried, contains not less than 11,500 Units and not more than 15,500 Units per mg. The unit of Colistin Sodium Methanesulfonate is expressed as mass of colistin A (R = 6-methyloctanic acid, R’ = H; C₈H₁₆O₆N₃S₅·2H₂O: 1169.46).

Description — Colistin Sodium Methanesulfonate occurs as a white to light yellow-white powder.
It is freely soluble in water, and practically insoluble in ethanol (95).

Identification (1) — Dissolve 20 mg of Colistin Sodium Methanesulfonate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, and add 5 drops of copper (II) sulfate TS while shaking; a blue-purple color develops.
(2) — Dissolve 40 mg of Colistin Sodium Methanesulfonate in 1 mL of 1 mol/L hydrochloric acid TS, and add 0.5 mL of dilute iodine TS: the color of iodine disappears.
(3) — Determine the infrared absorption spectrum of Colistin Sodium Methanesulfonate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.27>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Colistin Sodium Methanesulfonate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.
(4) — Colistin Sodium Methanesulfonate responds to Qualitative Tests <1.09> (1) for sodium salt.

pH <2.5> — Dissolve 0.1 g of Colistin Sodium Methanesulfonate in 10 mL of water, and allow to stand for 30 minutes: the pH of the solution is between 6.5 and 8.5.
Purity (1) — Clarity and color of solution—Dissolve 0.16 g of Colistin Sodium Methanesulfonate in 10 mL of water: the solution is clear and colorless.
(2) — Heavy metals <1.07> — Proceed with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).
(3) — Arsenic <1.17> — Prepare the test solution with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test (not more than 2 ppm).
(4) — Free colistin—Dissolve 80 mg of Colistin Sodium Methanesulfonate in 3 mL of water, add 0.05 mL of a solution of silicotungstic acid 26-water (1 in 10), and immediately compare the solution with the reference suspension described under Test Methods for Plastic Containers <7.02>: the turbidity is not greater than that of the reference suspension (not more than 0.25%).

Loss on drying <2.41> — Not more than 3.0% (0.1 g, reduced pressure, 60°C, 3 hours).

Assay — Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.
(i) — Test organism—Escherichia coli NIHJ
(ii) — Culture medium—To 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 20.0 g of agar add 1000 mL of water, then add a suitable amount of sodium hydroxide TS so that the pH of the medium is being 6.5 to 6.6 after sterilization, sterile, and use this as the seeded agar medium and the agar medium for base layer.
(iii) — Standard solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate RS, previously dried, dissolve in phosphate buffer solution (pH 6.0) to make a solution containing 100,000 Units per mL, and use this solution as the standard stock solution. Keep the standard stock solution at 10°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
(iv) — Sample solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate RS, previously dried, dissolve in phosphate buffer solution (pH 6.0) to make a solution containing about 100,000 Units per mL, and use this solution as the sample stock solution. Take exactly a suitable amount of the sample stock solution, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage — Containers—Tight containers.
Colistin Sulfate

**Identification** (1) Dissolve 20 mg of Colistin Sulfate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, and then add 5 drops of copper (II) sulfate TS while shaking: a purple color develops.

(2) Dissolve 50 mg of Colistin Sulfate in 10 mL of diluted hydrochloric acid (1 in 2). Transfer 1 mL of this solution in a tube for hydrolysis, seal, and heat at 135°C for 5 hours. After cooling, open the tube, and evaporate the content to dryness until the odor of hydrochloric acid is no more perceptible. Dissolve the residue in 0.5 mL of water, and use this solution as the sample solution. Separately, dissolve 20 mg each of l-leucine, l-threonine, phenylalanine and l-serine in 10 mL of water, and use these solutions as the standard solution (1), (2), (3) and (4). Prepare the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 1 mL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of pyridine, 1-butanol, water and acetic acid (100:9:2:20) for 10 minutes. Spray evenly ninhydrin-butanol TS on the plate, and heat at 100°C for about 20 minutes: the spots other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Escherichia coli NIHJ

(ii) Culture medium—Dissolve 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 15.0 g of agar in 1000 mL of water, adjust the pH with sodium hydroxide TS so that the solution will be 6.5 to 6.6 after sterilization, and use as the agar media for seed layer and for base layer.

(iii) Standard solutions—Weigh accurately an amount of Colistin Sulfate RS, previously dried, equivalent to about 1,000,000 units, and dissolve in phosphate buffer solution (pH 6.0) to make 1 mL of the solution, and use this solution as the standard solution. Keep the standard stock solution at not exceeding 10°C, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Colistin Sulfate, previously dried, equivalent to about 1,000,000 units, and dissolve in phosphate buffer solution (pH 6.0) to make exactly 10 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

---

*The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)*
**Copovidone**

(\(\text{C}_6\text{H}_{12}\text{O}_3\text{N})_m(\text{C}_2\text{H}_5\text{O}_2)_m\))

Poly[(2-oxopyrrolidin-1-yl)ethylene-co-(1-acetoxyethylene)]

[25086-89-9]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (\(\ast\ \ast\)), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (\(\circ\ \circ\)).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Copovidone is a copolymer of 1-vinyl-2-pyrrolidone and vinyl acetate at the ratio by mass of 3:2.

It contains not less than 35.3% and not more than 42.0% of vinyl acetate (\(\text{C}_2\text{H}_4\text{O}_2\): 86.09), and not less than 7.0% and not more than 8.0% of nitrogen (N: 14.01), calculated on the dried basis.

The nominal K-value is shown on the label.

**Description** Copovidone occurs as a white to yellowish white powder. It is odorless or has a faint, characteristic odor.

It is very soluble in methanol and in ethanol (95), and freely soluble in water.

It is hygroscopic.

**Identification** Determine the infrared absorption spectrum of Copovidone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(\text{2.25}\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** \(\text{2.5-4}\) Dissolve 1.0 g of Copovidone in 10 mL of water: the pH of this solution is between 3.0 and 7.0.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Copovidone in 10 mL of water: the solution is clear or slightly opalescent and colorless to pale yellow, or pale red.

\(\circ\) (2) Heavy metals \(\text{1.07}\)—Ignite 2.0 g of Copovidone as directed under Residue on Ignition Test \(\text{2.44}\), add 2 mL of hydrochloric acid to the residue, then proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

\(\circ\) (3) Aldehydes—Weigh accurately about 1 g of Copovidone, dissolve in 0.05 mol/L pyrophosphate buffer solution (pH 9.0) to make exactly 100 mL. Stopper, heat at 60°C for 60 minutes, allow to cool to room temperature, and use this solution as the sample solution. Separately, dissolve 0.140 g of acetaldehyde ammonia trimer hydrate in water to make exactly 200 mL. Pipet 1 mL of this solution, add 0.05 mol/L pyrophosphate buffer solution (pH 9.0) to make exactly 100 mL, and use this solution as the standard solution. Measure exactly 0.5 mL each of the sample solution, standard solution and water, transfer to separate 1-cm cells, add 2.5 mL of 0.05 mol/L pyrophosphate buffer solution (pH 9.0) and 0.2 mL of \(\beta\)-nicotinamide adenine dinucleotide TS to each of these cells, mix and stopper tightly. Allow to stand for 2 to 3 minutes at 22 ± 2°C, and perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry \(\text{2.24}\) using water as the control solution. Determine the absorbances, \(A_{T1}, A_{T2}\) and \(A_{B1}\), of the subsequent solutions of the sample solution, the standard solution and water (blank) at 340 nm. Then, add 0.05 mL of aldehyde dehydrogenase TS to each of the cells, stir, and stopper tightly. Allow to stand at 22 ± 2°C for 5 minutes. Determine the absorbances, \(A_{T2}, A_{B2}\) and \(A_{B1}\), of these solutions in the same manner as above: the content of aldehyde is not more than 500 ppm.

Content (ppm) of aldehydes [as acetaldehyde (\(\text{C}_2\text{H}_4\text{CHO}\)])

\[
M: \text{Amount (g) of Copovidone taken, calculated on the dried basis}
\
C: \text{Concentration (mg/mL) of acetaldehyde in the standard solution, using 0.72 as conversion factor for acetaldehyde ammonia trimer hydrate to acetaldehyde}
\
(4) 1-Vinyl-2-pyrrolidone and free vinyl acetate—Store the sample solution and the standard solution at 5°C or below, and use within 8 hours. Weigh accurately about 0.25 g of Copovidone, dissolve in a mixture of water and acetonitrile (23:2) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 50 mg each of 1-vinyl-2-pyrrolidone and vinyl acetate in methanol to make exactly 100 mL. Pipet 1 mL of this solution and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add a mixture of water and acetonitrile (23:2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 mL each of the sample solution and standard solution as directed under Liquid Chromatography \(\text{2.01}\) according to the following conditions, determine the peak areas, \(A_{T1}, A_{T2}\), \(A_{B1}\), and \(A_{B2}\), of 1-vinyl-2-pyrrolidone and free vinyl acetate in each solution, and calculate the content of 1-vinyl-2-pyrrolidone and vinyl acetate by the following equations: they are not more than 10 ppm.

Content (ppm) of 1-vinyl-2-pyrrolidone

\[
A_{T1}/A_{B1} \times C_{S1}/C_T \times 1000
\]

Content (ppm) of free vinyl acetate

\[
A_{T1}/A_{B1} \times C_{S0}/C_T \times 1000
\]

\(C_{S1}\): Concentration (\(\mu\)g/mL) of 1-vinyl-2-pyrrolidone in the standard solution

\(C_{S0}\): Concentration (\(\mu\)g/mL) of vinyl acetate in the standard solution

\(C_T\): Concentration (mg/mL) of Copovidone in the sample solution, calculated on the dried basis

**Operating conditions**—

Column: Two stainless steel columns, one is 4 mm in inside diameter and 33 mm in length and the other is 4 mm in inside diameter and 250 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter), and use them as the pre-column and the separation column, respectively.

Column temperature: A constant temperature of about...
40°C.

Mobile phase: A mixture of water and acetonitrile (23:2). Flow rate: 1.0 mL per minute (Retention times of 1-vinyl-2-pyrrolidone and vinyl acetate are about 17 and about 22 minutes, respectively).

Time span of measurement: For 40 minutes.

Washing of column: After each test with the sample solution, elute and wash away remaining sample by passing the mobile phase through the separation column or the pre-column backwards at the flow rate mentioned above for about 30 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions (wavelength: 205 nm), 1-vinyl-2-pyrrolidone and vinyl acetate are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of 1-vinyl-2-pyrrolidone and vinyl acetate are not more than 2.0%, respectively.

(5) Peroxides—Weigh exactly an amount of Copovidone, equivalent to 4.0 g calculated on the dried basis, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. To 25 mL of the sample solution add 2 mL of titanium (III) chloride-sulfuric acid TS, and mix. Allow to stand for 30 minutes, and perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry 2.2.2, using a solution prepared by adding 2 mL of diluted sulfuric acid (13 in 100) to 25 mL of the sample solution as a blank: the absorbance of the sample solution at 405 nm is not more than 0.35 (not more than 400 ppm, as hydrogen peroxide).

(6) Hydrazine—Weigh exactly an amount of Copovidone equivalent to 2.5 g calculated on the dried basis, transfer to a 50-mL centrifuge tube, add 25 mL of water, and stir to dissolve. Add 500 µL of a solution of salicylaldehyde in methanol (1 in 20), stir and warm at 60°C for 15 minutes in a water bath. Allow to cool, add 2.0 mL of toluene, stopper tightly, shake vigorously for 2 minutes, centrifuge, and use the upper layer of the mixture as the sample solution. Separately, dissolve 90 mg of salicylaldehyde in toluene to make exactly 100 mL. Pipet 1 mL of this solution, add toluene to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.3.2.5. Spot 10 µL each of the sample solution and standard solution on a plate of dimethylsilanized silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol and water (2:1) to a distance of about three-fourths of the length of the plate, and air-dry the plate. Examine under ultraviolet light (main wavelength: 365 nm): the fluorescence of the spot obtained from the sample solution corresponding to the spot having a Rt value of about 0.3 from the standard solution is not more intense than that of the spot from the standard solution (not more than 1 ppm).

(7) 2-Pyrrolidone—Weigh accurately about 1 g of Copovidone, add 5 mL of methanol for liquid chromatography, and sonicate to dissolve. Add water to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve 0.150 g of 2-pyrrolidone in a mixture of water and methanol for liquid chromatography (19:1) to make exactly 100 mL. Pipet 3 mL of this solution, add a mixture of water and methanol for liquid chromatography (19:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography 2.4.1 according to the following conditions, and determine the peak areas, A1 and A2, of 2-pyrrolidone in each solution. Calculate the content of 2-pyrrolidone by the following equation: not more than 0.5%.

\[ \text{Content} = \frac{A_1}{A_2} \times C_5 / C_4 \times 100 \]

\( C_5 \): Concentration (mg/mL) of 2-pyrrolidone in the standard solution

\( C_i \): Concentration (mg/mL) of Copovidone in the sample solution, calculated on the dried basis

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: Two stainless steel columns, one is 4.0 mm in inside diameter and 10 mm in length and the other is 4.6 mm in inside diameter and 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter), and use them as the pre-column and the separation column, respectively.

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanol and water for liquid chromatography (19:1).

Flow rate: 0.8 mL per minute (retention time of 2-pyrrolidone is about 7 minutes).

Time span of measurement: For 30 minutes.

Washing of column: After each test with the sample solution, elute and wash away remaining sample by passing the mobile phase through the separation column or the pre-column backwards at the flow rate mentioned above for about 30 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the symmetry factor of the peak of 2-pyrrolidone is not more than 1.5.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 2-pyrrolidone is not more than 2.0%.

Loss on drying 2.4.1 Not more than 5.0% (0.5 g, 105°C, 3 hours).

Residue on ignition 2.4.4 Not more than 0.1% (1 g).

K-value Weigh accurately an amount of Copovidone, equivalent to 1.00 g, calculated on the dried basis, dissolve in water to make exactly 100 mL, allow to stand for 60 minutes, and use this solution as the sample solution. Perform the test with the sample solution and with water at 25°C as directed in Method 1 under Viscosity Determination 2.5.2, and calculate the K-value by the following formula: the K-value of Copovidone is not less than 90.0% and not more than 110.0% of the nominal K-value.

\[ K = \frac{1.5 \log V_{rel} - 1}{0.15 + 0.003c} \]

\[ \sqrt{\frac{300c \log V_{rel} + (c + 1.5c \log V_{rel})^2}{0.15c + 0.003c^2}} \]

\( c \): Mass (g) of Copovidone in 100 mL of the solution, calculated on the dried basis

\( V_{rel} \): Kinematic viscosity of the sample solution relative to that of water

Assay (1) Vinyl acetate—Weigh accurately about 2 g of
Determine the absorption spectrum of a solution of Cortisone Acetate (86.09 – 102.0) of cortisone (97.0). Perform a blank determination in the same manner, and make any necessary correction.

Amount (% of vinyl acetate)

\[
M = \frac{0.1 \times 86.09}{56.11} \times \frac{28.05 (n_2 - n_1)}{M}
\]

M: Amount (g) of Copovidone taken, calculated on the dried basis

n₁: Volume (mL) of 0.5 mol/L hydrochloric acid VS consumed in the test

n₂: Volume (mL) of 0.5 mol/L hydrochloric acid VS consumed in the blank test

(2) Nitrogen—Weigh accurately about 0.1 g of Copovidone, and place in a Kjeldahl flask. Add 5 g of a decomposition accelerator (a powdered mixture of 33 g of potassium sulfate, 1 g of copper (II) sulfate pentahydrate and 1 g of titanium (IV) oxide), and wash down any adhering sample from the neck of the flask with a small amount of water. Add 7 mL of sulfuric acid allowing to flow down the inside wall of the flask. Heat the flask gradually until the solution has a clear, yellow-green color, and the inside wall of the flask is free from a carbonized material, and then heat for further 45 minutes. After cooling, add cautiously 20 mL of water, and connect the flask to the distillation apparatus previously washed by passing steam through it. To the absorption flask add 30 mL of a solution of boric acid (1 in 25), 3 drops of bromocresol green-methyl red TS and sufficient water to immerse the lower end of the condenser tube. Add 30 mL of a solution of sodium hydroxide (2 in 5) through the funnel, rinse cautiously the funnel with 10 mL of water, immediately close the clamp attached to the rubber tube, then start the distillation with steam to obtain 80 to 100 mL of the distillate. Remove the absorption flask from the lower end of the condenser tube, rinsing the end part with a small quantity of water, and titrate 0.025 mol/L sulfuric acid VS until the color of the solution changes from green through pale grayish blue to pale grayish red-purple. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.025 mol/L sulfuric acid VS = 0.700 mg of N

Containers and storage—Tight containers.

Cortisone Acetate

Identifications (1) To 2 mg of Cortisone Acetate add 2 mL of sulfuric acid, and allow to stand for a while: a yellowish green color is produced, and it gradually changes to yellow-orange. Examine the solution under ultraviolet light: the solution shows a light green fluorescence. Add carefully 10 mL of water to this solution: the color of the solution is discharged, and the solution remains clear.

(2) Determine the absorption spectrum of a solution of Cortisone Acetate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cortisone Acetate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Cortisone Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cortisone Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Cortisone Acetate and Cortisone Acetate RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

 Optical rotation <2.49° [d]20 +207 – +216° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Purity Related substances—Dissolve 25 mg of Cortisone Acetate in 10 mL of a mixture of acetonitrile, water and acetic acid (100) (70:30:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution add the mixture of acetonitrile, water and acetic acid (100) (70:30:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography, according to the following conditions, and determine each peak area by the automatic integration method: each peak area of cortisone acetate obtained from the sample solution is not larger than 1/2 times the peak area of cortisone acetate from the standard solution, and the total area of the peaks other than cortisone acetate is not larger than 1.5 times the peak area of cortisone acetate from the standard solution.

 Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of water and acetonitrile (7:3).

Mobile phase B: A mixture of acetonitrile and water (7:3).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Cortisone Acetate, when dried, contains not less than 97.0% and not more than 102.0% of cortisone acetate (C₂₃H₃₀O₈).
Absorptive Cream is white in color and is according to the following Containers—Tight containers.

To make 1000 g

Melt White Petrolatum, Stearyl Alcohol, polyoxymethylene hydrogenated castor oil 60 and Glycerin Monostearate by heating on a water bath, stir, and keep temperature of the mixture at about 75°C. To Propylene Glycol add Methyl Parahydroxybenzoate and Propyl Parahydroxybenzoate, melt by warming if necessary, dissolve in Purified Water or Purified Water in Containers, and warm to about 75°C. Add this solution to the above mixture, stir to form emulsion, cool, and stir thoroughly until it congeals.
Description Hydrophilic Cream is white in color. It has a slight, characteristic odor.

Containers and storage Containers—Tight containers.

Cresol クレゾール

C₇H₈O: 108.14

Cresol is a mixture of isomeric cresols.

Description Cresol is a clear, colorless or yellow to yellow-brown liquid. It has a phenol-like odor.

It is miscible with ethanol (95) and with diethyl ether.

It is sparingly soluble in water.

It dissolves in sodium hydroxide TS.

A saturated solution of Cresol is neutral to bromocresol purple TS.

It is a highly refractive liquid.

It becomes dark brown by light or on aging.

Identification To 5 mL of a saturated solution of Cresol add 1 to 2 drops of dilute iron (III) chloride TS: a blue-purple color develops.

Specific gravity <2.50 \( \rho \approx 1.032 - 1.041 \)

Purity (1) Hydrocarbons—Dissolve 1.0 mL of Cresol in 60 mL of water: the solution shows no more turbidity than that produced in the following control solution.

Control solution: To 54 mL of water add 6.0 mL of 0.005 mol/L sulfuric acid VS and 1.0 mL of barium chloride TS, and after thorough shaking, allow to stand for 5 minutes.

(2) Sulfur compounds—Transfer 20 mL of Cresol Solution, exactly measured, to a 500-mL distilling flask. Add 40 g of sodium chloride and 3 mL of dilute sulfuric acid, and connect the distilling apparatus with the distilling flask, and distil into a cassia flask which contains 50 g of powdered sodium chloride and 3 mL of kerosene, exactly measured, until the distillate measures 90 mL. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Shake often the cassia flask in warm water to dissolve the sodium chloride, and allow to stand for 15 minutes. After cooling to 15°C, add a saturated solution of sodium chloride, and allow to stand for more than 3 hours with occasional shaking. Allow to stand for 1 to 2 minutes with gentle shaking to combine the separated oil drops with the oil layer. The difference between the number of mL of the oil layer measured and 3 mL represents the amount (mL) of cresol.

Containers and storage Containers—Tight containers.

Cresol Solution クレゾール水

Cresol Solution contains not less than 1.25 vol% and not more than 1.60 vol% of cresol.

Method of preparation

Saponated Cresol Solution 30 mL

Water, Purified Water or Purified Water in Containers a sufficient quantity

To make 1000 mL

Prepare by mixing the above ingredients.

Description Cresol Solution is a clear or slightly turbid, yellow solution. It has the odor of cresol.

Identification Shake 0.5 mL of the oily layer obtained in the Assay with 30 mL of water, filter, and perform the following tests using this filtrate as the sample solution:

(1) To 5 mL of the sample solution add 1 to 2 drops of iron (III) chloride TS: a blue-purple color develops.

(2) To 5 mL of the sample solution add 1 to 2 drops of bromine TS: a light yellow, flocculent precipitate is produced.

Assay Transfer 200 mL of Cresol Solution, exactly measured, to a 500-mL distilling flask. Add 40 g of sodium chloride and 3 mL of dilute sulfuric acid, and connect the distilling apparatus with the distilling flask, and distil into a cassia flask which contains 50 g of powdered sodium chloride and 3 mL of kerosene, exactly measured, until the distillate measures 90 mL. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Shake often the cassia flask in warm water to dissolve the sodium chloride, and allow to stand for 15 minutes. After cooling to 15°C, add a saturated solution of sodium chloride, and allow to stand for more than 3 hours with occasional shaking. Allow to stand for 1 to 2 minutes with gentle shaking to combine the separated oil drops with the oil layer. The difference between the number of mL of the oil layer measured and 3 mL represents the amount (mL) of cresol.

Containers and storage Containers—Tight containers.

Saponated Cresol Solution クレゾール石ケン液

Saponated Cresol Solution contains not less than 42 vol% and not more than 52 vol% of cresol.

Method of preparation

Cresol 500 mL

Fixed Oil 300 mL

Potassium Hydroxide a suitable quantity

Water, Purified Water or Purified Water in Containers a sufficient quantity

To make 1000 mL

Dissolve Potassium Hydroxide, in required quantity for saponification, in a sufficient quantity of Water, Purified Water or Purified Water in Containers, add this solution to fixed oil, previously warmed, add a sufficient quantity of Ethanol, if necessary, heat in a water bath by thorough stirring, and continue the saponification. After complete saponification, add Cresol, stir thoroughly until the mixture becomes clear, and add sufficient Water, Purified Water or Purified Water in Containers to make 1000 mL. A corresponding amount of Sodium Hydroxide may be used in place of Potassium Hydroxide.

Description Saponated Cresol Solution is a yellow-brown to red-brown, viscous liquid. It has the odor of cresol.

It is miscible with water, with ethanol (95) and with glycerin.

It is alkaline.

Identification Proceed as directed in the Identification under Cresol, using the distillate in the Purity (3).

Purity (1) Alkalinity—Mix well 0.50 mL of Saponated Cresol Solution with 10 mL of neutralized ethanol, add 2 to 3 drops of phenolphthalein TS and 0.10 mL of 1 mol/L hydrochloric acid VS: no red color develops.

(2) Unsaponified matter—To 1.0 mL of Saponated Cresol Solution add 5 mL of water, and shake: the solution is clear.
Determine the absorption spectrum of a solution of Croconazole Hydrochloride in methanol (1 in 10 mL). Pipet 0.05 g of Croconazole Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Ultraviolet-Visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Determine the infrared absorption spectrum of Croconazole Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Dissolve 0.05 g of Croconazole Hydrochloride in 10 mL of water, add 2 mL of sodium hydroxide TS and 20 mL of diethyl ether, and shake. Wash the separated aqueous layer with two 10-mL portions of diethyl ether, and acidify the solution with 2 mL of dilute nitric acid: the solution responds to Qualitative Tests <1.09> for chloride.

Melting point <2.60> 148 – 153°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Croconazole Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Croconazole Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

2.24. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol and ammonia solution (28:30:15:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 60°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Croconazole Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS [indicator: 1 to 2 drops of a solution of malachite green oxalate in acetic acid (100) (1 in 100)] until the color of the solution changes from blue-green through green to yellow-green. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.72 mg of \( \text{C}_18\text{H}_12\text{ClN}_2\text{O}_2\text{HCl} \)

Containers and storage Containers—Tight containers.

Storage—Light-resistant.
Crosopovidone
クロスポビドン

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The parts of the text that are not harmonized are marked with symbols (● ●). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Crosopovidone is a cross-linked polymer of 1-vinyl-2-pyrrolidone.

It contains not less than 11.0% and not more than 12.8% of nitrogen (N: 14.01), calculated on the dried basis.

Two types of Crosopovidone are available, depending on the particle size: type A and type B.

● The label states the type. ●

●Description Crosopovidone occurs as a white to pale yellow-powder.

It is practically insoluble in water, in methanol and in ethanol (99.5).

It is hygroscopic. ●

Identification (1) Suspend 1 g of Crosopovidone in 10 mL of water, add 0.1 mL of iodine TS, shake for 30 seconds, then add 1 mL of starch TS, and shake: a blue color is not produced within 30 seconds.

(2) When add 0.1 g of Crosopovidone to 10 mL of water, shake to suspend, and allow the suspension to stand, a clear liquid is not produced within 15 minutes.

●Particle size Weigh accurately about 20 g of Crosopovidone, place in a 1000-mL conical flask, add 500 mL of water, shake for 30 minutes, and pour onto an accurately tared No. 235 (63 μm) sieve, previously washed with hot water and dried at 105°C for a night, and wash the residue with water until the passing water is clear. Dry the residue together with the sieve in a drying machine at 105°C for 5 hours without air-circulation. After cooling down in a desiccator for 30 minutes, weigh the mass of the residue with sieve, and calculate the amount of the residue on the sieve by the following equation: Type A is more than 15%, and type B is not more than 15%.

Amount (%): of the residue of Crosopovidone on No. 235 (63 μm) sieve

\[ \frac{M_1 - M_3}{M_3} \times 100 \]

M₁: The mass (g) of the residue with sieve after 5 hours drying
M₃: Amount (g) of Crosopovidone taken, calculated on the dried basis
M₄: Mass (g) of the sieve

Purity (1) Heavy metals <1.0%—Proceed with 2.0 g of Crosopovidone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Water-soluble substances—Place 25.0 g of Crosopovidone in a 400-mL beaker, add 200 mL of water, and stir for 1 hour. Transfer the suspension to a 250-mL volumetric flask, rinsing with water, and dilute to volume with water. Allow the bulk of the solids to settle. Filter about 100 mL of the almost clear supernatant liquid through a 0.45 μm membrane filter, protected by superimposing a 3 μm membrane filter. Transfer exactly 50 mL of the clear filtrate to a tared 100-mL beaker, evaporate to dryness and dry at 105 – 110°C for 3 hours: the mass of the residue is not more than 75 mg.

(3) 1-Vinyl-2-pyrrolidone—To 1,250 g of Crosopovidone add exactly 50 mL of methanol, and shake for 60 minutes. Leave bulk to settle, filter through a 0.2 μm membrane filter, and use the filtrate as the sample solution. Separately, dissolve 50 mg of 1-vinyl-2-pyrrolidone in methanol to make exactly 100 mL. Pipet 1 mL of this solution, and add methanol to make exactly 100 mL. To exactly 5 mL of this solution add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL of each of the sample solution and standard solution as directed under Liquid Chromatography 2.04 according to the following conditions: the peak area of 1-vinyl-2-pyrrolidone obtained from the sample solution is not larger than that from the standard solution (not more than 10 ppm).

Operating conditions—

Column: Two stainless steel columns, one is 4 mm in inside diameter and 25 mm in length and the other is 4 mm in inside diameter and 250 mm in length, they are packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter), and used them as the pre-column and the separation column, respectively.

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and acetonitrile (9:1). Flow rate: 1.0 mL per minute.

Washing of pre-column: After each injection of the sample solution, wash the pre-column by passing the mobile phase backwards, at the same flow rate as applied in the test, for 30 minutes.

System suitability—

System performance: Dissolve 10 mg of 1-vinyl-2-pyrrolidone and 0.50 g of vinyl acetate in methanol to make 100 mL. To 1 mL of this solution add the mobile phase to make 100 mL. When the procedure is run with 50 μL of this solution under the above operating conditions, 1-vinyl-2-pyrrolidone and vinyl acetate are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 1-vinyl-2-pyrrolidone is not more than 2.0%.

(4) Peroxides—

Method 1: Apply to the sample labeled as type A. Suspend 4.0 g of Crosopovidone in 100 mL of water, and use as the sample suspension. To 25 mL of the sample suspension add 2 mL of titanium (III) chloride-sulfuric acid TS, allow to stand for 30 minutes, and filter. Determine the absorbance of the filtrate at 405 nm as directed under Ultraviolet-visible Spectrophotometry 2.2.9, using the control, prepared by filtering the sample suspension and adding 2 mL of diluted sulfuric acid (13 in 100) to 25 mL of this filtrate: not more than 0.35 (not more than 400 ppm expressed as hydrogen peroxide).

Method 2: Apply to the sample labeled as type B. Suspend 2.0 g of Crosopovidone in 50 mL of water, and use as the sample suspension. To 10 mL of the sample suspension add water to make 25 mL, add 2 mL of titanium (III) chloride-sulfuric acid TS, allow to stand for 30 minutes, and filter. Determine the absorbance of the filtrate at 405 nm as di-
rected under Ultraviolet-visible Spectrophotometry \(<2.24\), using the control, prepared by filtrating the sample suspension, adding water to 10 mL of this filtrate to make 25 mL and 2 mL of diluted sulfuric acid (13 in 100): not more than 0.35 (not more than 1000 ppm expressed as hydrogen peroxide).

Loss on drying \(<2.41\) Not more than 5.0\% (0.5 g, 105°C, constant mass).

Residue on ignition \(<2.44\) Not more than 0.1\% (1 g).

Assay Weigh accurately about 0.1 g of Crospovidone, place in a Kjeldahl flask, add 5 g of a decomposition accelerator (a powdered mixture of 33 g of potassium sulfate, 1 g of copper (II) sulfate pentahydrate and 1 g of titanium (IV) oxide) and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of water. Add 7 mL of sulfuric acid, allowing it to run down the inside wall of the flask. Gradually heat the flask until the solution has a clear, yellowish-green color, and the inside wall of the flask is free from carbonized material, and then heat for a further 45 minutes. After cooling, cautiously add 20 mL of water, and connect the flask to the distillation apparatus previously washed by passing steam through it. To the absorption flask add 30 mL of a solution of boric acid (1 in 25), 3 drops of bromocresol green-methyl red TS and sufficient water to immerse the lower end of the condenser tube. Add 30 mL of a solution of sodium hydroxide (21 in 50) through a funnel, and allow to stand for 15 minutes with occasional shaking. Add water to make exactly 100 mL, filter, discard the first 20 mL of the filtrate, and pipet 50 mL of the subsequent filtrate. After neutralizing this solution with dilute nitric acid, add 3 mL of dilute nitric acid, 10 mL of ammonia TS and exactly 50 mL of 0.1 mol/L silver nitrate VS, and allow to stand for 15 minutes with occasional shaking. Add water to make exactly 100 mL, filter, discard the first 20 mL of the filtrate, and pipet 50 mL of the subsequent filtrate. After neutralizing this solution with dilute nitric acid, add 3 mL of dilute nitric acid, and titrate \(<2.50\) the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L silver nitrate VS = 2.102 mg of CH$_2$N$_2$

Containers and storage Containers—Tight containers.

Cyanamide

シアナミド

H$_2$N—CN

CH$_2$N$_2$: 42.04
Aminonitrile [420-04-2]

Cyanamide contains not less than 97.0\% and not more than 101.0\% of cyanamide (CH$_2$N$_2$), calculated on the anhydrous basis.

Description Cyanamide occurs as white, crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (99.5) and in acetone.

The pH of a solution of 1.0 g of Cyanamide in 100 mL of water is between 5.0 and 6.5.

It is hygroscopic.

Melting point: about 46°C

Identification (1) To 1 mL of a solution of Cyanamide (1 in 100) add 1 mL of potassium 1,2-naphthoquinone-4-
Cyanocobalamin

Vitamin B₁₂

シアノコバラミン

\[
\text{C₆₈H₈₆CoN₃O₃P: 1355.37}
\]
\[
\text{Co}_{3}[(\text{α-(5,6-Dimethyl-1H-benzimidazol-1-yl)})-\text{CoF}]-
\]
cyanoacobamide

[68-19-9]

Cyanocobalamin contains not less than 96.0% and not more than 102.0% of cyanocobalamin (C₆₈H₈₆CoN₃O₃P, calculated on the dried basis).

**Description** Cyanocobalamin occurs as dark red, crystals or powder.

It is sparingly soluble in water, and slightly soluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cyanocobalamin RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Mix 1 mg of Cyanocobalamin with 50 mg of potassium hydrogen sulfate, and fuse by igniting. Cool, break up the mass with a glass rod, add 3 mL of water, and dissolve by boiling. Add 1 drop of phenolphthalein TS, then add dropwise sodium hydroxide TS until a light red color just develops. Add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of a solution of disodium 1-nitroso-2-naphthol-3,6-disulfonate (1 in 500): a red to orange-red color is immediately produced. Then add 0.5 mL of hydrochloric acid, and boil for 1 minute: the red color does not disappear.

(3) Transfer 5 mg of Cyanocobalamin to a 50-mL distilling flask, dissolve in 5 mL of water, and add 2.5 mL of hypophosphorous acid. Connect the flask with a short condenser, and dips its tip into a test tube containing 1 mL of a solution of sodium hydroxide (1 in 50). Heat gently for 10 minutes, then distil 1 mL into a test tube. To the test tube add 4 drops of a saturated solution of ammonium iron (II) sulfate hexahydrate, shake gently, then add about 30 mg of sodium fluoride, and heat the contents to boil. Immediately add dropwise diluted sulfuric acid (1 in 7) until a clear solution results, then add 3 to 5 drops more of diluted sulfuric acid (1 in 7): a blue to blue-green color develops.

**pH <2.54>** Dissolve 0.10 g of Cyanocobalamin in 20 mL of water: the pH of this solution is between 4.2 and 7.0.

**Purity (1)** Clarity and color of solution—Dissolve 20 mg of Cyanocobalamin in 10 mL of water: the solution is clear and red in color.

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 10 mg of Cyanocobalamin in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peak other than cyanocobalamin obtained from the sample solution is not larger than the peak area of cyanocobalamin from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 361 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 10 g of anhydrous disodium hydrogen phosphate in 1000 mL of water, and adjust to pH 3.5 with phosphoric acid. To 147 mL of this solution add 53 mL of methanol.

Flow rate: Adjust so that the retention time of cyanocobalamin is about 7 minutes.

Time span of measurement: About 4 times as long as the retention time of cyanocobalamin, beginning after the solvent peak.

**System suitability—**

Test for required detectability: To 1 mL of the sample solution, add the mobile phase to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cyanocobalamin obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the solution for system suitability test.

System performance: Perform this procedure quickly after the solution is prepared. To 25 mg of cyanocobalamin add 10 mL of water, and warm, if necessary, to dissolve. After cooling, add 0.5 mL of sodium toluenesulfonchloramide TS, 0.5 mL of 0.05 mol/L hydrochloric acid TS and water to make 25 mL, mix, and allow the solution to stand for 5 minutes. To 1 mL of the solution add the mobile phase to make 10 mL. When the procedure is run with 20 μL of the solution under the above operating conditions, two principal peaks appear with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cyanocobalamin is not more than 3.0%.

**Loss on drying <2.47>** Not more than 12% (50 mg, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V)
Assay  Weigh accurately about 20 mg each of Cyanocobalamin and Cyanocobalamin RS (previously determined the loss on drying under the same conditions as Cyanocobalamin), dissolve in water to make exactly 1000 mL, respectively, and use these solutions as the sample solution and the standard solution. Determine the absorbances, \( A_1 \) and \( A_2 \), of the sample solution and standard solution, at 361 nm as directed under Ultraviolet-visible Spectrophotometry. \( M_5 \): Amount (mg) of Cyanocobalamin RS taken, calculated on the dried basis.

Containers and storage  Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Cyanocobalamin Injection

### Vitamin B\(_{12} \) Injection

シアンコバラミン注射液

Cyanocobalamin Injection is an aqueous injection. It contains not less than 95.0% and not more than 115.0% of the labeled amount of cyanocobalamin (C\(_{63}H_{88}CoN_4O_{16}P\); 1355.37).

### Method of preparation

Prepare as directed under Injections, with Cyanocobalamin.

### Description

Cyanocobalamin Injection is a clear, light red to red liquid.

### Identification

Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 277 nm and 279 nm, between 360 nm, and 362 nm and between 548 nm and 552 nm. Determine the absorbances, \( A_1 \) and \( A_2 \), of this solution at the wavelengths of 360 nm and 362 nm, and between 548 nm and 552 nm, respectively: the ratio \( A_2/A_1 \) is not less than 0.29 and not more than 0.32.

### Bacterial endotoxins

Less than 0.30 EU/\( \mu \)g.

### Extractable volume

It meets the requirement.

### Foreign insoluble matter

Perform the test according to Method 1: it meets the requirement.

### Insoluble particulate matter

It meets the requirement.

### Sterility

Perform the test according to the Membrane filtration method: it meets the requirement.

### Assay

Measure exactly a volume of Cyanocobalamin Injection, equivalent to about 2 mg of cyanocobalamin (C\(_{63}H_{88}CoN_4O_{16}P\)), add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Cyanocobalamin RS (previously determined the loss on drying under the same conditions as Cyanocobalamin), add water to make exactly 1000 mL, and use this solution as the standard solution. Then proceed as directed in the Assay under Cyanocobalamin.

Amount (mg) of cyanocobalamin (C\(_{63}H_{88}CoN_4O_{16}P\))

\[
M_5 = M_5 \times A_1/A_2 \times 1/10
\]

\( M_5 \): Amount (mg) of Cyanocobalamin RS taken, calculated on the dried basis.

## Cyclopentolate Hydrochloride

### シクロペンタート塩酸塩

Cyclopentolate Hydrochloride, when dried, contains not less than 98.5% of cyclopentolate hydrochloride (C\(_{17}H_{23}NO_3\)HCl).

### Description

Cyclopentolate Hydrochloride occurs as a white crystalline powder. It is odorless, or has a characteristic odor. It is very soluble in water, freely soluble in ethanol (95%), in acetic acid (100) and in chloroform, sparingly soluble in acetanhydride, and practically insoluble in diethyl ether.

### Identification

1. To 1 mL of a solution of Cyclopentolate Hydrochloride (1 in 100) add 1 mL of Reinecke salt TS: a light red precipitate is formed.
2. Dissolve 0.2 g of Cyclopentolate Hydrochloride in 2 mL of water, add 2 mL of sodium hydroxide TS, and boil for 1 minute. After cooling, add 2 drops of nitric acid: a phenylacetic acid-like odor is perceptible.
3. Determine the infrared absorption spectrum of Cyclopentolate Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry: both spectra exhibit similar intensities of absorption at the same wave numbers.
4. A solution of Cyclopentolate Hydrochloride (1 in 50) responds to Qualitative Tests for chlorides.

### pH

\( 2.54 \) Dissolve 0.20 g of Cyclopentolate Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 5.5.

### Melting point

135 – 138°C

### Purity

1. Clarity and color of solution—Dissolve 1.0 g of Cyclopentolate Hydrochloride in 10 mL of water: the solution is clear and colorless.
2. Heavy metals—Proceed with 1.0 g of Cyclopentolate Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
3. Related substances—Dissolve 0.20 g of Cyclopentolate Hydrochloride in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography for Chlorides.
**Cyclophosphamide Hydrate / Official Monographs**

Containers—Tight containers.

Rearrange chromatography $<2.09\text{>}$ Spot 10 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, n-butyl acetate, water and ammonia solution (28) (100:60:23:17) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of sulfuric acid in ethanol (99.5) (1 in 10) on the plate, and heat the plate at 120°C for 30 minutes. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** $<2.41\text{>}$ Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** $<2.44\text{>}$ Not more than 0.05% (1 g).

**Assay** Weigh accurately about 0.5 g of Cyclophosphamide Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (4:1), and titrate $<2.50\text{>}$ with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.79 mg of $\text{C}_7\text{H}_5\text{NO}_3\text{Cl}$

Containers and storage Containers—Tight containers.

**Cyclophosphamide Tablets**

シクロホスファミド錠

Cyclophosphamide Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of cyclophosphamide hydrate ($\text{C}_7\text{H}_5\text{Cl}_2\text{N}_2\text{O}_3\text{P.H}_2\text{O}$: 279.10).

**Method of preparation** Prepare as directed under Tablets, with Cyclophosphamide Hydrate.

**Identification** To Cyclophosphamide Tablets add 1 mL of water for every 53 mg of Cyclophosphamide Hydrate, shake vigorously for 5 minutes, add 6 mL of methanol for every 53 mg of Cyclophosphamide Hydrate, and shake vigorously for 10 minutes. To this solution add methanol so that each mL contains about 5.3 mg of Cyclophosphamide Hydrate, and centrifuge. Filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard not less than 3 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, dissolve 53 mg of cyclophosphamide hydrate for assay in 10 mL of a mixture of methanol and water (9:1), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.09\text{>}$, Spot 2 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-propanol and water (8:1) to a distance of about 10 cm, and air-dry the plate. Heat the plate at 130°C for 15 minutes. After cooling, spray evenly ninhydrin-butanol TS on the plate, and after air-drying heat at 130°C for 10 minutes: the principal spot obtained from the sample solution and the spot from the standard solution show a red-purple color and the same $Rf$ value.

The $JP$ Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cyclophosphamide Tablets add 3 V/5 mL of a mixture of water and methanol (3:2), and shake vigorously to homogenously disperse the tablet. To this solution add a mixture of water and methanol (3:2) to make exactly V mL so that each mL contains about 1.1 mg of cyclophosphamide hydrate (C$_7$H$_6$Cl$_2$N$_2$O$_7$.P.H$_2$O), and centrifuge. Filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution.

Then, proceed as directed in the Assay.

Amount (mg) of cyclophosphamide hydrate

\[
(Mg) = M_s \times A_T/A_S \times V/50
\]

\(M_s\): Amount (mg) of cyclophosphamide hydrate for assay taken

Dissolution <6.10> When the test is performed at 100 revolutions per minute according to the Basket method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Cyclophosphamide Tablets is not less than 80%.

Start the test with 1 tablet of Cyclophosphamide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 59 µg of cyclophosphamide hydrate (C$_7$H$_6$Cl$_2$N$_2$O$_7$.P.H$_2$O) and use this solution as the sample solution.

Separately, weigh accurately about 30 mg of cyclophosphamide hydrate for assay, dissolve in a mixture of water and methanol (3:2), and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area, \(A_T\) and \(A_S\), of cyclophosphamide in each solution.

Dissolution rate (%) with respect to the labeled amount of cyclophosphamide hydrate (C$_7$H$_6$Cl$_2$N$_2$O$_7$.P.H$_2$O)

\[
(Mg) = M_s \times A_T/A_S \times V'/V \times 1/C \times 180
\]

\(M_s\): Amount (mg) of cyclophosphamide hydrate for assay taken

C: Labeled amount (mg) of cyclophosphamide hydrate (C$_7$H$_6$Cl$_2$N$_2$O$_7$.P.H$_2$O) in 1 tablet

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cyclophosphamide are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cyclophosphamide is not more than 1.0%.

Containers and storage Containers—Tight containers.

Cyclophosphamide Tablets

C$_7$H$_6$N$_2$O$_7$: 102.09

(4R)-4-Aminoisoxazolidin-3-one

[68-41-7]

Cyclophosphamide contains not less than 950 µg (potency) and not more than 1020 µg (potency) per mg, calculated on the dried basis. The potency of Cyclophosphamide is expressed as mass (potency) of cyclophosphamide (C$_7$H$_6$N$_2$O$_7$).

Description Cyclophosphamide occurs as white to light yellow-white, crystals or crystalline powder.

It is soluble in water, and sparingly soluble in ethanol (95).
**Cyproheptadine Hydrochloride Hydrate**

シプロヘプタジン塩酸塩水和物

**Identification**
Determine the infrared absorption spectrum of Cycloserine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cycloserine RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation**<sup>[2.49]</sup> \([\alpha]_D^{20}: +108 - +114^\circ\) (2.5 g calculated on the dried basis, 2 mol/L sodium hydroxide TS, 50 mL, 100 mm).

**pH**<sup>[2.54]</sup> Dissolve 1.0 g of Cycloserine in 20 mL of water: the pH of the solution is between 5.0 and 7.4.

**Purity** (1) Heavy metals<sup>[1.07]</sup>—Proceed with 1.0 g of Cycloserine according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Condensation products—Dissolve 20 mg of Cycloserine in sodium hydroxide TS to make exactly 50 mL, and determine the absorbance of this solution at 285 nm as directed under Ultraviolet-visible Spectrophotometry (<sup>2.24</sup>); not more than 0.8.

**Loss on drying**<sup>[2.41]</sup> Not more than 1.5% (0.5 g, reduced pressure, 60°C, 3 hours).

**Residue on ignition**<sup>[2.42]</sup> Not more than 0.5% (1 g).

**Assay**
Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics (<sup>4.02</sup>) according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.0 to 6.1 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Cycloserine RS, previously dried at 60°C for 3 hours under reduced pressure of not exceeding 0.67 kPa, equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 100 μg (potency) and 50 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Cycloserine equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 100 μg (potency) and 50 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage**
Containers—Well-closed containers.

---

C<sub>23</sub>H<sub>21</sub>N.HCl.1/2H<sub>2</sub>O: 350.88
4-(5H-Dibenzo[a,d]cyclohepten-5-ylidene)-1-methylpiperidine monohydrochloride sesquihydrate [41354-29-4]

Cyproheptadine Hydrochloride Hydrate, when dried, contains not less than 98.5% of cyproheptadine hydrochloride (C<sub>23</sub>H<sub>21</sub>N.HCl: 323.86).

**Description**
Cyproheptadine Hydrochloride Hydrate occurs as a white to pale yellow crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in methanol and in acetic acid (100), soluble in chloroform, sparingly soluble in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

**Identification** (1) Dissolve 0.1 g of Cyproheptadine Hydrochloride Hydrate in 10 mL of methanol, apply 1 drop of this solution on filter paper, air-dry, and examine under ultraviolet light (main wavelength: 254 nm): the solution shows a pale blue fluorescence.

(2) Weigh 0.1 g of Cyproheptadine Hydrochloride Hydrate, transfer to a separator, dissolve in 5 mL of chloroform, add 4 mL of water and 1 mL of sodium carbonate TS, and shake. Transfer the chloroform layer to another separator, and wash with 4 mL of water by shaking well. Filter the chloroform layer through absorbent cotton moistened previously with chloroform, and evaporate the filtrate to dryness. Dissolve the residue in 8 mL of dilute ethanol by warming at 65°C. Rub the inner wall of the container with a glass rod while cooling until crystallization begins, and allow to stand for 30 minutes. Collect the crystals, and dry at 80°C for 2 hours: the crystals melt <sup>[2.60]</sup> between 111°C and 115°C.

(3) Determine the absorption spectrum of a solution of Cyproheptadine Hydrochloride Hydrate in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry (<sup>2.24</sup>), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) A saturated solution of Cyproheptadine Hydrochloride Hydrate responds to Qualitative Tests <sup>[1.09]</sup> (2) for chloride.

**Purity** (1) Acidity—Dissolve 2.0 g of Cyproheptadine Hydrochloride Hydrate in 25 mL of methanol, and add 1 drop of methyl red TS and 0.30 mL of 0.1 mol/L sodium hydroxide VS: a yellow color develops.

(2) Heavy metals<sup>[1.07]</sup>—Proceed with 1.0 g of Cyproheptadine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying**<sup>[2.41]</sup> 7.0 – 9.0% (1 g, in vacuum at a pres-
Containers—Well-closed containers. Weigh accurately about 0.2 g of Cyproheptadine Hydrochloride Hydrate, previously dried, and dissolve in 20 mL of acetic acid (100) by warming at 50°C. After cooling, add 40 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.39 mg of C\textsubscript{21}H\textsubscript{21}N\textsubscript{3}H\textsubscript{2}Cl

Containers and storage Containers—Well-closed containers.

L-Cysteine

l-システイン

\[
\text{HS} \xrightarrow{\text{COOH}} \text{H} \xrightarrow{\text{N}} \text{K}
\]

C\textsubscript{6}H\textsubscript{7}NO\textsubscript{2}S: 121.16

(2R)-2-Amino-3-sulfanylpropanoic acid

[52-90-4]

L-Cysteine contains not less than 98.5% and not more than 101.0% of L-cysteine (C\textsubscript{6}H\textsubscript{7}NO\textsubscript{2}S), calculated on the dried basis.

Description L-Cysteine occurs as white crystals or a white crystalline powder. It has a characteristic odor and a pungent taste.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

It dissolves in 1 mol/L hydrochloric acid TS.

Identification Determine the infrared absorption spectrum of L-Cysteine as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25^\circ\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation \(2.49^\circ\) [\(\alpha\)]\textsubscript{D} = \(+8.0^\circ\) to \(+10.0^\circ\) (2 g calculated on the dried basis, 1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH \(2.54^\circ\) The pH of a solution prepared by dissolving 1.25 g of L-Cysteine in 50 mL of water is 4.7 to 5.7.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of L-Cysteine in 20 mL of water: the solution is clear and colorless.

(2) Chloride \(1.07^\circ\)—Dissolve 0.30 g of L-Cysteine in 10 mL of diluted nitric acid (1 in 4), add 10 mL of hydrogen peroxide (30), heat for 20 minutes in a boiling water bath, cool, and then add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.041%).

(3) Sulfate \(1.14^\circ\)—Dissolve 0.6 g of L-Cysteine in 30 mL of water and 3 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 3 mL of dilute hydrochloric acid and water to make 50 mL. Prepare the test solution and the control solution with 4 mL of barium chloride TS, respectively (not more than 0.028%).

(4) Ammonium \(1.02^\circ\)—Perform the test with 0.25 g of L-Cysteine, using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals \(1.07^\circ\)—Proceed with 1.0 g of L-Cysteine according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron \(1.10^\circ\)—Prepare the test solution with 1.0 g of L-Cysteine according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.10 g of L-Cysteine in N-ethylmaleimide solution (1 in 50) to make exactly 10 mL, leave for 30 minutes, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL, pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution (1). Separately, dissolve 0.10 g of L-cysteine in 0.5 mol/L hydrochloric acid TS to make exactly 20 mL. Pipet 1 mL of this solution, add water to make 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography \(2.63^\circ\). Spot 10 \(\mu\)L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate for 30 minutes at 80°C. Spray the plate evenly with a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) in 100, and then heat at 80°C for 10 minutes: the spot obtained from the sample solution corresponding to the spot from the standard solution (2) is not more intense than the spot from the standard solution (2). Also, the spots other than the principal spot and the spots mentioned above from the sample solution are not more intense than the spot from the standard solution (1).

Loss on drying \(2.47^\circ\) Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

Residue on ignition \(2.44^\circ\) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.2 g of L-Cysteine, place it in a stoppered flask, and dissolve in 20 mL of water. Dissolve 4 g of potassium iodide in this solution, immediately place in ice cold water, add 5 mL of dilute hydrochloric acid and exactly 25 mL of 0.05 mol/L iodine VS, leave in a dark place for 20 minutes, and then titrate with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank determination in the same manner.

Each mL of 0.05 mol/L iodine VS = 12.12 mg of C\textsubscript{6}H\textsubscript{7}NO\textsubscript{2}S

Containers and storage Containers—Tight containers.
L-Cysteine Hydrochloride Hydrate

L-システイン塩酸塩水和物

C₄H₈NO₅S.HCl.H₂O: 175.63
(2R)-2-Amino-3-sulfanylpropanoic acid monohydrochloride monohydrate

[7048-04-6]

L-Cysteine Hydrochloride Hydrate contains not less than 98.5% and not more than 101.0% of L-cysteine hydrochloride (C₄H₈NO₅S.HCl: 157.62), calculated on the dried basis.

Description L-Cysteine Hydrochloride Hydrate occurs as white, crystals or crystalline powder. It has a characteristic odor and a strong acid taste.

It is very soluble in water, and soluble in ethanol (99.5). It dissolves in 6 mol/L hydrochloric acid TS.

Identification (1) Determine the infrared absorption spectrum of L-Cysteine Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum; both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 10 mL of a solution of L-Cysteine Hydrochloride Hydrate (1 in 50) add 1 mL of hydrogen peroxide (30), heat on a water bath for 20 minutes, and cool: the solution responds to Qualitative Tests <1.09> (2) for chlorine.

Optical rotation <2.49> [α]D²⁰<sup>2</sup> +6.0 ~ +7.5° (2 g, calculated on the dried basis, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH <2.54> The pH of a solution prepared by dissolving 1.0 g of L-Cysteine Hydrochloride Hydrate in 100 mL of water is between 1.3 and 2.3.

Purity (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of L-Cysteine Hydrochloride Hydrate in 10 mL of water is clear and colorless.

(2) Sulfate <1.14>—Dissolve 0.8 g of L-Cysteine Hydrochloride Hydrate in 30 mL of water and 3 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 3 mL of dilute hydrochloric acid and water to make 50 mL. To both of the test solution and the control solution add 4 mL of barium chloride TS (not more than 0.021%).

(3) Ammonium <1.02>—Perform the test with 0.25 g of L-Cysteine Hydrochloride Hydrate using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of L-Cysteine Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Iron <1.10>—Prepare the test solution with 1.0 g of L-Cysteine Hydrochloride Hydrate according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.10 g of L-Cysteine Hydrochloride Hydrate in N-ethylmaleimide solution (1 in 50) to make 10 mL, allow to stand for 30 minutes, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-Layer Chromatography <2.03>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Then develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100) on the plate, and then heat at 80°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying <2.41> 8.5 ~ 12.0% (1 g, in vacuum, phosphorus (V) oxide, 20 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.25 g of L-Cysteine Hydrochloride Hydrate, place in a glass-stoppered flask, and dissolve in 20 mL of water. Dissolve 4 g of potassium iodide in this solution, soak immediately in ice cold water, add 5 mL of dilute hydrochloric acid and exactly 25 mL of 0.05 mol/L iodine VS, allow to stand for 20 minutes in a dark place, titrate <2.50> the excess of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 15.76 mg of C₄H₈NO₅S.HCl.

Containers and storage Containers—Tight containers.

L-Cystine

L-シスチン

C₄H₆N₂O₅S·2H₂O: 240.30
3,3′-Disulfanediylbis[(2R)-2-aminopropanoic acid]

[56-89-3]

L-Cystine, when dried, contains not less than 99.0% and not more than 101.0% of L-cystine (C₄H₈N₂O₅S₂).

Description L-Cystine occurs as white, crystals or crystalline powder.

It is practically insoluble in water and in ethanol (99.5). It dissolves in 1 mol/L hydrochloric acid TS.

Identification Determine the infrared absorption spectrum of L-Cystine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum; both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D²⁰<sup>2</sup> -215 ~ -225° (after drying, 1 g, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).
Cytarabine

シタラビン

C₆H₁₃N₂O₇: 243.22
1-β-D-Arabinofuranosylcytosine [147-94-4]

Cytarabine, when dried, contains not less than 98.5% and not more than 101.0% of cytarabine (C₆H₁₃N₂O₇).

Description Cytarabine occurs as white, crystals or crystal-line powder.

It is freely soluble in water, soluble in acetic acid (100), and very slightly soluble in ethanol (99.5).

It dissolves in 0.1 mol/L hydrochloric acid TS.

Melting point: about 214°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Cytarabine in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cytarabine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D +154 ~ +160° (after drying, 0.1 g, water, 10 mL, 100 mm).

pH <2.5> Dissolve 0.20 g of Cytarabine in 20 mL of water: the pH of this solution is between 6.5 and 8.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Cytarabine in 10 mL of water: the solution is clear and colorless.

(A) Chloride <1.03>—Perform the test with 1.0 g of Cytarabine. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.009%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Cytarabine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Cytarabine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add water to make exactly 25 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 µL of each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with 1-butanol saturated with water to a distance of about 12 cm, and air-dry the plate. If the plate is dried, contain not less than 98.5% and not more than 101.0% of cytarabine (C₆H₁₃N₂O₇).

Storage—Light-resistant.
Danazol

Danazol

Danazol occurs as a white to pale yellow crystalline powder.

It is soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 225°C (with decomposition).

Description

Danazol is a white to pale yellow crystalline powder. It is soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 225°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Danazol in ethanol (95) (1 in 50,000) as directed in the potassium bromide disk method under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Danazol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Danazol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.10>, and compare the spectrum with the Reference Spectrum or the spectrum of Danazol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D2: +8 to +11° (after drying, 0.25 g, ethanol (99.5), 50 mL, 100 mm).

Purity (1) Chloride <1.07>—To 2.0 g of Danazol add 80 mL of water, shake well, and boil for 5 minutes. After cooling, add water to make 100 mL, and filter through a glass filter (G4). Discard the first 30 mL of the filtrate, take 40 mL of the subsequent filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Danazol according to Method 2, and prepare the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.20 g of Danazol in 4 mL of acetone, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add acetone to make exactly 200 mL. Pipet 4 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ethyl acetate (3:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 1.0% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition <2.44> Not more than 0.5% (1 g).

Assay Weigh accurately about 0.2 g of Cytarabine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 12.16 mg of C₂₇H₃₇N₃O₅

Containers and storage Containers—Well-closed containers.

Danazol

ダナゾール

Danazol

C₂₇H₃₇N₃O₅: 337.46
17α-Pregna-2,4-dien-20-yno[2,3-]isoxazol-17-ol [17230-88-5]

Danazol, when dried, contains not less than 98.5% and not more than 101.0% of danazol (C₂₇H₃₇N₃O₅).

Description

Danazol occurs as a white to pale yellow crystalline powder. It is soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 225°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Danazol in ethanol (95) (1 in 50,000) as directed in the potassium bromide disk method under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Danazol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Danazol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Danazol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D2: +8 to +11° (after drying, 0.25 g, ethanol (99.5), 50 mL, 100 mm).

Purity (1) Chloride <1.07>—To 2.0 g of Danazol add 80 mL of water, shake well, and boil for 5 minutes. After cooling, add water to make 100 mL, and filter through a glass filter (G4). Discard the first 30 mL of the filtrate, take 40 mL of the subsequent filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Danazol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.20 g of Danazol in 4 mL of acetone, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add acetone to make exactly 200 mL. Pipet 4 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ethyl acetate (3:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.2% (1 g, in vacuum, phosphorous (V) oxide, 60°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 25 mg each of Danazol and Danazol RS, previously dried, dissolve separately in ethanol (95) to make exactly 50 mL. Pipet 2 mL each of these solutions, add ethanol (95) to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁ and A₅, at 285 nm.

Dantrolene Sodium Hydrate

ダントロレンタドリウム水和物

C₃₁H₃₈N₂Na₂O₇·3½H₂O: 399.29
Monosodium 3-[5-(4-nitrophenyl)furan-2-ylmethylene]amino-2,5-dioxo-1,3-imidazolidinate hemiheptahydrate [14663-23-1, anhydride]

Dantrolene Sodium Hydrate contains not less than 98.0% of dantrolene sodium (C₃₁H₃₈N₂Na₂O₇): 336.23, calculated on the anhydrous basis.

Description

Dantrolene Sodium Hydrate occurs as a yellowish orange to deep orange, crystalline powder.

It is soluble in propylene glycol, sparingly soluble in meth-
anol, slightly soluble in ethanol (95), very slightly soluble in water and in acetic acid (100), and insoluble in acetone, in tetrahydrofuran and in diethyl ether.

**Identification (1)** Determine the absorption spectrum of a solution of Dantrolene Sodium Hydrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Dantrolene Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.1 g of Dantrolene Sodium Hydrate add 20 mL of water and 2 drops of acetic acid (100), shake well, and filter: the filtrate responds to Qualitative Tests <1.00> (1) for sodium salt.

**Purity (1)** Alkalinity—To 0.7 g of Dantrolene Sodium Hydrate add 10 mL of water, shake well, and centrifuge or filter through a membrane filter. To 5 mL of the supernatant liquid or the filtrate add 45 mL of water, 3 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid VS: a red color is not produced.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Dantrolene Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related Substances—Dissolve 50 mg of Dantrolene Sodium Hydrate in 20 mL of tetrahydrofuran and 2 mL of acetic acid (100), add ethanol (99.5) to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area from these solutions by the automatic integration method: the total area of peaks other than dantrolene obtained from the sample solution is not larger than the peak area of dantrolene from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 300 nm).
Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of hexane, acetic acid (100) and ethanol (99.5) (90:10:9).
Flow rate: Adjust so that the retention time of dantrolene is about 8 minutes.
Selection of column: Dissolve 5 mg of Dantrolene Sodium Hydrate and 0.1 g of theophylline in 20 mL of tetrahydrofuran and 2 mL of acetic acid (100), and add ethanol (99.5) to make 100 mL. To 10 mL of this solution add ethanol (99.5) to make 100 mL. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of theophylline and dantrolene in this order with the resolution between these peaks being not less than 6.
Detection sensitivity: Adjust so that the peak height of dantrolene from 10 μL of the standard solution is 10 to 40% of the full scale.

**Time span of measurement:** About twice as long as the retention time of dantrolene, beginning after the solvent peak.

**Water**<2.49> 14.5 – 17.0% (0.2 g, volumetric titration, direct titration).

**Assay** Weigh accurately about 0.7 g of Dantrolene Sodium Hydrate, dissolve in 180 mL of a mixture of propylene glycol and acetone (1:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 33.62 mg of C_{13}H_{20}N_{2}NaO_{6}

**Containers and storage** Containers—Tight containers.

**Daunorubicin Hydrochloride**

ダウノルビシン塩酸塩

C_{27}H_{29}NO_{10}.HCl: 563.98
(25,45)-2-Acetyl-4-(3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranosylxy)-2,5,12-trihydroxy-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride [23541-50-6]

Daunorubicin Hydrochloride is the hydrochloride of an anthracenylene substance having antitumor activity produced by the growth of Streptomyces peucetius or Streptomyces coerulescens.

It contains not less than 940 μg (potency) and not more than 1050 μg (potency) per mg, calculated on the dried basis. The potency of Daunorubicin Hydrochloride is expressed as mass (potency) of daunorubicin hydrochloride (C_{27}H_{29}NO_{10}.HCl).

**Description** Daunorubicin Hydrochloride occurs as a red powder.

It is soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Daunorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Daunorubicin Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Daunorubicin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Daunorubicin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the
same wave numbers.

(3) A solution of Daunorubicin Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49> [α]D25 + 250 – +275° (15 mg calculated on the dried basis, methanol, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.15 g of Daunorubicin Hydrochloride in 30 mL of water: the pH of the solution is between 4.5 and 6.0.

**Purity** (1) Clarity and color of solution—Dissolve 20 mg of Daunorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Daunorubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately about 50 mg of Daunorubicin Hydrochloride, dissolve in diluted acetonitrile (43 in 100) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Daunorubicin Hydrochloride RS, and dissolve in diluted acetonitrile (43 in 100) to make exactly 50 mL. Pipet 1 mL of this solution, add diluted acetonitrile (43 in 100) to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 5 mg of Doxorubicin Hydrochloride RS, and dissolve in diluted acetonitrile (43 in 100) to make exactly 100 mL. Pipet 1 mL of this solution, add diluted acetonitrile (43 in 100) to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with exactly 5 µL each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of related substances by the following equations: each amount of each peak, having a relative retention time of about 0.3, about 0.6, about 0.7, about 0.8, about 1.7 and about 2.0 to daunorubicin, is not more than 1.3%, not more than 1.0%, not more than 0.3%, not more than 0.5%, not more than 0.4% and not more than 0.5%, respectively, and the amount of doxorubicin is not more than 0.4%. Furthermore, the total amount of the peaks, other than daunorubicin and the peaks mentioned above, is not more than 0.4%. For the area of the peak, having a relative retention time of about 0.3 to daunorubicin, multiply the correction factor, 0.7.

Each amount (%) of related substances other than doxorubicin

\[ M_{S2}/M_{T1} \times A_{T1}/A_{S1} \times 1/2 \]

\[ M_{S3}: \text{Amount (mg) of Daunorubicin Hydrochloride RS taken} \]
\[ M_{T1}: \text{Amount (mg) of Daunorubicin Hydrochloride taken} \]
\[ A_{S1}: \text{Peak area of daunorubicin obtained from the standard solution (1)} \]
\[ A_{T1}: \text{Peak area of each related substance obtained from the sample solution} \]
\[ \text{Amount} \%(\text{of doxorubicin}) = M_{S2}/M_{T1} \times A_{T1}/A_{S2} \times 5 \]

\[ M_{S2}: \text{Amount (mg) of Doxorubicin Hydrochloride RS taken} \]
\[ M_{T1}: \text{Amount (mg) of Daunorubicin Hydrochloride taken} \]
\[ A_{S2}: \text{Peak area of doxorubicin obtained from the standard solution (2)} \]
\[ A_{T2}: \text{Peak area of doxorubicin obtained from the sample solution} \]

**Operating conditions—**

- **Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.
- **Mobile phase:** Adjust the pH of a mixture of water and acetonitrile to be between 4.5 and 6.0.

- **Flow rate:** Adjust so that the retention time of daunorubicin is about 25 minutes.
- **Time span of measurement:** About 2 times as long as the retention time of daunorubicin.

**System suitability—**

Test for required detectability: To exactly 1 mL of the standard solution (1) add diluted acetonitrile (43 in 100) to make exactly 10 mL. Confirm that the peak area of daunorubicin obtained with 5 µL of this solution is equivalent to 7 to 13% of that with 5 µL of the standard solution (1).

**System performance:** Dissolve 5 mg each of Daunorubicin Hydrochloride and doxorubicin hydrochloride in 25 mL of diluted acetonitrile (43 in 100). To 1 mL of this solution add diluted acetonitrile (43 in 100) to make 10 mL. When the procedure is run with 5 µL of this solution under the above operating conditions, doxorubicin and daunorubicin are eluted in this order with the resolution between these peaks being not less than 13.

**System repeatability:** When the test is repeated 6 times with 5 µL of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of daunorubicin is not more than 3.0%.

**Loss on drying** <2.41> Not more than 7.5% (0.1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Daunorubicin Hydrochloride and Daunorubicin Hydrochloride RS, equivalent to about 20 mg (potency), dissolve each in a suitable amount of the mobile phase, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, \( Q_T/Q_S \), of the peak area of daunorubicin to that of the internal standard.

\[ \text{Amount [µg (potency)] of daunorubicin hydrochloride} \]
\[ \text{(C_{27}H_{30}NO_{10}HCl)} \]
\[ = M \times Q_T/Q_S \times 1000 \]

\[ M_S: \text{Amount [mg (potency)] of Daunorubicin Hydrochloride RS taken} \]

**Internal standard solution—** A solution of 2-naphthalenesulfonic acid in the mobile phase (1 in 100).

**Operating conditions—**

- **Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 µm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Adjust the pH of a mixture of water and acetonitrile to be between 4.5 and 6.0.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Deferoxamine Mesilate

**Description**
Deferoxamine Mesilate occurs as a white to pale yellow-white crystalline powder. It is freely soluble in water, and practically insoluble in ethanol (99.5%), in 2-propanol and in diethyl ether.

Melting point: about 147°C (with decomposition).

**Identification**
(1) To 5 mL of a solution of Deferoxamine Mesilate (1 in 500) add 1 drop of iron (III) chloride TS; a deep red color develops.

(2) A 50 mg portion of Deferoxamine Mesilate responds to Qualitative Tests for iron (<1.07> for iron) for mesilate.

(3) Determine the infrared absorption spectrum of Deferoxamine Mesilate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.040%).

(4) Heavy metals (<1.07>—Proceed with 2.0 g of Deferoxamine Mesilate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic (<1.11>—Prepare the test solution with 1.0 g of Deferoxamine Mesilate according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).

(6) Related substances—Dissolve 50 mg of Deferoxamine Mesilate in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (<2.01>) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of peaks other than deferoxamine obtained from the sample solution is not larger than the peak area of deferoxamine from the standard solution.

**Operating conditions**
Detector: An ultraviolet absorption photometer (wavelength: 230 nm).
Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1.32 g of diammonium hydrogen phosphate, 0.37 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate and 1.08 g of sodium 1-heptanesulfonate in 950 mL of water, and adjust the pH of this solution to 2.8 with phosphoric acid. To 800 mL of this solution add 100 mL of 2-propanol.
Flow rate: Adjust so that the retention time of deferoxamine is about 15 minutes.
Time span of measurement: About two times as long as the retention time of deferoxamine, beginning after the solvent peak.

**System suitability**
Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of deferoxamine obtained with 20 μL of this solution is equivalent to 1.5 to 2.5% of that with 20 μL of the standard solution.

System performance: Dissolve 16 mg of Deferoxamine Mesilate and 4 mg of methyl parahydroxybenzoate in 50 mL of the mobile phase. When the procedure is run with 20 μL of this solution under the above operating conditions, deferoxamine and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of deferoxamine is not more than 3.0%.

**Purity**
Clarity and color of solution—Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water: the pH of this solution is between 3.5 and 5.5. A 50 mg portion of Deferoxamine Mesilate responds to Qualitative Tests for chloride (<1.07>—Perform the test with 1.0 g of Deferoxamine Mesilate. Prepare the control solution with 0.90 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.032%).

Sulfate—(1.14)—Perform the test with 0.6 g of Deferoxamine Mesilate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.040%).

Water—<2.46> Not more than 2.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition—<2.44> Not more than 0.1% (1 g).

**Assay**
Weigh accurately about 60 mg of Deferoxamine Mesilate and Deferoxamine Mesilate RS (previously determine the water <2.48> in the same manner as Deferoxamine
Dehydrocholic Acid

デヒドロコール酸

C₂₅H₃₄O₅: 402.52
3,7,12-Trioxo-5β-cholan-24-oic acid
[81-23-2]

Dehydrocholic Acid, when dried, contains not less than 98.5% of dehydrocholic acid (C₂₅H₃₄O₅).

Description
Dehydrocholic Acid occurs as a white crystalline powder. It is odorless, and has a bitter taste.

It is sparingly soluble in acetone, slightly soluble in ethanol (95), and practically insoluble in water.

It dissolves in sodium hydroxide TS.

Identification
(1) Dissolve 5 mg of Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and a blue-green fluorescence.

(2) To 0.02 g of Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

Optical rotation [a]_D: +20° to +26° (after drying, 0.2 g, acetone, 10 mL, 100 mm).

Melting point 233° to 242°C

Purity
(1) Odor—To 2.0 g of Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.

(2) Clarity and color of solution—To 0.10 g of Dehydrocholic Acid, previously powdered in a mortar, add 30 mL of ethanol (95), and dissolve by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride (1.0%): To 2.0 g of Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(4) Sulfate (1.1%): Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals (1.0%): Proceed with 1.0 g of Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Barium—To the solution obtained in (1) add 2 mL of hydrochloric acid, and boil for 2 minutes. Cool, filter, and wash with water until 100 mL of the filtrate is obtained. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is produced.

Loss on drying [2.41] Not more than 1.0% (1 g, 105°C, 2 hours).

Residue on ignition [2.44] Not more than 0.2% (1 g).

Assay
Weigh accurately about 0.5 g of Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water, and dissolve by warming. Add 2 drops of phenolphthalein TS, titrate with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C₂₅H₃₄O₅.

Containers and storage—Well-closed containers.

Purified Dehydrocholic Acid

精製デヒドロコール酸

C₂₅H₃₄O₅: 402.52
3,7,12-Trioxo-5β-cholan-24-oic acid
[81-23-2]

Purified Dehydrocholic Acid, when dried, contains not less than 99.0% of dehydrocholic acid (C₂₅H₃₄O₅).

Description
Purified Dehydrocholic Acid occurs as a white crystalline powder. It is odorless, and has a bitter taste.
Dehydrocholic Acid Injection

**Dehydrocholic Acid Injection**

Dehydrocholic Acid Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of dehydrocholic acid (C$_{24}$H$_{34}$O$_5$: 402.52).

**Method of preparation**

Dissolve Purified Dehydrocholic Acid in a solution of Sodium Hydroxide, and prepare as directed under Injections.

**Description**

Dehydrocholic Acid Injection is a clear, colorless to light yellow liquid, and has a bitter taste.

**pH**

9 – 11

**Identification**

Transfer a volume of Dehydrocholic Acid Injection, equivalent to 0.1 g of Purified Dehydrocholic Acid, to a separator, and add 10 mL of water and 1 mL of dilute hydrochloric acid: a white precipitate is produced. Extract the mixture with three 15-mL portions of chloroform, combine all the chloroform extracts, evaporate the chloroform on a water bath, and dry the residue at 105°C for 1 hour: the residue so obtained melts between 235°C and 242°C.

**Purity**

Heavy metals 1 < 0.07 — Evaporate a volume of Dehydrocholic Acid Injection, equivalent to 1.0 g of Purified Dehydrocholic Acid, on a water bath to dryness. Proceed with the residue according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Bacterial endotoxins** 4 < 0.07 — Less than 0.30 EU/mg.

**Extractable volume** 6 < 0.05 — It meets the requirement.

**Foreign insoluble matter** 6 < 0.06 — Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** 6 < 0.07 — It meets the requirement.

**Sterility** 4 < 0.06 — Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay**

Transfer an exactly measured volume of Dehydrocholic Acid Injection, equivalent to about 0.5 g of dehydrocholic acid (C$_{24}$H$_{34}$O$_5$), to a 100-mL separator, and add, if necessary, water to make 25 mL. Add 2 mL of hydrochloric acid, and extract with 25-mL, 20-mL, and 15-mL portions of chloroform successively. Combine the chloroform extracts, wash with cold water until the washings become negative to acid, and evaporate the chloroform on a water bath. Dissolve the residue in 40 mL of neutralized ethanol and 20 mL of water by warming. Add 2 drops of phenolphthalein TS to this solution, titrate 2.50 with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C$_{24}$H$_{34}$O$_5$.

**Containers and storage**

Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

It is sparingly soluble in acetone, slightly soluble in ethanol (95), and practically insoluble in water.

It dissolves in sodium hydroxide TS.

**Identification**

(1) Dissolve 5 mg of Purified Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and blue-green fluorescence.

(2) To 0.02 g of Purified Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

**Optical rotation**

$\alpha_2^{20} + 20^0$ to $+26^0$ (after drying, 0.2 g, acetone, 10 mL, 100 mm).

**Melting point** 2.60 — 237 - 242°C

**Purity**

(1) Odor — To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.

(2) Clarity and color of solution — Dissolve 0.10 g of Purified Dehydrocholic Acid, previously powdered in a mortar, in 30 mL of ethanol (95) by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride

To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

**Sulfate**

Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

**Heavy metals**

Proceed with 1.0 g of Purified Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Bacterial endotoxins**

Less than 0.30 EU/mg.

**Extractable volume**

It meets the requirement.

**Foreign insoluble matter**

Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter**

It meets the requirement.

**Sterility**

Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay**

Transfer an exactly measured volume of Dehydrocholic Acid Injection, equivalent to about 0.5 g of dehydrocholic acid (C$_{24}$H$_{34}$O$_5$), to a 100-mL separator, and add, if necessary, water to make 25 mL. Add 2 mL of hydrochloric acid, and extract with 25-mL, 20-mL, and 15-mL portions of chloroform successively. Combine the chloroform extracts, wash with cold water until the washings become negative to acid, and evaporate the chloroform on a water bath. Dissolve the residue in 40 mL of neutralized ethanol and 20 mL of water by warming. Add 2 drops of phenolphthalein TS to this solution, titrate 2.50 with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C$_{24}$H$_{34}$O$_5$.

**Containers and storage**

Containers—Well-closed containers.
Demethylchlortetracycline Hydrochloride

Demethylchlortetracycline Hydrochloride is the hydrochloride of a tetracycline substance having antibacterial activity produced by the growth of the mutant of Streptomyces aureofaciens.

It contains not less than 900 µg (potency) and not more than 1010 µg (potency) per mg, calculated on the dried basis. The potency of Demethylchlortetracycline Hydrochloride is expressed as mass (potency) of demethylchlortetracycline hydrochloride (C_{21}H_{23}ClN_{6}O_{8}\cdot HCl).

Description

Demethylchlortetracycline Hydrochloride occurs as a yellow crystalline powder.

It is soluble in water, and slightly soluble in ethanol (99.5).

Identification

1. **Dissolve 40 mg of Demethylchlortetracycline Hydrochloride in 250 mL of water. To 10 mL of this solution add 85 mL of water and 5 mL of a solution of sodium hydroxide (1 in 5). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum or the spectrum of Demethylchlortetracycline Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.**

2. **Determine the infrared absorption spectrum of Demethylchlortetracycline Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of Demethylchlortetracycline Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.**

3. **A solution of Demethylchlortetracycline Hydrochloride (1 in 100) responds to Qualitative Tests (1.06) (2) for chloride.**

Optical rotation

**<2.49° [α]_D^20:\text{−}248 \sim −263° (0.25 g calculated on the dried basis, 0.1 mol/L hydrochloric acid TS, 25 mL, 100 mm).**

pH

**<2.54° Dissolve 1.0 g of Demethylchlortetracycline Hydrochloride in 100 mL of water: the pH of the solution is between 2.0 and 3.0.**

Purity

1. **Heavy metals**<1.07—Proceed with 1.0 g of Demethylchlortetracycline Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

2. **Related substances—Dissolve 25 mg of Demethylchlortetracycline Hydrochloride in 50 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Pipet 5 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than demethylchlortetracycline obtained from the sample solution is not larger than 1.2 times the peak area of demethylchlortetracycline from the standard solution, and the total area of the peaks other than demethylchlortetracycline from the sample solution is not larger than 2 times the peak area of demethylchlortetracycline from the standard solution.**

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.1 mm in inside diameter and 25 cm in length, packed with styrene-divinylbenzene
copolymer for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 60°C.

Mobile phase: Dissolve 3.5 g of dipotassium hydrogen phosphate, 1.5 g of tetrabutylammonium hydrogensulfate and 0.4 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 300 mL of water, and adjust the pH to 8.5 with sodium hydroxide TS. To this solution add 75.0 g of t-butanol and water to make 1000 mL.

Flow rate: Adjust so that the retention time of demethylchlortetracycline is about 8 minutes.

System suitability—

System performance: Heat 10 mL of the standard solution on a water bath for 60 minutes. When the procedure is run with 20 μL of this solution so obtained under the above operating conditions, 4-epidemethylchlortetracycline and demethylchlortetracycline are eluted in this order with the resolution between these peaks being not less than 3. The relative retention time of 4-epidemethylchlortetracycline to demethylchlortetracycline is about 0.7.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of demethylchlortetracycline is not more than 1.0%.

Containers and storage

Containers—Tight containers.

Storage—Light-resistant.

Deslanoside

デスラノシド

Deslanoside, when dried, contains not less than 90.0% and not more than 102.0% of deslanoside (C₁₇H₂₂O₉).

Description

Deslanoside occurs as colorless or white crystals or a white, crystalline powder. It is odorless.

It is freely soluble in dehydrated pyridine, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether. It is hygroscopic.

Identification

Transfer 1 mg of Deslanoside to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 1000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of two liquids a brown ring is produced, and the color of the upper layer near to the contact zone changes gradually to blue through purple, and the entire acetic acid layer shows a blue-green color through a deep blue color.

Purity (1) Clarity and color of solution—Dissolve 20 mg of Deslanoside in 10 mL of ethanol (95) and 3 mL of water by warming, cool, and dilute to 100 mL with water: the solution is clear and colorless.

(2) Related substances—Dissolve 10 mg of Deslanoside in exactly 5 mL of methanol, and use this solution as the sample solution. Dissolve 1.0 mg of Deslanoside RS in exactly 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid on the plate, and heat the plate at 110°C for 10 minutes: the spots other than the principal spot obtained from the sample solution are not larger and not more intense than the spot from the standard solution.

Optical rotation <2.49> [α]D20 + 6.5–+ 8.5° (after drying, 0.5 g, dehydrated pyridine, 25 mL, 100 mm).

Loss on drying <2.41> Not more than 8.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

Residue on ignition <2.44> Not more than 0.5% (0.1 g).

Assay

Dissolve about 12 mg each of Deslanoside and Deslanoside RS, previously dried and accurately weighed, in 20 mL each of methanol, add water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Pipet 5 mL each of these solutions, transfer to light-resistant, 25-mL volumetric flasks, shake well with 5 mL each of 2,4,6-trinitrophenol TS and 0.5 mL each of a solution of sodium hydroxide (1 in 10), add diluted methanol (1 in 4) to make 25 mL, and allow to stand at a temperature between 18°C and 22°C for 25 minutes. Determine the absorbances, A2 and A3, of the subsequent solutions of the sample solution and the standard solution, respectively, at 485 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared with 5 mL of diluted methanol (1 in 5) in the same manner as the blank.

Amount (mg) of deslanoside (C₁₇H₂₂O₉) = M₂ × A₂/A₃

M₂: Amount (mg) of Deslanoside RS taken

Containers and storage

Containers—Tight containers.
Deslanoside Injection

Deslanoside Injection is an aqueous injection. It contains not less than 90.0% and not more than 110.0% of the labeled amount of deslanoside (C_{27}H_{32}O_{19}: 943.08).

Method of preparation Dissolve Deslanoside in 10 vol% ethanol and prepare as directed under Injections. It may contain Glycerin. It may be prepared with a suitable amount of Ethanol and Water for Injection or Sterile Water for Injection in Containers.

Description Deslanoside Injection is a clear and colorless liquid.

pH: 5.0 - 7.0

Identification (1) Place a volume of Deslanoside Injection, equivalent to 2 mg of Deslanoside, in a separator, add sodium chloride in the ratio of 0.2 g to each mL of this solution, and extract with three 10-mL portions of chloroform. Combine the chloroform extracts, mix uniformly, pipet 15 mL of this solution, and evaporate the chloroform under reduced pressure. Proceed with the residue as directed in the Identification under Deslanoside.

(2) Evaporate the remaining chloroform extract obtained in (1) under reduced pressure, dissolve the residue in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 1 mg of Deslanoside RS in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.2.3). Spot 20 μL each of these solutions on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid upon the plate, and heat the plate at 110°C for 10 minutes: the spots from the sample solution and standard solution show a black color and have the same Rf value.

Bacterial endotoxins 4.0.1 Less than 500 EU/mg.

Extractable volume 6.0.6 It meets the requirement.

Foreign insoluble matter 6.0.6 Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter 6.0.7 It meets the requirement.

Sterility 4.0.6 Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Deslanoside Injection, equivalent to about 3 mg of deslanoside (C_{27}H_{32}O_{19}). Add 5 mL of methanol and water to make exactly 25 mL. Use this solution as the sample solution, and proceed as directed in the Assay under Deslanoside.

Amount (mg) of deslanoside (C_{27}H_{32}O_{19})

= M_s × A_1 / A_S × 1/4

M_S: Amount (mg) of Deslanoside RS taken

Containers and storage Containers—Hermetic containers. Storage—Light-resistant.

Dexamethasone

Dexamethasone, when dried, contains not less than 97.0% and not more than 102.0% of dexamethasone (C_{22}H_{29}FO_5).

Description Dexamethasone occurs as white to pale yellow, crystals or crystalline powder. It is sparingly soluble in methanol, in ethanol (95) and in acetone, slightly soluble in acetonitrile, and practically insoluble in water.

Melting point: about 245°C (with decomposition). It shows crystal polymorphism.

Identification (1) Proceed with 10 mg of Dexamethasone as directed under Oxygen Flask Combustion Method 1.06, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the solution obtained responds to Qualitative Tests 1.09 for fluoride.

(2) Dissolve 1 mg of Dexamethasone in 10 mL of ethanol (95). Mix 2 mL of the solution with 10 mL of phenylhydrazinium chloride TS, heat in a water bath at 60°C for 20 minutes, and cool the solution. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry 2.2.4, using as the blank the solution prepared with 2 mL of ethanol (95) in the same manner as the former solution, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Dexamethasone RS prepared in the same manner as the former solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Dexamethasone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Dexamethasone RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Dexamethasone and Dexamethasone RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

Optical rotation 2.4.9 [α]_D: +86 – +94° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Purity (1) Heavy metals 1.07—Proceed with 1.0 g of Dexamethasone according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.18 g of Dexamethasone in 100 mL of acetonitrile. To 33 mL of this solution add a solution, prepared by dissolving 1.32 g of ammonium formate in water to make 1000 mL and adjusted to pH 3.6 with formic acid, to make 100 mL, and use this solution as the sample solution. To exactly 1 mL of the sample solution add

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.0 \) according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than dexamethasone obtained from the sample solution is not larger than the peak area of dexamethasone from the standard solution, and the total area of the peaks other than dexamethasone from the sample solution is not larger than 2 times the peak area of dexamethasone from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.32 g of ammonium formate in 1000 mL of water, and adjust the pH to 3.6 with formic acid. To 670 mL of this solution add 330 mL of acetonitrile.

Flow rate: Adjust so that the retention time of dexamethasone is about 13 minutes.

Time span of measurement: About 4 times as long as the retention time of dexamethasone, beginning after the solvent peak.

**System suitability**

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of dexamethasone obtained with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of dexamethasone are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dexamethasone is not more than 1.0%.

**Loss on drying** \( <2.4 \) Not more than 0.5% (0.2 g, 105°C, 3 hours).

**Residue on ignition** \( <2.4 \) Not more than 0.1% (0.2 g, platinum crucible).

**Assay** Dissolve about 10 mg each of Dexamethasone and Dexamethasone RS, previously dried and accurately weighed, in 70 mL each of diluted methanol (1 in 2), add exactly 5 mL each of the internal standard solution, then add diluted methanol (1 in 2) to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.0 \) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of dexamethasone to that of the internal standard.

\[
\text{Amount (mg) of dexamethasone (C$_2$H$_{19}$FO$_3$)} = M_5 \times \frac{Q_1}{Q_2}
\]

\( M_5 \): Amount (mg) of Dexamethasone RS taken

**Internal standard solution**—A solution of propyl parahydroxybenzoate in diluted methanol (1 in 2) (1 in 1000).

**Dextran 40**

Dextran 40 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 40,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 40.

**Manufacture** Dextran 40 is produced by the manufacturing method to eliminate or minimize impurities having a possible antigenicity. The manufacturing method is verified to meet the antigenicity test.

**Antigenicity** Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days intraperitoneally to each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Inject 0.10 mL of horse serum intraperitoneally to each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit no signs mentioned above.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Description** Dextran 40 occurs as a white, amorphous powder. It is odorless and tasteless.

It is practically insoluble in ethanol (95%) and in diethyl
Dextran 40 Injection

Dextran 40 Injection is an aqueous injection. It contains not less than 9.5 w/v% and not more than 10.5 w/v% of dextran 40.

Method of preparation

Dextran 40 Inactive Sodium Chloride Solution a sufficient quantity To make 100 mL

Prepare as directed under Injections, with the above ingredients.

No preservative is added.

Description Dextran 40 Injection is a clear and colorless liquid. It is slightly viscous.

Identification (1) Dilute 1 mL of Dextran 40 Injection with water to 200 mL, and to 1 mL of the diluted solution add 2 mL of antrone TS: a blue-green color develops and turns gradually dark blue-green. Add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution does not change in color.

(2) Dextran 40 Injection responds to Qualitative Tests <1.08> for sodium salt and for chloride.

pH <2.5> 4.5 - 7.0

Bacterial endotoxins <4.0> Less than 0.50 EU/mL

Extractable volume <6.0> It meets the requirement.

Viscosity <2.5> To 2 to 5 mL of Dextran 40 Injection add isotonic sodium chloride solution to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with isotonic sodium chloride solution as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.16 and 0.19.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 115 to 135 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not more than 0.27.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 115 to 135 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not less than 0.09.

Assay Weigh accurately about 3 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation $\alpha_0$ with the sample solution as directed under Optical Rotation Determination <2.49> in a 100-mL cell at 20 ± 1°C.

Amount (mg) of dextran 40 = $\alpha_0 \times 253.8$

Containers and storage Containers—Tight containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
solution as directed under Optical Rotation Determination <2.49> in a 100-mm cell at 20 ± 1°C.

Amount (mg) of dextran 40 in 100 mL of Dextran 40 Injection

\[ \alpha \times 846.0 \]

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Storage—Avoid exposure to undue fluctuations in temperature.

**Dextran 70**

デキストラノン 70

Dextran 70 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 70,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 70.

**Description**

Dextran 70 occurs as a white, amorphous powder. It is odorless and tasteless. It is practically insoluble in ethanol (95) and in diethyl ether.

It dissolves gradually in water. It is hygroscopic.

**Identification**

To 1 mL of a solution of Dextran 70 (1 in 3000) add 2 mL of an anthrone TS: a blue-green color develops and turns gradually dark blue-green. Then to this solution add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100): the solution does not change in color.

**pH** <2.54> Dissolve 3.0 g of Dextran 70 in 50 mL of water: the pH of this solution is between 5.0 and 7.0.

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Dextran 70 in 10 mL of water with warming: the solution is clear and colorless.

(2) Chloride <1.07>—With 2.0 g of Dextran 70, perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextran 70 according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.1D>—Prepare the test solution with 1.5 g of Dextran 70 according to Method 1, and perform the test (not more than 1.3 ppm).

(5) Nitrogen—Weigh accurately about 2 g of Dextran 70, previously dried, perform the test as directed under Nitrogen Determination <1.08>, where 10 mL of sulfuric acid is used for decomposition, and 45 mL of a solution of sodium hydroxide (2 in 5) is added: the amount of nitrogen (N: 14.007) is not more than 0.010%.

(6) Reducing substances—Weigh exactly 3.00 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh exactly 0.300 g of glucose, previously dried, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the sample solution and the control solution, and add water to make exactly 50 mL, respectively. Pipet 5 mL of these diluted solutions, add exactly 5 mL of alkaline copper TS, and heat for 15 minutes in a water bath. After cooling, add 1 mL of a solution of potassium iodide (1 in 40) and 1.5 mL of dilute sulfuric acid, and titrate <2.50> with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

The titrant consumed for the sample solution is not less than that for the control solution.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C, 6 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Viscosity** <2.53> (1) Dextran 70—Weigh accurately about 0.2 to 0.5 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with water as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.21 and 0.26.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 7% to 10% of the precipitate (usually, 75 to 85 mL) at 25 ± 1°C with stirring. Dissolve the precipitate in a water bath at 35°C with occasional shaking, and allow to stand for more than 15 hours at 25 ± 1°C. Remove the supernatant liquid by decantation, and heat the precipitate of the lower layer on a water bath to dryness. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not more than 0.35.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 110 to 130 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not less than 0.10.

**Antigenicity**

Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days intraperitoneally to each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Separately, inject 0.10 mL of horse serum intraperitoneally to each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit no signs mentioned above. All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Pyrogen** <4.04>

Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride solution to make 100 mL, and perform the test: this solution meets the requirement.

**Assay**

Weigh accurately about 3 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation \( \alpha \) of the solution as directed under Optical Rotation Determination <2.49> in a 100-mm cell at 20 ± 1°C.
Dextran Sulfate Sodium Sulfur 5

Dextran Sulfate Sodium Sulfur 5 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with Leuconostoc mesenteroides Van Tieghem (Lactobacillaceae).

Description

Dextran Sulfate Sodium Sulfur 5 occurs as a white to light yellow-white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

Identification (1) To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

(2) To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

(3) A solution of Dextran Sulfate Sodium Sulfur 5 (1 in 100) responds to Qualitative Tests <1.10> (1) for sodium salt.

Optical rotation <2.49> [α]D 20° +135.0 – +155.0° (1.5 g calculated on the dried basis, water, 25 mL, 100 mm).

Viscosity <2.53>

Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 5, dissolve in 5 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.50> with 0.02 mol/L disodium hydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination in the same manner. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 3.0 and 6.0%.

Each mL of 0.02 mol/L barium chloride VS = 0.6414 mg of S

Loss on drying <2.41> Not more than 10.0% (0.5 g, in vacuum, phosphorus(V) oxide, 60°C, 4 hours).

Dextran Sulfate Sodium Sulfur 18

Dextran Sulfate Sodium Sulfur 18 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with Leuconostoc mesenteroides Van Tieghem (Lactobacillaceae).

Description

Dextran Sulfate Sodium Sulfur 18 occurs as a white to light yellow-white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

Identification (1) To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

(2) To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

(3) A solution of Dextran Sulfate Sodium Sulfur 18 (1 in 100) responds to Qualitative Tests <1.10> (1) for sodium salt.

Optical rotation <2.49> [α]D 20° +90.0 – +110.0° (1.5 g calculated on the dried basis, water, 25 mL, 100 mm).

Viscosity <2.53>

Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 18, dissolve, calculated on the dried basis, in a solution of sodium chloride (29 in 500) to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.50> with 0.02 mol/L disodium hydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination in the same manner. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 3.0 and 6.0%.

Each mL of 0.02 mol/L barium chloride VS = 0.6414 mg of S
Perform the test with the sample solution and a solution of sodium chloride (29 in 500) at 25 ± 0.02°C as directed: the intrinsic viscosity is between 0.020 and 0.032.

**pH**<sub>2.54</sub>—Dissolve 1.0 g of Dextran Sulfate Sodium Sulfur 18 in 20 mL of water: the pH of this solution is between 5.5 and 7.5.

**Purity** (1) Chloride (<1.0%)—Perform the test with 0.10 g of Dextran Sulfate Sodium Sulfate 18. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.106%).

(2) Sulfate (<1.14%)—Dissolve 0.10 g of Dextran Sulfate Sodium Sulfur 18 in 6 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 4 minutes. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL, allow to stand for 10 minutes, and observe: the turbidity of the solution is not more intense than that of the control solution. Prepare the control solution as follows: to 1.0 mL of 0.005 mol/L sulfuric acid VS add 6 mL of water, and proceed in the same manner (not more than 0.480%).

(3) Heavy metals (<1.07%)—Proceed with 1.0 g of Dextran Sulfate Sodium Sulfur 18 according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic (<1.11%)—Prepare the test solution with 1.0 g of Dextran Sulfate Sodium Sulfate 18 according to Method 3, and perform the test (not more than 2 ppm).

**Sulfur content**—Weigh accurately about 0.5 g of Dextran Sulfate Sodium Sulfur 18, dissolve in 5 mL of water, add 1.5 mL of hydrochloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetracetate tetrahydrate (1 in 25), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination in the same manner. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 15.0 and 20.0%.

Each mL of 0.02 mol/L barium chloride VS = 0.6414 mg of S

**Loss on drying** <2.41% Not more than 10.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Containers and storage**—Containers—Tight containers.

**Dextrin**

**Description**—Dextrin occurs as a white or light yellow, amorphous powder or granules. It has a slight, characteristic odor and a sweet taste. It does not irritate the tongue.

Dextrin is freely soluble in boiling water, soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

**Identification**—To 0.1 g of Dextrin add 100 mL of water, shake, and filter if necessary. To 5 mL of the filtrate add 1 drop of iodine TS: a light red-brown or light red-purple color develops.

Dextromethorphan Hydrobromide Hydrate contains not less than 98.0% of dextromethorphan hydrobromide (C₁₈H₂₅NO.HBr.H₂O: 370.32 (95,135,145)-3-Methoxy-17-methylmorphinan monohydrobromide monohydrate [6700-34-7]).
Description  Dextromethorphan Hydrobromide Hydrate occurs as white, crystals or crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (95%) and in acetic acid (100%), and sparingly soluble in water.

Melting point: about 126°C (Insert the capillary tube into the bath preheated to 116°C, and continue the heating so that the temperature rises at a rate of about 3°C per minute.)

Identification  (1) Determine the absorption spectrum of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry &lt;2.26>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dextromethorphan Hydrobromide Hydrate as directed in the potassium bromide disk method under Infrared Spectroscopy &lt;2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 50 mL of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 100) add 2 drops of phenolphthalein TS and sodium hydroxide TS until a red color develops. Add 50 mL of chloroform, shake, and add 5 mL of dilute nitric acid to 40 mL of the water layer. This solution responds to Qualitative Tests &lt;1.09> for bromide.

Optical rotation  &lt;2.49&gt;  [α]<sub>D</sub> = +26° ± 30° (0.34 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH  &lt;2.54&gt; Dissolve 1.0 g of Dextromethorphan Hydrobromide Hydrate in 100 mL of water: the pH of this solution is between 5.2 and 6.5.

Purity  (1) Clarity and color of solution—Dissolve 0.20 g of Dextromethorphan Hydrobromide Hydrate in 20 mL of water: the solution is clear and colorless.

(2) N,N-dimethylaniline—To 0.50 g of Dextromethorphan Hydrobromide Hydrate add 20 mL of water, and dissolve by heating on a water bath. After cooling, add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL: the solution has no more color than the following control solution.

Control solution: Dissolve 0.10 g of N,N-dimethylaniline in 400 mL of water by warming on a water bath, cool, and add water to make 500 mL. Pipet 5 mL of this solution, and add water to make 200 mL. To 1.0 mL of this solution add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL.

(3) Heavy metals  &lt;1.07&gt;—Proceed with 1.0 g of Dextromethorphan Hydrobromide Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Phenolic compounds—Dissolve 5 mg of Dextromethorphan Hydrobromide Hydrate in 1 drop of dilute hydrochloric acid and 1 mL of water, add 2 drops of iron (III) chloride TS and 2 drops of potassium hexacyanoferrate (III) TS, shake, and allow to stand for 15 minutes: no blue-green color develops.

(5) Related substances—Dissolve 0.25 g of Dextromethorphan Hydrobromide Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography &lt;2.07&gt;: Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate, methanol, dichloromethane and 13.5 mol/L ammonia TS (55:20:13:10:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly bismuth potassium iodide TS on the plate, and then spray evenly hydrogen peroxide TS on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Water  &lt;2.48&gt;  4.0 – 5.5% (0.2 g, volumetric titration, back titration).

Residue on ignition  &lt;2.44&gt;  Not more than 0.1% (1 g).

Assay  Weigh accurately about 0.5 g of Dextromethorphan Hydrobromide Hydrate, dissolve in 10 mL of acetic acid (100) and add 40 mL of acetic anhydride. Titrate &lt;2.50&gt; with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.23 mg of C<sub>13</sub>H<sub>22</sub>NO·HBr

Containers and storage  Containers—Well-closed containers.

Diastase

ジアスターゼ

Diastase is an enzyme drug mainly prepared from malt. It has amylolytic activity.

It contains not less than 440 starch saccharifying activity units per g.

It is usually diluted with suitable diluents.

Description  Diastase occurs as a light yellow to light brown powder.

It is hygroscopic.

Purity  Rancidity—Diastase has no unpleasant or rancid odor, and has no unpleasant or rancid taste.

Loss on drying  &lt;2.41&gt;  Not more than 4.0% (1 g, 105°C, 5 hours).

Assay  (i) Substrate solution—Use potato starch TS for amylolytic activity test.

(ii) Sample solution—Weigh accurately about 0.1 g of Diastase, and dissolve in water to make exactly 100 mL.

(iii) Procedure—Proceed as directed in 1.1. Measurement of starch saccharifying activity of 1. Assay for starch digestive activity under Digestion Test &lt;4.02&gt;.

Containers and storage  Containers—tight containers.

Storage—Not exceeding 30°C.

**Diazepam**

ジアゼバム

![Chemical structure of Diazepam](Image)

C_{16}H_{13}ClN_2O: 284.74  
7-Chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one  
[439-14-5]

Diazepam, when dried, contains not less than 98.0% of diazepam (C_{16}H_{13}ClN_2O).

**Description**  
Diazepam occurs as a white to light yellow crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in acetone, soluble in acetic anhydride and in ethanol (95), sparingly soluble in diethyl ether, slightly soluble in ethanol (99.5), and practically insoluble in water.

**Identification (1)**  
Dissolve 10 mg of Diazepam in 3 mL of sulfuric acid, and observe under ultraviolet light (main wavelength: 365 nm): the solution shows a yellow-green fluorescence.

**(2)**  
Dissolve 2 mg of Diazepam in 200 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)**  
Determine the infrared absorption spectrum of Diazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(4)**  
Perform the test with Diazepam as directed under Flame Coloration Test <1.06> (2): a blue to blue-green color appears.

**Melting point**  
<2.60> 130 - 134°C

**Purity (1)**  
Clarity of solution—Dissolve 0.10 g of Diazepam in 20 mL of ethanol (95): the solution is clear.

**(2)**  
Chloride <1.03>—To 1.0 g of Diazepam add 50 mL of water, allow to stand for 1 hour, with occasional shaking, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

**(3)**  
Heavy metals <1.07>—Proceed with 1.0 g of Diazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(4)**  
Related substances—Dissolve 1.0 g of Diazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying**  
<2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition**  
<2.44> Not more than 0.1% (1 g).

**Assay**  
Weigh accurately about 0.6 g of Diazepam, previously dried, dissolve in 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Diazepam Tablets

ジャイゼパム錠

Diazepam Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of diazepam (C₁₆H₂₁ClN₂O: 284.74).

Method of preparation
Prepare as directed under Tablets, with Diazepam.

Identification
To a portion of the powdered Diazepam Tablets, equivalent to 50 mg of Diazepam, add 50 mL of acetone, shake, and filter. Evaporate 1 mL of the filtrate on a water bath to dryness, and dissolve the residue with 100 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 〈2.01〉: it exhibits maxima between 240 nm and 244 nm, between 283 nm and 287 nm, and between 360 nm and 370 nm.

Uniformity of dosage units 〈6.02〉
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Diazepam Tablets add 5 mL of water, and disintegrate the tablet by shaking. Then add 30 mL of methanol, shake for 10 minutes, and add methanol to make exactly 50 mL, and centrifuge. Pipet V mL of the supernatant liquid, equivalent to 0.4 mg of diazepam (C₁₆H₂₁ClN₂O), add exactly 5 mL of the internal standard solution, then add methanol to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Diazepam for assay, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 5 mL of the internal standard solution and add methanol to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 〈2.01〉 under the following conditions, and calculate the ratios, Q₁ and Qₗ, of the peak area of diazepam to that of the internal standard.

Amount (mg) of diazepam (C₁₆H₂₁ClN₂O) = \( M_5 \times \frac{Q_1}{Q_0} \times \frac{1}{V} \)

\( M_5 \): Amount (mg) of diazepam for assay taken

Internal standard solution—A solution of ethyl parahydroxybenzoate in methanol (1 in 25,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanol and water (13:7). Flow rate: Adjust so that the retention time of diazepam is about 10 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and diazepam are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diazepam to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.
Dibekacin Sulfate

ジベカシン硫酸塩

\[
C_{18}H_{37}N_{8}O_{8} \cdot H_2SO_4
\]

3-Amino-3-deoxy-α-D-glucopyranosyl-(1→6)-[2,6-diamino-2,3,4,6-tetrahydroxy-erythro-hexopyranosyl-(1→4)]-2-deoxy-δ-streptamine sulfate

[58580-55-5]

Dibekacin Sulfate is the sulfate of a derivative of bekamycin.

It contains not less than 640 µg (potency) and not more than 740 µg (potency) per mg, calculated on the dried basis. The potency of Dibekacin Sulfate is expressed as mass (potency) of dibekacin (C_{18}H_{37}N_{8}O_{8} \cdot H_2SO_4: 451.52).

**Description** Dibekacin Sulfate occurs as a white to yellow-white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification**

1. **Dissolve** 20 mg each of Dibekacin Sulfate and Dibekacin Sulfate RS in 1 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia solution (28%) and water: the solution is clear.

2. **To 5 mL of a solution of Dibekacin Sulfate** (1 in 50) add 1 drop of barium chloride TS: a white precipitate is produced.

**Optical rotation** \(<2.49\> [α]_{D}^{20}:+96\text{ }+106^\circ\text{ (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).}

**pH** \(<2.54\>\> The pH of a solution obtained by dissolving 1.0 g of Dibekacin Sulfate in 20 mL of water is between 6.0 and 8.0.

**Purity**

1. Clarity and color of solution—Dissolve 3.0 g of Dibekacin Sulfate in 10 mL of water: the solution is clear. Determine the absorbance of this solution at 400 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\>: not more than 0.15.

2. Heavy metals \(<1.07\>\>—Proceed with 1.0 g of Dibekacin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** \(<2.47\>\> Not more than 5.0% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics \(<4.02\>\) according to the following conditions.

1. Test organism—*Bacillus subtilis* ATCC 6633
2. Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer having pH 6.5 to 6.6 after sterilization.
3. Standard solutions—Weigh accurately an amount of Dibekacin Sulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution (pH 6.0) (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
4. Sample solutions—Weigh accurately an amount of Dibekacin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

Dibekacin Sulfate Ophthalmic Solution

ジベカシン硫酸塩点眼液

Dibekacin Sulfate Ophthalmic Solution is an aqueous ophthalmic preparation.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of dibekacin (C_{18}H_{37}N_{8}O_{8} \cdot H_2SO_4: 451.52).

**Method of preparation** Prepare as directed under Ophthalmic Liquids and Solutions, with Dibekacin Sulfate.

**Description** Dibekacin Sulfate Ophthalmic Solution is a clear, colorless liquid.

**Identification** To a volume of Dibekacin Sulfate Ophthalmic Solution add water so that each mL contains about 2.5 mg (potency) of Dibekacin Sulfate, and use this solution as the sample solution. Separately, dissolve an amount of Dibekacin Sulfate RS, equivalent to 5 mg (potency), in 2 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Proceed as directed in the Identification (1) under Dibekacin Sulfate.

**pH** \(<2.54\>\> 6.5 - 7.5

**Foreign insoluble matter** \(<6.11\>\> It meets the requirement.

**Insoluble particulate matter** \(<6.08\>\> It meets the require-
Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium and standard solutions—Proceed as directed in the Assay under Dibekacin Sulfate.

(ii) Sample solutions—Pipet a volume of Dibekacin Sulfate Ophthalmic Solution, equivalent to about 12 mg (potency), and add water to make exactly 30 mL. Pipet a suitable volume of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Dibucaine Hydrochloride

Cinchocaine Hydrochloride

ジブカイン塩酸塩

C₂₉H₂₉N₂O₂·HCl: 379.92
2-Butyloxy-N-(2-diethylaminoethyl)-4-quinolinecarboxamide monohydrochloride [61-12-1]

Dibucaine Hydrochloride, when dried, contains not less than 98.0% of dibucaine hydrochloride (C₂₉H₂₉N₂O₂·HCl).

Description Dibucaine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in water, in ethanol (95) and in acetic acid (100), freely soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Dibucaine Hydrochloride in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dibucaine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Dibucaine Hydrochloride (1 in 10) responds to Qualitative Tests <1.09> for chloride.

pH <2.54> Dissolve 1.0 g of Dibucaine Hydrochloride in 50 mL of water: the pH of this solution is between 5.0 and 6.0.

Melting point <2.60> 95–100°C Charge Dibucaine Hydrochloride into a capillary tube for melting point determination, and dry in vacuum over phosphorus (V) oxide at 80°C for 5 hours. Seal immediately the open end of the tube, and determine the melting point.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Dibucaine Hydrochloride in 20 mL of water: the solution is clear and colorless. Determine the absorbance of this solution at 430 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank: it is not more than 0.03.

(2) Sulfate <1.14>—Perform the test with 0.30 g of Dibucaine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.056%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dibucaine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.20 g of Dibucaine Hydrochloride in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 20 mL, then pipet 2 mL of this solution, add ethanol (95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 2.0% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 5 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Dibucaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.00 mg of C₂₉H₂₉N₂O₂·HCl

Containers and storage Containers—Tight containers.

Diclofenac Sodium

ジクロフェナクトリウム

C₁₄H₁₀Cl₂NNaO₂: 318.13
Monosodium 2-(2,6-dichlorophenylamino)phenylacetate [15307-79-6]

Diclofenac Sodium, when dried, contains not less than 98.5% of diclofenac sodium (C₁₄H₁₀Cl₂NNaO₂).
low-white, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (95), sparingly soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification (1)** To 1 mL of a solution of Diclofenac Sodium in methanol (1 in 250) add 1 mL of nitric acid: a dark red color develops.

(2) Perform the test with 5 mg of Diclofenac Sodium as directed under Flame Coloration Test <1.07> (2): a light green color appears.

(3) Determine the infrared absorption spectrum of Diclofenac Sodium, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Diclofenac Sodium (1 in 100) responds to Qualitative Tests <1.09> for sodium salt.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Diclofenac Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Diclofenac Sodium according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.05 g of Diclofenac Sodium in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL of each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the area of each peak other than diclofenac obtained from the sample solutions by the automatic integration method: the area of each peak other than diclofenac obtained from the sample solution is not larger than the peak area of diclofenac from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 µm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of methanol and dilute acetic acid (100) (3 in 2500) (4:3).
Flow rate: Adjust so that the retention time of diclofenac is about 20 minutes.
Time span of measurement: About twice as long as the retention time of diclofenac, beginning after the solvent peak.

**System suitability**—
System performance: Dissolve 35 mg of ethyl parahydroxybenzoate and 0.05 g of propyl parahydroxybenzoate in 100 mL of the mobile phase. To 1 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 20 µL of this solution under the above operating conditions, ethyl parahydroxybenzoate and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of diclofenac is not more than 2.0%.

**Loss on drying <2.41>** Not more than 0.5% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.5 g of Diclofenac Sodium, previously dried, dissolve in 40 mL of water in a separator, add 2 mL of dilute hydrochloric acid, and extract the precipitate formed with 50 mL of chloroform. Extract again with two 20-mL portions of chloroform, and filter the extract each time through a pledget of absorbent cotton moistened with chloroform. Wash the tip of the separator and the absorbent cotton with 15 mL of chloroform, combine the washing with the extracts, add 10 mL of a solution of 1 mol/L hydrochloric acid TS in ethanol (99.5) (1 in 100), and titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS from the first equivalent point to the second equivalent point (potentiometric titration).

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 31.81 mg of C₁₈H₁₉Cl₂N₃NaO₂₃.

**Containers and storage** Containers—Tight containers.

---

**Diclofenac Sodium Suppositories**

ジクロフェナクナトリウム坐剤

Diclofenac Sodium Suppositories contain not less than 93.0% and not more than 107.0% of the labeled amount of diclofenac sodium (C₁₈H₁₉Cl₂N₃NaO₂₃ 318.13).

**Method of preparation** Prepare as directed under Suppositories for Rectal Application, with Diclofenac Sodium.

**Identification** To an amount of Diclofenac Sodium Suppositories, equivalent to 25 mg of Diclofenac Sodium, add 200 mL of a mixture of methanol and 0.01 mol/L sodium hydroxide TS (99:1), and dissolve by warming. Cool while shaking, add a mixture of methanol and 0.01 mol/L sodium hydroxide TS (99:1) to make 250 mL, and filter through a pledget of absorbent cotton if necessary. To 10 mL of this solution add a mixture of methanol and 0.01 mol/L sodium hydroxide TS (99:1) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 280 nm and 284 nm.

**Uniformity of dosage unit <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 suppository of Diclofenac Sodium Suppositories add 5 mL of tetrahydrofuran, and sonicate to dissolve. Add a mixture of methanol and water (3:2) to make exactly 100 mL, shake, and filter through a membrane filter with a pore size not exceeding 0.5 µm. Discard the first 5 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add a mixture of methanol and water (3:2) to make exactly 50 mL so that each mL contains about 0.125 mg of diclofenac sodium (C₁₈H₁₉Cl₂N₃NaO₂₃), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of diclofenac sodium (C₁₈H₁₉Cl₂N₃NaO₂₃) = M₅ × A₅ / A₅ × V’/V × 1/4

M₅: Amount (mg) of diclofenac sodium for assay taken

**Melting behavior of suppositories** Perform the test according to Method 2 under Melting Point Determination <2.60>:
Dicloxacillin Sodium Hydrate

ジクロキサシリンナトリウム水和物

\[
\text{C}_{19}\text{H}_{15}\text{Cl}_2\text{NaO}_7\text{S}\cdot\text{H}_2\text{O} = \text{510.32}
\]

Monosodium (2S,5R,6R)-6-[[3-(2,6-dichlorophenyl)-5-methylisoxazole-4-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate

[13412-64-1]

Dicloxacillin Sodium Hydrate contains not less than 910 µg (potency) and not more than 1020 µg (potency) per mg, calculated on the anhydrous basis. The potency of Dicloxacillin Sodium Hydrate is expressed as mass (potency) of dicloxacillin \((C_{19}H_{15}Cl_2N_2O_7S)\) 470.33.

Description

Dicloxacillin Sodium Hydrate occurs as a white to light yellow-white crystalline powder.

It is freely soluble in water and in methanol, and soluble in ethanol (95).

Identification

(1) Determine the absorption spectrum of a solution of Dicloxacillin Sodium Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry \(\angle 2.25\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Dicloxacillin Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Dicloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(\angle 2.25\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of Dicloxacillin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dicloxacillin Sodium Hydrate responds to Qualitative Tests \(\angle 1.09\rangle\) (1) for sodium salt.

Water \(\angle 2.48\rangle\) Not less than 3.0% and not more than 4.5% (0.1 g, volumetric titration, direct titration).

Assay

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics \(\angle 4.02\rangle\) according to the following conditions.

(i) Test organism—\textit{Bacillus subtilis} ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.5 to 6.6 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Dicloxacillin Sodium RS equivalent to about 50 mg (potency), dissolve in phosphate buffer solution (pH 6.0) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10 µg (potency) and 2.5 µg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

Containers and storage

Containers—Tight containers.

Storage—in a cold place.

Dicloxacillin Sodium Hydrate / Official Monographs

JP XVIII
(iv) Sample solutions—Weigh accurately about 0.75 g of Diethylcarbamazine Citrate, dissolve in phosphate buffer solution (pH 6.0) to make 50 mL. Take exactly a suitable amount of the solution, add phosphate buffer solution (pH 6.0) to make solutions so that each mL contains 10 μg (potency) and 2.5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Diethylcarbamazine Citrate

ジエチルカルバマジンケン酸塩

\[ C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2} : 391.42 \]

\[ N,N'-Diethyl-4-methylpiperazine-1-carboxamide \]
monocitrate
\[ [1642-54-2] \]

Diethylcarbamazine Citrate, when dried, contains not less than 98.0% of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2}).

Description Diethylcarbamazine Citrate occurs as a white, crystalline powder. It is odorless, and has an acid and bitter taste.

It is very soluble in water, soluble in ethanol (95), and practically insoluble in acetone, in chloroform and in diethyl ether.

A solution of Diethylcarbamazine Citrate (1 in 20) is acid.

Diethylcarbamazine Citrate is hygroscopic.

Identification (1) Dissolve 0.5 g of Diethylcarbamazine Citrate in 2 mL of water, add 10 mL of sodium hydroxide TS, and extract with four 5-mL portions of chloroform. Wash the combined chloroform extracts with 10 mL of water, and evaporate the chloroform on a water bath. Add 1 mL of iodoethane to the residue, and boil gently under a reflux condenser for 5 minutes. Evaporate the excess iodoethane with the aid of a current of air, and dissolve the residue in 4 mL of ethanol (95). Cool the ethanol solution in an ice bath, with continuous stirring, add diethyl ether until the crystals are formed, and stir until crystallization is evident. Allow to stand in the ice bath for 30 minutes, and collect the precipitate. Dissolve the precipitate in 4 mL of ethanol (95), repeat the recrystallization in the same manner, then dry at 105°C for 4 hours: the crystals so obtained melt between 151°C and 155°C.

(2) Neutralize the remaining aqueous layer obtained in (1) with dilute sulfuric acid: the solution responds to Qualitative Tests <1.09> (2) and (3) for citrate.

Melting point <2.60> 135.5 – 138.5°C

Purity Heavy metals <1.07>—Proceed with 2.0 g of Diethylcarbamazine Citrate according to Method 4, and perform the test. Prepare the control solution with 4.0 mL of Standard Lead Solution (not more than 20 ppm).

Loss on drying <2.41> Not more than 1.0% (2 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.75 g of Diethylcarbamazine Citrate, previously dried, dissolve in 50 mL of acetic acid (100) by warming, cool, and titrate 2.50 mL with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 39.14 mg of C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2}.

Containers and storage Containers—Tight containers.

Diethylcarbamazine Citrate Tablets

ジエチルカルバマジンケン酸塩錠

Diethylcarbamazine Citrate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2}: 391.42).

Method of preparation Prepare as directed under Tablets, with Diethylcarbamazine Citrate.

Identification To a quantity of the powdered Diethylcarbamazine Citrate Tablets, equivalent to 0.1 g of Diethylcarbamazine Citrate, add 10 mL of water, shake well, and filter. To the filtrate add 1 mL of Reinecke salt TS: a light red precipitate is formed.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Diethylcarbamazine Citrate Tablets add 70 mL of the mobile phase, shake vigorously for 10 minutes, add the mobile phase to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, pipet V mL of the subsequent filtrate, equivalent to about 2.5 mg of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2}), into exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of diethylcarbamazine citrate
\[ C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2} \]
\[ M_5: \text{Amount (mg) of Diethylcarbamazine Citrate RS taken} \]
\[ M_5 = M_0 \times Q_1 \times Q_2 \times 10/V \]

Internal standard solution—A solution of 2-aminobenzimidazol in the mobile phase (1 in 12,500).

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Diethylcarbamazine Citrate Tablets is not less than 80%.

Start the test with 1 tablet of Diethylcarbamazine Citrate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 56 μg of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C_{3}H_{6}O_{2}), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Diethylcarbamazine Citrate RS, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 100 mL.
Difenidol Hydrochloride / Official Monographs

Pipet 25 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions, and determine the peak areas, A_T and A_S, of diethylcarbamazine in each solution.

Dissolution rate (%) with respect to the labeled amount of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C\_6H_{5}O\_3\_2\_HCl) = \frac{M_S \times A_T}{A_S \times V/I \times C \times 225}

M_S: Amount (mg) of Diethylcarbamazine Citrate RS taken
C: Labeled amount (mg) of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C\_6H_{5}O\_3\_2\_HCl) in 1 tablet

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of diethylcarbamazine are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diethylcarbamazine is not more than 2.0%.

Assay Weigh accurately the mass of not less than 20 Diethylcarbamazine Citrate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C\_6H_{5}O\_3\_2\_HCl), add 70 mL of the mobile phase, shake vigorously for 10 minutes, add the mobile phase to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Diethylcarbamazine Citrate RS, previously dried at 105°C for 4 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of diethylcarbamazine to that of the internal standard.

Amount (mg) of diethylcarbamazine citrate (C_{10}H_{21}N_{2}O_{3}C\_6H_{5}O\_3\_2\_HCl) = \frac{M_S \times Q_T}{Q_S \times 2}

M_S: Amount (mg) of Diethylcarbamazine Citrate RS taken

Internal standard solution—A solution of 2-aminobenzimidazole in the mobile phase (1 in 12,500).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilsilane silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 0.05 mol/L potassium dihydrogen phosphate TS add phosphoric acid to adjust the pH to 2.5. To 950 mL of this solution add 50 mL of methanol.

Flow rate: Adjust so that the retention time of diethylcarbamazine is about 14 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, diethylcarbamazine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diethylcarbamazine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Well-closed containers.

Difenidol Hydrochloride

ジフェニドール塩酸塩

C_{21}H_{37}NO.HCl: 345.91
1,1-Diphenyl-4-piperidin-1-ylbutan-1-ol monohydrochloride [3254-89-7]

Difenidol Hydrochloride, when dried, contains not less than 98.5% of difenidol hydrochloride (C_{21}H_{37}NO.HCl).

Description Difenidol Hydrochloride occurs as white, crystals or crystalline powder. It is odorless.

It is freely soluble in methanol, soluble in ethanol (95), sparingly soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

Melting point: about 217°C (with decomposition).

Identification (1) Dissolve 0.01 g of Difenidol Hydrochloride in 1 mL of sulfuric acid: an orange-red color develops. To this solution add carefully 3 drops of water: the solution becomes yellowish brown, and colorless on the addition of 10 mL of water.

(2) To 5 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of Reinecke salt TS: a light red precipitate is formed.

(3) To 10 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of sodium hydroxide TS, and extract with two 15-mL portions of chloroform. Combine the extracts, w ash with three 10-mL portions of water, evaporate the chloroform on a water bath, and dry the residue in a desiccator (in vacuum, silica gel, 55°C) for 5 hours: the residue melts <2.60> between 103°C and 106°C.

(4) A solution of Difenidol Hydrochloride (1 in 100) responds to Qualitative Tests <1.099> for chloride.

pH <2.5> Dissolve 1.0 g of Difenidol Hydrochloride in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.7 and 6.5.
**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Difenidol Hydrochloride in 10 mL of methanol: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Difenidol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Difenidol Hydrochloride according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.10 g of Difenidol Hydrochloride in methanol to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of 1,1-diphenyl-4-piperidino-1-butene hydrochloride for thin-layer chromatography in methanol to make exactly 20 mL, pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, methanol and acetic acid (100:20:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, silica gel, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Difenidol Hydrochloride, previously dried, dissolve in 30 mL of acetic acid (100) and warm if necessary, cool, add 30 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 17.30 mg of C$_2$H$_7$NO.HCl

**Containers and storage** Containers—Well-closed containers.

---

**Diflorasone Diacetate**

ジフロラゾン酢酸エステル

![Chemical Structure](image)

C$_{26}$H$_{33}$F$_2$O$_5$: 494.52
60,9-Difluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17,21-diacetate [33564-31-7]

Diflorasone Diacetate, when dried, contains not less than 97.0 and not more than 102.0% of diflorasone diacetate (C$_{26}$H$_{33}$F$_2$O$_5$).

**Description** Diflorasone Diacetate occurs as a white to pale yellow, crystals or crystalline powder.

It is soluble in acetonitrile, slightly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 222°C (with decomposition).

**Identification** (1) Determine the infrared absorption spectrum of Diflorasone Diacetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Diflorasone Diacetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Prepare the test solution with 10 mg of Diflorasone Diacetate as directed under Oxygen Flask Combustion Method <1.007>, using 20 mL of diluted 0.01 mol/L sodium hydroxide VS (1 in 40) as the absorbing liquid: the test solution responds to Qualitative Tests <1.090> for fluoride.

**Optical rotation** <2.49> [α]$^0$$^0$D + 88° + 93° (after drying, 0.1 g, acetonitrile, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Diflorasone Diacetate according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 20 mg of Diflorasone Diacetate in 20 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area by the automatic integration method: the areas of the peaks, having a relative retention time of about 0.5, about 0.7, about 0.9 and about 1.1 to diflorasone diacetate, obtained from the sample solution are respectively not larger than 1/4 times, 1/4 times, 1/2 times and 3/4 times the peak area of diflorasone diacetate from the standard solution, and the total area of the peaks other than diflorasone diacetate and the peaks mentioned above from the sample solutions is not larger than 1/5 times the peak area of diflorasone diacetate from the standard solution. Furthermore, the total area of the peaks other than diflorasone diacetate from the sample solution is not larger than 1.5 times the peak area of diflorasone diacetate from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 1.4 times as long as the retention time of diflorasone diacetate, beginning after the solvent peak.

**System suitability**—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, and add acetonitrile to make exactly 20 mL. Confirm that the peak area of diflorasone diacetate obtained with 10 µL of this solution is equivalent to 7 to 13% of that with 10 µL of the standard solution.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution, the relative standard deviation of the peak area of diflorasone diacetate is not more than 2.0%.

**Loss on drying** <2.41> Not more than 1.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).
Residue on ignition <2.44> Not more than 0.2% (0.5 g, platinum crucible).

Assay Weigh accurately about 20 mg each of Diflucortolone Diacetate and Diflucortolone Diacetate RS, both previously dried, dissolve in exactly 4 mL each of the internal standard solution, add acetonitrile to make them 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_2 \) and \( Q_3 \), of the peak area of diflucortolone diacetate to that of the internal standard.

\[ M_2 = \text{Amount (mg) of Diflucortolone Diacetate RS taken} \]

\[ M_3 = \text{Amount (mg) of Diflucortolone Diacetate RS taken} \]

Internal standard solution—A solution of methyl parahydroxybenzoate in acetonitrile (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 4.0 with dilute phosphoric acid (1 in 200). To 550 mL of this solution add 400 mL of acetonitrile and 100 mL of tetrahydrofuran.
Flow rate: Adjust so that the retention time of diflucortolone diacetate is about 15 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and diflucortolone diacetate are eluted in this order with the resolution between these peaks being not less than 9.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diflucortolone diacetate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Diflucortolone Valerate
ジフルコルトロン吉草酸エステル

\[ \text{C}_{27} \text{H}_{38} \text{F}_{20} \text{O}_8: 478.57 \]
\[ 6\alpha,9\text{-Difluoro}-11\beta,21\text{-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione-21-pentanate} \]
\[ [\text{S}9198-70-8] \]

Diflucortolone Valerate contains not less than 98.0% and not more than 102.0% of diflucortolone valerate (\( \text{C}_{27} \text{H}_{38} \text{F}_{20} \text{O}_8 \)), calculated on the dried basis.

Description Diflucortolone Valerate occurs as white, crystals or crystalline powder.
It is sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification (1) Prepare the test solution by proceeding with 10 mg of Diflucortolone Valerate according to Oxygen Flask Combustion Method <1.06>1, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests <1.09> for fluoride.

(2) Determine the absorption spectrum of a solution of Diflucortolone Valerate in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Diflucortolone Valerate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Diflucortolone Valerate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Diflucortolone Valerate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.44> \( [\alpha]_D^0 +110 - +115^\circ \) (0.1 g calculated on the dried basis, ethanol (99.5), 10 mL, 100 mm).

Melting point <2.60> 200 - 204°C

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Diflucortolone Valerate in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm). Carbonize and incinerate as directed under Residue on Ignition <2.44>.

(2) Related substances—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of sample solution by the automatic integration method, and calculate the amounts of these peaks by the area percentage method: the amount of each peak of flucortolone valerate, 12α diflucortolone valerate and 14α diflucortolone valerate, having the relative retention times of about 0.97, 1.03 and 1.05 to diflucortolone valerate, respectively, is not more than 0.6%, respectively; the amount of the peak of elucortolone valerate, having the relative retention time of about 1.09, is not more than 0.3%: and the amount of each peak other than those mentioned above is not more than 0.1%. Furthermore, the total amount of the peaks other than diflucortolone valerate is not more than 2.0%.

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 1.4 times as long as the retention time of diflucortolone valerate, beginning after the solvent peak.

System suitability—
System performance and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To 0.1 mL of the sample
solution, add a mixture of water and acetonitrile (1:1) to make 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add a mixture of water and acetonitrile (1:1) to make exactly 20 mL. Confirm that the peak area of diflucortolone valerate obtained with 10 μL of this solution is equivalent to 3.5 to 6.5% of that with 10 μL of the solution for system suitability test.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 5 mg each of Diflucortolone Valerate and Diflucortolone Valerate RS (separately, determine the loss on drying <2.41> under the same conditions as Diflucortolone Valerate), dissolve each in a mixture of water and acetonitrile (1:1) to make exactly 10 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.05> according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of diflucortolone valerate in each solution.

Amount (mg) of diflucortolone valerate ($C_{27}H_{35}F_2O_3$) = $M_S \times A_T / A_S$

$M_S$: Amount (mg) of Diflucortolone Valerate RS taken, calculated on dried basis

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with sulfonamide group bound to hexadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, adjusted to pH 3.0 with phosphoric acid, and acetonitrile for liquid chromatography (11:9).

Mobile phase B: Acetonitrile for liquid chromatography.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>

</tbody>
</table>

Flow rate: 1.0 mL per minute.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of diflucortolone valerate are not less than 10,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diflucortolone valerate is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

**Digoxin**

ジゴキシン

C$_{41}$H$_{60}$O$_{14}$: 780.94
3β-[2,6-Dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl-oxy]-12β,14-dihydroxy-5β,14β-card-20(22)-enolide [20830-75-5]

Digoxin, when dried, contains not less than 96.0% and not more than 106.0% of digoxin (C$_{41}$H$_{60}$O$_{14}$).

**Description** Digoxin occurs as colorless or white crystals or a white crystalline powder.

It is freely soluble in pyridine, slightly soluble in ethanol (95), very slightly soluble in acetic acid (100), and practically insoluble in water.

**Identification**

(1) Transfer 1 mg of Digoxin to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 10,000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of the two liquids a brown ring free from a reddish color is produced, and the color of the upper layer near the contact zone changes to green through purple. Finally the entire acetic acid layer shows a green color through a deep blue color.

(2) Determine the infrared absorption spectrum of Digoxin, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D$^2$: +10.0 to +13.0° (after drying, 0.20 g, dehydrated pyridine, 10 mL, 100 mm).

**Purity**

(1) Clarity and color of solution—Dissolve 0.10 g of Digoxin in 15 mL of diluted ethanol (95) (4 in 5) by warming at 70°C: the solution is clear and colorless.

(2) Related substances—Dissolve 25.0 mg of Digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water and dilute ethanol to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve exactly 5.0 mg of Gitoxin for Purity RS, previously dried under reduced pressure at 105°C for 1 hour, in a mixture of acetonitrile and water (7:3) to make exactly 200 mL. Pipet 2 mL of this solution, add dilute ethanol to make exactly 50 mL, and use this solution as the standard solution. Perform
Digoxin Injection / Official Monographs

854

Digoxin Injection is an aqueous injection. It contains not less than 90.0% and not more than 105.0% of the labeled amount of digoxin (C_{41}H_{66}O_{47}: 780.94).

Method of preparation Prepare as directed under Injections, with a solution of Digoxin in 10 to 50 vol% ethanol.

Description Digoxin Injection is a clear, colorless liquid.

Identification Dilute Digoxin Injection, if necessary, with methanol so that each mL contains about 0.25 mg of Digoxin, and use this solution as the sample solution. In case where ingredients are suspected to affect the test, remove them by means of a solid-phase extraction. Separately, dissolve 0.5 mg of Digoxin RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.01>. Spot 10 μL each of the sample solution and standard solution on a plate of octadeclisilanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium toluenesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the Rf values of the principal spots with the sample solution and the standard solution are not different each other.

Alcohol number <1.01> 0.8 – 1.2 (Method 1).

Purity Related substances—To a volume of Digoxin Injection, equivalent to about 2.5 mg of Digoxin, add dilute ethanol to make 50 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amounts of these peaks by the area percentage method: the total amount of the peaks other than digoxin is not more than 5%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeclisilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of water and acetonitrile (7:3).
Flow rate: Adjust so that the retention time of digoxin is about 10 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Digoxin Injection
ジゴキシン注射液

Digoxin Injection is an aqueous injection. It contains not less than 90.0% and not more than 105.0% of the labeled amount of digoxin (C_{41}H_{66}O_{47}: 780.94).

Method of preparation Prepare as directed under Injections, with a solution of Digoxin in 10 to 50 vol% ethanol.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.
flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of digoxin, beginning after the solvent peak.

System suitability—
Test for required detectability: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, and add dilute ethanol to make exactly 100 mL. Confirm that the peak area of digoxin obtained with 10 μL this solution is equivalent to 0.07 to 0.13% of that with 10 μL of the solution for system suitability test.

System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 5 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000), 10 mL of water and dilute ethanol to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, digoxin and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of digoxin is not more than 2.5%.

Bacterial endotoxins <4.01> Less than 200 EU/mg.

Extractable volume <6.07> It meets the requirements.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07> Perform the test according to Method 1: it meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay To an exact volume of Digoxin Injection, equivalent to about 2.5 mg of digoxin (C42H46O14), add exactly 5 mL of the internal standard solution and dilute ethanol to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Digoxin RS, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of digoxin to that of the internal standard.

\[ \text{Amount (mg) of digoxin (C}_{42}\text{H}_{46}\text{O}_{14}) = M_5 \times Q_1 / Q_2 \times 1/10 \]

\[ M_5: \text{Amount (mg) of Digoxin RS taken} \]

Internal standard solution—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of water and acetonitrile (7:3).
Flow rate: Adjust so that the retention time of digoxin is about 10 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers, and colored containers may be used.
Storage—Light-resistant.

Digoxin Tablets
ジゴキシン錠

Digoxin Tablets contain not less than 90.0% and not more than 105.0% of the labeled amount of digoxin (C42H46O14: 780.94).

Method of preparation Prepare as directed under Tablets, with Digoxin.

Identification To an amount of powdered Digoxin Tablets, equivalent to 0.5 mg of Digoxin, add 2 mL of methanol, shake for 10 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 0.5 mg of Digoxin RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of octadecylsilanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium toulenesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the RF values of the principal spots with the sample solution and the standard solution are not different each other.

Purity Related substances—Powder not less than 20 Digoxin Tablets. Weigh a portion of the powder equivalent to 2.5 mg of Digoxin, add 30 mL of dilute ethanol, sonicate for 20 minutes, and shake for 5 minutes. After cooling, add dilute ethanol to make 50 mL, filter, and use the filtrate as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amount of these peaks by the area percentage method: the total amount of the peaks other than digoxin is not more than 5%.

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in
the Assay.

Time span of measurement: About 4 times as long as the retention time of digoxin, beginning after the solvent peak.

System suitability—

Test for required detectability: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, and add dilute ethanol to make exactly 100 mL. Confirm that the peak area of digoxin obtained with 10 \mu L of this solution is equivalent to 0.07 to 0.13% of that with 10 \mu L of the solution for system suitability test.

System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 5 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000), 10 mL of water and dilute ethanol to make 50 mL. When the procedure is run with 10 \mu L of this solution under the above operating conditions, digoxin and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 \mu L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of digoxin is not more than 2.5%.

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Digoxin Tablets add 0.5 mL of water to disintegrate, then add exactly 0.5 mL of the internal standard solution, and add \( V \) mL of dilute ethanol so that each mL contains about 21 \mu g of digoxin (\( C_{41}H_{64}O_{14} \)). Sonicate for 20 minutes, shake for 5 minutes, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 25 mg of Digoxin RS, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, and add ethanol (95) to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 0.5 mL of the internal standard solution, then add 1.5 mL of water and \( (V - 2) \) mL of dilute ethanol, and use this solution as the standard solution. Proceed with the sample solution and standard solution as directed in the Assay.

Amount (mg) of digoxin (\( C_{41}H_{64}O_{14} \))
\[
= M_S \times \frac{Q_T}{Q_S} \times \frac{1}{200}
\]

\( M_S \): Amount (mg) of Digoxin RS taken

\text{Internal standard solution—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).}

\text{Operating conditions—}

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \mu m in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of water and acetonitrile (7:3).

Flow rate: Adjust so that the retention time of digoxin is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 \mu L of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 \mu L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of 1 hour, dissolve in a small portion of ethanol (95), and add a mixture of ethanol (95) and water (4:1) to make exactly 500 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 500 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution, the standard solution and the dissolution medium, and transfer to brown glass-stoppered test tubes. Add exactly 10 mL of 0.012 g/dL t-ascorbic acid-hydrochloric acid TS to these tubes, and shake. Immediately add exactly 1 mL of dilute hydrogen peroxide TS, shake well, and allow to stand at a constant temperature between 25°C and 30°C for 45 minutes. Determine the fluorescence intensities, \( F_T \), \( F_S \), and \( F_B \), of these solutions at 360 nm of the excitation wavelength and at 485 nm of the fluorescence wavelength as directed under Fluorometry 2.22, respectively.

Dissolution rate (\%) with respect to the labeled amount of digoxin (\( C_{41}H_{64}O_{14} \))
\[
= \frac{M_S \times (F_T - F_B)/(F_T - F_B) \times 1/C}{C}
\]

\( M_S \): Amount (mg) of Digoxin RS taken

\( C \): The labeled amount (mg) of digoxin (\( C_{41}H_{64}O_{14} \)) in 1 tablet

\text{Assay} Weigh accurately the mass of not less than 20 Digoxin Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 2.5 mg of digoxin (\( C_{41}H_{64}O_{14} \)), add 30 mL of dilute ethanol, sonicate for 20 minutes, and shake for 5 minutes. **Dihydroergotamine Mesilate**

ジヒドロエルゴタミンメシル酸塩

\[
\text{C}_{32}\text{H}_{32}\text{N}_{10}\text{O}_{12}\text{S}: 679.78
\]

Dihydroergotamine Mesilate contains not less than 97.0% of dihydroergotamine mesilate (C₁₈H₁₇N₅O₆, CH₃O₅S), calculated on the dried basis.

**Description**

Dihydroergotamine Mesilate occurs as a white to yellowish white or grayish white to reddish white powder. It is freely soluble in acetic acid (100), sparingly soluble in methanol and in chloroform, slightly soluble in water and in ethanol (95), and practically insoluble in acetic anhydride and in diethyl ether.

It is gradually colored by light.

Melting point: about 214°C (with decomposition).

**Identification** (1) Dissolve 1 mg of Dihydroergotamine Mesilate in 5 mL of a solution of L-tartaric acid (1 in 1000). To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, and shake: a blue color develops.

(2) To 0.1 g of Dihydroergotamine Mesilate add 0.4 g of sodium hydroxide, stir well, and incinerate by gradual ignition. After cooling, add 10 mL of water to the residue, heat to boiling, cool, and filter. To the filtrate add 0.5 mL of hydrochloric acid: the solution responds to Qualitative Tests <1.09> for sulfate. Separately, to 0.1 g of Dihydroergotamine Mesilate add 5 mL of dilute hydrochloric acid, shake for 5 minutes, filter, and to the filtrate add 1 mL of barium chloride TS: the solution is clear.

(3) Determine the absorption spectrum of a solution of Dihydroergotamine Mesilate in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dihydroergotamine Mesilate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.23>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]₂₅° ′ = −16.7 to −22.7° [0.5 g, calculated on the dried basis, a mixture of ethanol (99.5), chloroform and ammonia solution (28) (10:10:1), 20 mL, 100 mm].

**pH** <2.54> Dissolve 0.05 g of Dihydroergotamine Mesilate in 50 mL of water: the pH of this solution is between 4.4 and 5.4.

**Purity** (1) Clarity and color of solution—Dissolve 0.10 g of Dihydroergotamine Mesilate in 0.1 mL of a solution of
methanesulfonic acid (7 in 100) and 50 mL of water: the solution is clear, and has no more color than the following control solutions [1] or [2].

Control solution [1]: Pipet 0.6 mL of Iron (III) Chloride CS and 0.15 mL of Cobalt (II) Chloride CS, mix, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution [2]: Pipet 0.6 mL of Iron (III) Chloride CS, 0.25 mL of Cobalt (II) Chloride CS and 0.1 mL of Copper (II) Sulfate CS, mix, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 0.10 g of Dihydroergotamine Mesilate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add a mixture of chloroform and methanol (9:1) to make exactly 25 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.02z>. Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and dry the plate with cold wind within 1 minute. Develop the plate again immediately with a freshly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying on the plate, and dry the plate with warm wind: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution (1), and the spots, which are more intense than the spot from the standard solution (2), are not more than two.

Loss on drying <2.41z> Not more than 4.0% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 6 hours).

Assay Weigh accurately about 0.2 g of Dihydroergotamine Mesilate, dissolve in 170 mL of a mixture of acetic anhydride and acetic acid (100) (10:1), and titrate <2.50p> with 0.02 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS = 13.60 mg of C₁₃H₁₇N₂O₄·CH₃O·S

Containers and storage Containers—Tight containers. Storage—Light-resistant.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Identification  Determine the infrared absorption spectrum of Dihydroergotoxine Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> $[\alpha]_D^{20} + 11.0 - + 15.0^\circ$ (0.2 g calculated on the anhydrous basis, dilute ethanol, 20 mL, 100 mm).

Purity  (1) Clarity and color of solution—Dissolve 0.10 g of Dihydroergotoxine Mesilate in 20 mL of water: the solution is clear and the color of the solution is not more intense than that of the following control solution.

Control solution: To a mixture of 1.0 mL of Cobalt (II) Chloride CS, 0.4 mL of Copper (II) Sulfate CS and 2.4 mL of Iron (III) Chloride CS add diluted hydrochloric acid (1 in 40) to make exactly 200 mL.

(2) Heavy metals  <1.07>—Proceed with 1.0 g of Dihydroergotoxine Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately 0.100 g of Dihydroergotoxine Mesilate, dissolve it in a mixture of chloroform and methanol (9:1) to make exactly 5 mL, and use this solution as the sample solution. Separately, weigh accurately 10 mg of dihydroergocristine mesilate for thin-layer chromatography, and dissolve in a mixture of chloroform and methanol (9:1) to make exactly 100 mL. Pipet 6 mL, 4 mL and 2 mL of this solution, add a mixture of chloroform and methanol (9:1) to make exactly 10 mL, respectively, and use these solutions as the standard solutions (1), (2) and (3), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03> without putting the filter paper in the developing vessel. Spot 5 µL each of the sample solution and the standard solutions (1), (2) and (3) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate with the aid of a cool air stream. Immediately after that, develop the plate again with a newly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate within 1 minute with the aid of a cool air stream. Spray evenly $p$-dimethylanisobenzal-dehyde-hydrochloric acid TS on the plate, dry the plate within 2 minutes with the aid of a cool air stream, and heat it at 40°C for 15 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution (1), not more than 2 spots are more intense than that from the standard solution (2), and not more than 4 spots are more intense than that from the standard solution (3).

Water  <2.48> Not more than 5.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition  <2.49> Not more than 0.1% (1 g).

Assay  (1) Dihydroergotoxine mesilate—Weigh accurately about 30 mg each of Dihydroergotoxine Mesilate and Dihydroergotoxine Mesilate RS, and dissolve them separately in a suitable amount of a mixture of water and acetonitrile (3:1). To these solutions add exactly 10 mL of the internal standard solution and an amount of a mixture of water and acetonitrile (3:1) to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 20 µL of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios of the peak areas of dihydroergocornine, dihydro-$\alpha$-ergocryptine, dihydroergocristine and dihydro-$\beta$-ergocryptine to the peak area of the internal standard of these solutions.

Amount (mg) of dihydroergotoxine mesilate

$$M_S = \frac{M_D \times (Q_{TA} + Q_{TH} + Q_{TC} + Q_{TD})}{(Q_{SA} + Q_{SB} + Q_{SC} + Q_{SD})}$$

Where $M_D$: Amount (mg) of Dihydroergotoxine Mesilate RS taken, calculated on the anhydrous basis;

$Q_{TA}$: Ratio of the peak area of dihydroergocornine to that of the internal standard of the sample solution $\times 659.80$;

$Q_{TB}$: Ratio of the peak area of dihydro-$\alpha$-ergocryptine to that of the internal standard of the sample solution $\times 673.83$;

$Q_{TC}$: Ratio of the peak area of dihydroergocristine to that of the internal standard of the sample solution $\times 707.85$;

$Q_{TD}$: Ratio of the peak area of dihydro-$\beta$-ergocryptine to that of the internal standard of the sample solution $\times 673.83$;

$Q_{SA}$: Ratio of the peak area of dihydroergocornine to that of the internal standard of the standard solution $\times 659.80$;

$Q_{SB}$: Ratio of the peak area of dihydro-$\alpha$-ergocryptine to that of the internal standard of the standard solution $\times 673.83$;

$Q_{SC}$: Ratio of the peak area of dihydroergocristine to that of the internal standard of the standard solution $\times 707.85$;

$Q_{SD}$: Ratio of the peak area of dihydro-$\beta$-ergocryptine to that of the internal standard of the standard solution $\times 673.83$.

Internal standard solution—Dissolve 0.04 g of chloramphenicol in a mixture of water and acetonitrile (3:1) to make 250 mL.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilsanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and triethylamine (30:10:1).

Flow rate: Adjust so that the retention time of chloramphenicol is about 5 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of dihydroergocornine, dihydro-$\alpha$-ergocryptine, dihydroergocristine and dihydro-$\beta$-ergocryptine are eluted in this order with the resolution between the peaks of dihydro-$\alpha$-ergocryptine and dihydroergocristine being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of dihydroergocornine, dihydro-$\alpha$-ergocryptine, dihydroergocristine and dihydro-$\beta$-ergocryptine to that of the internal standard is not more than 0.5%.

(2) Relative contents of dihydroergocornine mesilate, dihydroergocryptine mesilate and dihydroergocristine mesilate—Calculate the relative amounts of dihydroergocor-
nine mesilate, dihydroergocryptine mesilate (dihydro-o-ergocryptine mesilate and dihydro-beta-ergocryptine mesilate) and dihydroergocristine mesilate from the chromatogram obtained in Assay (1) for the sample solution using the following equations:

Relative amount (%) of dihydroergocornine mesilate

\[ \frac{Q_{TA}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100 \]

Relative amount (%) of dihydroergocryptine mesilate

\[ \frac{Q_{TA}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100 \]

Relative amount (%) of dihydroergocristine mesilate

\[ \frac{Q_{TC}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100 \]

(3) Ratio of the content of dihydro-o-ergocryptine mesilate to dihydro-beta-ergocryptine mesilate—Calculate the ratio of the amount of dihydro-o-ergocryptine mesilate to dihydro-beta-ergocryptine mesilate from the chromatogram obtained in the Assay (1) for the sample solution using the following equations:

Ratio of the content of dihydro-o-ergocryptine mesilate to dihydro-beta-ergocryptine mesilate

\[ \frac{Q_{TB}}{Q_{TD}} \]

Containers and storage
Containers—Well-closed containers.
Storage—Light-resistant.

Dilazep Hydrochloride Hydrate

ジラゼプ塩酸塩水和物

\[ C_{31}H_{42}N_{2}O_{10} \cdot 2HCl \cdot H_2O: 965.63 \]

\[ 3,3'-(1,4-Diazepane-1,4-diyl)di(propyl) bis(3,4,5-trimethoxybenzoate) dihydrochloride monohydrate \]

[20153-98-4, anhydride]

Dilazep Hydrochloride Hydrate contains not less than 98.0% of dilazep hydrochloride \((C_{31}H_{42}N_{2}O_{10} \cdot 2HCl: 677.62)\), calculated on the dried basis.

Description
Dilazep Hydrochloride Hydrate occurs as a white crystalline powder. It is odorless.

It is freely soluble in acetic acid (100) and in chloroform, soluble in water, slightly soluble in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

Melting point: 200 – 204°C Immerse the sample in a bath of 110°C, and raise the temperature at the rate of about 3°C per minute from 140°C to 150°C, about 10°C per minute from 160°C to 195°C and about 1°C per minute from 195°C.

Identification
To 1 mL of a solution of Dilazep Hydrochloride Hydrate (1 in 100) add 0.1 mL of a solution of hydroxylammonium chloride (1 in 10) and 0.1 mL of 8 mol/L potassium hydroxide TS, and warm in a water bath of 70°C for 10 minutes. After cooling, add 0.5 mL of dilute hydrochloric acid and 0.1 mL of iron (III) chloride TS: a purple color develops.

(2) To 5 mL of a solution of Dilazep Hydrochloride Hydrate (3 in 500) add 0.3 mL of Reinecke salt TS: a light red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Dilazep Hydrochloride Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dilazep Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH
Dilazep Hydrochloride Hydrate in 100 mL of water: the pH of this solution is between 3.0 and 4.0.

Purity
Clarity and color of solution—Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 20 mL of water: the solution is clear and colorless.

(2) Sulfate
Perform the test with 0.5 g of Dilazep Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals
Proceed with 2.0 g of Dilazep Hydrochloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic
Perform the test solution with 1.0 g of Dilazep Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances
Dissolve 0.40 g of Dilazep Hydrochloride Hydrate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ethyl acetate, dichloromethane and hydrochloric acid (500:200:100:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41>
2.0 – 3.0% (1 g, 105°C, 3 hours).

Residue on ignition <2.44>
Not more than 0.1% (1 g).

Assay
Weigh accurately about 0.3 g of Dilazep Hydrochloride Hydrate, dissolve in 40 mL of a mixture of acetic anhydride and acetic acid (100:7:3), and titrate <2.30> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

\[ = 33.88 \text{ mg of } C_{31}H_{42}N_{2}O_{10} \cdot 2HCl \]

Containers and storage
Containers—Tight containers.
Diltiazem Hydrochloride

**Description** Diltiazem Hydrochloride occurs as white, crystalline powder. It is odorless.

It is very soluble in formic acid, freely soluble in water, in methanol and in chloroform, sparingly soluble in acetonitrile, slightly soluble in acetic anhydride and in ethanol (99.5%), and practically insoluble in diethyl ether.

**Identification** (1) Dissolve 0.05 g of Diltiazem Hydrochloride in 1 mL of 1 mol/L hydrochloric acid TS, add 2 mL of ammonium thioacetic acid (II) nitrate TS and 5 mL of chloroform, shake well, and allow to stand: a blue color develops in the chloroform layer.

(2) Proceed as directed under Oxygen Flask Combustion Method <1.06> with 0.03 g of Diltiazem Hydrochloride, using 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution responds to Qualitative Tests <1.09> (1) for sulfate.

(3) Dissolve 0.01 g of Diltiazem Hydrochloride in 0.01 mol/L hydrochloric acid TS to make 100 mL. To 2 mL of the solution add 0.01 mol/L hydrochloric acid TS to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Diltiazem Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25> it exhibits absorption at the wave numbers of about 1741 cm$^{-1}$, 1678 cm$^{-1}$, 1252 cm$^{-1}$ and 1025 cm$^{-1}$.

(5) A solution of Diltiazem Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49> $[\alpha]_{D}^{20} +115-+120^\circ$ (after drying, 0.20 g, water, 20 mL, 100 mm).

**Melting point** <2.60> 210 – 215°C (with decomposition).

**pH** <2.54> Dissolve 1.0 g of Diltiazem Hydrochloride in 100 mL of water: the pH of this solution is between 4.3 and 5.3.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Diltiazem Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 1.0 g of Diltiazem Hydrochloride. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Diltiazem Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Place 1.0 g of Diltiazem Hydrochloride in a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the neck of the flask, and heat cautiously until white fumes are evolved. After cooling, add 2 mL of nitric acid, heat, and repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30%), and heat until the solution becomes colorless to pale yellow. After cooling, add 2 mL of saturated solution of ammonium oxalate monohydrate, and heat again until white fumes are evolved. After cooling, add water to make 5 mL, use this solution as the test solution, and perform the test: the test solution has no more color than the following control solution (not more than 2 ppm).

Control solution: Proceed in the same manner as the test solution without Diltiazem Hydrochloride, add 2.0 mL of Standard Arsenic Solution and water to make 5 mL, and proceed in the same manner as the test solution.

(5) Related substances—Dissolve 50 mg of Diltiazem Hydrochloride in 50 mL of diluted ethanol (4 in 5), and use this solution as the sample solution. Measure exactly 1 mL of the sample solution, add diluted ethanol (4 in 5) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by automatic integration method: the total area of peaks other than the peak of diltiazem obtained from the sample solution is not larger than 3/5 times the peak area of diltiazem from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 8 g of sodium acetate trihydrate and 1.5 g of d-camphorsulfonic acid in 500 mL of water, and filter using a membrane filter (0.4 μm in pore size). Add 250 mL each of acetonitrile and methanol to the filtrate.

Flow rate: Adjust so that the retention time of diltiazem is about 9 minutes.

Time span of measurement: About twice as long as the retention time of diltiazem, beginning after the solvent peak.

**System suitability**—

Test for required detectability: To exactly 2 mL of the standard solution add diluted ethanol (4 in 5) to make exactly 10 mL. Confirm that the peak area of diltiazem obtained with 20 μL of this solution is equivalent to 15 to 25% of that with 20 μL of the standard solution.

System performance: Dissolve 0.03 g of Diltiazem Hydrochloride, 0.02 g of d-3-hydroxy-cis-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4-(5H)-one hydrochloride (hereinafter referred to as de-acetyl substance) and 0.02 g of phenylbenzoate in 160 mL of ethanol (99.5%), and add water to make 200 mL. When the
procedure is run with 20 μL of this solution under the above operating conditions, de-acetyl substance, diltiazem and phenyl benzoate are eluted in this order with the resolutions between the peaks of de-acetyl substance and diltiazem and between the peaks of diltiazem and phenyl benzoate being not less than 2.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diltiazem is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Diltiazem Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 45.10 mg of C\textsubscript{22}H\textsubscript{26}N\textsubscript{2}O\textsubscript{8}S.HCl

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Diltiazem Hydrochloride Extended-release Capsules**

ジルチアゼム塩酸塩徐放カプセル

Diltiazem Hydrochloride Extended-release Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of diltiazem hydrochloride (C\textsubscript{22}H\textsubscript{26}N\textsubscript{2}O\textsubscript{8}S.HCl: 450.98)

**Method of preparation** Prepare as directed under Capsules, with Diltiazem Hydrochloride.

**Identification** Take out the content of Diltiazem Hydrochloride Extended-release Capsules, and powder. To a portion of the powder, equivalent to 0.1 g of Diltiazem Hydrochloride, add 100 mL of 0.01 mol/L hydrochloric acid TS, shake thoroughly, and filter. To 1 mL of the filtrate add 0.01 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.26>: it exhibits a maximum between 234 nm and 238 nm.

**Purity** Related substances—Take out the content of Diltiazem Hydrochloride Extended-release Capsules, and powder. To a portion of the powder, equivalent to 50 mg of Diltiazem Hydrochloride, add 30 mL of methanol, shake vigorously for 20 minutes, then add methanol to make 50 mL, filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, then add exactly 10 mL of the internal standard solution, and add methanol to make 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of diltiazem hydrochloride (C\textsubscript{22}H\textsubscript{26}N\textsubscript{2}O\textsubscript{8}S.HCl)

\[ M_s = M_Q \times Q_t/Q_s \times V/100 \]

\( M_s \): Amount (mg) of diltiazem hydrochloride for assay taken

**Operating conditions**—Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of diltiazem, beginning after the solvent peak.

**System suitability**—System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, and add methanol to make exactly 30 mL. Confirm that the peak area of diltiazem obtained with 20 μL of this solution is equivalent to 4.7 to 8.6% of that with 20 μL of the standard solution.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diltiazem is not more than 2.0%.

**Uniformity of dosage units** <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

Take out the content of 1 capsule of Diltiazem Hydrochloride Extended-release Capsules, add V/2 mL of methanol, then add exactly V/10 mL of the internal standard solution, and shake vigorously for 20 minutes. Add methanol to make V mL so that each mL contains about 1 mg of diltiazem hydrochloride (C\textsubscript{22}H\textsubscript{26}N\textsubscript{2}O\textsubscript{8}S.HCl), and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, pipet 3 mL of the subsequent filtrate, add methanol to make 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Diltiazem Hydrochloride Extended-release Capsules, add 30 mL of methanol, shake vigorously for 20 minutes, then add exactly 10 mL of the internal standard solution, and add methanol to make 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Diltiazem Hydrochloride Extended-release Capsules, weigh the mass of each capsule, dissolve in 50 mL of methanol, add exactly 10 mL of the internal standard solution, and add methanol to make 100 mL. Filter this solution through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 5 mL of the filtrate, to 3 mL of the subsequent filtrate add methanol to make 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

**Diltiazem Hydrochloride (C\textsubscript{22}H\textsubscript{26}N\textsubscript{2}O\textsubscript{8}S.HCl), add 50 mL of methanol, then add exactly 10 mL of the internal standard solution, and add methanol to make 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Diltiazem Hydrochloride Extended-release Capsules, add 30 mL of methanol, shake vigorously for 20 minutes, then add methanol to make 50 mL, filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than diltiazem obtained from the sample solution is not larger than the peak area of diltiazem from the standard solution.
Weigh accurately about 0.6 g of Dimemorfan Phosphate (1 g, 105 °C × 3 h) to 2 mL of a solution of Dimemorfan Phosphate (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(1) Determine the infrared absorption spectrum of Dimemorfan Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 2 mL of a solution of Dimemorfan Phosphate (1 in 100) add 2 to 3 drops of silver nitrate TS: a yellow precipitate is formed, and it dissolves on the addition of dilute nitric acid.

Optical rotation <2.49> [α]D25<br> = 25° + 27° (after drying, 1 g, methanol, 100 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Dimemorphan Phosphate in 100 mL of water: the pH of this solution is between 4.0 and 5.0.

Purity (1) Heavy metals <1.07>-Proceed with 1.0 g of Dimemorfan Phosphate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.12>-Prepare the test solution with 1.0 g of Dimemorfan Phosphate according to Method 3, and perform the test. Use 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).

(3) Related substances-Dissolve 0.10 g of Dimemorfan Phosphate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.07). Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonia solution (28:150:150:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly the plate with Dragendorff's TS for spraying: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105 °C, 3 hours).

Assay Weigh accurately about 0.6 g of Dimemorfan Phosphate, previously dried, dissolve in 100 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.34 mg of C18H25N.H3PO4

Containers and storage Containers—Tight containers.

Dimemorfan Phosphate

ジメモルファンリン酸塩

\[
\text{C}_{18}H_{25}N\cdot H_3\text{PO}_4: 353.39 \\
(98,135,145)-3,17-\text{Dimethylmorphinan monophosphate} [36504-84-4]
\]

Dimemorfan Phosphate, when dried, contains not less than 98.5% of dimemorfan phosphate (C18H25N.H3PO4).

Description Dimemorfan Phosphate occurs as white to pale yellow-white, crystals or crystalline powder. It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 265°C (with decomposition).
Dimenhydrinate

ジメンヒドリナート

\[
\begin{align*}
C_7H_{17}NO.C.HClN.O_2 & : 469.96 \\
2-(Diphénylméthoxy)-N,N-diméthylethylamine & \quad 8-
\end{align*}
\]

Dimenhydrinate, when dried, contains not less than 53.0% and not more than 55.5% of diphenhydramine \( (C_21H_{25}NO \) : 255.36 \), and not less than 44.0% and not more than 47.0% of 8-chlorotheophylline \((C_7H_{17}NO.C.HClN.O_2 \) : 214.61 \).

**Description** Dimenhydrinate occurs as a white crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in chloroform, freely soluble in ethanol (95), and slightly soluble in water and in diethyl ether.

**Identification (1)** Dissolve 0.5 g of Dimenhydrinate in 30 mL of dilute ethanol, add 30 mL of water, and use this solution as the sample solution. Transfer 30 mL of the sample solution to a separator, and add 2 mL of ammonia solution (28). Extract with two 10-mL portions of diethyl ether, combine the diethyl ether extracts, wash the combined extracts with 5 mL of water, and then extract the combined extracts with 15 mL of diluted hydrochloric acid (1 in 100). With this acid, extract perform the following tests.

(i) To 5 mL of this acid extract add 5 drops of Reinecke salt TS: a light red precipitate is produced.

(ii) To 10 mL of this acid extract add 10 mL of 2,4,6-trinitrophenol TS dropwise, and allow to stand for 30 minutes. Collect the precipitate by filtrating, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt between 128°C and 133°C.

(ii) To 30 mL of the sample solution obtained in (1) add 2 mL of dilute sulfuric acid, and cool for 30 minutes. Scratch the inside wall of the container frequently to facilitate crystallization. Filter, and wash the white crystals with a small amount of ice-cooled water. Dry the crystals for 1 hour at 105°C: the crystals melt between 300°C and 305°C with decomposition.

(iii) To 0.01 g of the crystals obtained in (2) add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue shows a yellow-red color. When the dish containing the residue is held over a vessel containing 2 to 3 drops of ammonia TS, the color changes to red-purple, which is discharged on the addition of 2 to 3 drops of sodium hydroxide TS.

(iv) Mix well 0.05 g of the crystals obtained in (2) with 0.5 g of sodium peroxide in a nickel crucible, and heat until the mass melts. Cool, dissolve the melted mass in 20 mL of water, and acidify with dilute nitric acid: the solution responds to Qualitative Tests \( <1.092 \) for chloride.

**Purity (1)** Chloride \( <1.05 \) — Transfer 50 mL of the filtrate obtained in the Assay (2) to a Nessler tube, add 1 mL of nitric acid, and allow to stand for 5 minutes: the turbidity of the solution is not greater than that of the following control solution (not more than 0.044%).

Control solution: Dilute 0.25 mL of 0.01 mol/L hydrochloric acid VS with 6 mL of dilute nitric acid and with water to make 50 mL, add 1 mL of silver nitrate TS, and allow to stand for 5 minutes.

(2) Bromide and iodide—Place 0.10 g of Dimenhydrinate in a glass-stoppered test tube, and add 0.05 g of sodium nitrate, 10 mL of chloroform and 10 mL of dilute hydrochloric acid. Stopper, shake well, and allow to stand: the chloroform layer remains colorless.

**Loss on drying \( <2.41 \) — Not more than 0.5% (3 g, in vacuum, phosphorus (V) oxide, 24 hours).

**Residue on ignition \( <2.44 \) — Not more than 0.3% (1 g).

**Assay (1)** Diphenhydramine—Weigh accurately about 0.5 g of Dimenhydrinate, previously dried, transfer to a 250-mL separator, and add 50 mL of water, 3 mL of ammonia TS and 10 g of sodium chloride. Extract with six 15-mL portions of diethyl ether with shaking, combine the diethyl ether extracts, and wash the combined diethyl ether extracts with three 50-mL portions of water. To the diethyl ether extracts add exactly 25 mL of 0.05 mol/L sulfuric acid VS, and add 25 mL of water. Shake thoroughly, and evaporate the diethyl ether gently. Cool, and titrate the excess sulfuric acid with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl red TS). Perform a blank determination in the same manner, and make any necessary correction.

\[
\text{Each mL of 0.05 mol/L sulfuric acid VS} = 25.54 \text{ mg C}_7\text{H}_3\text{NO}
\]

(2) 8-Chlorotheophylline—Weigh accurately about 0.8 g of Dimenhydrinate, previously dried, transfer to a 200-mL volumetric flask, add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), and heat on a water bath for 5 minutes. Add exactly 25 mL of 0.1 mol/L silver nitrate VS, heat on a water bath for 15 minutes with occasional shaking, cool, and add water to make exactly 200 mL. Allow to stand overnight to settle the precipitate, and filter through a dry filter paper, discarding the first 20 mL of the filtrate. Measure exactly 100 mL of the subsequent filtrate, acidify with nitric acid, add 3 mL of nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination in the same manner, and make any necessary correction.

\[
\text{Each mL of 0.1 mol/L silver nitrate VS} = 21.46 \text{ mg of C}_7\text{H}_3\text{ClN.O}_2
\]

**Containers and storage** Containers—Well-closed containers.

**Dimenhydrinate Tablets**

ジメンヒドリナート錠

Dimenhydrinate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of dimenhydrinate \((C_7H_{17}NO.C.HClN.O_2 \) : 469.96 \).

**Method of preparation** Prepare as directed under Tablets, with Dimenhydrinate.

**Identification (1)** Triturate a quantity of powdered Dimenhydrinate Tablets, equivalent to 0.5 g of Dimenhydrinate, with 25 mL of warm ethanol (95), and filter.
Dilute the filtrate with 40 mL of water, and filter again. Use the filtrate as the sample solution. Transfer 30 mL of the sample solution to a separator, and proceed as directed in the Identification (1) under Dimenhydrinate.

(2) With 30 mL of the sample solution obtained in (1), proceed as directed in the Identification (2), (3) and (4) under Dimenhydrinate.

Dissolution 6.10 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Dimenhydrinate Tablets is not less than 85%.

Start the test with 1 tablet of Dimenhydrinate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 28 μg of dimenhydrinate (C₁₇H₂₃NO₂C₅H₄₂ClN₄O₂), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of dimenhydrinate for assay, previously dried in vacuum using phosphorous (V) oxide as the desiccant for 24 hours, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, Aₐ and Aₕ, of the sample solution and standard solution at 276 nm as directed under Ultraviolet-visible Spectrophotometry 2.2.4.

Dissolution rate (%) with respect to the labeled amount of dimenhydrinate (C₁₇H₂₃NO₂C₅H₄₂ClN₄O₂)

\[ \text{Dissolution rate} = \frac{M_t}{M_s} \times \frac{A_t}{A_s} \times \frac{V'}{V} \times \frac{1}{C} \times 90 \]

Mₜ: Amount (mg) of dimenhydrinate for assay taken

C: Labeled amount (mg) of dimenhydrinate (C₁₇H₂₃NO₂C₅H₄₂ClN₄O₂) in 1 tablet

Assay Weigh accurately, and powder not less than 20 Dimenhydrinate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 g of dimenhydrinate (C₁₇H₂₃NO₂C₅H₄₂ClN₄O₂), transfer to a flask, add 40 mL of ethanol (95%), and heat with swirling on a water bath until the solution just boils. Continue to heat for 30 seconds, and filter through a glass filter (G4). Wash the filter with warm ethanol (95%), transfer the filtrate and washings to a flask, and evaporate the ethanol on a water bath to make 5 mL. Add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), heat the mixture on a water bath for 5 minutes, add exactly 25 mL of 0.1 mol/L silver nitrate VS, and heat on a water bath for 15 minutes with occasional shaking. Transfer the mixture to a 200-mL volumetric flask, using water to rinse the flask, cool, add water to make exactly 200 mL, and proceed as directed in the Assay (2) under Dimenhydrinate.

Each mL of 0.1 mol/L silver nitrate VS = 47.00 mg of C₁₇H₂₃NO₂C₅H₄₂ClN₄O₂

Containers and storage Containers—Well-closed containers.

---

Dimercaprol ジメルカプロール

C₇H₇O₇S₂: 124.23
(2RS)-2,3-Disulfanylp propane-1-ol [59-52-9]

Dimercaprol contains not less than 98.5% and not more than 101.5% of dimercaprol (C₇H₇O₇S₂).

Description Dimercaprol is a colorless or pale yellow liquid. It has a mercaptan-like, disagreeable odor.

It is miscible with methanol and with ethanol (99.5).

It is soluble in peanut oil, and sparingly soluble in water.

It shows no optical rotation.

Identification (1) Add 1 drop of Dimercaprol to a mixture of 1 drop of a solution of cobalt (II) chloride hexahydrate (1 in 200) and 5 mL of water: a yellow-brown color develops.

(2) Determine the infrared absorption spectrum of Dimercaprol as directed in the liquid film method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Refractive index 2.2.4 \( n^0_{D} \): 1.570 – 1.575

Specific gravity 2.2.5 \( d^0_{D} \): 1.238 – 1.248

Purity (1) Clarity and color of solution—Dissolve 1.0 mL of Dimercaprol in 20 mL of peanut oil: the solution is clear and colorless to pale yellow.

(2) Bromide—To 2.0 g of Dimercaprol add 25 mL of dilute potassium hydroxide-ethanol TS, and heat in a water bath under a reflux condenser for 2 hours. Evaporate the ethanol in a current of warm air, add 20 mL of water, and cool. Add a mixture of 10 mL of hydrogen peroxide (30%) and 40 mL of water, boil gently under a reflux condenser for 10 minutes, and filter rapidly after cooling. Wash the residue with two 10-mL portions of water, combine the washings with the filtrate, add 10 mL of dilute nitric acid and exactly 5 mL of 0.1 mol/L silver nitrate VS, and titrate 2.2.5 the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination in the same manner: not more than 1.0 mL of 0.1 mol/L silver nitrate VS is consumed.

(3) Heavy metals 1.07—Proceed with 1.0 g of Dimercaprol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Assay Weigh accurately about 0.15 g of Dimercaprol into a glass-stoppered flask, dissolve in 10 mL of methanol, and titrate 2.2.5 immediately with 0.05 mol/L iodine VS until a pale yellow color is produced. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 6.212 mg of C₇H₇O₇S₂

Containers and storage Containers—Tight containers.

Storage—Not exceeding 5°C.
Dimercaprol Injection

ジメルカプロール注射液

Dimercaprol Injection is an oily solution for injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of dimercaprol (C₃H₆OS₂: 124.23).

Method of preparation Prepare as directed under Injections, with Dimercaprol. Benzyl Benzoate or Benzyl Alcohol may be added to increase the solubility.

Description Dimercaprol Injection is a clear, colorless or light yellow liquid. It has an unpleasant odor.

Extractable volume Measure a volume of Dimercaprol Injection, with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform the test according to Method 1: it meets the requirement.

Foreign insoluble matter Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter Perform the test according to Method 2: it meets the requirement.

Sterility Perform the test according to Method 2: it meets the requirement.

Assay Pipet a volume of Dimercaprol Injection, equivalent to 30 mg of Dimercaprol, and proceed as directed in the Identification (1) under Dimercaprol.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Dimorpholamine in 50 mL of water: the solution is clear and colorless to pale yellow.

(2) Chloride To 20 mL of the solution obtained in (1) add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(3) Sulfate To 10 mL of the solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.005 mol/L sulfuric acid VS (not more than 0.096%).

(4) Heavy metals Proceed with 2.0 g of Dimorpholamine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Related substances—Dissolve 0.20 g of Dimorpholamine in 10 mL of ethanol (99.5), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5) and water (4:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 8 hours).

Residue on ignition Not more than 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Dimorpholamine, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Dimorpholamine, when dried, contains not less than 98.0%, and not more than 101.0% of dimorpholamine (C₈H₁₃N₂O₄).

Description Dimorpholamine is a white to light yellow, crystalline powder, masses or syrupy liquid. It is very soluble in ethanol (99.5) and in acetic anhydride, and soluble in water.

The pH of a solution prepared by dissolving 1.0 g of Dimorpholamine in 10 mL of water is between 6.0 and 7.0. It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Dimorpholamine (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dimorpholamine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Containers and storage Containers—Hermetic containers. Storage—In a cold place.

Dimorpholamine

ジモルホラミン

\[
\begin{align*}
\text{C}_8\text{H}_13\text{N}_2\text{O}_4: & \ 398.54 \\
\text{N,N’-(Ethane-1,2-diyl)bis(N-butylnormoline-4-carboxamide)} & \ [119-48-2]
\end{align*}
\]

Dimorpholamine, when dried, contains not less than 98.0%, and not more than 101.0% of dimorpholamine (C₈H₁₃N₂O₄).

Description Dimorpholamine is a white to light yellow, crystalline powder, masses or syrupy liquid. It is very soluble in ethanol (99.5) and in acetic anhydride, and soluble in water.

The pH of a solution prepared by dissolving 1.0 g of Dimorpholamine in 10 mL of water is between 6.0 and 7.0. It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Dimorpholamine (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dimorpholamine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Dimorpholamine in 50 mL of water: the solution is clear and colorless to pale yellow.

(2) Chloride To 20 mL of the solution obtained in (1) add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(3) Sulfate To 10 mL of the solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.005 mol/L sulfuric acid VS (not more than 0.096%).

(4) Heavy metals Proceed with 2.0 g of Dimorpholamine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Related substances—Dissolve 0.20 g of Dimorpholamine in 10 mL of ethanol (99.5), and use this solution as the sample solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5) and water (4:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 8 hours).

Residue on ignition Not more than 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Dimorpholamine, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Dimorpholamine, when dried, contains not less than 98.0%, and not more than 101.0% of dimorpholamine (C₈H₁₃N₂O₄).

Containers and storage Containers—Hermetic containers. Storage—In a cold place.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Dimorpholamine Injection

ジモルホラミン注射液

Dimorpholamine Injection is an aqueous injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of dimorpholamine (C_{20}H_{33}N_3O_5; 398.54).

Method of preparation Prepare as directed under Injections, with Dimorpholamine.

Description Dimorpholamine Injection is a clear, colorless liquid.

pH: 3.0 – 5.5

Identification (1) To a volume of Dimorpholamine Injection, equivalent to 0.1 g of Dimorpholamine, add 3 drops of Dragendorff’s TS: an orange color develops.

(2) To a volume of Dimorpholamine Injection, equivalent to 50 mg of Dimorpholamine, add 1 mL of dilute hydrochloric acid, and evaporate on a water bath to dryness. Dissolve the residue in 2 mL of hydrochloric acid, boil for 10 minutes under a reflux condenser, and evaporate to dryness on a water bath. Dissolve the residue with 1 mL of water, neutralize with sodium hydroxide TS, and add 0.2 mL of a solution of acetaldehyde (1 in 20), 0.1 mL of sodium pentacyanonitrosyl ferrate (III) TS and 0.5 mL of sodium carbonate TS: a blue color develops.

Bacterial endotoxins (4.0%) Less than 5.0 EU/mg. Perform the test with the sample diluted to 0.15 w/v% with water for bacterial endotoxins test.

Extractable volume (<0.0%) It meets the requirement.

Foreign insoluble matter (<0.05%) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter (<0.07%) It meets the requirement.

Sterility (4.0%) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Pipet a volume of Dimorpholamine Injection, equivalent to about 30 mg of dimorpholamine (C_{20}H_{33}N_3O_5), and add water to make exactly 200 mL. Pipet 1 mL of this solution, shake with exactly 4 mL of the internal standard solution (in vacuum, phosphorus (V) oxide) for 8 hours, and dissolve the residue in 2 mL of hydrochloric acid, boil for 10 minutes under a reflux condenser, and evaporate to dryness on a water bath. Dissolve the residue in 2 mL of hydrochloric acid, and evaporate to dryness. Dissolve the residue with 1 mL of water, neutralize with sodium hydroxide TS, and add 0.2 mL of a solution of acetaldehyde (1 in 20), 0.1 mL of sodium pentacyanonitrosyl ferrate (III) TS and 0.5 mL of sodium carbonate TS: a blue color develops.

System suitability—

Assay solution TS: a blue color develops.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave-length: 216 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and acetonitrile (1:1).

Flow rate: Adjust so that the retention time of dimorpholamine is about 4 minutes.

System performance—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, dimorpholamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dimorpholamine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

Dinoprost

ジノプロスト

C_{20}H_{33}O_{5}: 354.48

Dinoprost contains not less than 98.5% of dinoprost (C_{20}H_{33}O_{5}), calculated on the anhydrous basis.

Description Dinoprost occurs as white, waxy masses or powder, or a clear, colorless to light yellow and viscous liquid. It is odorless.

It is very soluble in N,N-dimethylformamide, freely soluble in methanol, in ethanol (99.5) and in diethyl ether, and very slightly soluble in water.

Identification (1) To 5 mg of Dinoprost add 2 mL of sulfuric acid, and dissolve by shaking for 5 minutes: a dark red color develops. To this solution add 30 mL of sulfuric acid: an orange color develops with a green fluorescence.

(2) Dissolve 1 mg of Dinoprost in 50 mL of diluted sulfuric acid (7 in 10), and warm in a water bath warmed at 50°C for 40 minutes. After cooling, determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Warm Dinoprost at 40°C to effect a liquid, and determine the infrared absorption spectrum of the liquid as directed in the liquid film method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibits similar intensities of absorption at the same wave numbers.

Optical rotation (2.46) [α]_D^20: +24 – +31° (0.2 g, ethanol (99.5), 10 mL, 100 mm).

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Purity (1) Clarity and color of solution—Dissolve 0.20 g of Dinoprost in 5 mL of ethanol (99.5); the solution is clear and colorless to pale yellow.

(2) Related substances—Dissolve 10 mg of Dinoprost in 2 mL of methanol, add water to make 10 mL, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add diluted methanol (1 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of these solutions by the automatic integration method; the total area of the peaks other than dinoprost obtained from the sample solution is not larger than the peak area of dinoprost from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 205 nm).
Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 0.02 mol/L potassium dihydrogenphosphate TS and acetonitrile (5:2).
Flow rate: Adjust so that the retention time of dinoprost is about 20 minutes.

Selection of column: Dissolve 0.01 g each of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in 2 mL of methanol, and add water to make 10 mL. To 1 mL of this solution add diluted methanol (1 in 5) to make 30 mL, proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in this order with the resolution between these peaks being not less than 2.5.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of dinoprost from the standard solution composes 5% to 15% of the full scale.

Time span of measurement: About 1.5 times as long as the retention time of dinoprost, beginning after the solvent peak.

Water (2.48) Not more than 0.5% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately about 50 mg of Dinoprost, dissolve in 30 mL of N,N-dimethylformamide, and titrate <2.50> with 0.02 mol/L tetramethylammonium hydroxide VS under a stream of nitrogen (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.02 mol/L tetramethylammonium hydroxide VS
= 7.090 mg of C₂₀H₂₆O₅

Containers and storage Containers—Tight containers.
Storage—Light-resistant, and in a place not exceeding 5°C.

Diphenhydramine
ジフェンヒドラミン

C₁₇H₂₁NO: 255.35
2-(Diphenylmethoxy)-N,N-dimethylethylamine
[58-73-1]

Diphenhydramine contains not less than 96.0% of diphenhydramine (C₁₇H₂₁NO).

Description Diphenhydramine is a clear, light yellow to yellow liquid. It has a characteristic odor, and has a burning taste at first, followed by a slight sensation of numbness on the tongue. It is miscible with acetic anhydride, with acetic acid (100), with ethanol (95) and with diethyl ether. It is very slightly soluble in water. It is gradually affected by light. Refractive index nD: about 1.55

Boiling point: about 162°C (in vacuum, 0.67 kPa).

Identification (1) To 50 mg of Diphenhydramine add 2 mL of sulfuric acid: an orange-red precipitate is produced immediately, and its color changes to red-brown on standing. Add carefully 2 mL of water to this solution: the intensity of the color changes, but the color tone does not change.

(2) Dissolve 0.1 g of Diphenhydramine in 10 mL of dilute ethanol, add an excess of a saturated solution of 2,4,6-trinitrophenol in dilute ethanol with stirring, and cool in ice. Collect the produced crystals, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt <2.60> between 128°C and 133°C.

Specific gravity <2.56> d₄³₀: 1.013 – 1.020

Purity (1) β-Dimethylaminoethanol—Dissolve 1.0 g of Diphenhydramine in 20 mL of diethyl ether, and extract with two 10-mL portions of water with thorough shaking. Combine the water extracts, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.05 mol/L sulfuric acid VS: no red color develops.

(2) Benzohydrol—Transfer 1.0 g of Diphenhydramine to a separator, dissolve in 20 mL of diethyl ether, and extract with two 25-mL portions of diluted hydrochloric acid (1 in 15) with thorough shaking. Separate the diethyl ether layer, evaporate slowly on a water bath, and dry in a desiccator (in vacuum, silica gel) for 2 hours: the mass of the residue is not more than 20 mg.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Diphenhydramine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Diphenhydramine, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 25.54 mg of C₁₇H₁₂NO

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant, and almost well-filled.

**Diphenhydramine Hydrochloride**

ジフェンヒドラミン塩酸塩

![Chemical Structure](image)

C₁₇H₂₃N₃O.HCl: 291.82
2-(Diphenylmethoxy)-N,N-dimethylethylamine monohydrochloride [147-24-0]

Diphenhydramine Hydrochloride, when dried, contains not less than 98.0% of diphenhydramine hydrochloride (C₁₇H₁₂NO.HCl).

**Description** Diphenhydramine Hydrochloride occurs as white, crystals or crystalline powder. It is odorless, and has a bitter taste, followed by a sensation of numbness on the tongue.

It is very soluble in methanol and in acetic acid (100), freely soluble in water and in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is gradually affected by light.

**Identification**

1. **Determination** the absorption spectrum of a solution of Diphenhydramine Hydrochloride in methanol (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

2. **Determine** the infrared absorption spectrum of Diphenhydramine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

3. **A solution** of Diphenhydramine Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the pH of this solution is between 4.0 and 5.0.

**Melting point**<2.60> 166 – 170°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) **Heavy metals** <1.07>—Proceed with 1.0 g of Diphenhydramine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) **Related substances**—Dissolve 0.20 g of Diphenhydramine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate, methanol and ammonia solution (28:10:4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly iodine TS on the plate: the spots other than the principal spot and the spot on the original point from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (2 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Diphenhydramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100:7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.18 mg of C₁₇H₁₂NO.HCl

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Diphenhydramine and Bromovalerylurea Powder**

To make 1000 g

Prepare as directed under Powders, with the above ingredients.

**Description** Diphenhydramine and Bromovalerylurea Powder occurs as a slightly grayish white powder.

**Identification**

1. **To 0.1 g of Diphenhydramine and Bromovalerylurea Powder add 5 mL of dilute hydrochloric acid, 1 mL of ethanol (95) and 10 mL of water, shake, and filter.** To the filtrate add 10 mL of sodium hydroxide TS, and extract with 10 mL of chloroform. Separate the chloroform layer, add 1 mL of bromophenol blue TS, and shake: a yellow color develops in the chloroform layer (diphenhydramine tannate).

(2) **Shake 0.02 g of Diphenhydramine and Bromovalerylurea Powder with 10 mL of diethyl ether, filter, and evaporate the filtrate on a water bath.** Dissolve the residue in 2 mL of sodium hydroxide TS, and add 5 mL of dimethylglyoxime-thiosemicarbazide TS, and heat on a water bath for 30 minutes: a red color develops (bromovalerylurea).

(3) **Shake 0.3 g of Diphenhydramine and Bromovalerylurea Powder with 5 mL of methanol, filter, and use the filtrate as the sample solution.** Dissolve 0.15 of bromovalerylurea and 0.03 g of diphenhydramine tannate in 5 mL each of methanol, and use the solutions as the standard solution (1) and standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluores-

Diphenhydramine, Phenol and Zinc Oxide Liniment

ジフェンヒドラミン・フェノール・亜鉛華リニメント

Method of preparation

<table>
<thead>
<tr>
<th>Component</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diphenhydramine</td>
<td>20 g</td>
</tr>
<tr>
<td>Phenol and Zinc Oxide Liniment</td>
<td>980 g</td>
</tr>
</tbody>
</table>

To make 1000 g

Dissolve and mix the above ingredients.

Description Diphenhydramine, Phenol and Zinc Oxide Liniment is a white to whitish, pasty mass. It has a slight odor of phenol.

Identification (1) To 3 g of Diphenhydramine, Phenol and Zinc Oxide Liniment add 20 mL of hexane, shake well, and separate the hexane layer. Shake thoroughly the hexane solution with 10 mL of 0.2 mol/L hydrochloric acid. Separate the aqueous layer, and add with sodium hydroxide TS to a pH of 4.6. Add 1 mL of bromophenol blue-potassium biphthalate TS and 10 mL of chloroform, and shake. A yellow color develops in the chloroform layer (diphenhydramine).

(2) Place 1 g of Diphenhydramine, Phenol and Zinc Oxide Liniment in a porcelain crucible, gradually raise the temperature by heating until the mass is charred, and ignite strongly: a yellow color is produced, and disappears on cooling. To the residue add 10 mL of water and 5 mL of dilute hydrochloric acid, shake well, and filter. Add 2 to 3 drops of potassium hexacyanoferrate (II) TS to the filtrate: a white precipitate is produced (zinc oxide).

(3) Shake 0.5 g of Diphenhydramine, Phenol and Zinc Oxide Liniment with 1 mL of water and 5 mL of chloroform, filter, and use the filtrate as the sample solution. Dissolve 0.01 g each of diphenhydramine and phenol in 5 mL each of chloroform, and use these solutions as the standard solution (1) and standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 5 µL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: two spots obtained from the sample solution and each spot from the standard solution (1) and (2) show the same Rf value. Sublime iodine, and spray Dragendorff’s TS evenly upon the plate: the spot from standard solution (1) and the corresponding spot from the sample solution reveal an orange color.

Containers and storage Containers—Well-closed containers. Storage—Light-resistant.
Freeze-dried Diphtheria Antitoxin, Equine

Freeze-dried Diphtheria Antitoxin, Equine, is a preparation for injection which is dissolved before use. It contains diphtheria antitoxin in immunoglobulin of horse origin.

It conforms to the requirements of Freeze-dried Diphtheria Antitoxin, Equine, in the Minimum Requirements for Biological Products.

Description
Freeze-dried Diphtheria Antitoxin, Equine, becomes a colorless or light yellow-brown, clear liquid or a slightly whitish turbid liquid on addition of solvent.

Diphtheria Toxoid

Diphtheria Toxoid is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity. It conforms to the requirements of Diphtheria Toxoid in the Minimum Requirements for Biological Products.

Description
Diphtheria Toxoid is a clear, colorless to light yellow-brown liquid.

Adsorbed Diphtheria Toxoid for Adult Use

Adsorbed Diphtheria Toxoid for Adult Use is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity and very few antigenic substances other than toxoid, and rendered insoluble with aluminum salt.

It conforms to the requirements of Adsorbed Diphtheria Toxoid for Adult Use in the Minimum Requirements of Biological Products.

Description
Adsorbed Diphtheria Toxoid for Adult Use becomes a homogeneous, whitish turbid liquid on shaking.

Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine

Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine is a liquid for injection consisting of a liquid containing the protective antigen of Bordetella pertussis, Diphtheria Toxoid and a liquid containing tetanus toxoid obtained by detoxifying the tetanus toxin with formaldehyde solution without impairing its immunogenicity, to which aluminum is added to make the antigen and the toxoids insoluble.

It conforms to the requirements of Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine in the Minimum Requirements for Biological Products.

Description
Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine becomes a homogeneous, white turbid liquid on shaking.

Adsorbed Diphtheria-Tetanus Combined Toxoid

Adsorbed Diphtheria-Tetanus Combined Toxoid is a liquid for injection containing diphtheria toxoid and tetanus toxoid which are prepared by treating diphtheria toxin and tetanus toxin, respectively, with formaldehyde by a method involving no appreciable loss of the immunogenicity and rendered insoluble by adding aluminum salt.

It conforms to the requirements of Adsorbed Diphtheria-Tetanus Combined Toxoid in the Minimum Requirements for Biological Products.

Description
Adsorbed Diphtheria-Tetanus Combined Toxoid becomes a homogeneous, whitish turbid liquid on shaking.
Dipyridamole

ジピリダモール

\[
\text{C}_{22}\text{H}_{26}\text{N}_{5}\text{O}_{4}: 504.63 \\
2,2',2''-\text{[14,8-Di(piperidin-1-yl)pyrimido[5,4-d]pyrimidine-2,6-diyl]dinitrilo]tetraethanol [58-32-2]}
\]

Dipyridamole, when dried, contains not less than 98.5% of dipyridamole (C_{22}H_{26}N_{5}O_{4}).

**Description** Dipyridamole occurs as yellow, crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in chloroform, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water and in diethyl ether.

**Identification**

1. Dissolve 5 mg of Dipyridamole in 2 mL of sulfuric acid, add 2 drops of nitric acid, and shake: a deep purple color develops.

2. Determine the absorption spectrum of a solution of Dipyridamole in a mixture of methanol and hydrochloric acid (99:1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

3. Determine the infrared absorption spectrum of Dipyridamole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 2.60° 165 – 169°C

**Purity**

1. Clarity and color of solution—Dissolve 0.5 g of Dipyridamole in 10 mL of chloroform: the solution is clear, and shows a yellow color.

2. Heavy metals <1.07>—Proceed with 2.0 g of Dipyridamole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

3. Arsenic <1.11>—Prepare the test solution with 1.0 g of Dipyridamole according to Method 3, and perform the test (not more than 2 ppm).

4. Related substances—Dissolve 50 mg of Dipyridamole in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography, according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than dipyridamole obtained from the sample solution is not larger than the peak area of dipyridamole from the standard solution.

**Operating conditions**

- Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
- Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: Dissolve 0.2 g of potassium dihydrogen phosphate in 200 mL of water, and add 800 mL of methanol.
- Flow rate: Adjust so that the retention time of dipyridamole is about 4 minutes.
- Time span of measurement: About 5 times as long as the retention time of dipyridamole.

**System suitability**

- Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of dipyridamole obtained with 20 µL of this solution is equivalent to 15 to 25% of that with 20 µL of the standard solution.
- System performance: Dissolve 7 mg of Dipyridamole and 3 mg of terphenyl in 50 mL of methanol. When the procedure is run with 20 µL of this solution under the above operating conditions, dipyridamole and terphenyl are eluted in this order with the resolution between these peaks being not less than 5.
- System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dipyridamole is not more than 1.0%.

**Loss on drying** <2.40> Not more than 0.2% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Dipyridamole, previously dried, dissolve in 70 mL of methanol, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 50.46 mg of C_{22}H_{26}N_{5}O_{4}

**Containers and storage**

Containers—Well-closed containers.

Storage—Light-resistant.
Disopyramide

ジソピラミド

C_{37}H_{37}N_{2}O: 339.47
(2RS)-4-Bis(1-methylethyl)amino-2-phenyl-2-(pyridin-2-y1)butanamide

Disopyramide contains not less than 98.5% of disopyramide (C_{37}H_{37}N_{2}O), calculated on the dried basis.

**Description** Disopyramide occurs as white, crystals or crystalline powder.

It is very soluble in methanol and in ethanol, freely soluble in acetic anhydride, in acetic acid (100) and in diethyl ether, and slightly soluble in water.

**Identification** (1) To 1 mL of a solution of Disopyramide in ethanol (95) (1 in 20) add 10 mL of 2,4,6-trinitrophenol TS, and warm: a yellow precipitate is formed. Filter this precipitate, wash with water, and dry at 105°C for 1 hour: the residue melts 172°C between 172°C and 176°C.

(2) Determine the absorption spectrum of a solution of Disopyramide in 0.05 mol/L sulfuric acid-methanol TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Disopyramide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Absorbance** <2.24> $E_{1\text{cm}}^{1\text{cm}}$ (269 nm): 194 – 205 (10 mg, 0.05 mol/L sulfuric acid-methanol TS, 500 mL).

**Purity** (1) Heavy metals <1.07>—Dissolve 1.0 g of Disopyramide in 10 mL of ethanol (95), and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 10 mL of ethanol (95), 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Disopyramide according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.40 g of Disopyramide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 400 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 µL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and ammonia solution (28:45:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, 80°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.25 g of Disopyramide, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 16.97 mg of C_{37}H_{37}N_{2}O

**Containers and storage** Containers—Tight containers.

Distigmine Bromide

ジスチグミン臭化物

C_{37}H_{37}Br_{2}N_{2}O: 576.32
3,3'-(Hexane-1,6-diybis(methyliminocarbonyloxy))bis(1-methylpyridinium) dibromide

Distigmine Bromide contains not less than 98.5% of distigmine bromide (C_{37}H_{37}Br_{2}N_{2}O), calculated on the anhydrous basis.

**Description** Distigmine Bromide occurs as a white crystalline powder.

It is very soluble in water, freely soluble in methanol, in ethanol (95) and in acetic acid (100), and slightly soluble in acetic anhydride.

The pH of a solution of Distigmine Bromide (1 in 100) is between 5.0 and 5.5.

It is slightly hygroscopic.

It is gradually colored by light.

Melting point: about 150°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Distigmine Bromide (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Distigmine Bromide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Distigmine Bromide (1 in 10) add 2 mL of dilute nitric acid: the solution responds to Qualitative Tests <1.09> (1) for bromide.

**Purity** (1) Clarity and color of solution—Dissolve 0.25 g of Distigmine Bromide in 5 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.40 g of Distigmine Bromide in 5 mL of water: the solution is not more intense than the 2 mL of 0.1 mol/L sulfuric acid TS.
Distigmine Bromide. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals $\leq 1.07$: Proceed with 2.0 g of Distigmine Bromide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppb).

(4) Related substances—Dissolve 40 mg of Distigmine Bromide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $\leq 0.07$. Spot 10 $\mu$L each of the sample solution and standard solution on a plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, ethanol (99.5) and acetic acid (100) (8:3:2:1) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Water $\leq 2.48$: Not more than 1.0% (1 g, volumetric titration, direct titration).

Residue on ignition $\leq 2.44$: Not more than 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Distigmine Bromide, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (8:1), and titrate $\leq 2.50$: with 0.1 mol/L perchloric acid VS (potentiometric titration with platinum electrode). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS $= 28.82$ mg of C$_2$H$_3$Br$_2$N$_2$O$_4$.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

**Distigmine Bromide Tablets**

ジスチゲミン塩化物

Distigmine Bromide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$: 576.32).

**Method of preparation** Prepare as directed under Tablets, with Distigmine Bromide.

**Identification** Determine the absorption spectrum of the sample solution obtained in the Assay, as directed under Ultraviolet-visible Spectrophotometry $\leq 2.24$: it exhibits a maximum between 268 nm and 272 nm, and a minimum between 239 nm and 243 nm.

**Uniformity of dosage units $\leq 5.02$** Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Distigmine Bromide Tablets add 30 mL of 0.1 mol/L hydrochloric acid TS, shake for 1 hour, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and filter. Discard the first 20 mL of the filtrate, pipet V mL of the subsequent filtrate, and add 0.1 mol/L hydrochloric acid TS to make exactly V’ mL so that each mL contains about 30 $\mu$g of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$), and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$) $= M_S \times (A_{T1} - A_{T1/2})/(A_{S2} - A_{S3}) \times V'/V \times 1/2$

$M_S$: Amount (mg) of distigmine bromide for assay taken, calculated on the anhydrous basis

**Dissolution $\leq 6.10$** When the test is performed at 75 revolutions per minute according to the Paddle method, using 500 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Distigmine Bromide Tablets is not less than 80%.

Start the test with 1 tablet of Distigmine Bromide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 $\mu$m. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 10 $\mu$g of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$), and use this solution as the sample solution. Separately, weigh accurately about 50 mg of distigmine bromide for assay (separately determine the water $\leq 2.48$ in the same manner as Distigmine Bromide), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 500 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $\leq 2.24$, and determine the absorbances, A$_{T1}$ and A$_{S1}$, at 270 nm, and A$_{T2}$ and A$_{S2}$, at 350 nm.

Dissolution rate (%): with respect to the labeled amount of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$) $= M_S \times (A_{T1} - A_{T2})/(A_{S1} - A_{S2}) \times V'/V \times 1/C \times 10$

$M_S$: Amount (mg) of distigmine bromide for assay taken, calculated on the anhydrous basis

C: Labeled amount (mg) of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 tablets of Distigmine Bromide Tablets. Weigh accurately a portion of the powder, equivalent to about 15 mg of Distigmine Bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$), add 30 mL of 0.1 mol/L hydrochloric acid TS, shake for 1 hour, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and filter. Discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of distigmine bromide for assay (previously determine the water $\leq 2.48$ in the same manner as Distigmine Bromide), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances of the sample solution and standard solution, A$_{T1}$ and A$_{S1}$, at 270 nm and, A$_{T2}$ and A$_{S2}$, at 241 nm as directed under Ultraviolet-visible Spectrophotometry $\leq 2.24$, respectively.

Amount (mg) of distigmine bromide (C$_2$H$_3$Br$_2$N$_2$O$_4$) $= M_S \times (A_{T1} - A_{T1/2})/(A_{S2} - A_{S3}) \times 1/2$

$M_S$: Amount (mg) of distigmine bromide for assay taken, calculated on the anhydrous basis

Containers and storage Containers—Tight containers.
Disulfiram

ジスルフィラム

C₁₀H₁₃N₅S₂: 296.54
Tetraethylthiuram disulfide
[97-77-8]

Disulfiram, when dried, contains not less than 99.0% of disulfiram (C₁₀H₁₃N₅S₂).

Description Disulfiram occurs as white to yellowish white, crystals or crystalline powder.

It is freely soluble in acetone and in toluene, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Disulfiram in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.2.8>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Disulfiram, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.6.6> 70 – 73°C

Purity (1) Heavy metals <1.6.7>—Proceed with 2.0 g of Disulfiram according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Disulfiram according to Method 4, and perform the test (not more than 2 ppm).

(3) Diethylidithiocarbamic acid—Dissolve 0.10 g of Disulfiram in 10 mL of toluene, and shake with 10 mL of diluted sodium carbonate TS (1 in 20). Discard the toluene layer, wash the water layer with 10 mL of toluene, shake with 5 drops of a solution of cupric sulfate (1 in 250) and 2 mL of toluene, and allow to stand: no light yellow color develops in the toluene layer.

(4) Related substances—Dissolve 50 mg of Disulfiram in 40 mL of methanol, add water to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and the standard solution as directed under Liquid Chromatography <2.0.1> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than disulfiram obtained from the sample solution is not larger than the peak area of disulfiram from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and water (7:3).
Flow rate: Adjust so that the retention time of disulfiram is about 8 minutes.

Selection of column: Dissolve 50 mg of Disulfiram and 50 mg of benzophenone in 40 mL of methanol, and add water to make 50 mL. To 1 mL of this solution add the mobile phase to make 200 mL. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of benzophenone and disulfiram in this order with the resolution between these peaks being not less than 4.

Detection sensitivity: Adjust so that the peak height of disulfiram obtained from 10 μL of the standard solution is 15 – 30 mm.

Time span of measurement: About 3.5 times of the retention time of disulfiram.

Loss on drying <2.4.1> Not more than 0.20% (2 g, silica gel, 24 hours).

Residue on ignition <2.4.4> Not more than 0.1% (2 g).

Assay Weigh accurately about 0.2 g of Disulfiram, previously dried, in an iodine bottle, dissolve in 20 mL of acetone, add 1.5 mL of water and 1.0 g of potassium iodide, and dissolve by shaking thoroughly. To this solution add 3.0 mL of hydrochloric acid, stop the bottle tightly, shake, and allow to stand in a dark place for 3 minutes. Add 70 mL of water, and titrate <2.50> with 0.1 mol/L sodium thiosulfate VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS = 14.83 mg of C₁₀H₁₃N₅S₂

Containers and storage Containers—Tight containers.

Dobutamine Hydrochloride

ドブタミン塩酸塩

C₁₆H₂₃NO₄·HCl: 337.84
4-[(1RS)-3-(4-Hydroxyphenyl)-1-methylpropylamino]ethyl]benze-1,2-diol monohydrochloride [49745-95-1]

Dobutamine Hydrochloride, when dried, contains not less than 98.0% of dobutamine hydrochloride (C₁₆H₂₃NO₄·HCl).

Description Dobutamine Hydrochloride occurs as white to very pale orange, crystalline powder or grains.

It is freely soluble in methanol, sparingly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Dobutamine Hydrochloride (1 in 100) shows no optical rotation.

Identification (1) Determine the infrared absorption spec-
A solution of Dobutamine Hydrochloride (1 in 50) responds to Qualitative Tests \(<1.09\) (2) for chloride.

\[
P H \ < 2.54\] Dissolve 1.0 g of Dobutamine Hydrochloride in 100 mL of water: the pH of this solution is between 4.0 and 5.5.

\[
M e l t i n g \ p o i n t \ < 2.60\] 188 – 192°C

\[
P u r i t y \ \(1\)\] Clarity and color of solution—Dissolve 0.5 g of Dobutamine Hydrochloride in 30 mL of water: the solution is clear and colorless.

\[
(2) \] Heavy metals \(<1.07\)—Dissolve 1.0 g of Dobutamine Hydrochloride in 40 mL of water by warming, cool, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add water to make 50 mL (not more than 20 ppm).

\[
(3) \] Related substances—Dissolve 0.10 g of Dobutamine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.60\). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and formic acid (78:22:5) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

\[
L o s s \ o n \ d r y i n g \ < 2.41\] Not more than 0.30% (1 g, 105°C, 3 hours).

\[

\[
H_{24}C_{30}H_{42}O_{14}.3H_2O: 861.93
\]

\[
\]

Docetaxel Hydrate contains not less than 97.5% and not more than 102.0% of docetaxel (C_{30}H_{42}N_{14}O_{14}; 807.88), calculated on the anhydrous and residual solvent-free basis.

\[
D e s c r i p t i o n\] Docetaxel Hydrate occurs as a white crystalline powder.

It is freely soluble in \(N,N\)-dimethylformamide and in ethanol (99.5), soluble in methanol and in dichloromethane, and practically insoluble in water.

It decomposes on exposure to light.

Identification (1) Determine the absorption spectrum of a solution of Docetaxel Hydrate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.25\>\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Docetaxel Hydrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Dissolve 60 mg of Docetaxel Hydrate in 1 mL of dichloromethane. Perform the test with this solution as directed in the solution method under Infrared Spectrophotometry \(<2.25\>\) using a fixed cell composed of potassium bromide optical plates with the cell length of 0.1 mm, and compare the spectrum with the Reference Spectrum or the spectrum of Docetaxel Hydrate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.
Optical rotation $<2.4^\circ$: $[\alpha]_D^{20} = -39 - 41\ ^\circ$ (0.2 g calculated on the anhydrous and residual solvent-free basis, methanol, 20 mL, 100 mm).

Purity (1) Heavy metals $<1.0\%$—Proceed with 1.0 g of Docetaxel Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Perform the test with 10 $\mu$L of the sample solution obtained in the Assay, as directed under Liquid Chromatography $<2.0\%$ according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of each peak by the area percentage method: the amount of each peak, having the relative retention time of about 0.97, about 1.08, and about 1.13 to docetaxel, is not more than 0.50%, not more than 0.30%, and not more than 0.30%, respectively, the amount of each peak other than docetaxel and the peaks mentioned above is not more than 0.10%, and the total amount of the peaks other than docetaxel is not more than 1.0%. For the area of the peak, having the relative retention time of about 0.97 to docetaxel, multiply the correction factor 1.6.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: For 39 minutes after injection, beginning after the solvent peak.

System suitability—
Test for required detectability: To 1 mL of the sample solution add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make 100 mL. To 1 mL of this solution add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make 10 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make exactly 10 mL. Confirm that the peak area of docetaxel obtained with 10 $\mu$L of this solution is equivalent to 35 to 65% of that with 10 $\mu$L of the solution for system suitability test.

System performance: When the procedure is run with 10 $\mu$L of the solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of docetaxel are not less than 100,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of docetaxel is not more than 1.0%.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

**Docetaxel Injection**

ドセタキセル注射液

Docetaxel Injection is a hydrophilic injection. It contains not less than 93.0% and not more than 105.0% of the labeled amount of docetaxel ($C_{43}H_{53}NO_{43}$: 807.88).

Method of preparation Prepare as directed under Injections, with Docetaxel Hydrate.

Description Docetaxel Injection occurs as a clear and pale yellow to orange-yellow, liquid.

Identification To a volume of Docetaxel Injection, equivalent to 20 mg of docetaxel ($C_{43}H_{53}NO_{43}$), add 50 mL of methanol, and use this solution as the sample solution. Separately, dissolve 4 mg of docetaxel hydrate in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.0\%$. Spot 10 $\mu$L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Then develop the plate with a mixture of ethyl acetate, heptane and ethanol (99.5) (12:3:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the RI value of the spot from the sample solution and the standard solution is the same.
pH  Being specified separately when the drug is granted approval based on the Law.

Purity  Related substances—Perform the test with 20 μL of the sample solution obtained in the Assay, as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the amount of each peak, having the relative retention time of about 0.27, about 1.05, about 1.08, about 1.13, and about 1.18 to docetaxel, is not more than 0.30%, not more than 1.5%, not more than 1.5%, not more than 0.50%, and not more than 0.50%, respectively. The amount of each peak other than docetaxel, the peak having the relative retention time of about 0.97 and the peaks mentioned above is not more than 0.20%, and the total amount of the peaks other than docetaxel and the peak having the relative retention time of about 0.97 is not more than 3.5%. For the area of the peak, having the relative retention time of about 0.27 to docetaxel, multiply the correction factor 0.67.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay under Docetaxel Hydrate.
Time span of measurement: For 39 minutes after injection, beginning after the solvent peak.
System suitability—
Test for required detectability: To 1 mL of the sample solution add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make 100 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make exactly 100 mL. Confirm that the peak area of docetaxel obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the solution for system suitability test.
System performance: When the procedure is run with 20 μL of the solution for system suitability test under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of docetaxel are not less than 100,000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of docetaxel is not more than 1.0%.

Containers and storage  Containers—Hermetic containers.
Storage—Light-resistant.

Docetaxel for Injection  注射用ドセタキセル

Docetaxel for Injection is a preparation for injection which is dissolved before use.
It contains not less than 93.0% and not more than 105.0% of the labeled amount of docetaxel (C43H53NO14: 807.88).

Method of preparation  Prepare as directed under Injections, with Docetaxel Hydrate.

Description  Docetaxel for Injection occurs as a clear and yellow to orange-yellow, viscous liquid.

Identification  To an amount of Docetaxel for Injection, equivalent to 20 mg of docetaxel (C43H53NO14), add 50 mL of methanol, and use this solution as the sample solution. Separately, dissolve 4 mg of docetaxel hydrate in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Then develop the plate with a mixture of ethyl acetate, heptane and ethanol (99.5) (12:3:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the Rf value of the spot obtained from the sample solution and the standard solution is the same.

pH  Being specified separately when the drug is granted approval based on the Law.

Purity  Related substances—Perform the test with 20 μL of the sample solution obtained in the Assay, as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the
area percentage method: the amount of each peak, having the relative retention time of about 0.27, about 1.05, about 1.08, about 1.13, and about 1.18 to docetaxel, is not more than 0.30%, not more than 1.3%, not more than 1.5%, not more than 0.50%, and not more than 0.50%, respectively, the amount of each peak other than docetaxel, the peak having the relative retention time of about 0.97 and the peaks mentioned above is not more than 0.20%, and the total amount of the peaks other than docetaxel and the peak having the relative retention time of about 0.97 is not more than 3.5%. For the area of the peak, having the relative retention time of about 0.27 to docetaxel, multiply the correction factor 0.67.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay under Docetaxel Hydrate.

Time span of measurement: For 39 minutes after injection, beginning after the solvent peak.

System suitability—

Test for required detectability: To 1 mL of the sample solution add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make 100 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make exactly 100 mL. Confirm that the peak area of docetaxel obtained with 20 \( \mu L \) of this solution is equivalent to 3.5 to 6.5% of that with 20 \( \mu L \) of the solution for system suitability test.

System performance: When the procedure is run with 20 \( \mu L \) of the solution for system suitability test under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of docetaxel are not less than 100,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of docetaxel is not more than 2.0%.

Bacterial endotoxins \(<4.01\) Less than 2.5 EU/mg.

Uniformity of dosage units \(<6.02\) It meets the requirement of the Mass variation test. (T: 120.0%).

Foreign insoluble matter \(<6.06\) Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter \(<6.07\) It meets the requirement.

Sterility \(<4.06\) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Weigh accurately an amount of Docetaxel for Injection, equivalent to about 20 mg of docetaxel \((C_{22}H_{24}ClN_{5}O_{3})\), add 5 mL of ethanol (99.5), further add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of Docetaxel RS (separately determine the water \(<2.48\) and the residual solvent in the same manner as Docetaxel Hydrate), dissolve in 20 mL of ethanol (99.5), add a mixture of water, acetonitrile for liquid chromatography and acetic acid (100) (1000:1000:1) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine the peak areas, \( A_{T} \) and \( A_{S} \), of docetaxel in each solution.

Amount (mg) of docetaxel \((C_{22}H_{24}ClN_{5}O_{3})\) in 1 mL of Docetaxel for Injection

\[ M_{S}: \text{Amount (mg) of Docetaxel RS taken, calculated on the anhydrous and residual solvent-free basis} \]

\[ M_{T}: \text{Amount (mg) of Docetaxel for Injection taken} \]

\[ d: \text{Density (g/mL) of Docetaxel for Injection} \]

Operating conditions—

Proceed as directed in the operating conditions in the Assay under Docetaxel Hydrate.

System suitability—

System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of docetaxel are not less than 100,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of docetaxel is not more than 1.0%.

Containers and storage

Containers—Hermetic containers. Storage—Light-resistant.

Domperidone

Domperidone, when dried, contains not less than 99.0% and not more than 101.0% of domperidone \((C_{22}H_{24}ClN_{5}O_{3})\).

Description

Domperidone occurs as a white to pale yellow, crystalline powder or powder. It is freely soluble in acetic acid (100), slightly soluble in methanol and in ethanol (99.5), very slightly soluble in 2-propanol, and practically insoluble in water.

Melting point: about 243°C (with decomposition).

Identification

(1) Determine the absorption spectrum of a solution of Domperidone in a mixture of 2-propanol and 0.1 mol/L hydrochloric acid TS (9:1) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Domperidone as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave
numbers.

**Purity (1)** Heavy metals $<1.0\%$—Proceed with 2.0 g of Domperidone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Domperidone in 100 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions, and determine each peak area of each solution by the automatic integration method: the area of each peak other than domperidone obtained from the sample solution is not larger than 1/2 times the peak area of domperidone from the standard solution. Furthermore, the total area of the peaks other than domperidone is not larger than the peak area of domperidone from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 287 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.5 of this solution with a solution prepared by dissolving 2.31 g of phosphoric acid in water to make 1000 mL. To 500 mL of this solution add 500 mL of methanol.
Flow rate: Adjust so that the retention time of domperidone is about 9 minutes.
Time span of measurement: About 4 times as long as the retention time of domperidone, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Pipet 2 mL of the standard solution, and add methanol to make exactly 5 mL. Confirm that the peak area of domperidone obtained with 10 $\mu$L of this solution is equivalent to 30 to 50% of that with 10 $\mu$L of the standard solution.

System performance: Dissolve 10 mg of Domperidone and 20 mg of ethyl parahydroxybenzoate in 100 mL of methanol. When the procedure is run with 10 $\mu$L of this solution under the above operating conditions, domperidone and ethyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of domperidone is not more than 3.0%.

**Loss on drying** $<2.41>$—Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** $<2.44>$—Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Domperidone, previously dried, dissolve in 50 mL of acetic acid (100), and titrate $<2.50d>$ with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS $= 42.59$ mg of $C_{22}H_{23}ClIN_{2}O_{3}$

**Containers and storage** Containers—Well-closed contain-

ers.

**Storage**—Light-resistant.

**Donepezil Hydrochloride**

**General**

Determination of infrared absorption spectrum of Donepezil Hydrochloride occurs as a white crystalline powder.

It is soluble in water, and slightly soluble in ethanol (99.5). A solution of Donepezil Hydrochloride (1 in 100) shows no optical rotation.

Donepezil Hydrochloride shows crystal polymorphism.

**Identification (1)** Determine the absorption spectrum of a solution of Donepezil Hydrochloride (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Donepezil Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Donepezil Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum or the spectrum of Donepezil Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, recrystallize the sample and the RS according to the method otherwise specified, filter and dry the crystals, and perform the test with the crystals.

(3) A solution of Donepezil Hydrochloride (1 in 50) responds to Qualitative Tests $<1.099>$ (2) for chloride.

**Purity (1)** Heavy metals $<1.0\%$—To 1.0 g of Donepezil Hydrochloride in a porcelain or platinum crucible add 5 mL of sulfuric acid, incinerate by heating gradually, then incinerate by ignition between 500 and 600°C. If a carbonized residue still retains, moisten the residue with a little amount of sulfuric acid, and incinerate again by ignition between 500 and 600°C. After cooling, dissolve the residue with 3 mL of hydrochloric acid, then evaporate to dryness on a water bath or hot plate, and dissolve the residue with 10 mL of water by warming. Then, proceed as directed in Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Donepezil Hydrochloride in 25 mL of the mobile phase. To 10 mL of this solution add the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add the mobile phase to make exactly 100
mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than donepezil obtained from the sample solution is not larger than the peak area of donepezil from the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of donepezil, beginning after the solvent peak.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Containers and storage**  Containers—Well-closed containers.

---

**Donepezil Hydrochloride Fine Granules**

Donepezil Hydrochloride Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of donepezil hydrochloride (C$_{29}$H$_{39}$NO$_{3}$.HCl: 415.95).

**Method of preparation**  Prepare as directed under Granules, with Donepezil Hydrochloride.

**Identification**  To 2.5 mL of the sample solution obtained in the Assay add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24> : it exhibits maxima between 228 nm and 232 nm, between 269 nm and 273 nm, and between 313 nm and 317 nm.

**Uniformity of dosage units** <6.02>  Perform the test according to the following method: the Donepezil Hydrochloride Fine Granules in single-dose packages meet the requirement of the Content uniformity test.

To the total amount of the content of 1 package of Donepezil Hydrochloride Fine Granule add exactly V mL of 0.1 mol/L hydrochloric acid TS so that each mL contains about 0.2 mg of donepezil hydrochloride (C$_{29}$H$_{39}$NO$_{3}$.HCl), disperse the particles by sonication with occasional shaking, and sonicate for a further 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS, (separately determine the water <2.48> in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL. Pipet 5 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_1$ and $A_S$, of donepezil in each solution.

Amount (mg) of donepezil hydrochloride (C$_{29}$H$_{39}$NO$_{3}$.HCl) = $M_S \times A_1/A_S$

$M_S$: Amount (mg) of Donepezil Hydrochloride RS taken, calculated on the anhydrous basis

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 271 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2.5 g of sodium 1-decansulfonate in 650 mL of water, and add 350 mL of acetonitrile and 1 mL of perchloric acid.

Flow rate: Adjust so that the retention time of donepezil is about 11 minutes.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.
area of donepezil is not more than 1.0%.

**Dissolution** 6.10  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Donepezil Hydrochloride Fine Granules is not less than 80%.

Start the test with an accurately weighed amount of Donepezil Hydrochloride Fine Granules, equivalent to about 3 mg of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 55 mg of Donepezil Hydrochloride RS (separately determine the water 2.48 in the same manner as Donepezil Hydrochloride), and dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 50 mL. Pipet 3 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine the peak areas, A_{T} and A_{5}, of donepezil in each solution.

Dissolution rate (%) with respect to the labeled amount of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl) = \[ M_{5} = \frac{M_{T} \times A_{T} \times A_{5} \times (1/C \times 27/5)}{S} \]

M_{5}: Amount (mg) of Donepezil Hydrochloride RS taken, calculated on the anhydrous basis
M_{T}: Amount (mg) of Donepezil Hydrochloride Fine Granules taken
C: Labeled amount (mg) of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl) in 1 g

**Operating conditions—**
Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.
Mobile phase: A mixture of water, acetonitrile and perchloric acid (650:350:1).
Flow rate: Adjust so that the retention time of donepezil is about 4 minutes.

**System suitability—**
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.
Storage—Light-resistant.

### Donepezil Hydrochloride Tablets

Donepezil Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl: 415.95).

**Method of preparation** Prepare as directed under Tablets, with Donepezil Hydrochloride.

**Identification** To 2.5 mL of the sample solution obtained in the Assay add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits maxima between 228 nm and 232 nm, between 269 nm and 273 nm, and between 313 nm and 317 nm.

**Uniformity of dosage units** 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Donepezil Hydrochloride Tablets add exactly V mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) so that each mL contains about 0.2 mg of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl), disperse by sonication. Shake until the tablet is disintegrated, and sonicate for a further 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately, determine the water 2.48 in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL. Pipet 5 mL of this solution, add a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL. Pipet 5 mL of this solution, add a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make
exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, A_T and A_S, of donepezil in each solution.

**Amount (mg) of donepezil hydrochloride (C_{24}H_{30}NO_{3}.HCl)**

\[ M_S = \frac{m_S}{A_T/A_S \times V/250} \]

**M_S**: Amount (mg) of Donepezil Hydrochloride RS taken, calculated on the anhydrous basis

**Operating conditions**

Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

**System suitability**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Dissolution (6.6.2)** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Donepezil Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Donepezil Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 3.3 μg of donepezil hydrochloride (C_{24}H_{30}NO_{3}.HCl), and use this solution as the sample solution. Separately, weigh accurately about 55 mg of Donepezil Hydrochloride RS (separately determine the water \(2.48\%\) in the same manner as Donepezil Hydrochloride), and dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately, determine the water \(2.48\%\) in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL. Pipet 10 mL of this solution, add a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, A_T and A_S, of donepezil in each solution.

**Amount (mg) of donepezil hydrochloride (C_{24}H_{30}NO_{3}.HCl)**

\[ M_S = \frac{m_S}{A_T/A_S \times V/250} \]

**M_S**: Amount (mg) of Donepezil Hydrochloride RS taken, calculated on the anhydrous basis

**Operating conditions**

Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

**System suitability**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Assay** Accurately weigh the mass of not less than 20 Donepezil Hydrochloride Tablets and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of donepezil hydrochloride (C_{24}H_{30}NO_{3}.HCl), add 30 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1), disperse by sonicating, and add a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately, determine the water \(2.48\%\) in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, A_T and A_S, of donepezil in each solution.

**Amount (mg) of donepezil hydrochloride (C_{24}H_{30}NO_{3}.HCl)**

\[ M_S = \frac{m_S}{A_T/A_S \times 2/5} \]

**M_S**: Amount (mg) of Donepezil Hydrochloride RS taken, calculated on the anhydrous basis

**Operating conditions**

Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

**System suitability**

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Dopamine Hydrochloride

ドパミン塩酸塩

C₆H₁₁NO₂.HCl: 189.64
4-(2-Aminoethyl)benzene-1,2-dioli monohydrochloride [62-31-7]

Dopamine Hydrochloride, when dried, contains not less than 98.5% of dopamine hydrochloride (C₆H₁₁NO₂.HCl).

**Description** Dopamine Hydrochloride occurs as white, crystals or crystalline powder.

It is freely soluble in water and in formic acid, and sparingly soluble in ethanol (95).

Melting point: about 248°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Dopamine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry. Perform the test with 0.8 g of Dopamine Hydrochloride, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dopamine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry. Prepare the test solution with 1.0 g of Dopamine Hydrochloride. Prepare the control solution with 2.0 mL of Standard Lead Solution. The test solution and control solution exhibit similar absorption intensities at the same wave numbers.

(3) A solution of Dopamine Hydrochloride (1 in 50) responds to Qualitative Tests (1.099) (1) for chloride.

**pH** \( <2.54 \) Dissolve 1.0 g of Dopamine Hydrochloride in 50 mL of water: the pH of this solution is between 4.0 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Dopamine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate \( \text{less than 2.24} \) Perform the test with 0.8 g of Dopamine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS: it exhibits a maximum between 278 nm and 282 nm.

(3) Heavy metals \( \text{less than 8.01} \) Proceed with 1.0 g of Dopamine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic \( \text{less than 0.1 ppm} \) Prepare the test solution with 1.0 g of Dopamine Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.1 g of Dopamine Hydrochloride in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 250 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Develop the plate with a mixture of 1-propanol, water and acetic acid (100) (16:8:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat the plate at 90°C for 10 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \( \text{<2.4%} \) Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** \( \text{<2.4%} \) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Dopamine Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 15 minutes. After cooling, add 50 mL of acetic acid (100), and titrate \( \text{<2.50} \) the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform the blank determination in the same manner.

Each mL of 0.1 mol/L perchloric acid VS = 18.96 mg of C₆H₁₁NO₂.HCl

**Containers and storage** Containers—Tight containers.

Dopamine Hydrochloride Injection

ドパミン塩酸塩注射液

Dopamine Hydrochloride Injection is an aqueous injection.

It contains not less than 97.0% and not more than 103.0% of the labeled amount of dopamine hydrochloride (C₆H₁₁NO₂.HCl: 189.64).

**Method of preparation** Prepare as directed under Injections, with Dopamine Hydrochloride.

**Description** Dopamine Hydrochloride Injection occurs as a clear, colorless liquid.

**Identification** To a volume of Dopamine Hydrochloride Injection, equivalent to 0.04 g of Dopamine Hydrochloride, add 0.1 mol/L hydrochloric acid TS to make 100 mL. To 5 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 278 nm and 282 nm.

**pH** \( \text{<2.54} \) 3.0 – 5.0

**Bacterial endotoxins** \( \text{<0.1 EU/mg} \) It meets the requirement.

**Extractable volume** \( \text{<6.0%} \) It meets the requirement.

**Foreign insoluble matter** \( \text{<6.0%} \) Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** \( \text{<6.0%} \) It meets the requirement.

**Sterility** \( \text{<6.0%} \) Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** To an exact volume of Dopamine Hydrochloride Injection, equivalent to about 30 mg of dopamine hydrochloride (C₆H₁₁NO₂.HCl), add the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of dopamine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution.
Doripenem Hydrate

Doripenem Hydrate contains not less than 970 µg (potency) and not more than 1020 µg (potency) per mg, calculated on the anhydrous basis. The potency of Doripenem Hydrate is expressed as mass (potency) of doripenem (C₁₇H₂₃N₅O₆S₂): 420.50.

Description Doripenem Hydrate occurs as a white to pale yellow-brown-crystalline powder. It is sparingly soluble in water, slightly soluble in methanol, and practically insoluble in ethanol (99.5).

It is gradually colored to pale yellow-brown-white by light.

Identification (1) Determine the absorption spectrum of a solution of Doripenem Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doripenem RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doripenem Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Doripenem RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.45> [α]D₁₀: +33° ± 38° (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH <2.5> Dissolve 0.3 g of Doripenem Hydrate in 30 mL of water: the pH of the solution is between 4.5 and 6.0.

Purity (1) Clarity and color of solution—Dissolve 0.2 g of Doripenem Hydrate in 20 mL of water, and perform the test with this solution as directed under Turbidity Measurement <2.61>: the solution is clear. Perform the test with this solution according to Method 2 under Methods for Color Matching <2.65>: the solution is not more colored than Matching Fluid Y4.

(2) Heavy metals <1.07>—Moisten 1.0 g of Doripenem Hydrate with sulfuric acid, cover loosely, and heat gently to carbonize. Then proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances (i)—Dissolve 20 mg of Doripenem Hydrate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the peak areas of related substance A, having the relative retention time of about 2.2 to doripenem, related substance B, having the relative retention time of about 2.5, and related substance C, having the relative retention time of about 3.2, obtained from the sample solution, are not larger than 1/10 times the peak area of doripenem from the standard solution, and the area of the peak other than doripenem, the peaks mentioned above and the peak having the relative retention time of about 2.1, from the sample solution, is not larger than 1/20 times the peak area of doripenem from the standard solution. Furthermore, the total area of the peaks other than doripenem and the peak having the relative retention time of about 2.1 from the sample solution is not larger than 1/2 times the peak area of doripenem from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave-length: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A: Dissolve 2.04 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust to pH 5.6 – 5.7 with a solution prepared by dissolving 2.61 g of dipotassium hydrogen phosphate in water to make 1000 mL. To 970 mL of this solution add 30 mL of acetonitrile for liquid chromatography.

Optional Monographs / Doripenem Hydrate 887

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Mobile phase B: Dissolve 2.04 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust to pH 5.6 – 5.7 with a solution prepared by dissolving 2.61 g of dipotassium hydrogen phosphate in water to make 1000 mL. To 700 mL of this solution add 300 mL of acetonitrile for liquid chromatography.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>

Flow rate: 1.0 mL per minute.

Time span of measurement: For 55 minutes after injection, beginning after the peak having the relative retention time of about 0.2 to doripenem.

System suitability—

Test for required detectability: Pipet 1.5 mL of the standard solution, and add water to make exactly 50 mL. Confirm that the peak area of doripenem obtained with 20 μL of this solution is equivalent to 2.1 to 3.9% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doripenem is not less than 0.95%.

(ii) Dissolve 20 mg of Doripenem Hydrate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the areas of the peaks, having the relative retention time of about 1.8, about 2.2 and about 2.3 to doripenem, obtained from the sample solution are not larger than 1/20, 7/100 and 1/20 times the peak area of doripenem from the standard solution, respectively.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 310 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase A: To 11 mL of perchloric acid add water to make 500 mL. To 100 mL of this solution add water to make 1000 mL. To 600 mL of this solution add 100 mL of water, and adjust to pH 1.9 – 2.0 with a solution prepared by adding water to 2.81 g of sodium perchlorate monohydrate to make 1000 mL. To 900 mL of this solution add 100 mL of acetonitrile.

Mobile phase B: To 11 mL of perchloric acid add water to make 500 mL. To 100 mL of this solution add water to make 1000 mL. To 600 mL of this solution add 100 mL of water, and adjust to pH 1.9 – 2.0 with a solution prepared by adding water to 2.81 g of sodium perchlorate monohydrate to make 1000 mL. To 300 mL of this solution add 200 mL of acetonitrile.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>

Flow rate: 0.8 mL per minute.
System suitability—
Test for required detectability: Pipet 2.5 mL of the standard solution, and add water to make exactly 50 mL. Confirm that the peak area of doripenem obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doripenem are not less than 15,000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 3 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doripenem is not more than 0.95%.

Water <2.48> 4.0–5.0% (0.3 g, volumetric titration, back titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately amounts of Doripenem Hydrate and Doripenem RS (separately determine the water <2.48> in the same manner as Doripenem Hydrate), equivalent to about 25 mg (potency), dissolve each in water to make exactly 200 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A3, of doripenem in each solution.

Amount [μg (potency)] of doripenem (C15H23N5O8S) = Ms × A1/A3 × 1000
Ms: Amount [mg (potency)] of Doripenem RS taken, calculated on the anhydrous basis

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 300 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Adjust the pH of 90 mL of 0.02 mol/L potassium dihydrogen phosphate TS to pH 5.6–5.7 with a solution prepared by dissolving 3.48 g of dipotassium hydrogen phosphate in water to make 1000 mL. To 100 mL of this solution add water to make exactly 1000 mL. To 970 mL of this solution add 30 mL of acetonitrile.

Flow rate: Adjust so that the retention time of doripenem is about 15 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doripenem are not less than 5000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doripenem is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—At a temperature between 2°C and 8°C.

Others
Related substance A: (4R,5S,6S)-3-[(3S,5S)-5-[(N-(E)-

(Dimethylamino)methylene)sulfamoyl]amino)methyl] pyrrolidin-3-ylsulfanyl]-6-[(1R)-1-hydroxyethyl]-4-methyl-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid

Related substance B: (1S,4S,5S,6R)-4-[(1R)-1-Hydroxyethyl]-8-[(4R,5S,6S)-6-[(1R)-1-hydroxyethyl]-4-methyl-7-oxo-3-[(3S,5S)-5-[(sulfamoylamino)methyl]pyrrolidin-3-ylsulfanyl]-1-azabicyclo[3.2.0]hept-2-ene-2-carbonyl]-6-methyl-3-oxo-1-[(3S,5S)-5-[(sulfamoylamino)methyl]pyrrolidin-3-ylsulfanyl]-2-oxa-8-azabicyclo[3.2.1]octane-1-carboxylic acid

Related substance C: (4R,5S,6S)-3-[(3S,5S)-5-[(N-(1,1-Dimethylethyl)sulfamoyl]amino)methyl]pyrrolidin-3-ylsulfanyl]-6-[(1R)-1-hydroxyethyl]-4-methyl-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid

Related substance D: (2S,3R,4S)-2-[(1S,2R)-1-Carboxy-2-hydroxypropyl]-3-methyl-4-[(3S,5S)-5-[(sulfamoylamino)methyl]pyrrolidin-3-ylsulfanyl]-3,4-dihydro-2H-pyrrole-5-carboxylic acid

Doripenem for Injection

注射用ドリペネム

Doripenem for Injection is a preparation for injection, which is dissolved before use.

It contains not less than 95.0% and not more than 105.0% of the labeled potency of doripenem (C15H23N5O8S): 420.50.

Method of preparation Prepare as directed under Injections, with Doripenem Hydrate.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Description  Doripenem for Injection occurs as a white to pale yellow-brown-white crystalline powder.

Identification  Proceed as directed in the Identification (2) under Doripenem Hydrate.

pH  \( < 2.5 \)  Dissolve an amount of Doripenem for Injection, equivalent to 0.3 g (potency) of Doripenem Hydrate, in 30 mL of water: the pH of the solution is between 4.5 and 6.0.

Purity  (1) Clarity and color of solution—Dissolve an amount of Doripenem for Injection, equivalent to 0.2 g (potency) of Doripenem Hydrate in 20 mL of water, and proceed as directed in the Purity (1) under Doripenem Hydrate.

(2) Related substances—(i) Dissolve an amount of Doripenem for Injection, equivalent to 20 mg (potency) of Doripenem Hydrate, in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \( < 2.01 \) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than doripenem and the peak having the relative retention time of about 2.1 to doripenem, related substance A having the relative retention time of about 2.2, related substance B having the relative retention time of about 2.5 and related substance C having the relative retention time of about 3.2, obtained from the sample solution, is not larger than 1/10 times the peak area of doripenem from the standard solution, and the total area of the peaks other than doripenem and the peak mentioned above from the sample solution is not larger than 1/2 times the peak area of doripenem from the standard solution.

Operational conditions—
Proceed as directed in the operating conditions in the Purity (3) (i) under Doripenem Hydrate.

System suitability—
Test for required detectability: Pipet 2.5 mL of the standard solution, and add water to make exactly 50 mL. Confirm that the peak area of doripenem obtained with 20 \( \mu L \) of this solution is equivalent to 3.5 to 6.5% of that with 20 \( \mu L \) of the standard solution.

System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doripenem are not less than 3000 and 0.7 to 1.3, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doripenem is not more than 2.0%.

Water  \( < 2.48 \)  4.0 – 5.0% (0.3 g, volumetric titration, back titration).

Bacterial endotoxins  \( < 4.01 \)  Less than 0.25 EU/mg (potency).

Uniformity of dosage units  \( < 6.02 \)  It meets the requirement of the Mass variation test.

Foreign insoluble matter  \( < 6.06 \)  Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter  \( < 6.07 \)  It meets the requirement.

Sterility  \( < 4.06 \)  Perform the test according to the Membrane filtration method: it meets the requirement.

Assay  Weigh accurately the mass of the contents of not less than 10 containers of Doripenem for Injection. Weigh accurately an amount of the contents, equivalent to about 25 mg (potency) of Doripenem Hydrate, dissolve in water to make exactly 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg (potency) of Doripenem RS (separately determine the water \( < 4.0 \) in the same manner as Doripenem Hydrate), dissolve in water to make exactly 200 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Doripenem Hydrate.

Amount [\( \mu g \) (potency)] of doripenem \((C_{15}H_{25}N_7O_9S_2)\)
\[
= M_{S} \times A_{T}/A_{S} \times 1000
\]

\( M_{S} \): Amount [\( \mu g \) (potency)] of Doripenem RS taken, calculated on the anhydrous basis

Containers and storage  Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Others  Related substances A, B, C and D: Refer to them described in Doripenem Hydrate.
Dorzolamide Hydrochloride

Doruza
d Honda

\[C_{10}H_{16}N_{2}O_{2}S\cdot HCl: 360.90\]

(45,65)-4-Ethylamino-6-methyl-5,6-dihydro-

4H-thieno[2,3-b]thiopyran-2-sulfonamide 7,7-dioxide

monohydrochloride

[130693-82-2]

Dorzolamide Hydrochloride contains not less than 99.0% and not more than 101.0% of dorzola-

mide hydrochloride \((C_{10}H_{16}N_{2}O_{2}S \cdot HCl)\), calculated on the anhydrous basis.

Description Dorzolamide Hydrochloride occurs as a white crystalline powder.

It is soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol (99.5).

It dissolves in solutions of ammonia solution (28) (13 in 400).

Optical rotation \([\alpha]_{D}^{25}: -16.0 \rightarrow -17.5^\circ\) (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

Dorzolamide Hydrochloride shows crystal polymorphism.

Identification (1) Determine the absorption spectrum of a solution of Dorzolamide Hydrochloride in a solution of hy-

drochloric acid in methanol (9 in 1000) (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry \(2.227\), and compare the spectrum with the Reference Spectrum (3) or the spectrum of a solution of Dorzolamide Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dorzolamide Hydrochloride as directed in the potassium bro-

mide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum or the spectrum of Dorzolamide Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Dorzolamide Hydrochloride (1 in 100) responds to Qualitative Tests \(1.09\) for chlorid.

Purity (1) Heavy metals \(<1.07\) — Proceed with 2.0 g of Dorzolamide Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Dorzolamide Hydrochloride in 50 mL of a mixture of water and methanol (4:1), and use this solution as the sample solution. Perform the test with 10 \(\mu L\) of the sample solution as directed under Liquid Chromatography \(2.07\) according to the following conditions. Determine each peak area by the automatic integration method, and calculate their amounts by the area percentage method: the amount of the peaks other than dorzolamide is not more than 0.1%.

Operating conditions—

Detector, column, column temperature, and flow rate: Proceed as directed in the operating conditions in the Assay.

Mobile phase A: Adjust to \(pH 4.5\) of a mixture of water and acetic acid (100) (1000:1) with triethylamine.

Mobile phase B: Acetonitrile.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as detailed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 10</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>10 - 30</td>
<td>100 (\rightarrow) 50</td>
<td>0 (\rightarrow) 50</td>
</tr>
</tbody>
</table>

Time span of measurement: About 3 times as long as the retention time of dorzolamide, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 2 mL of the sample solution, and add a mixture of water and methanol (4:1) to make exactly 100 mL. Pipet 1 mL of this solution, and add a mixture of water and methanol (4:1) to make exactly 20 mL, and use this solution as the solution for system suitability test. Confirm that the peak area of dorzolamide obtained with 10 \(\mu L\) of the solution for system suitability test is equivalent to 0.07 to 0.13% of that with 10 \(\mu L\) of the sample solution.

System performance: To 1 mL of the sample solution add 2 mL of a mixture of water and methanol (4:1). When the procedure is run with 10 \(\mu L\) of this solution under the above operating conditions, the number of theoretical plates and the asymmetry factor of the peak of dorzolamide is not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 \(\mu L\) of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of dorzolamide is not more than 7%.

(3) Enantiomer—Dissolve 20 mg of Dorzolamide Hydrochloride in 4 mL of diluted ammonia solution (28) (13 in 400), and extract this solution with two 4-mL portions of ethyl acetate. Combine the extracts, and evaporate the ethyl acetate at 50°C under a current of nitrogen. Dissolve the residue in 3 mL of acetonitrile, add 3 drops of (S)-1-

phenylethyl isocyanate, and allow to stand at 50°C for 10 minutes. Evaporate at 50°C under a current of nitrogen, dissolve the residue in 10 mL of a mixture of tert-butylmethyl ether, acetic acid (100) and acetonitrile (873:100:27), and use this solution as the sample solution. Perform the test with 5 \(\mu L\) of the sample solution as directed under Liquid Chromatography \(2.07\) according to the following conditions, and determine the peak areas of dorzolamide, \(A_1\), and that of the enantiomer, having the relative retention time of about 1.5 to dorzolamide, \(A_1\), by the automatic integration method: the result of \(A_1/(A_1 + A_2)\) is not more than 0.005.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave-

length: 254 nm).

Column: A stainless steel column 4.6 mm in inside diame-

ter and 25 cm in length, packed with silica gel for liquid chromatography (5 \(\mu m\) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To a mixture of 30 mL of acetonitrile and 3 mL of water add tert-butylmethyl ether to make 1000 mL. To 650 mL of this solution add 350 mL of heptane.

Flow rate: Adjust so that the retention time of dorzolamide is about 8 minutes.

System suitability—

Test for required detectability: Pipet 1 mL of the sample solution, add a mixture of tert-butylmethyl ether, acetic acid
Dorzolamide Hydrochloride Ophthalmic Solution

Dorzolamide Hydrochloride Ophthalmic Solution is an aqueous opthalmic preparation.

It contains not less than 95.0% and not more than 107.0% of the labeled amount of dorzolamide (C_10H_16N_2O_5S, formula: 324.44).

**Method of preparation** Prepare as directed under Ophthalmic Liquids and Solutions, with Dorzolamide Hydrochloride.

**Description** Dorzolamide Hydrochloride Ophthalmic Solution occurs as a clear and colorless liquid.

**Identification** To a volume of Dorzolamide Hydrochloride Ophthalmic Solution, equivalent to about 1.2 mg of dorzolamide (C_{10}H_{16}N_2O_5S), add 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 252 nm and 256 nm.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity** cis-Isomer—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area, A_1, and A_3, of dorzolamide in each solution.

Amount (mg) of Dorzolamide Hydrochloride

\[
C_{10}H_{16}N_2O_5S \cdot HCl
\]

\[
M_s = \frac{M_A}{A_1/A_3}
\]

M_s: Amount (mg) of Dorzolamide Hydrochloride taken, calculated on the anhydrous basis

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 8.3 cm in length, packed with octylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Adjust to pH 4.5 of a mixture of water and acetic acid (100:1) with triethylamine.

Flow rate: Adjust so that the retention time of dorzolamide is about 9 minutes.

**System suitability**

System performance: Proceed as directed in the operating conditions in the Assay.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test, the relative standard deviation of the peak area of dorzolamide is not more than 7%.

Foreign insoluble matter <6.11> It meets the requirement.

Insoluble particulate matter <6.08> It meets the requirement.

Sterility <4.06> Perform the test according to the Direct inoculation method, using the culture medium containing 0.7% polysorbate 80 and 0.1% of lecithin: it meets the requirement.
**Assay**  Weigh accurately a portion of Dorzolamide Hydrochloride Ophthalmic Solution, equivalent to about 5 mg of dorzolamide (C₁₀H₁₇N₂O₅S₂), add the diluting solution to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Dorzolamide Hydrochloride RS (separately determine the water <2.4%) in the same manner as Dorzolamide Hydrochloride, dissolve in the diluting solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₂, of dorzolamide in each solution.

Diluting solution: To 2 mL of phosphoric acid add 900 mL of water, adjust to pH 3.0 with triethylamine, then add water to make 1000 mL.

Amount (mg/mL) of dorzolamide (C₁₀H₁₇N₂O₅S₂) = M₁/M₂ × A₁/A₂ × 1/4 × d × 0.899

M₂: Amount (mg) of Dorzolamide Hydrochloride RS taken, calculated on the anhydrous basis

M₁: Amount (g) of Dorzolamide Hydrochloride Ophthalmic Solution taken
d: Density (g/mL) of Dorzolamide Hydrochloride Ophthalmic Solution

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 253 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of the diluting solution and acetonitrile (19:1).
Flow rate: Adjust so that the retention time of dorzolamide is about 10 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of dorzolamide are not less than 6000 and not more than 1.8, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dorzolamide is not more than 1.0%.

**Containers and storage**  Containers—Tight containers.

**Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution**

**Description**  Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution is a clear, colorless, and slightly viscous liquid.

**Identification (1)**  Perform the test with 20 μL each of the sample solution and the standard solution obtained in the Assay (1) as directed under Liquid Chromatography <2.01> according to the conditions described in the Assay (1): the retention times of the peak of dorzolamide in the chromatograms obtained from the sample solution and the standard solution are the same.

(2) Perform the test with 20 μL each of the sample solution and the standard solution obtained in the Assay (2) as directed under Liquid Chromatography <2.01> according to the conditions described in the Assay (2): the retention times of the peak of timolol in the chromatograms obtained from the sample solution and the standard solution are the same.

**Osmotic pressure ratio**  Being specified separately when the drug is granted approval based on the Law.

**Viscosity**  Being specified separately when the drug is granted approval based on the Law.

**pH**  Being specified separately when the drug is granted approval based on the Law.

**Purity (1)** Related substance 1—Use the sample solution obtained in the Assay (1) as the sample solution. Pipet 1 mL of the sample solution, add a mixture of diluted phosphoric acid (1 in 500) and acetonitrile (19:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of related substance OA having the relative retention time of about 0.8 to dorzolamide obtained from the sample solution is not larger than 1/5 times the peak area of dorzolamide from the standard solution, and the peak area of related substance OB having the relative retention time of about 1.2 to dorzolamide from the sample solution is not larger than 2.4 times the peak area of dorzolamide from the standard solution. The area of the peak other than dorzolamide and the peaks mentioned above from the sample solution is not larger than 1/5 times the peak area of dorzolamide from the standard solution. Furthermore, the total area of the peaks other than dorzolamide from the sample solution is not larger than 2.5 times the peak area of dorzolamide from the standard solution.

**Operating conditions**—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay (1).
Time span of measurement: For 18 minutes after injection of the sample solution.

**System suitability**—
System performance: Proceed as directed in the system suitability in the Assay (1).

Test for required detectability: Pipet 2 mL of the standard solution, add a mixture of diluted phosphoric acid (1 in 500 mL) and acetonitrile (19:1) to make exactly 20 mL. Confirm that the peak area of dorzolamide obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dorzolamide is not more than 1.0%.

**Method of Preparation**  Prepare as directed under Ophthalmic Liquids and Solutions, with Dorzolamide Hydrochloride and Timolol Maleate.
area of dorzolamide is not more than 5.0%.

(2) Related substance 2—Use the sample solution obtained in the Assay (2) as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than timolol and the peak having the relative retention time of about 0.49 to timolol obtained from the sample solution is not larger than 2/5 times the peak area of timolol from the standard solution. Furthermore, the total area of the peaks other than timolol and the peak having the relative retention time of about 0.49 to timolol, from the sample solution is not larger than 1/2 times the peak area of timolol from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay (2).

Time span of measurement: For 10 minutes after injection of the sample solution.

System suitability—
System performance and system repeatability: Proceed as directed in the system suitability in the Assay (2).

Test for required detectability: Pipet 10 mL of the standard solution, add the mobile phase to make exactly 100 mL. Confirm that the peak area of timolol obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

Foreign insoluble matter <6.11> It meets the requirement.

Insoluble particulate matter <6.08> It meets the requirement.

Sterility <6.06> It meets the requirement.

Assay (1) Dorzolamide hydrochloride—Pipet a volume of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution, equivalent to about 2.5 mg of dorzolamide (C_{10}H_{18}N_{2}O_{5}S), add a mixture of diluted phosphoric acid (1 in 500) and acetoneitrile (19:1) to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Dorzolamide Hydrochloride RS (separately determine the water <2.49> in the same manner as Dorzolamide Hydrochloride), dissolve in a mixture of diluted phosphoric acid (1 in 500) and acetoneitrile (19:1) to make exactly 25 mL, and use this solution as the sample solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A_{T} and A_{S}, of dorzolamide in each solution.

Amount (mg) of dorzolamide (C_{10}H_{18}N_{2}O_{5}S) in 1 mL of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution

\[ M_{S} = \frac{M_{S}}{M_{T}} \times A_{T}/A_{S} \times 1/8 \times d \times 0.899 \]

M_{S}: Amount (mg) of Dorzolamide Hydrochloride RS taken, calculated on the anhydrous basis
M_{T}: Amount (g) of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution taken

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 253 nm).

Flow rate: 1.2 mL per minute.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution, the number of theoretical plates and the symmetry factor of the peak of dorzolamide are not less than 5000 and not more than 3.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution, the relative standard deviation of the peak area of dorzolamide is not more than 2.0%.

(2) Timolol maleate—Pipet a volume of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution, equivalent to about 6.5 mg of timolol (C_{16}H_{22}N_{2}O_{5}), add the mobile phase to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 34 mg of Timolol Maleate RS, previously dried at 100°C under reduced pressure for 3 hours, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A_{T} and A_{S}, of timolol in each solution.

Amount (mg) of timolol (C_{16}H_{22}N_{2}O_{5}) in 1 mL of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution

\[ M_{T} = \frac{M_{T}}{M_{S}} \times \frac{A_{T}}{A_{S}} \times 4/1 \times d \times 0.732 \]

M_{T}: Amount (mg) of Timolol Maleate RS taken
M_{S}: Amount (g) of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution taken
d: Density (g/mL) of Dorzolamide Hydrochloride and Timolol Maleate Ophthalmic Solution

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 295 nm).

Flow: 1.0 mL per minute.
System suitability—

System performance: Dissolve 44 mg of Timolol Maleate RS in 4 mL of sodium hydroxide solution (1 in 250), warm at 70°C for 15 hours, and add the mobile phase to make 25 mL. To 5 mL of this solution, add 28 mg of Dorzolamide Hydrochloride RS to dissolve, add the mobile phase to make 25 mL, and use this solution as the solution for system suitability test. When the procedure is run with 20 μL of the solution for system suitability test according to the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of timolol are not less than 3000 and not more than 2.0, respectively. The resolution between the co-eluting peak of dorzolamide and maleate, having the relative retention time of about 0.49 to timolol, and the peak, having the relative retention time of about 0.58 to timolol, is not less than 1.5, and the resolution between the peaks having the relative retention times of about 0.58 and about 0.70 to timolol is not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test, the relative standard deviation of the peak area of timolol is not more than 2.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Doxapram Hydrochloride Hydrate

Doxapram Hydrochloride Hydrate contains not less than 98.0% of doxapram hydrochloride (C_{24}H_{30}N_{2}O_{2}.HCl: 414.97), calculated on the anhydrous basis.

Description Doxapram Hydrochloride Hydrate occurs as white, crystals or crystalline powder.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in water, in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

Identification (1) Determine the absorption spectrum of a solution of Doxapram Hydrochloride Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxapram Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Doxapram Hydrochloride Hydrate (1 in 50) responds to Qualitative Tests <1.09> for chloride.

pH <2.54> Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the pH of this solution is between 3.5 and 5.0.

Melting point <2.60> 218 – 222°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 1.0 g of Doxapram Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Doxapram Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.17>—Prepare the test solution with 1.0 g of Doxapram Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.5 g of Doxapram Hydrochloride Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test
with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 6 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, formic acid, ethyl formate and methanol (8:3:3:2) to a distance of about 10 cm, and air-dry the plate. Place the plate to stand in iodine vapor: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Water**<sup>2.48</sup> 3.5 – 4.5% (0.5 g, volumetric titration, direct titration).

**Residue on ignition**<sup>2.44</sup> Not more than 0.3% (1 g).

**Assay** Weigh accurately about 0.8 g of Doxapram Hydrochloride Hydrate, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate<sup>2.50</sup> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 41.50 mg of C₂H₃N₂O₅·HCl

**Containers and storage** Containers—Tight containers.

### Doxazosin Mesilate

[Chemical structure image]

C₂H₁₆N₂O₂·C₂H₃O₃S: 547.58

1-(4-Amino-6,7-dimethoxyquinazolin-2-yl)-4-[[2RS]-2,3-dihydro-1,4-benzodioxin-2-yl]carbonyl]piperazine monomethanesulfonate

[77883-43-3]

Doxazosin Mesilate, when dried, contains not less than 98.0% and not more than 102.0% of doxazosin mesilate (C₂H₁₆N₂O₂·C₂H₃O₃S).

**Description** Doxazosin Mesilate occurs as a white to yellowish white crystalline powder.

It is freely soluble in dimethylsulfoxide, slightly soluble in water and in methanol, and very slightly soluble in ethanol (99.5%).

A solution of Doxazosin Mesilate in dimethylsulfoxide solution (1 in 20) shows no optical rotation.

Melting point: about 272°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Doxazosin Mesilate in 0.01 mol/L hydrochloric acid-methanol TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxazosin Mesilate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Heavy metals <1.0>—Proceed with 1.0 g of Doxazosin Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Dissolve 20 mg of Doxazosin Mesilate in 5 mL of a mixture of methanol and acetic acid (100) (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and acetic acid (100) (1:1) to make exactly 100 mL. Pipet 5 mL of this solution, add a mixture of methanol and acetic acid (100) (1:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.09>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with an upper layer of a mixture, prepared by adding 1 volume of water and 1 volume of acetic acid (100) to 2 volumes of 4-methyl-2-pentanone and shaking, to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot at the Rf value about 0.15 obtained from the sample solution is not more intense than the spot from the standard solution, and no spots other than the principal spot and other than the spots mentioned above appear from the sample solution.

**Loss on drying**<sup>2.41</sup> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition**<sup>2.44</sup> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 25 mg each of Doxazosin Mesilate and Doxazosin Mesilate RS, previously dried, dissolve separately in methanol to make exactly 50 mL. Pipet 3 mL each of these solutions, add the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas, A₁ and A₅, of doxazosin in each solution.

Amount (mg) of doxazosin mesilate (C₂H₁₆N₂O₂·C₂H₃O₃S) = Mₛ × A₁/A₅

Mₛ: Amount (mg) of Doxazosin Mesilate RS taken

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 3.0), methanol and acetonitrile (12:8:3).

Flow rate: Adjust so that the retention time of doxazosin is about 5 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doxazosin are not less than 2000 and
not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxazosin is not more than 1.0%.

Containers and storage Containers—Tight containers.

**Doxazosin Mesilate Tablets**

**Doxazosin Mesilate Tablets** contain not less than 95.0% and not more than 105.0% of the labeled amount of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$; 451.48).

**Method of preparation** Prepare as directed under Tablets, with Doxazosin Mesilate.

**Identification** To a quantity of powdered Doxazosin Mesilate Tablets, equivalent to 5 mg of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$), add 100 mL of 0.01 mol/L hydrochloric acid-methanol TS, shake vigorously, and centrifuge. To 4 mL of the supernatant liquid add 0.01 mol/L hydrochloric acid-methanol TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24; it exhibits a maximum between 244 nm and 248 nm.

**Uniformity of dosage units** 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Doxazosin Mesilate Tablets add 1 mL of water, disintegrate the tablet by shaking, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and shake for 30 minutes. Centrifuge, pipet 5 mL of the supernatant liquid, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 5 mL so that each mL contains about 5 µg of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$), and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, and dissolve in 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$) = $M_S \times A_T / A_S \times V'/V \times 1/50 \times 0.825$

$M_S$: Amount (mg) of Doxazosin Mesilate RS taken

**Dissolution** 6.01b When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution (pH 4.0) as the dissolution medium, the dissolution rate in 15 minutes of Doxazosin Mesilate Tablets is not less than 75%.

Start the test with 1 tablet of Doxazosin Mesilate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, and add the dissolution medium to make exactly V mL so that each mL contains about 0.56 µg of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$). Pipet 5 mL of this solution, add exactly 5 mL of methanol, and use this solution as the sample solution. Separately, weigh accurately about 21 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL. Then, pipet 2 mL of this solution, add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the dissolution medium, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of doxazosin in each solution.

Dissolution rate (%) with respect to the labeled amount of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$) = $M_S \times A_T / A_S \times V'/V \times 1/C \times 72/25 \times 0.825$

$M_S$: Amount (mg) of Doxazosin Mesilate RS taken

C: Labeled amount (mg) of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$) in 1 tablet

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate in 500 mL of water, and adjust to pH 3.0 with diluted phosphoric acid (1 in 10). To 450 mL of this solution add 550 mL of methanol.

Flow rate: Adjust so that the retention time of doxazosin is about 5 minutes.

**System suitability—**

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doxazosin are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxazosin is not more than 2.0%.

**Assay** Weigh accurately the mass of not less than 20 Doxazosin Mesilate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$), add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and stir for 30 minutes. Centrifuge, pipet 4 mL of the supernatant liquid, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 24 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, and dissolve in 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use this solution as the sample solution. Determine the absorbances, $A_T$ and $A_S$, of the sample solution and standard solution at 246 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.

Amount (mg) of doxazosin (C$_{23}$H$_{25}$N$_{2}$O$_{5}$) = $M_S \times A_T / A_S \times 1/X \times 0.825$

$M_S$: Amount (mg) of Doxazosin Mesilate RS taken

**Containers and storage** Containers—Well-closed containers.
Doxifluridine

Doxifluridine, when dried, contains not less than 98.5% and not more than 101.0% of doxifluridine (C₉H₇FN₂O₃).

Description
Doxifluridine occurs as a white crystalline powder.
It is freely soluble in N,N-dimethylformamide, soluble in water and in methanol, and slightly soluble in ethanol (99.5).
It dissolves in 0.1 mol/L hydrochloric acid TS and in 0.01 mol/L sodium hydroxide TS.
Melting point: about 191°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Doxifluridine in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.22>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxifluridine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.23>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D° = +160° to +174° (after drying, 0.1 g, water, 10 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 0.10 g of Doxifluridine in 10 mL of water is between 4.2 and 5.2.

Purity (1) Fluoride—Dissolve 0.10 g of Doxifluridine in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution into a 20-mL volumetric flask, add 5 mL of a mixture of acetone and lanthanum-alizarin complexone TS (2:1) and water to make 20 mL, allow to stand for 1 hour, and use this solution as the sample solution. Separately, put 1.0 mL of Standard Fluorine Solution in a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) and 5 mL of the mixture of acetone and alizarin complexone TS (2:1), then proceed in the same manner as for preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances, A₁ and Aₚ, of the sample solution and standard solution at 520 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution obtained in the same way with 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) as a blank: A₁ is not larger than Aₚ.

(2) Chloride <1.07>—Perform the test with 0.30 g of Doxifluridine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.035%).
(3) Heavy metals <1.07>—Proceed with 1.0 g of Doxifluridine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
(4) Related substances—Dissolve 20 mg of Doxifluridine in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 25 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the number of the spot other than the principal spot obtained from the sample solution is not more than three, and they are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).
Residue on ignition <2.44> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.25 g of Doxifluridine, previously dried, dissolve in 50 mL of N,N-dimethylformamide, and titrate <2.30> with 0.1 mol/L tetrabutylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Each mL of 0.1 mol/L tetrabutylammonium hydroxide VS = 24.62 mg of C₉H₇FN₂O₃.

Containers and storage Containers—Tight containers.

Doxifluridine Capsules

Doxifluridine Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of doxifluridine (C₉H₇FN₂O₃: 246.19).

Method of preparation Prepare as directed under Capsules, with Doxifluridine.

Identification (1) Dissolve an amount of the contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine, in 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. To 1 mL of the filtrate add 0.01 mol/L hydrochloric acid TS to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.22>, using 0.1 mol/L hydrochloric acid TS as the blank: it exhibits a maximum between 267 nm and 271 nm.

(2) To an amount of powdered contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine, add 2 mL of methanol, shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of doxifluridine in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer...
chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show a dark purple color and these Rf values are the same.

**Uniformity of dosage units**<sup>6.02</sup> It meets the requirement of the Mass variation test.

**Dissolution**<sup>6.10b</sup> When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Doxifluridine Capsules is not less than 85%.

Start the test with 1 capsule of Doxifluridine Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V′ mL so that each mL contains about 0.05 mg of doxifluridine (C29H32FN4O5.HCl), and use this solution as the sample solution. Separately, weigh accurately about 26 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A<sub>1</sub> and A<sub>2</sub>, of the sample solution and standard solution at 269 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) with respect to the labeled amount of doxifluridine (C<sub>29</sub>H<sub>32</sub>F<sub>5</sub>N<sub>4</sub>O<sub>5</sub>)

\[
M_5 = M_3 \times \frac{A_1}{A_2} \times \frac{V′}{V} \times \frac{1}{C} \times 45
\]

M<sub>3</sub>: Amount (mg) of doxifluridine for assay taken

C: Labeled amount (mg) of doxifluridine (C<sub>29</sub>H<sub>32</sub>F<sub>5</sub>N<sub>4</sub>O<sub>5</sub>) in 1 capsule

**Assay** Weigh accurately the mass and powder the contents of not less than 20 Doxifluridine Capsules. Weigh accurately a portion of the powder, equivalent to about 50 mg of doxifluridine (C<sub>29</sub>H<sub>32</sub>F<sub>5</sub>N<sub>4</sub>O<sub>5</sub>), add 40 mL of water, shake for 10 minutes, add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 10 mL of the internal standard solution, then add a mixture of water and methanol (5:3) to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution, then add the mixture of water and methanol (5:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q<sub>1</sub> and Q<sub>2</sub>, of the peak height of doxifluridine to that of the internal standard.

\[
\text{Amount (mg) of doxifluridine (C}_{29}\text{H}_{32}\text{F}_{5}\text{N}_{4}\text{O}_{5}) = M_5 \times \frac{Q_1}{Q_2}
\]

M<sub>5</sub>: Amount (mg) of doxifluridine for assay taken

**Internal standard solution**—A solution of anhydrous caffeine (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (13:7).

Flow rate: Adjust so that the retention time of doxifluridine is about 2.5 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, doxifluridine and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak height of doxifluridine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

**Doxorubicin Hydrochloride**

ドキソルビシン塩酸塩

C<sub>27</sub>H<sub>33</sub>NO<sub>11</sub>.HCl: 579.98

(2S,4S)-4-(3-Amino-2,3,6-trideoxy-alpha-L-hexopyranosyloxy)-2,5,12-trihydroxy-2-hydroxyacetyl-7-methoxy-1,2,3,4-tetrahydrotriacene-6,11-dione monohydrochloride

[25316-40-9]

Doxorubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

It contains not less than 980 μg (potency) and not more than 1080 μg (potency) per mg, calculated on the anhydrous basis. The potency of Doxorubicin Hydrochloride is expressed as mass (potency) of doxorubicin hydrochloride (C<sub>27</sub>H<sub>33</sub>NO<sub>11</sub>.HCl).

**Description** Doxorubicin Hydrochloride occurs as a red-orange crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in acetonitrile.

**Identification** (1) Determine the absorption spectrum of a solution of Doxorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxorubicin Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxorubicin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry.
Doxorubicin Hydrochloride for Injection  /  Official Monographs  JP XVIII

<2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxorubicin Hydrochloride RS; both spectra exhibit similar intensities of absorption at the same wave numbers.

3) A solution of Doxorubicin Hydrochloride (1 in 200) responds to Qualitative Tests <1.09> (1) for chloroide.

Optical rotation <2.49> [α]D20 25 +240 – +290° (20 mg calculated on the anhydrous basis, methanol, 20 mL, 100 nm).

pH <2.5> The pH of a solution obtained by dissolving 50 mg of Doxorubicin Hydrochloride in 10 mL of water is between 4.0 and 5.5.

Purity (1) Clarity and color of solution—Dissolve 50 mg of Doxorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

2) Related substances—Dissolve 25 mg of Doxorubicin Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than doxorubicin obtained from the sample solution is not larger than 1/4 times the peak area of doxorubicin from the standard solution, and the total area of the peaks other than doxorubicin from the sample solution is not larger than the peak area of doxorubicin from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of doxorubicin.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of doxorubicin obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the standard solution.

System performance: Dissolve 5 mg of Doxorubicin Hydrochloride in 20 mL of water, add 1.5 mL of phosphoric acid, and allow to stand at room temperature for 30 minutes. Adjust the pH of this solution to 2.5 with 2 mol/L sodium hydroxide TS. When the procedure is run with 20 μL of this solution under the above operating conditions, doxorubicinone, having the relative retention time of about 0.6 to doxorubicin, and doxorubicin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxorubicin is not more than 2.0%.

Water <2.48> Not more than 3.0% (0.3 g, volumetric titration, direct titration).

Assay Weigh accurately amounts of Doxorubicin Hydrochloride and Doxorubicin Hydrochloride RS, equivalent to about 10 mg (potency), add exactly 5 mL of the internal standard solution to each, dissolve each in the mobile phase to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q5, of the peak area of doxorubicin to that of the internal standard.

Amount [μg (potency)] of doxorubicin hydrochloride (C22H29NO11·HCl) = M1 × Q1/Q5 × 1000

M1: Amount [mg (potency)] of Doxorubicin Hydrochloride RS taken

Internal standard solution—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 3 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (7 in 5000), and add 1000 mL of acetonitrile.
Flow rate: Adjust so that the retention time of doxorubicin is about 8 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, doxorubicin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5, and the symmetry factor of the peak of doxorubicin is 0.8 to 1.2.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of doxorubicin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Doxorubicin Hydrochloride for Injection
注射用ドキソルビシン塩酸塩

Doxorubicin Hydrochloride for Injection is a preparation for injection, which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of doxorubicin hydrochloride (C22H29NO11·HCl: 579.98).

Method of preparation Prepare as directed under Injections, with Doxorubicin Hydrochloride.

Description Doxorubicin Hydrochloride for Injection occurs as a red-orange, powder or masses.

Identification Dissolve an amount of Doxorubicin Hydrochloride for Injection, equivalent to 10 mg (potency) of Doxorubicin Hydrochloride, in methanol to make 100 mL. To 5 mL of this solution add methanol to make 50 mL, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>:

It exhibits maxima between 231 nm and 235 nm, between 250 nm and 254 nm, between 477 nm and 481 nm, and between 493 nm and 497 nm, and exhibits a shoulder between 528 nm and 538 nm.
The pH of a solution, prepared by dissolving an amount of Doxorubicin Hydrochloride for Injection equivalent to 10 mg (potency) of Doxorubicin Hydrochloride, in 2 mL of water, is 5.0 to 6.0.

Purity Clarity and color of solution—Dissolve an amount of Doxorubicin Hydrochloride for Injection, equivalent to 50 mg (potency) of Doxorubicin Hydrochloride, in 10 mL of water: the solution is clear and red.

Water Not more than 4.0% (0.25 g, volumetric titration, direct titration).

Bacterial endotoxins Less than 2.50 EU/mg (potency).

Uniformity of dosage units It meets the requirements of the Mass variation test.

Foreign insoluble matter Perform the test according to Method 2: it meets the requirements.

Insoluble particulate matter It meets the requirements.

Sterility Perform the test according to the Membrane filtration method: it meets the requirements.

Assay Weigh accurately an amount of Doxorubicin Hydrochloride for Injection. Weigh accurately an amount of the contents, equivalent to about 10 mg (potency) of Doxorubicin Hydrochloride, add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and use the solution as the sample solution. Separately, weigh accurately an amount of Doxorubicin Hydrochloride RS, equivalent to 10 mg (potency), add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 mL each of the sample solution and standard solution as directed under Liquid Chromatography, and calculate the ratios, Q₁ and Q₂, of the peak area of doxorubicin to that of the internal standard.

Amount (mg (potency)) of doxorubicin hydrochloride (C₂₂H₂₄N₂O₈·HCl) = Mₛ × Q₁/₉₈

Mₛ: Amount (mg (potency)) of Doxorubicin Hydrochloride RS taken

Internal standard solution—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeccysilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 3 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (7 in 5000). To this solution add 1000 mL of acetonitrile.
Flow rate: Adjust so that the retention time of doxorubicin is about 8 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, doxorubicin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5, and the symmetry factor of the peak of doxorubicin is between 0.8 and 1.2.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of doxorubicin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

Doxycycline Hydrochloride Hydrate

Doxycycline Hydrochloride Hydrate is the hydrochloride of a derivative of oxytetracycline.

It contains not less than 880 μg (potency) and not more than 943 μg (potency) per mg, calculated on the anhydrous and residual ethanol-free basis. The potency of Doxycycline Hydrochloride Hydrate is expressed as mass (potency) of doxycycline (C₂₂H₂₄N₂O₈·444.43).

Description Doxycycline Hydrochloride Hydrate occurs as yellow to dark yellow, crystals or crystalline powder. It is freely soluble in water and in methanol, and slightly soluble in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Doxycycline Hydrochloride Hydrate in 0.01 mol/L hydrochloric acid-methanol TS (1 in 74,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxycycline Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption Spectrum of Doxycycline Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum or the spectrum of Doxycycline Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 10 mg of Doxycycline Hydrochloride Hydrate in 10 mL of water, and add silver nitrate TS: a white turbidity is produced.

Absorbance 222: E₁₀₀₅ (349 nm): 285 – 315 (10 mg, 0.01 mol/L hydrochloric acid-methanol TS, 500 mL).

Optical rotation 222: [α]D₂₂ : –105 – 120° (0.25 g calculated on the anhydrous and residual ethanol-free basis, 0.01 mol/L hydrochloric acid-methanol TS, 25 mL, 100 mm).
Determine within 5 minutes after the sample solution is prepared.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Doxycycline Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 5.0 mL of Standard Lead Solution (not more than 50 ppm).

(2) Related substance—Dissolve 20 mg of Doxycycline Hydrochloride Hydrate in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, dissolve 20 mg of 6-epidoxycycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the 6-epidoxycycline hydrochloride stock solution. Separately, dissolve 20 mg of metacycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the metacycline hydrochloride stock solution. Pipet 2 mL each of the 6-epidoxycycline hydrochloride stock solution and the metacycline hydrochloride stock solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of metacycline and 6-epidoxycycline obtained from the sample solution are not larger than the peak areas of them from the standard solution, respectively, and the areas of the two peaks, appeared between the solvent peak and metacycline and behind of doxycycline, from the sample solution are not larger than 1/4 times the peak area of 6-epidoxycycline from the standard solution, and the total area of the peaks other than doxycycline and metacycline obtained with 20 μL of the standard solution under the above operating conditions, ethanol and the internal standard are eluted in this order with the resolutions between these peaks being not less than 2.0, respectively, and the symmetry factor of the peak of doxycycline is not more than 1.3.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of metacycline and 6-epidoxycycline are not more than 3.0% and not more than 2.0%, respectively.

**Ethanol** Weigh accurately about 0.1 g of Doxycycline Hydrochloride Hydrate, dissolve in the internal standard solution to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.4 g of ethanol (99.5), and add the internal standard solution to make exactly 100 mL. Pipet 1 mL of this solution, add the internal standard solution to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of ethanol to that of the internal standard:

\[ \text{Amount (mg) of ethanol (99.5) taken} \]
\[ M_2 = M_1 \times Q_2/Q_1 \]

\[ M_1: \text{Amount (mg) of Doxycycline Hydrochloride Hydrate taken} \]

**Internal standard solution**—A solution of 1-propanol (1 in 2000).

**Operating conditions**—

- Detector: A hydrogen flame-ionization detector.
- Column: A glass column 3.2 mm in inside diameter and 1.5 m in length, packed with porous ethylvinylbenzene-divinylbenzene copolymer for liquid chromatography (8 μm in particle diameter).
- Column temperature: A constant temperature of about 135°C.
- Carrier gas: Nitrogen.
- Flow rate: Adjust so that the retention time of ethanol is about 5 minutes.

System suitability—

- System performance: When the procedure is run with 1 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ethanol to that of the internal standard is not more than 2.0%.

- System repeatability: When the test is repeated 5 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ethanol to that of the internal standard is not more than 2.0%.

**Water** <2.40> Not less than 1.4% and not more than 2.8% (0.6 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** Weigh accurately an amount of Doxycycline Hydrochloride and Doxycycline Hydrochloride RS, equivalent to about 50 mg (potency), dissolve each in water...
to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of doxycycline in each solution.

Amount [μg (potency)] of doxycycline (C$_{22}$H$_{24}$N$_2$O$_6$) = $M_S \times A_T/A_S \times 1000$

$M_S$: Amount [μg (potency)] of Doxycycline Hydrochloride RS taken

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: Dissolve 7.0 g of sodium dihydrogen phosphate dihydrate in 450 mL of water, add 553 mL of a mixture of methanol and N,N-dimethyl-α-octylamine (550:3), and adjust the pH to 8.0 with a solution of sodium hydroxide (43 in 200).
Flow rate: Adjust so that the retention time of doxycycline is about 6 minutes.

**System suitability**—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the theoretical plates and the symmetry factor of the peak of doxycycline are not less than 1000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxycycline is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Doxycycline Hydrochloride Tablets**

ドキシサイクリン塩酸塩錠

Doxycycline Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled potency of doxycycline (C$_{22}$H$_{24}$N$_2$O$_6$; 444.43).

**Method of preparation** Prepare as directed under Tablets, with Doxycycline Hydrochloride Hydrate.

**Identification** Weigh a portion of powdered Doxycycline Hydrochloride Tablets, equivalent to 1 mg (potency) of Doxycycline Hydrochloride Hydrate, add 100 mL of 0.01 mol/L hydrochloric acid-methanol TS, shake thoroughly, and filter. Determine the absorption spectrum of this filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>:
- it exhibits maxima between 266 nm and 271 nm and between 347 nm and 353 nm.

**Purity** 4-Epidoxycycline—Use the sample solution obtained in the Assay as the sample solution. Pipet 2 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 0.6 to doxycycline, obtained from the sample solution is not larger than 1.5 times the peak area of doxycycline from the standard solution.

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay.

**System suitability**—
Test for required detectability: To exactly 2 mL of the standard solution add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Confirm that the peak area of doxycycline obtained with 10 μL of this solution is equivalent to 7 to 13% of the peak area of doxycycline with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and symmetry factor of the peak of doxycycline are not less than 2200 and not more than 1.6, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of doxycycline is not more than 2.0%.

**Uniformity of dosage units**<6.02>D

Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Doxycycline Hydrochloride Tablets add 0.01 mol/L hydrochloric acid TS, disperse the tablet by sonicating, shake for 15 minutes, then add 0.01 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 1 mg (potency) of Doxycycline Hydrochloride Hydrate. Centrifuge this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount [μg (potency)] of doxycycline (C$_{22}$H$_{24}$N$_2$O$_6$) = $M_S \times A_T/A_S \times V/20$

$M_S$: Amount [μg (potency)] of Doxycycline Hydrochloride RS taken

**Dissolution**<6.10>D

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Doxycycline Hydrochloride Tablets is not less than 85%.

Start the test with 1 tablet of Doxycycline Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 11 μg (potency) of Doxycycline Hydrochloride Hydrate, and use this solution as the sample solution. Separately, weigh accurately about 22 mg (potency) of Doxycycline Hydrochloride RS, dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, $A_T$ and $A_S$, at 274 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>:

Dissolution rate (%) with respect to the labeled amount of doxycycline (C$_{22}$H$_{24}$N$_2$O$_6$) = $M_S \times A_T/A_S \times V'/V \times 1/C \times 45$

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Droperidol / Official Monographs

Mₜ: Amount [mg (potency)] of Doxycycline Hydrochloride RS taken
C: Labeled amount [mg(potency)] of doxycycline (C₂₂H₂₄N₂O₃) in 1 tablet

Assay To 10 Doxycycline Hydrochloride Tablets add 0.01 mol/L hydrochloric acid TS, disperse them by sonication, shake for 15 minutes, and add 0.01 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 2 mg (potency) of Doxycycline Hydrochloride Hydrate. Centrifuge, if necessary, pipet 10 mL of the supernatant liquid, add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Filter this solution through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Doxycycline Hydrochloride RS, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL of the sample solution and standard solution as directed under Liquid Chromatography <<2.01 >> according to the following conditions, and determine the peak areas, Aₜ and Aₛ, of doxycycline in each solution.

\[ Mₜ = \frac{Mₜ \times Aₜ}{Aₛ} \times \frac{V}{100} \]

Mₜ: Amount [mg (potency)] of Doxycycline (C₂₂H₂₄N₂O₃) in 1 tablet

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 7.0 g of sodium dihydrogen phosphate dihydrate in 450 mL of water. Add to this solution 553 mL of a mixture of methanol and N,N-dimethyl-n-octylamine (550:3), and adjust to pH 8.0 with sodium hydroxide solution (43 in 200).

Flow rate: Adjust so that the retention time of doxycycline is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and symmetry factor of the peak of doxycycline are not less than 2200 and not more than 1.6, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxycycline is not more than 1.0%.

Containers and storage—Containers—Tight containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)

Droperidol

droperidol

C₂₂H₂₅F₃N₂O₂: 379.43
1-{[4-(4-Fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydropyridin-4-yl}-1,3-dihydro-2H-benimidazol-2-one

Droperidol, when dried, contains not less than 98.0% of droperidol (C₂₂H₂₅F₃N₂O₂).

Description Droperidol occurs as a white to light yellow powder.

It is freely soluble in acetic acid (100), soluble in dichloromethane, slightly soluble in ethanol (99.5), and practically insoluble in water.

It is gradually colored by light.

It shows crystal polymorphism.

Identification (1) Put 30 mg of Droperidol in a brown volumetric flask, and dissolve in 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Transfer 5 mL of the solution to a brown volumetric flask, and add 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <<2.24>>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Droperidol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <<2.25>>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Droperidol in acetone, evaporate the acetone, dry the residue in a desiccator (in vacuum, silica gel, 70°C) for 4 hours, and perform the test with the residue.

Purity (1) Heavy metals <<1.07>>—Proceed with 1.0 g of Droperidol in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 50 mg of Droperidol in 5 mL of dichloromethane, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <<2.09>>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, chloroform, methanol and acetic acid-sodium acetate buffer solution (pH 4.7) (54:23:18:5) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254
Droxidopa

**Identification (1)** Determine the absorption spectrum of a solution of Droxidopa in 0.1 mol/L hydrochloric acid TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Droxidopa as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D = −38 to −43° (after drying, 0.1 g, 0.1 mol/L hydrochloric acid TS, 20 mL, 100 mm).

**Purity (1)** Chloride <1.03>—Dissolve 0.40 g of Droxidopa in 6 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Droxidopa according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Loss on drying** <2.47> Not more than 3.0% (0.5 g, in vacuum, silica gel, 70°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Droperidol, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 37.94 mg of C₂H₃NO₂

**Containers and storage** Containers—Well-closed containers. Storage—Light-resistant.

**Droxidopa**

Droxiシドバ

C₉H₁₇NO₃: 213.19
(2S,3R)-2-Amino-3-(3,4-dihydroxyphenyl)-3-hydroxypropanoic acid
[23651-95-8]

Droxidopa, when dried, contains not less than 99.0% and not more than 101.0% of droxidopa (C₉H₁₇NO₃).

**Description** Droxidopa occurs as white to light brown, crystals or crystalline powder.

It is slightly soluble in water and practically insoluble in ethanol (99.5). It dissolves in 0.1 mol/L hydrochloric acid TS.

**Loss on drying** <2.47> Not more than 0.1% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Droxidopa, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid VS to make exactly 100 mL. Pipet 5 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than droxidopa obtained from the sample solution is not larger than the peak area of droxidopa from the standard solution. Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.0 g of sodium 1-heptanesulfonate and 1.36 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 2.0 with phosphoric acid. To 930 mL of this solution add 70 mL of acetonitrile.

Flow rate: Adjust so that the retention time of droxidopa is about 5 minutes.

Time span of measurement: About 12 times as long as the retention time of droxidopa, beginning after the solvent peak.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of droxidopa are not less than 10,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of droxidopa is not more than 2.0%.

**Loss on drying** <2.47> Not more than 0.1% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Droxidopa, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid VS, add 50 mL of 0.1 mol/L hydrochloric acid (100), and titrate <2.50> with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 21.32 mg of C₉H₁₇NO₃.
Droxidopa Capsules

Droxidopa Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of droxidopa (C₇H₁₅NO₃: 213.19).

Method of preparation Prepare as directed under Capsules, with Droxidopa.

Identification (1) To an amount of the contents of Droxidopa Capsules, equivalent to 50 mg of Droxidopa, add 50 mL of water, shake for 10 minutes, and filter. To 5 mL of the filtrate add 1 mL of ninhydrin TS, and heat in a water bath for 3 minutes: a blue-purple color develops.

(2) To an amount of the contents of Droxidopa Capsules, equivalent to 20 mg of Droxidopa, add 20 mL of diluted acetic acid (100) (1 in 500), shake for 10 minutes, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to light brown.

(3) To an amount of the contents of Droxidopa Capsules, equivalent to 50 mg of Droxidopa, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. Discard the first 10 mL of the filtrate, and to 2 mL of the subsequent filtrate add 0.1 mol/L hydrochloric acid TS to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24, and it exhibits a maximum between 278 nm and 282 nm.

Uniformity of dosage units 6.02 Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To the contents of 1 capsule of Droxidopa Capsules, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake well, and add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 0.5 mg of droxidopa (C₇H₁₅NO₃). Filter this solution, discard the first 10 mL of the filtrate, and to 2 mL of the subsequent filtrate add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, and determine the absorbances, A₁ and A₅, at 280 nm.

Amount (mg) of droxidopa (C₇H₁₅NO₃)

\[ M_5 \times \frac{A_1}{A_5} \times \frac{V}{V_{100}} \]

M₅: Amount (mg) of droxidopa for assay taken

Dissolution 6.10D When the test is performed at 75 revolutions per minute according to the Paddle method using the sinter, using 900 mL of water as the dissolution medium, the dissolution rate in 90 minutes of Droxidopa Capsules is not less than 70%.

Start the test with 1 capsule of Droxidopa Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 56 μg of droxidopa (C₇H₁₅NO₃), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, and determine the absorbances, A₁ and A₅, at 280 nm, and A₁ and A₅, at 350 nm.

Dissolution rate (%) with respect to the labeled amount of droxidopa (C₇H₁₅NO₃)

\[ M_5 \times \frac{(A_1 - A_5)}{(A_{S1} - A_{S2})} \times \frac{V}{V_{100}} \times 1/C \times 180 \]

M₅: Amount (mg) of droxidopa for assay taken

C: Labeled amount (mg) of droxidopa (C₇H₁₅NO₃) in 1 capsule

Assay Take out the contents of not less than 20 Droxidopa Capsules, weigh accurately the mass of the contents, and mix uniformly. Weigh accurately an amount equivalent to about 50 mg of droxidopa (C₇H₁₅NO₃), add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, and determine the absorbances, A₁ and A₅, at 280 nm.

Amount (mg) of droxidopa (C₇H₁₅NO₃)

\[ M_5 \times \frac{A_1}{A_5} \]

M₅: Amount (mg) of droxidopa for assay taken

Droxidopa Fine Granules

Droxidopa Fine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of droxidopa (C₇H₁₅NO₃: 213.19).

Method of preparation Prepare as directed under Granules, with Droxidopa.

Identification (1) To a quantity of powdered Droxidopa Fine Granules, equivalent to 50 mg of Droxidopa, add 50 mL of water, shake for 10 minutes, and filter. To 5 mL of the filtrate add 1 mL of ninhydrin TS, heat in a water bath for 3 minutes: a blue-purple color develops.

(2) To a quantity of powdered Droxidopa Fine Granules, equivalent to 20 mg of Droxidopa, add 20 mL of diluted acetic acid (100) (1 in 500), shake for 10 minutes, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to light brown.

(3) To a quantity of powdered Droxidopa Fine Granules,
equivalent to 50 mg of Droxidopa, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. Discard the first 10 mL of the filtrate, to 2 mL of the subsequent filtrate add 0.1 mol/L hydrochloric acid TS to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>:

Dissolution <6.10> When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Droxidopa Fine Granules is not less than 70%.

Start the test with an accurately weighed amount of Droxidopa Fine Granules, equivalent to about 0.1 g of droxidopa (C₂₁H₂₃NO₅), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add exactly 5 mL of water, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁₁ and A₉₅, at 280 nm, and A₁₁₂ and A₂₅₂, at 350 nm.

Dissolution rate (%) with respect to the labeled amount of droxidopa (C₂₁H₂₃NO₅)

\[ M₉ = M₅ \times (A₁₁ - A₁₁₂)/(A₉₅ - A₂₅₂) \times 1/C \times 360 \]

M₅: Amount (mg) of droxidopa for assay taken
M₉: Amount (g) of Droxidopa Fine Granules taken
C: Labeled amount (mg) of droxidopa (C₂₁H₂₃NO₅) in 1 g

Assay Powder not less than 20 g of Droxidopa Fine Granules. Weigh accurately a portion of the powder, equivalent to about 50 mg of droxidopa (C₂₁H₂₃NO₅), add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁₁ and A₉₅, at 280 nm.

**Dydrogesterone**

ジドロゲステロン

C₂₁H₂₃O₅: 312.45
9β,10α-Pregna-4,6-diene-3,20-dione

[152-62-3]

Dydrogesterone, when dried, contains not less than 98.0% and not more than 102.0% of dydrogesterone (C₂₁H₂₃O₅).

**Description** Dydrogesterone occurs as white to light yellow-white, crystals or crystalline powder. It is odorless.

It is freely soluble in chloroform, soluble in acetone, sparingly soluble in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) To 5 mg of Dydrogesterone add 5 mL of 4-methoxybenzaldehyde-acetic acid TS and 2 to 3 drops of sulfuric acid, and heat in a water bath for 2 minutes: an orange-red color develops.

(2) Determine the absorption spectrum of a solution of Dydrogesterone in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave-lengths.

(3) Determine the infrared absorption spectrum of Dydrogesterone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D: -470° to -500° (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

**Melting point** <2.60> 167° to 171°C

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Dydrogesterone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 10 mg of Dydrogesterone in 200 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of peaks other than dydrogesterone obtained from the sample solution is not larger than the peak area of dydrogesterone from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 µm in parti-
Dydrogesterone Tablets

Dydrogesterone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of dydrogesterone (C_{21}H_{28}O_2: 312.45).

Method of preparation Prepare as directed under Tablets, with Dydrogesterone.

Identification (1) To a quantity of powdered Dydrogesterone Tablets, equivalent to 0.05 g of Dydrogesterone, add 50 mL of methanol, shake well, and filter. Evaporate 5 mL of the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1) under Dydrogesterone.

(2) To 1 mL of the filtrate obtained in (1) add methanol to make 200 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 284 nm and 288 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Crush 1 tablet of Dydrogesterone Tablets, and add methanol to make exactly 100 mL. Shake until the tablet is completely disintegrated, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 20 mL of the filtrate, pipet V mL of the subsequent filtrate, add methanol to make exactly V' mL so that each mL contains about 5 μg of dydrogesterone (C_{21}H_{28}O_2), and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of dydrogesterone (C}_{21}\text{H}_{28}\text{O}_2) = M_b \times \frac{A_l}{A_s} \times \frac{V'}{V} \times \frac{1}{C} \times 9
\]

\[M_5: \text{Amount (mg) of dydrogesterone for assay taken}
\]

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Dydrogesterone Tablets is not less than 80%.

Start the test with 1 tablet of Dydrogesterone Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V' mL so that each mL contains about 56 μg of dydrogesterone (C_{21}H_{28}O_2), and use this solution as the sample solution. Separately, weigh accurately about 50 mg of dydrogesterone for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, and dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_l and A_s, of the sample solution and standard solution at 286 nm as directed under Ultraviolet-visible Spectrophotometry (2.24), using water as the control.

Dissolution rate (%) with respect to the labeled amount of dydrogesterone (C_{21}H_{28}O_2) = M_5 \times \frac{A_l}{A_s} \times \frac{V'}{V} \times \frac{1}{C} \times 9

\[M_5: \text{Amount (mg) of dydrogesterone for assay taken}
\]

C: Labeled amount (mg) of dydrogesterone (C_{21}H_{28}O_2) in 1 tablet.

Assay Weigh accurately and powder not less than 20 Dydrogesterone Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of Dydrogesterone (C_{21}H_{28}O_2), shake with 50 mL of methanol, and add methanol to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 20 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separate, weigh accurately about 10 mg of dydrogesterone for assay, previously dried in vacuum for 24 hours using phosphorus (V) oxide as a desiccant, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use the solution as the standard solution. Determine the absorbances, A_l and A_s, of the sample solution and standard solution at 286 nm as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 284 nm and 288 nm.

\[
\text{Amount (mg) of dydrogesterone (C}_{21}\text{H}_{28}\text{O}_2) = M_b \times \frac{A_l}{A_s}

Containers and storage Containers—Tight containers.
Ebastine

エバスチン

C_{12}H_{19}NO_2: 469.66
1-[4-(1,1-Dimethylethyl)phenyl]-
4-[4-(diphenylmethoxy)piperidin-1-yl]butan-1-one
[90729-43-4]

Ebastine, when dried, contains not less than 99.0% and not more than 101.0% of ebastine (C_{12}H_{19}NO_2).

**Description**

Ebastine occurs as white, crystals or crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in ethanol (95), and practically insoluble in water.

It gradually becomes yellowish white on exposure to light.

**Identification**

1. Dissolve 20 mg of Ebastine in 5 mL of ethanol (95), add 2 mL of 1,3-dinitrobenzene TS and 2 mL of sodium hydroxide TS, and allow to stand: the color of the solution is purple to red-purple, which gradually changes to brown.

2. Determine the absorption spectrum of a solution of Ebastine in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

3. Determine the infrared absorption spectrum of Ebastine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 84 – 87°C

**Purity** (1)

Heavy metals <1.07>—Proceed with 1.0 g of Ebastine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm). A platinum crucible may be used.

2. Related substances—Dissolve 0.10 g of Ebastine in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 5 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than ebastine obtained from the sample solution is not larger than the peak area of ebastine from the standard solution, and the total area of the peaks other than ebastine from the sample solution is not larger than 4 times the peak area of ebastine from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust to pH 3.0 with diluted phosphoric acid (1 in 5), and add water to make 1000 mL. To 375 mL of this solution add 625 mL of acetonitrile for liquid chromatography, and dissolve 0.72 g of sodium lauryl sulfate in this solution.

Flow rate: Adjust so that the retention time of ebastine is about 9 minutes.

Time span of measurement: About 2 times as long as the retention time of ebastine, beginning after the solvent peak.

**System suitability**

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ebastine obtained with 10 μL of this solution is equivalent to 35 to 65% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ebastine are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine is not more than 2.0%.

**Loss on drying** <2.47> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.5 g of Ebastine, previously dried, dissolve in 60 mL of acetic acid (100), and titrate <2.59> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 46.97 mg of C_{12}H_{19}NO_2

**Containers and storage**

Containers—Well-closed containers.

Storage—Light-resistant.

**Ebastine Orally Disintegrating Tablets**

エバスチン口腔内崩壊錠

Ebastine Orally Disintegrating Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ebastine (C_{12}H_{19}NO_2: 469.66).

**Method of preparation**

Prepare as directed under Tablets, with Ebastine.

**Identification**

Powder Ebastine Orally Disintegrating Tablets. To a portion of the powder, equivalent to 30 mg of Ebastine, add 70 mL of methanol, shake for 10 minutes, then add methanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 251 nm and 255 nm.
Purity Related substances—Powder Ebastine Orally Disintegrating Tablets. To a portion of the powder, equivalent to 50 mg of Ebastine, add 30 mL of methanol for liquid chromatography, shake for 10 minutes, and add the mobile phase to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than ebastine obtained from the sample solution is not larger than the peak area of ebastine from the standard solution, and the total area of the peaks other than ebastine from the sample solution is not larger than 2 times the peak area of ebastine from the standard solution.

Operating conditions—

Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Time span of measurement: About 3 times as long as the retention time of ebastine, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 10 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of ebastine obtained with 10 μL of this solution is equivalent to 15 to 25% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ebastine are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine is not more than 2.0%.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ebastine Orally Disintegrating Tablets add V/10 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles by sonicating. Add 3V/5 mL of methanol, shake for 10 minutes, then add methanol to make exactly V mL so that each mL contains about 0.1 mg of ebastine (C_{12}H_{18}NO_3), and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of ebastine (C_{12}H_{18}NO_3)} = M_s \times Q_s / Q_0 \times V / 500
\]

M_s: Amount (mg) of ebastine for assay taken

Internal standard solution—A solution of diphenyl in the mobile phase (1 in 40,000).

Disintegration Being specified separately when the drug is granted approval based on the Law.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Ebastine Orally Disintegrating Tablets is not less than 80%.

Start the test with 1 tablet of Ebastine Orally Disintegrating Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 5.6 μg of ebastine (C_{12}H_{18}NO_3), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of ebastine for assay, previously dried at 60°C under reduced pressure with phosphorous (V) oxide for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the sample solution and standard solution at 258 nm as directed under Ultraviolet-visible Spectrophotometry <2.247>, using the dissolution medium as the blank.

\[
\text{Dissolution rate (％) with respect to the labeled amount of ebastine (C_{12}H_{18}NO_3)} = M_s \times A_T / A_S \times V / V \times 1 / C \times 18
\]

M_s: Amount (mg) of ebastine for assay taken

C: Labeled amount (mg) of ebastine (C_{12}H_{18}NO_3) in 1 tablet

Assay Weigh accurately the mass of not less than 20 Ebastine Orally Disintegrating Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of ebastine (C_{12}H_{18}NO_3), add 20 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles by sonicating. Add 120 mL of methanol, shake for 10 minutes, then add methanol to make exactly 200 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of ebastine for assay, previously dried at 60°C under reduced pressure with phosphorous (V) oxide for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add 5 mL of 0.1 mol/L hydrochloric acid TS, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of ebastine to that of the internal standard.

\[
\text{Amount (mg) of ebastine (C_{12}H_{18}NO_3)} = M_s \times Q_T / Q_S \times 2 / 5
\]

M_s: Amount (mg) of ebastine for assay taken

Internal standard solution—A solution of diphenyl in the mobile phase (1 in 40,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust to pH 3.0 with diluted phosphoric acid (1 in 5), and add water to make 1000 mL. To 375 mL of this solution add 625 mL of acetonitrile for liquid chromatography, and dissolve 0.72 g of sodium lauryl sulfate in this solution.
Flow rate: Adjust so that the retention time of ebastine is about 9 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ebastine are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Ebashine Tablets

Ebashine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ebastine (C_{32}H_{39}N_{2}O_{3}: 469.66).

Method of preparation Prepare as directed under Tablets, with Ebastine.

Identification Powder Ebastine Tablets. To a portion of the powder, equivalent to 30 mg of Ebastine, add 70 mL of methanol, shake for 10 minutes, then add methanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 251 nm and 255 nm.

Purity Related substances—Powder Ebastine Tablets. To a portion of the powder, equivalent to 50 mg of Ebastine, add 30 mL of methanol for liquid chromatography, shake for 10 minutes, and add the mobile phase to make 50 mL. **Ecabet Sodium Hydrate**

エカベトナトリウム水和物

![Ecabet Sodium Hydrate Structure](image)

C₂₀H₂₅NaO₃·5H₂O: 492.56
(1R,4aS,10aR)-1,4a-Dimethyl-7-(1-methylethyl)-6-sodiosulfonato-1,2,3,4,4a,9,10,10a-octahydrophenanthrene-1-carboxylic acid pentahydrate

[219773-47-4]

Ecabet Sodium Hydrate contains not less than 98.5% and not more than 101.5% of ecabet sodium (C₂₀H₂₅NaO₃S: 402.48), calculated on the anhydrous basis.

**Description**—Ecabet Sodium Hydrate is white crystals. It is freely soluble in methanol, and slightly soluble in water and in ethanol (99.5).

It dissolves in sodium hydroxide TS.

Dissolve 1.0 g of Ecabet Sodium Hydrate in 200 mL of water: the pH of the solution is about 3.5.

**Identification** (1) Determine the absorption spectrum of a solution of Ecabet Sodium Hydrate in dilute sodium hydroxide TS (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry 2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ecabet Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Place 1 g of Ecabet Sodium Hydrate in a porcelain crucible, and carbonize. After cooling, add 0.5 mL of nitric acid, heat gradually to incinerate, and dissolve the residue in 10 mL of water: the solution responds to Qualitative Tests 1.09> for sodium salt.

**Optical rotation** 2.49> [α]D: +69° to +76° (0.25 g calculated on the anhydrous basis, methanol, 25 mL, 100 mm).

**Purity** (1) Heavy metals 1.07>—Proceed with 2.0 g of Ecabet Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 10 mg of Ecabet Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of each peak other than ecabet obtained from the sample solution is not larger than the peak area of ecabet from the standard solution.

---

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 225 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 0.1 mol/L potassium dihydrogen phosphate TS add phosphoric acid to adjust the pH to 3.0. To 730 mL of this solution add 270 mL of acetonitrile.
Flow rate: Adjust so that the retention time of ecabet is about 8 minutes.
Time span of measurement: About 2 times as long as the retention time of ecabet, beginning after the solvent peak.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ecabet are not less than 5000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ecabet is not more than 2.0%.

Water 2.48 17.3 – 19.2% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 1.2 g of Ecabet Sodium Hydroxide, dissolve in 30 mL of methanol, add 30 mL of water, and titrate 2.50 with 0.1 mol/L sodium hydroxide VS (indicator: 4 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C₃H₇NaO₂S
Containers and storage Containers—Well-closed containers.

Ecabet Sodium Granules
エカベトナトリウム顆粒

Ecabet Sodium Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O: 492.56).

Method of preparation Prepare as directed under Granules, with Ecabet Sodium Hydrate.

Identification To a quantity of Ecabet Sodium Granules, equivalent to 50 mg of Ecabet Sodium Hydrate, add 25 mL of dilute sodium hydroxide TS, shake, and filter. Discard the first 10 mL of the filtrate, and to 3 mL of the subsequent filtrate add dilute sodium hydroxide TS to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24; it exhibits maxima between 269 nm and 273 nm, and between 278 nm and 282 nm.

Uniformity of dosage units 6.02 Perform the test according to the following method: Ecabet Sodium Granules in single-dose packages meet the requirement of the Content uniformity test. Take out the total amount of the content of 1 package of Ecabet Sodium Granules, add 70 mL of dilute sodium hydroxide TS, sonicate for 5 minutes with occasional shaking, add dilute sodium hydroxide TS to make exactly V mL so that each mL contains about 10 mg of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O), and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of ecabet sodium hydrate for assay (separately, determine the water 2.48 in the same manner as Ecabet Sodium Hydrate), dissolve in 2 mL of dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, Aₜ and Aₕ, of the sample solution and standard solution at 271 nm as directed under Ultraviolet-visible Spectrophotometry 2.24, using water as the blank.

Amount (mg) of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O) = Mₛ × Aₜ/ₕ × V/₂ × 1.224

Mₛ: Amount (mg) of ecabet sodium hydrate for assay taken, calculated on the anhydrous basis

Dissolution 6.10 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Ecabet Sodium Granules is not less than 80%.

Start the test with an accurately weighed amount of Ecabet Sodium Granules, equivalent to about 1 g of Ecabet Sodium Hydrate, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of ecabet sodium hydrate for assay (separately, determine the water 2.48 in the same manner as Ecabet Sodium Hydrate), dissolve in 1 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, Aₜ and Aₕ, at 271 nm in the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, using water as the blank.

Dissolution rate (%) with respect to the labeled amount of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O) = Mₛ/Mₜ × Aₜ/ₕ × 1/C × 4500 × 1.224

Mₛ: Amount (mg) of ecabet sodium hydrate for assay taken, calculated on the anhydrous basis
Mₜ: Amount (g) of Ecabet Sodium Granules taken
C: Labeled amount (mg) of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O) in 1 g

Assay Weigh accurately an amount of Ecabet Sodium Granules, equivalent to about 30 mg of ecabet sodium hydrate (C₃H₇NaO₂S.5H₂O), add exactly 5 mL of the internal standard solution, add 25 mL of diluted methanol (1 in 2), shake vigorously for 20 minutes, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, to 3 mL of the subsequent filtrate add the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of ecabet sodium hydrate for assay (separately, determine the water 2.48 in the same manner as Ecabet Sodium Hydrate), add exactly 5 mL of the internal standard solution, and dissolve in dilute methanol (1 in 2) to make 30 mL. To 3 mL of this solution add the mobile phase to make...
50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of ecabet to that of the internal standard.

Amount (mg) of ecabet sodium hydrate
(C₈H₁₉NO₃S·5H₂O)
\[ M_s = \frac{Q_1}{Q_2} \times 1.224 \]

\(M_s\): Amount (mg) of ecabet sodium hydrate for assay taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in dilute methanol (1 in 2) (3 in 400).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 225 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 0.1 mol/L potassium dihydrogen phosphate TS add phosphoric acid to adjust the pH to 3.0. To 730 mL of this solution add 270 mL of acetonitrile.
Flow rate: Adjust so that the retention time of ecabet is about 8 minutes.

**System suitability**—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, ecabet and the internal standard are eluted in this order with the retention times being not less than 6.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ecabet to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Well-closed containers.

---

**Ecothiopate Iodide**

エコチオパートヨウ化物

\[ \text{C}_9\text{H}_{13}\text{INO}_3\text{PS} \]

**Description**—Ecothiopate Iodide occurs as white, crystals or crystalline powder.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol (95%), and practically insoluble in diethyl ether.

**Identification**—(1) Dissolve 0.1 g of Ecothiopate Iodide in 2 mL of water, and add 1 mL of nitric acid: a brown precipitate is formed. To 1 drop of the turbid solution containing this precipitate add 1 mL of hexane, and shake: a light red color develops in the hexane layer.

(2) Heat the suspension of the precipitate obtained in (1) until it becomes colorless, cool, add 10 mL of water, and use this solution as the sample solution. Two mL of the sample solution responds to Qualitative Tests \(<1.09\) (2) for phosphate.

(3) Two mL of the sample solution obtained in (2) responds to Qualitative Tests \(<1.09\) for sulfate.

**pH**—Dissolve 0.1 g of Ecothiopate Iodide in 40 mL of water: the pH of this solution is between 3.0 and 5.0.

**Melting point**—116°–122°C

**Purity**—Clarity and color of solution—Dissolve 0.5 g of Ecothiopate Iodide in 5 mL of water: the solution is clear and colorless.

(2) Heavy metals—To 1.0 g of Ecothiopate Iodide in a Kjeldahl flask add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the mouth of the flask, and heat carefully until white fumes are evolved. After cooling, add 2 mL of nitric acid, and heat. Repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30%), and heat until the solution becomes colorless, and white fumes are evolved. After cooling, transfer the solution together with a small quantity of water to a Nessler tube, and add water to make about 20 mL. Adjust the solution with ammonia solution (28) and ammonia TS to a pH between 3.0 and 3.5, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution as follows: proceed in the same manner as the preparation of the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Ecothiopate Iodide in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03\) Spot 10 μL each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid (100) (4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying**—Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 50°C, 3 hours).

**Assay**—Weigh accurately about 0.125 g of Ecothiopate Iodide, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add 30 mL of water, and then add exactly 10 mL of phosphate buffer solution (pH 12), stop the container, and allow to stand at 25 ± 3°C for 20 minutes. To this solution add quickly 2 mL of acetic acid (100), and titrate \(<2.5\) with 0.002 mol/L iodine VS (potentiometric titration). Perform the test in the same manner without phosphate buffer solution (pH 12), and make any necessary correction.

Each mL of 0.002 mol/L iodine VS = 1.533 mg of \(\text{C}_9\text{H}_{13}\text{INO}_3\text{PS}\)

**Containers and storage**—Containers—Tight containers.
Storage—Light-resistant, and not exceeding 0°C.
Edaravone

エダラボン

\[ \text{C}_{10}	ext{H}_{15}	ext{N}_2	ext{O} : 174.20 \]

5-Methyl-2-phenyl-2,4-dihydro-3H-pyrazol-3-one

[89-25-8]

Edaravone, when dried, contains not less than 99.0% and not more than 101.0% of edaravone \((\text{C}_{10}	ext{H}_{15}	ext{N}_2\text{O})\).

**Description** Edaravone occurs as white to pale yellow-white, crystals or crystalline powder.

It is freely soluble in ethanol (99.5) and in acetic acid (100), and slightly soluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Edaravone (1 in 200,000) as directed under Ultra-violet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Edaravone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**pH** \(<2.5\rangle\) The pH of a solution obtained by dissolving 20 mg of Edaravone in 20 mL of water is between 4.0 and 5.5.

**Melting point** \(>2.60\rangle\) 127 - 131°C

**Purity** (1) Heavy metals \(<1.07\rangle\)—Proceed with 2.0 g of Edaravone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Edaravone in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than edaravone obtained from the sample solution is not larger than the peak area of edaravone from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water, methanol and acetic acid (100) (100:100:1).

Flow rate: Adjust so that the retention time of edaravone is about 4 minutes.

**System suitability**—

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of edaravone is not more than 2.0%.

**Loss on drying** \(<2.4\rangle\) Not more than 0.1% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

**Residue on ignition** \(<2.4\rangle\) Not more than 0.1% (1 g).

**Identification** To a volume of Edaravone Injection, equivalent to 1.5 mg of Edaravone, add water to make 50 mL. To 5 mL of this solution add water to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\): it exhibits a maximum between 238 nm and 242 nm.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Containers and storage** Containers—Well-closed containers.

**Edaravone Injection**

エダラボン注射液

Edaravone Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of edaravone \((\text{C}_{10}	ext{H}_{15}	ext{N}_2\text{O}) : 174.20\).

**Method of preparation** Prepare as directed under Injections, with Edaravone.

**Description** Edaravone Injection occurs as a clear and colorless liquid.

**Identification** To a volume of Edaravone Injection, equivalent to 1.5 mg of Edaravone, add water to make 50 mL. To 5 mL of this solution add water to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\): it exhibits a maximum between 238 nm and 242 nm.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity** Related substance—(1) Perform the following test 1). For preparations to which the test 2) can be applied, the test 2) may be performed instead of 1).

1) To a suitable amount of Edaravone Injection add the mobile phase so that each mL contains 0.3 mg of edaravone \((\text{C}_{10}	ext{H}_{15}	ext{N}_2\text{O})\), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 50 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than
Edaravone Injection / Official Monographs

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (2) under Edaravone.

Time span of measurement: About 7 times as long as the retention time of edaravone, beginning after the peak of edaravone.

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of edaravone are not less than 1500 and not more than 1.4, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of edaravone is not more than 2.0%.

2) Use Edaravone Injection as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than edaravone obtained from the sample solution is not larger than 2 times the peak area of edaravone from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (2) under Edaravone.

Time span of measurement: About 7 times as long as the retention time of edaravone, beginning after the peak of edaravone.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of edaravone are not less than 1500 and not more than 1.4, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of edaravone is not more than 2.0%.

(ii) Perform the following test 1). For preparations to which the test 2) can be applied, the test 2) may be performed instead of 1).

1) To a suitable amount of Edaravone Injection add the mobile phase so that each mL contains 0.3 mg of edaravone (C₆H₁₂N₂O₄), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.4, obtained from the sample solution is not larger than 4 times the peak area of edaravone from the standard solution, the area of the peak, having the relative retention time of about 0.4, obtained from the sample solution is not larger than the peak area of edaravone from the standard solution, and the area of the peak other than edaravone and the peaks mentioned above from the sample solution is not larger than 2 times the peak area of edaravone from the standard solution.

Operating conditions—

Detector, column, and mobile phase: Proceed as directed in the operating conditions in the Assay 1).

Column temperature: A constant temperature of about 40°C.

Flow rate: Adjust so that the retention time of edaravone is about 11 minutes.

Time span of measurement: About 2.5 times as long as the retention time of edaravone, beginning after the solvent peak.

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of edaravone are not less than 2000 and not more than 1.4, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of edaravone is not more than 2.0%.

2) Use Edaravone Injection as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.3 to edaravone, obtained from the sample solution is not larger than 4 times the peak area of edaravone from the standard solution, the area of the peak, having the relative retention time of about 0.4, from the sample solution is not larger than the peak area of edaravone from the standard solution, the area of the peak other than edaravone and the peaks mentioned above from the sample solution is not larger than 2 times the peak area of edaravone from the standard solution.

Operating conditions—

Detector, column, and mobile phase: Proceed as directed in the operating conditions in the Assay 1).

Column temperature: A constant temperature of about 40°C.

Flow rate: Adjust so that the retention time of edaravone is about 11 minutes.

Time span of measurement: About 2.5 times as long as the retention time of edaravone, beginning after the solvent peak.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of edaravone are not less than 2000 and not more than 1.4, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of edaravone is not more than 2.0%.

Bacterial endotoxins <4.01> Less than 5.0 EU/mg.

Extractable volume <5.05> It meets the requirement.
Foreign insoluble matter <6.06> Perform the test according to Method 1; it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method; it meets the requirement.

Assay Perform the following test 1). For preparations to which the test 2) can be applied, the test 2) may be performed instead of 1).

1) To exactly $V$ mL of Edaravone Injection add methanol to make exactly $V$ mL so that each mL contains about 0.3 mg of edaravone ($C_{10}H_{18}N_2O$). Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, then add methanol to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of edaravone for assay, previously dried in vacuum using phosphorus (V) oxide as a desiccant for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, then add methanol to make 20 mL, and use this solution as the standard solution. Perform the test with 10 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and measure the peak area of edaravone to that of the internal standard.

Amount (mg) of edaravone ($C_{10}H_{18}N_2O$)

\[ \text{Amount (mg) of edaravone} = \frac{M_s \times Q_t}{Q_s \times V/V} \times 1/100 \]

$M_s$: Amount (mg) of edaravone for assay taken

Internal standard solution—A solution of ethyl aminobenzate in methanol (1 in 2500).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A mixture of diluted dilute acetic acid (1 in 100) and methanol (3:1), adjusted to pH 5.5 with diluted ammonia solution (28) (1 in 20).

Flow rate: Adjust so that the retention time of edaravone is about 8 minutes.

System suitability—

System performance: When the procedure is run with 10 $\mu$L of the standard solution under the above operating conditions, edaravone and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the procedure is repeated 6 times with 2 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of edaravone to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Edrophonium Chloride

エドロホニウム塩化物

$C_{10}H_{18}CINO$; 201.69
$N$-Ethyl-3-hydroxy-$N,N$-dimethylanilinium chloride
[116-38-1]

Edrophonium Chloride, when dried, contains not less than 98.0% of edrophonium chloride ($C_{10}H_{18}CINO$).

Description Edrophonium Chloride occurs as white, crystals or crystalline powder. It is odorless.

It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

It is hygroscopic.

It is gradually colored by light.

Identification (1) To 5 mL of a solution of Edrophonium Chloride (1 in 100) add 1 drop of iron (III) chloride TS: a light red-purple color develops.

(2) Determine the absorption spectrum of a solution of Edrophonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Edrophonium Chloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Edrophonium Chloride (1 in 50) responds to Qualitative Tests <1.09> for chloride.
**Edrophonium Chloride Injection**

Edrophonium Chloride Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of edrophonium chloride (C₁₀H₁₅ClNO: 201.69).

**Method of preparation** Prepare as directed under Injections, with Edrophonium Chloride.

**Description** Edrophonium Chloride Injection is a clear and colorless liquid.

**Identification**

(1) To a volume of Edrophonium Chloride Injection, equivalent to 0.04 g of Edrophonium Chloride, add 4 mL of barium nitrate TS, shake, and filter. Proceed with the filtrate as directed in the Identification (1) under Edrophonium Chloride.

(2) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 272 nm and 276 nm.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsine <1.11>—Prepare the test solution with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.50 g of Edrophonium Chloride in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethanol (95) to make exactly 100 mL. Pipet 3 mL of this solution, add ethanol (95) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonia solution (28:16:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.44> Not more than 0.20% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Edrophonium Chloride, previously dried, and dissolve in 100 mL of a mixture of acetic anhydride and acetic acid (100:7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and prepare the standard solution in the same manner.

Each mL of 0.1 mol/L perchloric acid VS = 20.17 mg of C₁₀H₁₅ClNO

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**pH** <2.54> Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the pH of this solution is between 3.5 and 5.0.

**Melting point** <2.60> 166 – 171°C (with decomposition).

**Containers and storage** Light-resistant.
Elcatonin

エルカトニン

\[
\text{C}_{34}\text{H}_{34}\text{N}_{2}\text{O}_{17}; \quad 3363.77
\]

[60731-46-6]

Elcatonin contains not less than 5000 Elcatonin Units and not more than 7000 Elcatonin Units per mg of peptide, calculated on the anhydrous and residual acetic acid-free basis.

**Description**

Elcatonin is a white powder. It is very soluble in water, freely soluble in ethanol (95), and practically insoluble in acetonitrile. It is hygroscopic.

The pH of a solution of Elcatonin (1 in 500) is between 4.5 and 7.0.

**Identification**

Dissolve 5 mg of Elcatonin in 5 mL of water. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Constituent amino acids**

Put about 1 mg of Elcatonin in a test tube for hydrolysis, add phenol-hydrochloric acid TS to dissolve, replace the air inside with Nitrogen, seal the tube under reduced pressure, and heat at 110 ± 2°C for 24 hours. After cooling, open the tube, evaporate the hydrolyzate to dryness under reduced pressure, dissolve the residue in about 1 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution. Separately, weigh exactly 1.33 mg of L-aspartic acid, 1.19 mg of L-threonine, 1.05 mg of L-serine, 1.47 mg of L-glutamic acid, 1.15 mg of L-proline, 0.75 mg of glycine, 0.89 mg of L-alanine, 1.17 mg of L-valine, 1.89 mg of L-2-amino-4-hydroxybutyric acid, 1.31 mg of L-leucine, 1.81 mg of L-tyrosine, 1.83 mg of L-lysin hydrochloride, 2.10 mg of L-histidine hydrochloride monohydrate and 2.11 mg of L-arginine hydrochloride, dissolve them in 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution.

Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions: 14 peaks of amino acids appear on the chromatogram obtained from the sample solution, and their respective molar ratios against alanine are 1.7 – 2.2 for aspartic acid, 3.5 – 4.2 for threonine, 2.4 – 3.0 for serine, 2.7 – 3.2 for glutamic acid, 1.7 – 2.2 for proline, 2.7 – 3.2 for glycine, 1.6 – 2.2 for valine, 0.8 – 1.2 for 2-aminosuberic acid, 4.5 – 5.2 for leucine, 0.7 – 1.2 for tyrosine, 1.7 – 2.2 for lysine, 0.8 – 1.2 for histidine and 0.7 – 1.2 for arginine.

**Operating conditions—**

Detector: A visible spectrophotometer (wavelength: 440 nm and 570 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography composed with a sulfonated styrene-divinylbenzene copolymer (3 µm in particle diameter).

Column temperature: Varied between 50°C and 65°C.

Chemical reaction vessel temperature: A constant temperature of about 130°C.

Color developing time: About 1 minute.

Mobile phase: Buffer solutions A, B, C and D, with sodium ion concentrations of 0.10 mol/L, 0.135 mol/L, 1.26 mol/L and 0.20 mol/L, respectively. The ion concentration of the mobile phase is changed stepwise from 0.10 mol/L to 1.26 mol/L by using these buffer solutions.

**Purity (1)** Acetic acid—Weigh accurately 3 – 6 mg of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, add exactly 1 mL of the internal standard solution to dissolve it, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of acetic acid (100), and add the internal standard solution to make exactly 100 mL. Pipet 5 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of acetic acid to that of the internal standard: the amount of acetic acid is not more than 7.0%.

\[
\text{Amount (g) of acetic acid (100) taken} = M_{ST} / M_{SA} \times Q_T / Q_S \times 50
\]

\(M_{ST}\): Amount (g) of acetic acid (100) taken

\(M_{SA}\): Amount (mg) of Elcatonin taken

Internal standard solution—A solution of citric acid monohydrate (1 in 4000).
Elcatonin / Official Monographs

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 13.2 g of diammonium hydrogen phosphate in 900 mL of water, add phosphoric acid to adjust the pH to 2.5, and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of acetic acid is about 4 minutes.

Selection of column: Proceed with 20 μL of the standard solution under the above operating conditions. Use a column from which acetic acid and citric acid are eluted in this order with the resolution between their peaks being not less than 2.0.

(2) Related substances—Dissolve 1.0 mg of Elcatonin in 1 mL of a mixture of trifluoroacetic acid TS and acetonitrile (2:1), and use this solution as the sample solution. Take exactly 0.3 mL of the sample solution, add a mixture of trifluoroacetic acid TS and acetonitrile (2:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than elcatonin obtained from the sample solution is not larger than 1/3 times the peak area of elcatonin from the standard solution, and the total of the peak areas other than elcatonin is not larger than the peak area of elcatonin from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of trifluoroacetic acid TS and acetonitrile (change the ratio linearly from 85:15 to 55:45 in 30 minutes).

Flow rate: Adjust so that the retention time of elcatonin is about 25 minutes.

Selection of column: Dissolve 2 mg of Elcatonin in 200 μL of trifluoroacetic acid TS for test of elcatonin, warm at 37°C for 1 hour, then add 1 drop of acetic acid (100), and heat at 95°C for 1 minute. To 10 μL of this solution add 50 μL of the sample solution, and mix. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column such that the resolution between their peaks being not less than 2.0, and the retention time of elcatonin is about 25 minutes.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of elcatonin from 10 μL of the standard solution is between 50 mm and 200 mm.

Time span of measurement: Continue measurement until the regularly changing base-line of the chromatogram disappears, beginning after the solvent peak.

Water <2.40> Weigh accurately 1 – 3 mg of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, and perform the test as directed in Coulometric titration: not more than 8.0%.

Nitrogen content Weigh accurately 0.015 – 0.02 g of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, and perform the test as directed under Nitrogen Determination <1.06>: it contains not less than 16.1% and not more than 18.7% of nitrogen (N: 14.01) in the peptide, calculated on the anhydrous and residual acetic acid-free basis.

Assay (i) Animals: Select healthy male Sprague-Dawley rats each weighing between 90 g and 110 g. Keep the rats for not less than 3 days before use, providing an appropriate uniform diet and water.

(ii) Diluent for elcatonin: Dissolve 2.72 g of sodium acetate trihydrate in water to make 200 mL, add 0.2 g of bovine serum albumin, and adjust the pH to 6.0 with acetic acid (100). Prepare before use.

(iii) Standard solution: Dissolve Elcatonin RS in the diluent for elcatonin to make two standard solutions, one to contain exactly 0.075 Unit in each mL which is designated as the high-dose standard solution, S_H, and the other to contain exactly 0.0375 Unit in each mL which is designated as the low-dose standard solution, S_L.

(iv) Sample solution: Weigh accurately 0.5 – 2.0 mg of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, and dissolve in the diluent for elcatonin to make two sample solutions, the high-dose sample solution, T_H, which contains the Units per mL equivalent to S_H and the low-dose sample solution, T_L, which contains the Units per mL equivalent to S_L.

(v) Deproteinizing solution for elcatonin: Dissolve 160 g of trichloroacetic acid and 30.6 g of strontium chloride in water to make 3600 mL.

(vi) Procedure: Divide the animals into 4 equal groups of not less than 10 animals each. Withhold all food, but not water, for 18 to 24 hours before the injections, and withhold water during the assay until the final blood sample is taken. Handle the animals with care in order to avoid undue excitement.

Inject exactly 0.2 mL each of the standard solutions and the sample solutions into the tail vein of each animal as indicated in the following design:

First group
Second group
Third group
Fourth group

At 1 hour after the injection, take a sufficient blood sample to perform the test from the carotid artery and vein of each animal under ether anesthesia, centrifuge the blood samples to separate serum, and determine the serum calcium according to the following (vii).

(vii) Serum calcium determination: Take exactly 0.3 mL of the serum, add the deproteinizing solution for elcatonin to make exactly 3 mL, mix well, centrifuge, and use the supernatant liquid as the sample solution for calcium determination. Separately, pipet 1 mL of Standard Calcium Solution for Atomic Absorption Spectrophotometry, and add a solution of sodium chloride (17 in 2000) to make exactly 10 mL. Pipet 5 mL of this solution, add the deproteinizing solution for elcatonin to make exactly 50 mL, and use this solution as the standard solution for calcium determination. Determine the absorbances, A_T and A_S, of the sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions. Determine the absorbance, A_C, of a solution obtained in the same manner used for preparation of the standard solution, but with 1 mL of water instead of the standard solution.
Amount (mg) of calcium (Ca) in 100 mL of the serum
= 0.01 \times (A_1 - A_2)/(A_3 - A_0) \times 10 \times 100

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Calcium hollow-cathode lamp.

Wavelength: 422.7 nm.

(viii) Calculation: Amounts of calcium in 100 mL of the serum obtained with S_1, S_2, S_3 and T_4 in (vii) are symbolized as y_1, y_2, y_3 and y_4, respectively. Sum up individual y_1, y_2, y_3 and y_4 to obtain Y_1, Y_2, Y_3 and Y_4, respectively.

Units per mg of peptide, calculated on the anhydrous and residual acetic acid-free basis
= \text{antilog} M \times \text{units per mL of } S_H \times b/a

M = 0.3010 \times Y_0 / Y_0

Y_1 = -Y_1 - Y_2 + Y_3 + Y_4
Y_2 = Y_1 - Y_2 + Y_1 - Y_4

a: Amount (mg) of Elcatonin taken
\times [(100 - \text{water content} (\%)) + \text{acetic acid content} (\%)/100]

b: Total volume (mL) of the high-dose sample solution prepared by dissolving Elcatonin with diluent for elcatonin

F^2 computed by the following equation should be smaller than F shown in the table against n with which s^2 is calculated. Calculate L (P = 0.95) by use of the following equation: L should be not more than 0.20. If F^2 exceeds F, or if L exceeds 0.20, repeat the test, increasing the number of animals or arranging the assay conditions so that F^2 is not more than F and L is not more than 0.20.

\[ F^2 = (-Y_1 + Y_2 + Y_3 - Y_4)^2/4f s^2 \]

f: Number of the animals of each group

s^2 = [\Sigma y^2 - (Y/y)]/n

\[ \Sigma y^2: \text{The sum of squares of } y_1, y_2, y_3 \text{ and } y_4 \text{ in each group} \]

Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2

n = 4 (f - 1)

\[ L = 2/[(C - 1)(CM^2 + 0.09062)] \]

C = Y_4^2/(Y_1^2 - 4f s^2 r^2)

r^2: Value shown in the following table against n used to calculate s^2

Containers and storage: Containers—Tight containers. Storage—Not exceeding 8°C.

Emedastine Fumarate

エメダスチンフマル酸塩

C_{17}H_{28}N_2O_6·2C,H_2O_4: 534.56
1-(2-Ethoxyethyl)-2-(4-methyl-1,4-diazepan-1-yl)-1H-benzimidazole difumarate

[8723-62-3]

Emedastine Fumarate, when dried, contains not less than 98.5% and not more than 101.0% of emedastine fumarate (C_{17}H_{28}N_2O_6·2C,H_2O_4).

Description: Emedastine Fumarate occurs as a white to pale yellow crystalline powder.

It is freely soluble in water, soluble in methanol, sparingly soluble in ethanol (99.5), and slightly soluble in acetic acid (100).

It shows crystal polymorphism.

Identification (1) Dissolve 10 mg of Emedastine Fumarate in 10 mL of water. To 2 mL of this solution add 1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultra-violet-visible Spectrophotometry <2.24> and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Emedastine Fumarate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 30 mg of Emedastine Fumarate in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 10 mg of fumaric acid for thin-layer chromatography in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 \mu L of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl ether, formic acid and water (90:7:3) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the spot on the starting point obtained from the sample solution and the spot from the standard solution show the same Rt value.

Melting point <2.60> 149 - 152°C

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Emedastine Fumarate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 10 mg of Emedastine Fumarate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 \mu L of each of the sample solu-
tion and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than emedastine and fumaric acid obtained from the sample solution is not larger than the peak area of emedastine from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 6.0 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 3.9 g of sodium dihydrogen phosphate dihydrate and 2.5 g of sodium lauryl sulfate in 1000 mL of water, and adjust to pH 2.4 with phosphoric acid. To 550 mL of this solution add 450 mL of acetonitrile.

Flow rate: Adjust so that the retention time of emedastine is about 18 minutes.

Time span of measurement: About 2 times as long as the retention time of emedastine, beginning after the solvent peak.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of emedastine are not less than 10,000 and not more than 1.2, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of emedastine is not more than 2.0%.

**Loss on drying <2.41>** Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Emedastine Fumarate, previously dried, dissolve in 80 mL of acetic acid (100), and titrate <2.50D> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 26.73 mg of C₁₇H₂₆N₂O₂.2C₆H₄O₈

**Containers and storage** Containers—Tight containers.

---

**Emedastine Fumarate Extended-release Capsules**

エメダスチンフマル酸塩徐放カプセル

Emedastine Fumarate Extended-release Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of emedastine fumarate (C₁₇H₂₆N₂O₂.2C₆H₄O₈: 534.56).

**Method of preparation** Prepare as directed under Capsules, with Emedastine Fumarate.

**Identification** (1) Powder the content of Emedastine Fumarate Extended-release Capsules. To a portion of the powder, equivalent to 10 mg of Emedastine Fumarate, add 10 mL of water, shake thoroughly, and filter. Spot 1 drop of the filtrate on a filter paper, and spray Dragendorff’s TS for spraying on the filter: the spot shows an orange color.

(2) To 2 mL of the filtrate obtained in (1) add 1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24D; it exhibits maxima between 278 nm and 282 nm, and between 284 nm and 288 nm.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Emedastine Fumarate Extended-release Capsules add 40 mL of the mobile phase, sonicate for 30 minutes while occasional vigorous shaking, and add the mobile phase to make exactly V mL so that each mL contains about 20 μg of emedastine fumarate (C₁₇H₂₆N₂O₂.2C₆H₄O₈). Centrifuge this solution, pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of emedastine fumarate

\[ M_5 = \frac{Q_v}{Q_s} \times \frac{V}{1000} \]

**Containers**

- **Internal standard solution**—A solution of 4-methyl-benzophenone in the mobile phase (1 in 40,000).

**Dissolution** Being specified separately when the drug is granted approval based on the Law.

**Assay** Weigh accurately the content of not less than 20 Emedastine Fumarate Extended-release Capsules, and powder. Weigh accurately a portion of the powder, equivalent to about 2 mg of emedastine fumarate (C₁₇H₂₆N₂O₂.2C₆H₄O₈), add 10 mL of the mobile phase, sonicate for 30 minutes while occasional vigorous shaking, and add the mobile phase to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of emedastine fumarate for assay, previously dried at 105°C for 3 hours, and dissolve in the mobile phase to make 100 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 50 mL. Then, pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01D>, according to the following conditions, and calculate the ratios, Qₜ and Qₛ, of the peak area of emedastine to that of the internal standard.

Amount (mg) of emedastine fumarate

\[ M_3 = \frac{Q_t}{Q_s} \times \frac{1}{10} \]

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Emedastine Fumarate Extended-release Capsules add 40 mL of the mobile phase, sonicate for 30 minutes while occasional vigorous shaking, and add the mobile phase to make exactly V mL so that each mL contains about 20 μg of emedastine fumarate (C₁₇H₂₆N₂O₂.2C₆H₄O₈). Centrifuge this solution, pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of emedastine fumarate

\[ M_5 = \frac{Q_v}{Q_s} \times \frac{V}{1000} \]
phate dihydrate and 2.5 g of sodium lauryl sulfate in 1000 mL of water, and adjust to pH 2.4 with phosphoric acid. To 500 mL of this solution add 500 mL of acetonitrile.

Flow rate: Adjust so that the retention time of emedastine is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, emedastine and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of emedastine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

**Emorfazone**

エモルファゾン

\[
\text{C}_{13}H_{17}N_2O_3; 239.27
\]

4-Ethoxy-2-methyl-5-(morpholin-4-yl)pyrazin-3(2H)-one

[38957-41-4]

Emorfazone, when dried, contains not less than 98.5% and not more than 101.0% of emorfazone (C_{13}H_{17}N_2O_3).

**Description** Emorfazone occurs as colorless crystals or a white to light yellow crystalline powder.

It is very soluble in ethanol (99.5%), and freely soluble in water and in acetic anhydride.

It dissolves in 1 mol/L hydrochloric acid TS.

It gradually turns yellow and decomposes on exposure to light.

**Identification** (1) Dissolve 20 mg of Emorfazone in 2 mL of 1 mol/L hydrochloric acid TS, and add 5 drops of Reinecke’s TS: light red floating matters are formed.

(2) Determine the absorption spectrum of a solution of Emorfazone (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\) and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Emorfazone as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\) and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** \(\geq 2.60\) 89 – 92°C (after drying).

**Purity** (1) Chloride \(<1.07\)—Perform the test with 1.0 g of Emorfazone. Prepare the control solution with 0.50 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(2) Heavy metals \(<1.07\)—Proceed with 2.0 g of Emorfazone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \(<1.17\>—Prepare the test solution with 2.0 g of Emorfazone according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 0.5 g of Emorfazone in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than emorfazone obtained from the sample solution is not larger than 1/10 times the peak area of emorfazone from the standard solution, and the total area of the peaks other than emorfazone from the sample solution is not larger than 1/2 times the peak area of emorfazone from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (11:10).

Flow rate: Adjust so that the retention time of emorfazone is about 5 minutes.

Time span of measurement: About 2.5 times as long as the retention time of emorfazone, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, add the mobile phase to make exactly 20 mL. Confirm that the peak area of emorfazone obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the standard solution.

System performance: Dissolve 16 mg of Emorfazone and 30 mg of 2,4-dinitrophenylhydrazine in 100 mL of methanol. When the procedure is run with 20 μL of this solution under the above operating conditions, emorfazone and 2,4-dinitrophenylhydrazine are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of emorfazone is not more than 1.0%.

**Loss on drying** \(<2.4\>) Not more than 0.5% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition** \(<2.4\>) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Emorfazone, previously dried, dissolve in 60 mL of acetic anhydride, and titrate \(<2.3.6\> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 23.93 mg of C_{13}H_{17}N_2O_3.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.
Emorfazone Tablets

エモルファゾン錠

Emorfazone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of emorfazone (C₁₁H₁₇N₃O₃; 239.27).

Method of preparation Prepare as directed under Tablets, with Emorfazone.

Identification To a quantity of powdered Emorfazone Tablets, equivalent to 0.1 g of Emorfazone, add 100 mL of water, shake well, and centrifuge. Filter the supernatant liquid, and to 1 mL of the filtrate add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 237 nm and 241 nm, and between 310 nm and 314 nm, and a shoulder between 288 nm and 298 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Emorfazone Tablets add methanol to make exactly 5 mL, so that each mL contains about 4 mg of emorfazone (C₁₁H₁₇N₃O₃), and shake well to disintegrate. Centrifuge this solution, pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

\[
\text{Amount (mg) of emorfazone (C}_11\text{H}_{17}\text{N}_3\text{O}_3) = M_S \times \frac{Q_t}{Q_b} \times \frac{\lambda_1}{\lambda_2}\]

MS: Amount (mg) of emorfazone for assay taken

Internal standard solution—A solution of 2,4-dinitrophenyl-hydrazine in methanol (3 in 2000). Prepare before use.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Emorfazone Tablets is not less than 80%.

Start the test with 1 tablet of Emorfazone Tablets; withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 3 mL of the subsequent filtrate, add water to make exactly 5 mL, so that each mL contains about 11 μg of emorfazone (C₁₁H₁₇N₃O₃), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of emorfazone for assay, previously dried in vacuum at 60°C for 4 hours, and dissolve in methanol to make exactly 25 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the sample solution. Perform the test with 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₇ and Q₉, of the peak area of emorfazone to that of the internal standard.

\[
\text{Amount (mg) of emorfazone (C}_11\text{H}_{17}\text{N}_3\text{O}_3) = M_S \times \frac{Q_7}{Q_9} \times 2/5\]

MS: Amount (mg) of emorfazone for assay taken

Internal standard solution—A solution of 2,4-dinitrophenyl-hydrazine in methanol (3 in 2000). Prepare before use.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 313 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water and methanol (11:10).
Flow rate: Adjust so that the retention time of emorfazone is about 5 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, emorfazone and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of emorfazone to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Enalapril Maleate

エナラプリルマレイン酸塩

\[
\text{C}_{29}\text{H}_{38}\text{N}_{2}\text{O}_{7}\cdot\text{C}_3\text{H}_4\text{O}_4: 492.52}\]

(2S)-1-[(2S)-2-[(1S)-1-Ethoxycarbonyl-3-phenylpropylamino]propanoyl]pyrrolidine-2-carboxylic acid monomaleate [76095-16-4]

Enalapril Maleate, when dried, contains not less than 98.0% and not more than 102.0% of enalapril maleate (C₂₉H₃₈N₂O₇•C₃H₄O₄).
**Description**
Enalapril Maleate occurs as white, crystals or crystalline powder.

It is freely soluble in methanol, sparingly soluble in water and in ethanol (99.5), and slightly soluble in acetonitrile.

Melting point: about 145°C (with decomposition).

**Identification (1)**
Determine the infrared absorption spectra of Enalapril Maleate as directed in the potassium bromide disc method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of Enalapril Maleate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 20 mg of Enalapril Maleate add 5 mL of 1 mol/L hydrochloric acid TS, shake, add 5 mL of diethyl ether, and shake for 5 minutes. Take 3 mL of the upper layer, distil off the diethyl ether on a water bath, add 5 mL of water to the residue with shaking, and add 1 drop of potassium permanganate TS: the red color of the test solution immediately disappears.

**Optical rotation**
\(<2.4\rangle \ [\alpha]_D^2: \ -41.0 - 43.5^\circ \) (after drying, 0.25 g, methanol, 25 mL, 100 mm).

**Purity (1)**
Heavy metals \(<1.07\rangle — Proceed with 2.0 g of Enalapril Maleate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Enalapril Maleate in 100 mL of a mixture of sodium dihydrogen phosphate TS (pH 2.5) and acetonitrile (19:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of sodium dihydrogen phosphate TS (pH 2.5) and acetonitrile (19:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and determine the peak areas, \(A_T\) and \(A_S\), of enalapril in each solution.

Amount (mg) of enalapril maleate \((C_{28}H_{32}N_{2}O_{5},C_{6}H_{12}O_{4})\)

\[M_S : \text{Amount (mg) of Enalapril Maleate RS taken} \]

Operating conditions—

- Column: A stainless steel column 4.1 mm in inside diameter and 15 cm in length, packed with porous styrene-divinylbenzene copolymer for liquid chromatography (5 \(\mu\)m in particle diameter).
- Column temperature: A constant temperature of about 70°C.

Mobile phase A: Dissolve 3.1 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 6.8 with a solution of sodium hydroxide (1 in 4), and add water to make 1000 mL. To 950 mL of this solution, add 50 mL of acetonitrile for liquid chromatography.

Mobile phase B: Dissolve 3.1 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 6.8 with a solution of sodium hydroxide (1 in 4), and add water to make 1000 mL. To 340 mL of this solution, add 660 mL of acetonitrile for liquid chromatography.

Flowing of mobile phase: Control the concentration gradient by changing the ratio of the mobile phases A and B as follows.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>20 – 25</td>
<td>40</td>
<td>60</td>
</tr>
</tbody>
</table>

Flow rate: 1.4 mL per minute.

**System suitability**—
- System performance: When the procedure is run with 50 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of enalapril are not less than 3000 and not more than 2.0, respectively.
- System repeatability: When the test is repeated 6 times with 50 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of enalapril is not more than 1.0%.

**Containers and storage**
Containers—Well-closed containers.
Enalapril Maleate Tablets

エナラプリルマレイン酸塩

Enalapril Maleate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂: 492.52).

Method of preparation Prepare as directed under Tablets, with Enalapril Maleate.

Identification To a quantity of powdered Enalapril Maleate Tablets, equivalent to 50 mg of enalapril maleate, add 20 mL of methanol, shake, centrifuge, and then use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of enalapril maleate in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-Layer Chromatography.<ref>2.03</ref>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of water, acetone, 1-butanol, acetic acid (100) and toluene (1:1:1:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the RF values of the 2 spots obtained from the sample solution and the 2 spots from the standard solution are equivalent.

Purity Enalaprilat and enalapril diketopiperazine—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add sodium dihydrogen phosphate TS (pH 2.2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography.<ref>2.01</ref> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the peak area of enalaprilat, having the relative retention time of about 0.5 to enalapril obtained from the sample solution, is not larger than 2 times the peak area of enalapril from the standard solution. Also, the peak area of enalapril diketopiperazine, having the relative retention time of about 1.5 to enalapril, from the sample solution is not larger than the peak area of enalapril from the standard solution.

Operating conditions—Proceed as directed in the operating conditions in the Assay.

System suitability—System performance: Proceed as directed in the system suitability in the Assay. Test for required detectability: Pipet 1 mL of the standard solution, and add sodium dihydrogen phosphate TS (pH 2.2) to make exactly 10 mL. Confirm that the peak area of enalapril obtained with 50 μL of this solution is equivalent to 7 to 13% of that with 50 μL of the standard solution.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of enalapril is not more than 2.0%.

Uniformity of dosage units<ref>6.02</ref> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

Take 1 tablet of Enalapril Maleate Tablets, add V/2 mL of sodium dihydrogen phosphate TS (pH 2.2), sonicate for 15 minutes, shake for 30 minutes, and add sodium dihydrogen phosphate TS (pH 2.2) to make exactly V mL so that each mL contains about 0.1 mg of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂). Sonicate this solution for 15 minutes, filter through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂) = M₅ × A₅/A₄ × V/200

M₅: Amount (mg) of Enalapril Maleate RS taken

Dissolution<ref>6.10</ref> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rates in 15 minutes of a 2.5- and 5-mg tablet and in 30 minutes of a 10-mg tablet are not less than 85%, respectively.

Start the test with 1 tablet of Enalapril Maleate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 2.8 μg of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂), and use this solution as the sample solution. Separately, weigh accurately about 14 mg of Enalapril Maleate RS, previously dried in vacuum at 60°C for 2 hours, and dissolve in water to make exactly 500 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL of each sample solution and standard solution as directed under Liquid Chromatography.<ref>2.01</ref> according to the following conditions, and determine the peak areas, A₄ and A₅, of enalapril in each solution.

Dissolution rate (％) with respect to the labeled amount of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂) = M₅ × A₅/A₄ × V'/V × 1/C × 18

M₅: Amount (mg) of Enalapril Maleate RS taken

C: Labeled amount (mg) of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂) in 1 tablet

Operating conditions—Detector, column, column temperature, and flow rate: Proceed as directed in the operating conditions in the Assay. Mobile phase: Dissolve 1.88 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 2.2 with phosphoric acid, and add water to make 1000 mL. To 750 mL of this solution add 250 mL of acetonitrile.

System suitability—System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of enalapril are not less than 300 and not more than 2.0, respectively.

System reproducibility: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of enalapril is not more than 2.0%.

Assay Weigh accurately not less than 20 Enalapril Maleate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 10 mg of enalapril maleate (C₂₀H₂₈N₂O₅·C₂H₅O₂), add 50 mL of sodium dihydrogen phosphate TS (pH 2.2), sonicate for 15 minutes, shake for 30 minutes, and then add sodium dihydrogen phosphate TS (pH 2.2) to make exactly 100 mL. Sonicate this solution for 15 minutes, filter through a membrane filter with a pore size

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
not exceeding 0.45 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg of Enalapril Maleate RS, previously dried in vacuum at 60°C for 2 hours, dissolve in sodium dihydrogen phosphate TS (pH 2.2) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A7 and A8, of enalapril in each solution.

Amount (mg) of enalapril maleate (C39H38N2O3.S.C6H8O3) = M5 × A7/A8 × 1/2

M5: Amount (mg) of Enalapril Maleate RS taken

Operating conditions—

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A mixture of sodium dihydrogen phosphate TS (pH 2.2) and acetonitrile (3:1).

Flow rate: Adjust so that the retention time of enalapril is about 5 minutes.

System suitability—

System performance: Heat to fusion about 20 mg of enalapril maleate. After cooling, add 50 mL of acetonitrile, and sonicate to dissolve. To 1 mL of this solution, add the standard solution to make 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 50 μL of the solution for system suitability test under the above operating conditions, enalapril and enalapril diketopiperazine, which has a relative retention time of about 1.5 to enalapril, are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 50 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of enalapril is not more than 1.0%.

Containers and storage—Containers—Well-closed containers.

**Enflurane**

エンフルラン

\[
\text{C}_3\text{H}_2\text{ClF}_2\text{O} : 184.49 \\
(2RS)-2\text{Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane} \\
[13838-16-9]
\]

Description Enflurane is a clear, colorless liquid.

It is slightly soluble in water.

It is miscible with ethanol (95) and with diethyl ether.

It is a volatile, and not an inflammable.

It shows no optical rotation.

Boiling point: 54 – 57°C

Identification (1) Take 50 μL of Enflurane, and prepare the test solution as directed to the Oxygen Flask Combustion Method <1.06> using 40 mL of water as the absorbing liquid.

The test solution responds to Qualitative Tests <1.09> for chloride and fluoride.

(2) Determine the infrared absorption spectrum of Enflurane as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45> \(nD^4 = 1.302 – 1.304\)

**Specific gravity** <2.50> \(\delta\) = 1.520 – 1.540

Purity (1) Acidity or alkalinity—To 60 mL of Enflurane add 60 mL of freshly boiled and cooled water, shake for 3 minutes, separate the water later, and use the layer as the sample solution. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide VS; the color of the solution is purple. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.06 mL of 0.01 mol/L hydrochloric acid VS; the color of the solution is yellow.

(2) Chloride <1.03>—To 20 g of Enflurane add 20 mL of water, shake well, and separate the water layer. Take 10 mL of the water layer add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

(3) Related substances—Proceed the test with 5 μL of Enflurane as directed under Gas chromatography <2.02> according to the following conditions. Determine each peak area other than the peak of air which appears soon after injection of the sample by the automatic integration method, and calculate the amount of each peak by the area percentage method: the amount of the substances other than enflurane is not more than 0.10%.

Operating conditions—

Detector: A thermal conductivity detector.

Column: A column 3 mm in inside diameter and 3 m in length, packed with siliceous earth for gas chromatography, 180 to 250 μm in particle diameter, coated with diethylene glycol succinate ester for gas chromatography in the ratio of 20%.

Column temperature: A constant temperature of about 80°C.

Carrier gas: Helium.

Flow rate: Adjust so that the retention time of enflurane is about 3 minutes.

Time span of measurement: About 3 times as long as the retention time of enflurane.

System suitability—

Test for required detectability: To exactly 1 mL of enflurane add 2-propanol to make exactly 100 mL. To exactly 2 mL of this solution add 2-propanol to make exactly 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add 2-propanol to make exactly 10 mL. Confirm that the peak area of enflurane obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the solution for system suitability test.

System performance: Mix 5 mL of Enflurane and 5 mL of 2-propanol. When the procedure is run with 5 μL of this mixture under the above operating conditions, enflurane and 2-propanol are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of enflurane is not more than 2.0%.
Enoxacin Hydrate

エノキサシン水和物

C₁₅H₁₇FN₄O₇·1½H₂O: 347.34
1-Ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid sesquihydrate [84294-96-2]

Enoxacin Hydrate, when dried, contains not less than 98.5% of enoxacin (C₁₅H₁₇FN₄O₇: 320.32).

Description Enoxacin Hydrate occurs as white to pale yellow-brown, crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol, very slightly soluble in chloroform, and practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute sodium hydroxide TS.

It is gradually colored by light.

Identification (1) Place 0.02 g of Enoxacin Hydrate and 0.05 g of sodium in a test tube, and heat gradually to ignition with precaution. After cooling, add 0.5 mL of methanol and then 5 mL of water, and heat to boiling. To this solution add 2 mL of dilute acetic acid, and filter: the filtrate responds to Qualitative Tests <1.09> (2) for fluoride.

(2) Dissolve 0.05 g of Enoxacin Hydrate in dilute sodium hydroxide TS to make 100 mL. To 1 mL of the solution add water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Enoxacin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.60> 225 – 229°C (after drying).

Purity (1) Sulfate <1.14>—Dissolve 1.0 g of Enoxacin Hydrate in 50 mL of dilute sodium hydroxide TS, shake with 10 mL of dilute hydrochloric acid, and centrifuge. Filter the supernatant liquid, and to 30 mL of the filtrate add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 25 mL of dilute sodium hydroxide TS, 5 mL of dilute hydrochloric acid TS and water to make 50 mL (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Enoxacin Hydrate according to Method 2, and perform the test.

Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.17>—Prepare the test solution with 1.0 g of Enoxacin Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Enoxacin Hydrate in 25 mL of a mixture of chloroform and methanol (7:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (7:3) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> 7.0 – 9.0% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.3 g of Enoxacin Hydrate, previously dried, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.03 mg of C₁₅H₁₇FN₄O₇

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Entacapone

エンタカポン

C₁₄H₁₅N₃O₃: 305.29
(2E)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-N,N-diethylprop-2-enamide [130929-57-6]

Entacapone contains not less than 98.0% and not more than 102.0% of entacapone (C₁₄H₁₅N₃O₃), calculated on the dried basis.

Description Entacapone occurs as a yellow to greenish yellow crystalline powder.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water. It shows crystal polymorphism.

Identification (1) Dissolve 35 mg of Entacapone in 200 mL of methanol. To 7 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared by adding 0.1 mol/L hydrochloric acid TS to 7 mL of methanol to make 100 mL as the blank, and compare the spec-
Purity (1) Heavy metals—Dissolve 1.0 g of Entacapone in 20 mL of a mixture of methanol and N,N-dimethylformamide (3:1), and use this solution as the sample solution. Separately, weigh exactly 0.400 g of lead (II) nitrate, dissolve in water to make exactly 250 mL. Before use, dilute this solution with water to make exactly 10 times the initial volume, then dilute this solution with water to make exactly 10 times the initial volume. Pipet 1 mL of this solution, add a mixture of methanol and N,N-dimethylformamide (3:1) to make exactly 20 mL, and use this solution as the standard solution. To each of the sample solution and standard solution add 2 mL of acetate buffer solution (pH 3.5), mix, add 1.2 mL of thioacetamide TS, and mix immediately. Allow them to stand for 2 minutes, filter separately all the amount of each solution through a membrane filter with a pore size of 0.45 μm, wash the membrane filters with not less than 20 mL of methanol, and compare the colors on the membrane filters: the color obtained from the sample solution is not darker than that obtained from the standard solution (not more than 10 ppm).

(2) Halide—Being specified separately when the drug is granted approval based on the Law.

(3) Related substances—Dissolve 50 mg of Entacapone in 50 mL of a mixture of methanol and tetrahydrofuran (7:3), and use this solution as the sample solution. Pipet 5 mL of the sample solution, and add a mixture of methanol and tetrahydrofuran (7:3) to make exactly 50 mL. Pipet 5 mL of this solution, and add a mixture of methanol and tetrahydrofuran (7:3) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of methanol and tetrahydrofuran (7:3) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography 2.017 according to the following conditions. Determine each peak area by the automatic integration method: the peak area of the related substance A, having the relative retention time of about 0.8 to entacapone, obtained from the sample solution is not larger than 1.5 times the peak area of entacapone from the standard solution, the areas of the peak other than entacapone and the peak mentioned above from the sample solution is not larger than the peak area of entacapone from the standard solution, and the total area of the peaks other than entacapone and the related substance A, having the relative retention time of about 0.8 to entacapone, from the sample solution is not larger than 2 times the peak area of entacapone from the standard solution. For the areas of the peaks of related substances B and C, having the relative retention times of about 0.6 and about 1.4 to entacapone, multiply their correction factors, 1.7 and 2.5, respectively.

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of entacapone, beginning after the solvent peak.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 5 mL of the standard solution, add a mixture of methanol and tetrahydrofuran (7:3) to make exactly 10 mL. Confirm that the peak area of entacapone obtained with 10 μL of this solution is equivalent to 35 to 65% of that obtained with 10 μL of the standard solution.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of entacapone is not more than 5%.

Loss on drying 2.412 Not more than 0.5% (1 g, in vacuum, 60°C, 3 hours).

Residue on ignition 2.44 Not more than 0.1% (1 g).

Assay Weigh accurately about 50 mg each of Entacapone and Entacapone RS (separately determine the loss on drying 2.412 under the same conditions as Entacapone), dissolve each in a mixture of methanol and tetrahydrofuran (7:3) to make exactly 50 mL. Pipet 5 mL each of these solutions, add a mixture of methanol and tetrahydrofuran (7:3) to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.017 according to the following conditions, and determine the peak areas, A_{R} and A_{S}, of entacapone in each solution.

\[
M_{5} = \frac{M_{S}}{A_{R}/A_{S}}
\]

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 300 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.34 g of sodium dihydrogen phosphate dihydrate in water to make 1000 mL, and adjust to pH 2.1 with phosphoric acid. To 540 mL of this solution add 440 mL of methanol and 20 mL of tetrahydrofuran.

Flow rate: 1 mL per minute.

System suitability—

System performance: Dissolve 5 mg of Entacapone Related Substance A for System Suitability RS in a mixture of methanol and tetrahydrofuran (7:3) to make 25 mL. To 1 mL of this solution add a mixture of methanol and tetrahydrofuran (7:3) to make 20 mL, and use this solution as the solution for system suitability test. Separately, to 5 mL of the standard solution add a mixture of methanol and tetrahydrofuran (7:3) to make 50 mL. To 1 mL of this solution and 1 mL of the solution for system suitability test add a mixture of methanol and tetrahydrofuran (7:3) to make 10 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the related substance A and entacapone are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak
area of entacapone is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

**Others**

Related substance A:

(2Z)-2-Cyano-3-(3,4-dihydroxy-5-nitrophenyl)-N,N-diethylprop-2-enamide

![Related substance A](image)

Related substance B:

(2E)-2-Cyano-3-(3,4-dihydroxyphenyl)-N,N-diethylprop-2-enamide

![Related substance B](image)

Related substance C:

(2E)-3-(3-Bromo-4,5-dihydroxyphenyl)-2-cyano-N,N-diethylprop-2-enamide

**Entacapone Tablets**

エンタカポン錠

Entacapone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of entacapone (C₁₅H₁₄N₃O₄: 305.29).

**Method of preparation** Prepare as directed under Tablets, with Entacapone.

**Identification** To 1 mL of the sample solution obtained in the Assay add methanol to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 301 nm and 305 nm.

**Uniformity of dosage units** Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L potassium dihydrogen phosphate TS, adjusted to pH 5.5 with sodium hydroxide TS, as the dissolution medium, the dissolution rate in 30 minutes of Entacapone Tablets is not less than 80%.

Start the test with 1 tablet of Entacapone Tablets, withdraw not less than 15 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 5 mL of the first filtrate, pipet V mL of the subsequent filtrate, and add the dissolution medium to make exactly V mL so that each mL contains about 11 μg of entacapone (C₁₅H₁₄N₃O₄), and use this solution as the sample solution. Separate, weigh accurately about 22 mg of Entacapone RS (separately determine the loss on drying under the same conditions as Entacapone), add 4 mL of methanol, dissolve by sonication, and add the dissolution medium to make exactly 200 mL. Pipet 5 mL of this solution, and add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₂, of the sample solution and standard solution at 313 nm as directed under Ultraviolet-visible Spectrophotometry, using the dissolution medium as the blank.

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately the mass of not less than 20 Entacapone Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g of entacapone (C₁₅H₁₄N₃O₄), add 60 mL of tetrahydrofuran, and sonicate for 3 minutes. Add 60 mL of methanol, shake for 5 minutes, and add methanol to make exactly 200 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separate, weigh accurately about 50 mg of Entacapone RS (separately determine the loss on drying under the same conditions as Entacapone), dissolve in 30 mL of tetrahydrofuran, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL of each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine the peak areas, A₁ and A₂, of entacapone in each solution.

![Assay](image)
Enviomycin Sulfate is the sulfate of a mixture of peptide substances having antibacterial activity produced by the growth of *Streptomyces griseoverticillus* var. *tuberacticus*.

It contains not less than 770 µg (potency) and not more than 920 µg (potency) per mg, calculated on the dried basis. The potency of Enviomycin Sulfate is expressed as mass (potency) of tuberactinomycin N \((C_{32}H_{34}N_{13}O_{10})\_6: 685.69\).

**Description** Enviomycin Sulfate occurs as a white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification**

(1) To 5 mL of a solution of Enviomycin Sulfate (1 in 200) add 1.5 mL of sodium hydroxide TS, and add 1 drop of a mixture of 0.01 mol/L citric acid TS and copper (II) sulfate TS (97.3) : a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Enviomycin Sulfate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) To 2 mL of a solution of Enviomycin Sulfate (1 in 20) add 1 drop of barium chloride TS: a white precipitate is produced.

**Optical rotation** \(<2.49\rangle\) \([\alpha]_D^20: -16.2\pm 2.0^\circ\) (0.5 g calculated on the dried basis, water, 50 mL, 100 mm).

**pH** \(<2.54\rangle\) The pH of a solution obtained by dissolving 2.0 g of Enviomycin Sulfate in 20 mL of water is between 5.5 and 7.5.

**Content ratio of the active principle** Dissolve 0.1 g of Enviomycin Sulfate in water to make 100 mL, and use this solution as the sample solution. Perform the test with 3 µL of the sample solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and determine the peak areas, \(A_{T1}\) and \(A_{T2}\), of tuberactinomycin N and tuberactinomycin O, having the relative retention time, 1.4 ± 0.4, to tuberactinomycin N, by the automatic integration method: \(A_{T2}/(A_{T1} + A_{T2})\) is between 0.090 and 0.150.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of ammonium acetate TS, 1,4-dioxane, tetrahydrofuran, water and ammonia solution (28) (100:75:50:23:2).

Flow rate: Adjust so that the retention time of tuberactinomycin N is about 9 minutes.

**System suitability**—

System performance: When the procedure is run with 3 µL of the sample solution under the above operating conditions, tuberactinomycin N and tuberactinomycin O are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 3 µL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of tuberactinomycin N is not more than 2.0%.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Enviomycin Sulfate in 10 mL of water: the solution is clear and colorless.
(2) Heavy metals <1.07>—Proceed with 2.0 g of Enviomycin Sulfate according to Method 1, and prepare the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3)Arsenic <1.1D>—Prepare the test solution with 2.0 g of Enviomycin Sulfate according to Method 1, and prepare the test (not more than 1 ppm).

**Loss on drying** <2.4J> Not more than 4.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) **Test organism**—Bacillus subtilis ATCC 6633

(ii) **Culture medium**—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Enviomycin Sulfate RS, equivalent to about 20 mg (potency), dissolve in water to make exactly 20 mL, and use this solution as the standard stock solution. Keep the standard stock solution at a temperature not exceeding 5°C and use within 10 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 400 μg (potency) and 100 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Enviomycin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 20 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 400 μg (potency) and 100 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

**Epalrestat**

エパルレスタット

\[
\text{C}_{13}\text{H}_{13}\text{NO}_2\text{S}_2: \ 319.40
\]

2-([(5Z)-5-[(2E)-2-Methyl-3-phenylprop-2-en-1-ylidene]-4-oxo-2-thioxothiazolidin-3-yl]acetic acid

[82159-09-9]

Epalrestat, when dried, contains not less than 98.0% and not more than 102.0% of epalrestat (C_{13}H_{13}NO_2S_2).

**Description** Epalrestat occurs as yellow to orange, crystals or crystalline powder.

It is soluble in N,N-dimethylformamide, slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

It gradually fades the color and decomposes on exposure to light.

It shows crystal polymorphism.

**Identification (1)** Determine the absorption spectrum of a solution of Epalrestat in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.2.4>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Epalrestat RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Epalrestat as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Epalrestat RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, proceed as follows, using a light-resistant vessel. To 0.1 g of Epalrestat add 40 mL of methanol, dissolve the sample by warming in a water bath, and filter while hot, and cool in ice. Collect the crystals formed, dry, and perform the test.

**Melting point** <2.60> 222 - 227°C

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Epalrestat according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve about 20 mg of Epalrestat in 8 mL of N,N-dimethylformamide, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add N,N-dimethylformamide to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 3 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than epalrestat obtained from the sample solution is not larger than 1/5 times the peak area of epalrestat from the standard solution, and the total area of the peaks other than epalrestat from the sample solution is not larger than the peak area of epalrestat from the standard solution.

**Operating conditions**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of epalrestat, beginning after the solvent peak.

**System suitability**

Test for required detectability: Pipet 1 mL of the standard solution, and add N,N-dimethylformamide to make exactly 10 mL. Confirm that the peak area of epalrestat obtained with 3 μL of this solution is equivalent to 7 to 13% of that with 3 μL of the standard solution.

System performance: When the procedure is run with 3 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of epalrestat are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of epalrestat is not more than 2.0%.

**Loss on drying** <2.4J> Not more than 0.2% (1 g, in vacuum, silica gel, 60°C, 3 hours).

**Residue on ignition** <2.4J> Not more than 0.1% (1 g).

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately about 20 mg each of Epalrestat and Epal-
Epalrestat Tablets

エパルレストット錠

Epalrestat Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of epalrestat (C₁₅H₁₅NO₃S₂): 319.40.

Method of preparation Prepare as directed under Tablets, with Epalrestat.

Identification (1) Powder Epalrestat Tablets. To a portion of the powder, equivalent to 50 mg of Epalrestat, add 100 mL of methanol, shake thoroughly, and filter. To 1 mL of the filtrate add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, it exhibits maxima between 235 nm and 239 nm, between 290 nm and 294 nm, and between 387 nm and 391 nm.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

Conduct this procedure using light-resistant vessels. To 1 tablet of Epalrestat Tablets add exactly 30 mL of N₅N-dimethylformamide, shake thoroughly to completely disintegrate the tablet, and centrifuge. Pipet 1 mL of the supernatant liquid, and add N₅N-dimethylformamide to make exactly 100 mL. Pipet V mL of this solution, add exactly V′ mL of N₅N-dimethylformamide so that each mL contains about 4.2 μg of epalrestat (C₁₅H₁₅NO₃S₂), and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Epalrestat RS, previously dried in vacuum at 60°C for 3 hours with silica gel as a desiccant, and dissolve in exactly 30 mL of N₅N-dimethylformamide. Pipet 1 mL of this solution, add N₅N-dimethylformamide to make exactly 100 mL. Pipet 5 mL of this solution, add N₅N-dimethylformamide to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₂, at 392 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of epalrestat (C₁₅H₁₅NO₃S₂) = M₅ × A₁/A₂ × V′/V × 1/4

M₅: Amount (mg) of Epalrestat RS taken

Dissolution <6.10b> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 45 minutes of Epalrestat Tablets is not less than 70%.

Conduct this procedure using light-resistant vessels. Start the test with 1 tablet of Epalrestat Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 5.6 μg of epalrestat (C₁₅H₁₅NO₃S₂), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Epalrestat RS, previously dried in vacuum at 60°C for 3 hours with silica gel as a desiccant, dissolve in 10 mL of N₅N-dimethylformamide, and add the dissolution medium to make exactly 100 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₂, at 398 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using the dissolution medium as the control.

Dissolution rate (% with respect to the labeled amount of epalrestat (C₁₅H₁₅NO₃S₂) = M₅ × A₁/A₂ × V′/V × 1/C × 45/2

M₅: Amount (mg) of Epalrestat RS taken

C: Labeled amount (mg) of epalrestat (C₁₅H₁₅NO₃S₂) in 1 tablet

Assay Conduct this procedure using light-resistant vessels. Weigh accurately the mass of not less than 20 Epalrestat Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of epalrestat (C₁₅H₁₅NO₃S₂), add 20 mL of N₅N-dimethylformamide, add exactly 5 mL of the internal standard solution, shake, and centrifuge. To 2 mL of the supernatant liquid add N₅N-dimethylformamide to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Epalrestat RS, previously dried in vacuum at 60°C for 3 hours with silica gel as a desiccant, dissolve in 8 mL of N₅N-dimethylformamide, add exactly 2 mL of the internal standard solution, and shake. To 2 mL of this solution add
Eperisone Hydrochloride / Official Monographs

Eperisone Hydrochloride occurs as a white crystalline powder.

Description Eperisone Hydrochloride occurs as a white crystalline powder.

It is freely soluble in water, in methanol and in acetic acid (100), and soluble in ethanol (99.5).

Melting point: about 167°C (with decomposition).

A solution of Eperisone Hydrochloride in methanol (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Eperisone Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Eperisone Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Eperisone Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> for chloride.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Eperisone Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Piperidine hydrochloride—Dissolve 1.0 g of Eperisone Hydrochloride in 20 mL of water, add 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the sample solution. Separately, to 2.0 mL of a solution of piperidine hydrochloride (1 in 1000) add 18 mL of water, 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the standard solution. To each of the sample solution and standard solution add 10 mL of a mixture of isopropylether and carbon disulfide (3:1), shake for 30 seconds, allow them to stand for 2 minutes, and compare the color of the upper layer: the color obtained from the sample solution is not more darker than that obtained from the standard solution.

(3) Related substances—Dissolve 0.1 g of Eperisone Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than eperisone obtained from the sample solution is not larger than 1/5 times the peak area of eperisone from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of methanol, 0.0375 mol/L sodium 1-decanesulfonate TS and perchloric acid (600:400:1).

Flow rate: Adjust so that the retention time of eperisone is about 17 minutes.

Time span of measurement: About 2 times as long as the retention time of eperisone.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of eperisone obtained with 10 µL of this solution is equivalent to 7 to 13% of that with 10 µL of the standard solution.

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eperisone are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of eperisone is not more than 3.0%.

Water <2.48> Not more than 0.20% (0.1 g, coulometric titration).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.6 g of Eperisone Hydrochloride, dissolve in 20 mL of acetic acid (100), add 80 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.59 mg of C₁₇H₂₅NO₃HCl.

Containers and storage Containers—Well-closed containers.
Ephedrine Hydrochloride

**Description**
Ephedrine Hydrochloride occurs as white, crystals or crystalline powder.

It is freely soluble in water, soluble in ethanol (95%), slightly soluble in acetic acid (100), and practically insoluble in acetonitrile and in acetic anhydride.

**Identification**
1. Determine the absorption spectrum of a solution of Ephedrine Hydrochloride (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

2. Determine the infrared absorption spectrum of Ephedrine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

3. A solution of Ephedrine Hydrochloride (1 in 15) responds to Qualitative Tests for Chloride.

**Optical rotation**
\[ \alpha_D^{20} = 33.0 - 36.0^\circ \text{ (after drying, 1 g, water, 20 mL, 100 mm)} \]

**pH**
Dissolve 1.0 g of Ephedrine Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 6.5.

**Melting point**
218 - 222°C

**Purity**
1. Clarity and color of solution—Dissolve 0.5 g of Ephedrine Hydrochloride in 10 mL of water: the solution is clear and colorless.

2. Sulfate—Dissolve 0.05 g of Ephedrine Hydrochloride in 40 mL of water, add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS, and allow to stand for 10 minutes: no turbidity is produced.

3. Heavy metals—Proceed with 1.0 g of Ephedrine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

4. Related substances—Dissolve 0.05 g of Ephedrine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine the areas of each peak by the automatic integration method: the total area of the peaks other than ephedrine obtained from the sample solution is not larger than the peak area of ephedrine from the standard solution.

**Operating conditions**
- **Detector**: An ultraviolet absorption photometer (wavelength: 210 nm).
- **Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature**: A constant temperature of about 45°C.
- **Mobile phase**: A mixture of sodium lauryl sulfate (1 in 128), acetonitrile and phosphoric acid (640:360:1).
- **Flow rate**: Adjust so that the retention time of ephedrine is about 14 minutes.
- **Time span of measurement**: About 3 times as long as the retention time of ephedrine, beginning after the solvent peak.

**System suitability**
Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of ephedrine obtained with 10 \( \mu L \) of this solution is equivalent to 4 to 6% of that with 10 \( \mu L \) of the standard solution.

System performance: Dissolve 1 mg of ephedrine hydrochloride for assay and 4 mg of atropine sulfate hydrate in 100 mL of diluted methanol (1 in 2). When the procedure is run with 10 \( \mu L \) of this solution under the above operating conditions, ephedrine and atropine are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of ephedrine is not more than 2.0%.

**Loss on drying**
Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition**
Not more than 0.1% (1 g).

**Assay**
Weigh accurately about 0.4 g of Ephedrine Hydrochloride, previously dried, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3) by warming. Cool, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 20.17 mg of \( \text{C}_10\text{H}_15\text{NO.HCl} \)

**Containers and storage**
Containers—Well-closed containers.

---

**Ephedrine Hydrochloride Injection**

Ephedrine Hydrochloride Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of ephedrine hydrochloride (\( \text{C}_10\text{H}_15\text{NO.HCl} \): 201.69).

**Method of preparation**
Prepare as directed under Injections, with Ephedrine Hydrochloride.

**Description**
Ephedrine Hydrochloride Injection is a clear, colorless liquid.

**pH**
4.5 - 6.5
10% Ephedrine Hydrochloride Powder

エフェドリン塩酸塩 10％

10% Ephedrine Hydrochloride Powder contains not less than 9.3% and not more than 10.7% of ephedrine hydrochloride (C₁₉H₂₉NO.HCl: 201.69).

Method of preparation

Ephedrine Hydrochloride 100 g
Starch, Lactose Hydrate or their mixture a sufficient quantity

To make 1000 g

Prepare as directed under Granules or Powders, with the above ingredients.

Identification To 0.5 g of 10% Ephedrine Hydrochloride Powder add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Dissolution 10.10 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of 10% Ephedrine Hydrochloride Powder is not less than 85%.
ing conditions, the relative standard deviation of the peak area of ephedrine is not more than 2.0%.

**Assay**  Weigh accurately about 0.4 g of 10% Ephedrine Hydrochloride Powder, add 150 mL of water, and extract by sonicating for 10 minutes with occasional shaking. Shake more for 10 minutes, then add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL, each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of ephedrine to that of the internal standard.

Amount (mg) of ephedrine hydrochloride (C₁₈H₂₂NO.HCl)  
\[ M_s = \frac{M_5 \times Q_1}{Q_2} \]

M₅: Amount (mg) of ephedrine hydrochloride for assay taken

**Internal standard solution**—A solution of etilefrine hydrochloride (1 in 500).

**Operating conditions**—

Detector, column, column temperature, mobile phase and flow rate: Perform as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

**Containers and storage**  Containers—Well-closed containers.

---

**Ephedrine Hydrochloride Tablets**

エフェドリン塩酸塩錠

Ephedrine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of ephedrine hydrochloride (C₁₈H₂₂NO.HCl: 201.69).

**Method of preparation**  Prepare as directed under Tablets, with Ephedrine Hydrochloride.

**Identification**  To an amount of powdered Ephedrine Hydrochloride Tablets, equivalent to 0.05 g of Ephedrine Hydrochloride, add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

**Uniformity of dosage units** 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ephedrine Hydrochloride Tablets add V mL of water so that each mL contains about 0.25 mg of ephedrine hydrochloride (C₁₈H₂₂NO.HCl), then add exactly V/4 mL of the internal standard solution, disperse the tablet into small particles by sonicating, then sonicate for a further 10 minutes. Shake this solution for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of ephedrine hydrochloride (C₁₈H₂₂NO.HCl)  
\[ M_s = \frac{M_5 \times Q_1}{Q_2} \times \frac{V}{100} \]

M₅: Amount (mg) of ephedrine hydrochloride for assay taken

**Internal standard solution**—A solution of etilefrine hydrochloride (1 in 2000).

**Dissolution** 6.10b When the test is performed at 50 revolutions per minute according to the Paddle method, with 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Ephedrine Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Ephedrine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of ephedrine in each solution.

Dissolution rate (%) with respect to the labeled amount of ephedrine hydrochloride (C₁₈H₂₂NO.HCl)  
\[ M_s = \frac{M_5 \times A_1}{A_5} \times \frac{1}{C} \times 90 \]

M₅: Amount (mg) of ephedrine hydrochloride for assay taken

C: Labeled amount (mg) of ephedrine hydrochloride (C₁₈H₂₂NO.HCl) in 1 tablet

**Operating conditions**—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ephedrine are not less than 10,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ephedrine is not more than 2.0%.

**Assay**  Weigh accurately not less than 20 tablets of Ephedrine Hydrochloride Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 40 mg of
Epirizole, when dried, contains not less than 99.0% of epirizole (C₁₂H₁₈N₄O₂).

Description Epirizole occurs as white, crystals or crystalline powder. It is odorless, and has a bitter taste. It is very soluble in methanol and in acetic acid (100), freely soluble in ethanol (95), and sparingly soluble in water and in diethyl ether. It dissolves in dilute hydrochloric acid and in sulfuric acid. The pH of a solution of 1.0 g of Epirizole in 100 mL of water is between 6.0 and 7.0.

Identification (1) To 0.1 g of Epirizole add 0.1 g of vanillin, 5 mL of water and 2 mL of sulfuric acid, and mix with shaking for a while: a yellow precipitate is formed.

(2) Dissolve 0.1 g of Epirizole in 10 mL of water, and add 10 mL of 2,4,6-trinitrophenol TS: a yellow precipitate is produced. Collect the precipitate by filtration, wash with 50 mL of water, and dry at 105°C for 1 hour: it melts <2.60> between 163°C and 169°C.

(3) Determine the absorption spectrum of a solution of Epirizole in 0.1 mol/L hydrochloric acid TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point <2.60> 88 – 91°C

Purity (1) Clarity and color of solution—Dissolve 0.2 g of Epirizole in 20 mL of water: the solution is clear and colorless.

(2) Chloride <1.06>—Add 0.5 g of Epirizole to a ground mixture of 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, mix well, transfer little by little to a platinum crucible, previously heated, and heat until the reaction is completed. After cooling, add 15 mL of dilute sulfuric acid and 5 mL of water to the residue, boil for 5 minutes, filter, wash the insoluble matter with 10 mL of water, and to the combined filtrate and washings add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: proceed with the same quantities of the same reagents as directed for the preparation of the test solution, and add 0.25 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Epirizole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Epirizole according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 1.0 g of Epirizole in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl ether, ethanol (95) and water (23:10:2) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution. Place this plate in a chamber filled with iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(6) Readily carbonizable substances <1.15>—Perform the test with 0.10 g of Epirizole: the solution has no more color than Matching Fluid A.

Loss on drying <2.41> Not more than 0.5% (1 g, silica gel, 4 hours).
Residue on ignition <2.46> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Epirizole, previously dried, dissolve in 40 mL of acetic acid (100) and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS) until the color of the solution changes from purple through blue-green to green.

Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 23.43 mg of C\textsubscript{11}H\textsubscript{14}N\textsubscript{2}O\textsubscript{2}

Containers and storage Containers—Well-closed containers.

Epirubicin Hydrochloride

エピルビシン塩酸塩

\[
\text{C}_{27}\text{H}_{36}\text{NO}_{11}\cdot\text{HCl}: 579.98
\]
\((25,45)-4-(3\text{-Amino}-2,3,6\text{-trideoxy-α-L-arabinofuranosyl})-2,5,12\text{-trihydroxy}-2\text{-hydroxyacetetyl}-7\text{-methoxy}-1,2,3,11\text{-dione monohydrochloride}
\]

Epirubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

It contains not less than 970 µg (potency) and not more than 1020 µg (potency) per mg, calculated on the anhydrous and residual solvent-free basis. The potency of Epirubicin Hydrochloride is expressed as mass (potency) of epirubicin hydrochloride \((\text{C}_{27}\text{H}_{36}\text{NO}_{11}\cdot\text{HCl})\).

Description Epirubicin Hydrochloride occurs as a pale yellowish red to brownish red powder.

It is soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Epirubicin Hydrochloride in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Epirubicin Hydrochloride and Epirubicin Hydrochloride RS as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> \(\left[\alpha\right]_D^\text{20}: +310° \text{ to } +340°\) (10 mg calculated on the anhydrous and residual solvent-free basis, methanol, 20 mL, 100 mm).

pH <2.50> Dissolve 10 mg of Epirubicin Hydrochloride in 2 mL of water: the pH of the solution is between 4.0 and 5.5.

Purity (1) Clarity and color of solution—Dissolve 50 mg of Epirubicin Hydrochloride in 5 mL of water: the solution is clear and dark red.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Epirubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Perform the test with 10 µL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, determine each peak area by the automatic integration method, and calculate the total amount of the peaks other than epirubicin and 2-naphthalenesulfonic acid by the area percentage method: not more than 5.0%.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of epirubicin, beginning after the solvent peak.

System suitability—

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To 1 mL of the sample solution add the mobile phase to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of epirubicin obtained with 10 µL of this solution is equivalent to 7 to 13% of that with 10 µL of the solution for system suitability test.

Water <2.48> Not more than 8.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.5% (0.1 g).

Assay Weigh accurately an amount of Epirubicin Hydrochloride and Epirubicin Hydrochloride RS, equivalent to about 30 mg (potency), dissolve each in the internal standard solution to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of epirubicin to that of the internal standard.

\[
\text{Amount}_{\mu g \text{ (potency)}} \text{ of epirubicin hydrochloride (C}_{27}\text{H}_{36}\text{NO}_{11}\cdot\text{HCl}) = M_5 \times Q_1/Q_2 \times 1000
\]

\[
M_2: \text{Amount}_{\mu g \text{ (potency)}} \text{ of Epirubicin Hydrochloride RS taken}
\]

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with trimethylsilylized silica gel for liquid chromatography (6 µm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in a
mixture of water, acetonitrile, methanol and phosphoric acid (540:290:170:1) to make 1000 mL.

Flow rate: Adjust so that the retention time of epirubicin is about 9.5 minutes.

System suitability—

System performance: When the procedure is run with 10 \( \mu \)L of the standard solution under the above operating conditions, the internal standard and epirubicin are eluted in this order with the resolution between these peaks being not less than 20.

System repeatability: When the test is repeated 5 times with 10 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of epirubicin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—At a temperature between 0°C and 5°C.

Eplerenone

エプレレノン

\[
\text{C}_{22}\text{H}_{30}\text{O}_{6}: 414.49 \\
9,11\alpha\text{-Epoxy}-7\alpha-(methoxycarbonyl)-3\text{-oxo-}17\alpha\text{-pregn-4-ene}-21,17\text{-carbolactone} \\
[107724-20-9]
\]

Eplerenone contains not less than 98.0% and not more than 102.0% of eplerenone (\( \text{C}_{22}\text{H}_{30}\text{O}_{6} \)), calculated on the dried basis.

Description Eplerenone occurs as a white crystalline powder.

It is freely soluble in acetonitrile, sparingly soluble in methanol, and very slightly soluble in water and in ethanol (99.5).

It shows crystal polymorphism.

Identification (1) Determine the absorption spectrum of a solution of Eplerenone in methanol (1 in 77,000) as directed under Ultraviolet-visible Spectrophotometry \( <2.24> \), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Eplerenone RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Eplerenone as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25> \), and compare the spectrum with the Reference Spectrum or the spectrum of Eplerenone RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation \( <2.49> \) \( [\alpha]_{D}^{20} \) = \(-14.0\) to \(-16.0\)° (0.25 g calculated on the dried basis, acetonitrile, 25 mL, 100 mm).

Purity (1) Heavy metals—Take 1.0 g of Eplerenone in a crucible, wet the sample with a suitable amount of sulfuric acid, cover loosely, and heat gently to carbonize. After cooling, add 2 mL of nitric acid, and 5 drops of sulfuric acid to the carbonized residue, and heat gently until white fumes are no longer evolved. Then, incinerate by ignition at 500–600°C. After cooling, add 4 mL of 6 mol/L hydrochloric acid TS, cover the crucible, warm on a water bath for 15 minutes, then remove the cover from the crucible, and slowly evaporate to dryness on a water bath. Wet the residue with 1 drop of hydrochloric acid, add 10 mL of hot water, and warm for 2 minutes. After cooling, add ammonia TS until the solution shows alkalinity to litmus paper, add 15 mL of water, and adjust to pH 3.0 – 4.0 with dilute acetic acid. Filter, if necessary, wash the crucible and filter paper with 10 mL of water, put the filtrate and the washings in a Nessler tube, add water to make 40 mL, and use this solution as the sample solution. Separately, take 2.0 mL of Standard Lead Solution in a Nessler tube, and add water to make 25 mL. Adjust to pH 3.0 – 4.0 of this solution with dilute acetic acid or ammonia TS, add water to make 40 mL, and use this solution as the control solution. To the sample solution and the control solution add 2 mL of acetate buffer solution (pH 3.5) and 1.2 mL of thioacetamide-alkaline glycerin TS, then add water to make 50 mL, allow them to stand for 2 minutes, and observe vertically against a white background: the solution obtained from the sample solution is not more colored than that obtained from the control solution (not more than 20 ppm).

(2) Related substances—Dissolve 25 mg of Eplerenone in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01> \) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 0.58, about 0.85, about 0.90, about 1.2 and about 1.6 to eplerenone, obtained from the sample solution is respectively not larger than 1/5, 3/10, 3/10 and 3/10 times the peak area of eplerenone from the standard solution, and the area of the peak other than eplerenone and the peak mentioned above from the sample solution is not larger than 7/50 times the peak area of eplerenone from the standard solution. Furthermore, the total area of the peaks other than eplerenone from the sample solution is not larger than 1.2 times the peak area of eplerenone from the standard solution. For the area of the peak, having the relative retention time of about 0.85 to eplerenon, multiply the correction factor 0.6.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of eplerenone, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, add the mobile phase to make exactly 10 mL. Confirm that the peak area of eplerenone obtained with 20 \( \mu \)L of this solution is equivalent to 7 to 13% of that with 20 \( \mu \)L of the standard solution.

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eplerenone are not less than 15,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak
area of eplerenone is not more than 2.0%.

**Loss on drying** $\leq 2.4\%$ Not more than 0.5% (0.5 g, 105°C, 4 hours).

**Residue on ignition** $\leq 2.4\%$ Not more than 0.1% (1 g).

**Assay** Weigh accurately about 25 mg each of Eplerenone and Eplerenone RS (separately determine the loss on drying under the same conditions as Eplerenone), separately dissolve in the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography $\leq 2.0\%$ according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of eplerenone in each solution.

Amount (mg) of eplerenone ($C_{24}H_{30}O_6$) = $M_S \times A_T/A_S$

$M_S$: Amount (mg) of Eplerenone RS taken, calculated on the dried basis

**Operating conditions**
- Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 35°C.
- Mobile phase: Dissolve 1.4 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 3.0 with phosphoric acid. To 580 mL of this solution add 360 mL of acetonitrile for liquid chromatography and 60 mL of methanol.
- Flow rate: Adjust so that the retention time of eplerenone is about 12 minutes.

**System suitability**
- System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eplerenone are not less than 15,000 and not more than 1.5, respectively.
- System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of eplerenone is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

**Eplerenone Tablets**

エプレレノン錠

Eplerenone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of eplerenone ($C_{24}H_{30}O_6$: 414.49).

**Method of preparation** Prepare as directed under Tablets, with Eplerenone.

**Identification** Determine the absorption spectrum of the sample solution obtained in the Uniformity of dosage units as directed under Ultraviolet-visible Spectrophotometry $\leq 2.2\%$: it exhibits a maximum between 240 nm and 244 nm.

**Uniformity of dosage units** $\leq 6.0\%$ Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Eplerenone Tablets add a suitable amount of a mixture of acetonitrile and water (3:2), shake, disintegrate the tablet by sonication, add a mixture of acetonitrile and water (3:2) to make exactly 100 mL, and centrifuge. Take exactly $V$ mL of the supernatant liquid, add a mixture of acetonitrile and water (3:2) to make exactly $V/10$ mL so that each mL contains about 25 μg of eplerenone ($C_{24}H_{30}O_6$), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Eplerenone RS (separately determine the loss on drying under the same conditions as Eplerenone), and dissolve in a mixture of acetonitrile and water (3:2) to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of acetonitrile and water (3:2) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, $A_T$ and $A_S$, at 243 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $\leq 2.2\%$.

Amount (mg) of eplerenone ($C_{24}H_{30}O_6$) = $M_S \times A_T/A_S \times V/V \times 1/10$

$M_S$: Amount (mg) of Eplerenone RS taken, calculated on the dried basis

**Dissolution** $\leq 6.10\%$ When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Eplerenone Tablets is not less than 75%.

Start the test with 1 tablet of Eplerenone Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 5 mL of the first filtrate, pipet $V$ mL of the subsequent filtrate, add the dissolution medium to make exactly $V/10$ mL so that each mL contains about 1 μg of eplerenone ($C_{24}H_{30}O_6$) and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Eplerenone RS (separately determine the loss on drying under the same conditions as Eplerenone), dissolve in 5 mL of acetonitrile, and add the dissolution medium to make exactly 500 mL. Pipet 10 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, $A_T$ and $A_S$, at 243 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $\leq 2.2\%$ using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of eplerenone ($C_{24}H_{30}O_6$) = $M_S \times A_T/A_S \times V/V \times 1/C \times 36$

$M_S$: Amount (mg) of Eplerenone RS taken, calculated on the dried basis

C: Labeled amount (mg) of eplerenone ($C_{24}H_{30}O_6$) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Eplerenone Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of eplerenone ($C_{24}H_{30}O_6$), add a suitable amount of a mixture of acetonitrile and water (3:2), sonicate to disperse the particles, and add a mixture of acetonitrile and water (3:2) to make exactly 100 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of Eplerenone RS (separately determine the loss on drying under the same conditions as Eplerenone), dissolve in a mixture of acetonitrile and water (3:2) to make exactly 50 mL, and use this solution as the standard solution.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of eplerenone in each solution.

\[
\text{Amount (mg) of eplerenone (C}_{24}\text{H}_{30}\text{O}_{6}) = M_S \times \frac{A_T}{A_S} \times 2
\]

$M_S$: Amount (mg) of Eplerenone RS taken, calculated on the dried basis

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 243 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.4 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 3.0 with phosphoric acid. To 550 mL of this solution add 360 mL of methanol and 90 mL of acetonitrile.

Flow rate: Adjust so that the retention time of eplerenone is about 12 minutes.

**System suitability**—

System performance: When the procedure is run with 15 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eplerenone are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of eplerenone is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

\[
\text{APPRLCQDSR VLERYLLAE EZAN1TQGA HKELAENIT YGQCNVPNFA}
\]

**Carbohydrate moiety (structure of major glycans)**

N24, N38, N83 and S126: glycosylation

**Description**

Epoetin Alfa (Genetical Recombination) occurs as a clear and colorless liquid.

**Identification (1)** Dilute a suitable volume of Epoetin Alfa (Genetical Recombination) and Epoetin Alfa RS with water. To 3 volume of these solutions add 1 volume each of buffer solution for epoetin alfa sample, heat at 100°C for 5 minutes, and use these solutions as the sample solution and the standard solution, respectively. Transfer a volume of the sample solution and the standard solution, equivalent to 0.7 μg of protein, into each sample well of the polyacrylamide gel for epoetin alfa, and start the SDS-polyacrylamide gel electrophoresis using a vertical discontinuous buffer solution system. After the electrophoresis, immerse the gel, a polyvinylidene fluoride membrane and a filter paper in the blotting TS. Set them on a semi-dry blotting apparatus, and transcribe for about 1 hour with a constant electric current of 0.7 – 0.9 mA/cm² depending on the dimension of the filter paper. Then, immerse the polyvinylidene fluoride membrane in the blocking TS for epoetin alfa, and start the secondary antibody TS, wash the membrane with phosphate-buffered sodium chloride TS, add the secondary antibody TS, and shake for more than 1 hour. Remove the secondary antibody TS, wash the membrane with phosphate-buffered sodium chloride TS, add the avidin-biotin TS, and shake for more than 1 hour. Remove the avidin-biotin TS, wash the mem-
brane with phosphate-buffered sodium chloride TS, and add the substrate TS for epoetin alfa for developing the color image: the main stained bands obtained from the sample solution appear as similar migrating image as those from the standard solution.

(2) Evaporate to dryness under reduced pressure a volume of Epoetin Alfa (Genetical Recombination) and Epoetin Alfa RS, equivalent to about 35 µg of protein, and dissolve these residues in 100 µL of 0.1 mol/L tris buffer solution (pH 7.3). To these solutions add 5 µL of trypsin TS for epoetin alfa, warm at 37°C for 6 hours, then cool in ice, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 45 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and compare the chromatograms obtained from these solutions: both chromatograms show the similar peaks at the corresponding retention time.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 214 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 45°C.
Mobile phase A: A mixture of water and trifluoroacetic acid (5000:3).
Mobile phase B: A mixture of acetonitrile, water and trifluoroacetic acid (4000:1000:3).
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 5</td>
<td>98</td>
<td>2</td>
</tr>
<tr>
<td>5 – 95</td>
<td>98 → 35</td>
<td>2 → 65</td>
</tr>
</tbody>
</table>

Flow rate: 0.75 mL per minute.

System suitability—
System performance: When the procedure is run with 45 µL of the standard solution under the above conditions, the chromatogram shows the similar pattern with the chromatogram of Epoetin Alfa RS obtained in the Peptide mapping.

Sialic acid content To an exact volume of Epoetin Alfa (Genetical Recombination), equivalent to about 1 nmol of protein, add water to make exactly 45 µL. Add exactly 5 µL of sodium hydroxide TS, allow to stand in ice water for 90 minutes, and add exactly 5 µL of dilute acetic acid. Add exactly 45 µL of water and exactly 100 µL of a mixture of water and acetic acid (100) (27:8), and warm at 80°C for 210 minutes. After cooling, add exactly 200 µL of the fluorescence TS, and warm at 60°C for 2 hours avoiding exposure to light. After cooling, add exactly 200 µL of sodium hydroxide TS, and use this solution as the sample solution. Separately, just before starting the test, to exactly 250 µL of 0.4 mmol/L N-acetylmuramic acid TS add exactly 20 µL of 0.1 mmol/L N-glycolylneuraminic acid TS and exactly 180 µL of water. Proceed with exactly 45 µL of this solution in the same manner as for the sample solution, and use the solution so obtained as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, determine the peak areas of N-acetylmuramic acid and N-glycolylneuraminic acid, A1 and A2, obtained from the sample solution, and the peak areas of those, A51 and A52, from the standard solution. Calculate the content of sialic acid in Epoetin Alfa (Genetical Recombination) by the following equation: between 10 mol/mol and 12 mol/mol.

\[
\text{Content (mol/mol) of sialic acid} = \frac{A_{11}/A_{51} \times 10 + A_{12}/A_{52} \times 1/5}{a}
\]

where, molar concentration (mmol/L) of Epoetin Alfa (Genetical Recombination) is calculated by the following equation, using the absorbance A at 280 nm obtained in the Assay (1).

Molar concentration (mmol/L) of Epoetin Alfa (Genetical Recombination) = \( A \times 10^2 / 22,430 \)

22,430: Molar absorbance coefficient ε

Operating conditions—
Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: A mixture of water, acetonitrile and methanol (84:9:7).
Mobile phase B: A mixture of water and methanol (1:1).
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>

</tr>
<tr>
<td>20.1 – 27</td>
<td>0</td>
<td>100</td>
</tr>
</tbody>
</table>

Flow rate: 0.6 mL per minute.

System suitability—
System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, N-glycolyneuraminic acid and N-acetylmuraminic acid are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of N-glycolyneuraminic acid and N-acetylmuraminic acid are not more than 2.0%, respectively.

Oligosaccharide profile Being specified separately when the drug is granted approval based on the Law.

Molecular mass Use the sample solution obtained in the Identification (1) as the sample solution. Separately, to 20 µL of molecular mass standard stock solution add 6.7 µL of the buffer solution for epoetin alfa sample, heat at 100°C for 5 minutes, and use this solution as the molecular mass standard solution. Transfer a volume of the sample solution, equivalent to 3.5 µg of protein and the total volume of the molecular mass standard solution into each sample well of the vertical discontinuous buffer solution system SDS-polyacrylamide gel, composed with resolving and stacking.
gels, and perform the electrophoresis. After the electrophoresis, immerse the gel in a solution of Coomassie brilliant blue R-250, containing 1.25 g in a mixture of 450 mL of methanol, 100 mL of acetic acid (100) and sufficient amount of water making up to 1000 mL. Determine the relative mobilities of the stained bands of egg albumin (molecular mass: about 45,000), carbonic anhydrase (molecular mass: about 31,000), soybean trypsin inhibitor (molecular mass: about 21,500) and lysozyme (molecular mass: 14,400), and prepare a calibration curve by linear regression against the logarithm of the molecular masses. Determine the relative mobility of the center of the main band obtained from the sample solution, and calculate the molecular mass of Epoetin Alfa (Genetical Recombination) from the calibration curve: it is between 37,000 and 42,000.

**pH**
5.7 – 6.7

**Purity (1)** Multimers—Perform the test with a volume of Epoetin Alfa (Genetical Recombination), equivalent to 50 µg of protein, as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area by the automatic integration method, and calculate their amounts by the area percentage method: the total amount of the peaks other than epoetin alpha is not more than 2%.

**Operating conditions—**

Column: A stainless steel column 7.5 mm in inside diameter and 60 cm in length, packed with hydrophilic silica gel for liquid chromatography.

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 91 mg of disodium hydrogen phosphate dodecahydrate, 0.27 g of sodium dihydrogen phosphate dihydrate and 8.77 g of sodium chloride in water to make 1000 mL.

Flow rate: Adjust so that the retention time of epoetin alfa is about 16 minutes.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion column until the elution of epoetin alfa is finished.

**System suitability—**

Test for required detectability: To 1 volume of Epoetin Alfa (Genetical Recombination) add 49 volumes of the mobile phase, and use this solution as the solution for system suitability test. Confirm that the peak area of epoetin alfa obtained with a volume, equivalent to 1 µg of protein, of the solution for system suitability test is equivalent to 1.5 to 2.5% of that with the same volume of Epoetin Alfa (Genetical Recombination).

System performance: Dissolve 40 mg of bovine serum albumin for gel filtration molecular mass marker and 20 mg of chymotrypsinogen for gel filtration molecular mass marker in 100 mL of the mobile phase. When the procedure is run with 50 µL of this solution under the above operating conditions, bovine serum albumin and chymotrypsinogen are eluted in this order with the resolution between these peaks being not less than 4.

System repetitiveness: When the test is repeated 6 times with a volume of Epoetin Alfa (Genetical Recombination), equivalent to 50 µg of protein, under the above operating conditions, the relative standard deviation of the area of the principal peak of epoetin alfa is not more than 2.0%.

(2) Host cell proteins—Being specified separately when the drug is granted approval based on the Law.

(3) Host cell DNA—Being specified separately when the drug is granted approval based on the Law.

**Assay (1)** Protein content—Take a suitable amount of Epoetin Alfa (Genetical Recombination), dilute with phosphate buffer solution for epoetin alfa, if necessary, so that each mL contains 0.5 – 0.8 mg protein and use the solution as the sample solution. Determine the absorbance, A, at 280 nm of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.29>, using the phosphate buffer solution for epoetin alfa as the blank.

Amount (mg) of protein in 1 mL of Epoetin Alfa (Genetical Recombination) = \( A \times d \times 0.909 \)

\( d \): Dilution factor for the sample solution

0.909: Reciprocal number of absorption coefficient \( (E_{1}\%) \) of epoetin alfa protein

(2) Specific activity

(i) Animals: Select healthy 6 to 8 weeks female mice (B6D2F1, etc.). Keep the mice for not less than a week before use, providing an appropriate uniform diet and water.

(ii) Standard solutions: To Epoetin Alfa RS add the bovine serum albumin-saline solution so that each mL contains exactly 10 – 40 units, and designate this solution as the high-dose standard solution, \( S_u \). Dilute \( S_u \) exactly 4 times with the bovine serum albumin-saline solution, and designate this solution as the low-dose standard solution, \( S_l \).

(iii) Sample solutions: To Epoetin Alfa (Genetical Recombination) add the bovine serum albumin-saline solution to make two sample solutions, the high-dose sample solution, \( T_u \), which contains the Units per mL equivalent to \( S_u \), and the low-dose sample solution, \( T_l \), which contains the Units per mL equivalent to \( S_l \).

(iv) Procedure: Divide the animals into 4 equal groups of not less than 5 animals each. On the 1st, 2nd and 3rd days, inject exactly 0.2 mL each of the standard solutions and the sample solutions into each animal subcutaneously as indicated in the following design:

First group \( S_u \) Third group \( T_u \)
Second group \( S_l \) Fourth group \( T_l \)

On the 4th day, take a sufficient blood sample to perform the test from each animal. To 10 mL of the dilution fluid for particle counter add exactly 20 µL of the blood sample, mix, add 100 µL of the appropriate hemolysis agent, stir for 5 minutes, and determine the count of particles derived from hemolytic-resistant erythroid cells.

(v) Calculation: Logarithmic converted counts of the fine particles obtained with \( S_u \), \( S_l \), \( T_u \) and \( T_l \) in (iv) are symbolized as \( y_1 \), \( y_2 \), \( y_3 \) and \( y_4 \), respectively. Sum up individual \( y_1 \), \( y_2 \), \( y_3 \) and \( y_4 \) to obtain \( Y_1 \), \( Y_2 \), \( Y_3 \) and \( Y_4 \), respectively.

**Specific activity (unit/mg protein) of Epoetin Alfa (Genetical Recombination)**

\( = \) activity (unit/mL) of Epoetin Alfa (Genetical Recombination) / C

Activity (unit/mL) of Epoetin Alfa (Genetical Recombination) = \( \log 4 \times \frac{Y_3}{Y_5} \) \( = \frac{-Y_1 - Y_2 + Y_3 + Y_4}{Y_5} \) \( = \frac{Y_1 - Y_2 + Y_3 - Y_4}{d} \)

\( d \): Dilution factor for \( T_u \)

C: Concentration (mg/mL) of protein obtained in Assay (1)

\( F' \) computed by the following equation should be smaller than 0.1.
Epoetin Beta (Genetical Recombination)

Epoetin Beta (Genetical Recombination) is an aqueous solution in which a desired product is a recombinant human erythropoietin produced in Chinese hamster ovary cells. It is a glycoprotein (molecular mass: ca. 30,000) consisting of 165 amino acid residues.

It contains not less than 0.5 mg and not more than 1.5 mg of protein per mL, and not less than 1.5 \times 10^5 units per mg of protein.

Description Epoetin Beta (Genetical Recombination) occurs as a clear and colorless liquid.

Identification (1) Use Epoetin Beta (Genetical Recombination) and Epoetin Beta RS as the sample solution and the standard solution, respectively. When perform a capillary electrophoresis with the sample solution and standard solution according to the following conditions, the mobility of each peak obtained from both solutions is the same and their migrating images are similar each other.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 200 nm).
Column: A silica capillary tube 50 μm in inside diameter and about 50 cm in length, chemically coated inner surface with amino groups (about 40 cm in effective length).
Electrolyte solution: Dissolve 32.8 g of sodium dihydrogen phosphate dihydrate in water to make 1000 mL, and adjust to pH 4.5 with a solution, prepared by dissolving 75.2 g of disodium hydrogen phosphate dodecahydrate in water to make 1000 mL. To 19 volumes of this solution add 1 volume of ethanol (99.5).
Running temperature: A constant temperature of about 20°C.
Running conditions: Migration current (a constant current of about 45 μA), migration time (30 minutes).
Injection of sample and standard solutions: 5 seconds (pressurization: 0.5 psi).
Time span of measurement: From 10 minutes to 30 minutes after injection (excluding the peak of solvent ori-
gin).
System suitability—
System performance: When the procedure is run with the
standard solution under the above operating conditions,
more than 4 major peaks of epoetin beta are detected, and
the resolution between the first and second eluted major
peaks is not less than 0.8.
System repeatability: When the test is repeated 3 times
with the standard solution under the above operating condi-
tions, the relative standard deviation of the migration time
of the first eluted major peak is not more than 2.0%.
(2) Desalt a volume each of Epoetin Beta (Genetical
Recombination) and Epoetin Beta RS, equivalent to 600 µg
of protein, by a suitable method, and term them as the
desalted sample and the desalted reference standard, respec-
tively. Dissolve the desalted sample and the desalted refer-
ence standard in 600 µL each of a solution, prepared by
dissolving 2.3 g of N-ethylmorpholine in 100 mL of water
and adjusting to pH 8.0 with acetic acid (100), and use these
solutions as the desalted sample solution and the desalted refer-
ence standard solution, respectively. To 500 µL each of the
desalted sample solution and the desalted reference standard
solution add 3.3 µL of triethylamine for epoetin beta and 1.5
µL of 2-mercaptoethanol for epoetin beta, and react at 37°C
for 1 hour. After cooling, add 5.5 µL of 4-vinylpyridine to
them, and react at 25°C for 1 hour. To these solutions add
50 µL of diluted trifluoroacetic acid for epoetin beta (1 in 10)
stop the reaction, remove the reagents by a suitable
method, and use the substances so obtained as the
pyridylethylated sample and the pyridylethylated reference
substance, respectively. Dissolve the pyridylethylated sample
and the pyridylethylated reference substance separately in
500 µL of sodium hydrogen carbonate solution (21 in 2500).
To 400 µL each of these solutions add 16 µL of a solution of
lysyl endopeptidase in sodium hydrogen carbonate solution
(21 in 2500) (1 in 50,000), and react at 37°C for 24 hours.
While this reaction, additional two 16-µL portions of a solu-
tion of lysyl endopeptidase in sodium hydrogen carbonate
(21 in 2500) (1 in 50,000) are added at 4 hours and 20 hours
after starting the reaction. Then, stop the reaction by adding
100 µL of diluted trifluoroacetic acid for epoetin beta (1 in 10),
and use these solutions as the sample solution and the
standard solution, respectively. Perform the test with 100 µL
each of the sample solution and standard solution as directed
under Liquid Chromatography<2.01> according to the
following conditions, and compare the chromatograms ob-
tained from these solutions: both chromatograms show the
similar peaks at the corresponding retention times.
Operating conditions—
Detector: An ultraviolet absorption photometer (wave-
length: 214 nm).
Column: A stainless steel column 4.6 mm in inside diame-
ter and 25 cm in length, packed with octadecyldsilanized silica
gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about
25°C.
Mobile phase A: A mixture of water and trifluoroacetic
acid for epoetin beta (1000:1).
Mobile phase B: A mixture of acetonitrile for liquid chro-
matography, water, and trifluoroacetic acid for epoetin beta
(900:100:1).
Flowing of mobile phase: Control the gradient by mixing
the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>

</table>

Flow rate: Adjust so that the retention time of the first
peak, which appears after the solvent peak, is about 17
minutes.
System suitability—
System performance: When the procedure is run with the
standard solution under the above operating conditions, 9
major peptide peaks are appeared after the solvent peak, and
the resolution between the peaks eluted at the fifth and the
sixth is not less than 3.
Sialic acid content To exactly 100 µL of Epoetin Beta
(Genetical Recombination) add 1 mL of resorcinol-copper
(II) sulfate TS, and heat on a water bath for 30 minutes.
After ice-cooling, add 2 mL of a mixture of n-butyl acetate
and 1-butanol (4:1), shake vigorously, and use the upper
layer as the sample solution. Separately, dissolve N-acetyl-
neuraminic acid in water to make three solutions, containing
0.1 mg, 0.2 mg and 0.3 mg of N-acetylneuraminic acid in
each mL, and use these solutions as the standard stock solu-
tion (1), the standard stock solution (2) and the standard
stock solution (3), respectively. Pipet 100 µL each of these
standard stock solutions, add 1 mL of resorcinol-copper (II)
sulfate TS to them, then proceed in the same way as for the
sample solution, and use these solutions so obtained as the
standard solution (1), the standard solution (2) and the
standard solution (3), respectively. Determine the absorb-
ances of the sample solution and the standard solutions (1),
(2) and (3) at 625 nm as directed under Ultraviolet-visible
Spectrophotometry<2.24>. Calculate the amount of sialic
acid (mg/mL) in the sample solution, by using the calibra-
tion curve obtained from the standard solutions, and calcu-
late the amount of sialic acid in Epoetin Beta (Genetical
Recombination) by the following equation: between 10
mol/mol and 13 mol/mol.

Amount of sialic acid (mol/mol of epoetin beta protein)

\[ A/C \times 18,236/309.27 \]

\[ A \]: Amount (mg/mL) of sialic acid in the sample solution
\[ C \]: Amount (mg/mL) of protein in Epoetin Beta (Geneti-

cal Recombination)

18,236: Molecular mass of protein moiety of epoetin beta
309.27: Molecular mass of N-acetylneuraminic acid

Oligosaccharide profile Being specified separately when the
drug is granted approval based on the Law.

\[ pH \ <2.5 \quad 7.0 \sim 8.0 \]

Purity (I) Related substances—Perform the test with 20
µL of Epoetin Beta (Genetical Recombination) as directed
under Liquid Chromatography<2.01> according to the
following conditions. Determine each peak area by the auto-
matic integration method, and calculate the amount of these
peaks other than the solvent peak by the area percentage
method: the total area of the peaks other than epoetin beta
is not more than 1.0%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wave-
length: 214 nm).

Mobile phase A: A mixture of water, methanol and trifluoroacetic
acid for epoetin beta (1000:40:3).

Mobile phase B: A mixture of methanol and trifluoroacetic
acid for epoetin beta (900:100:3).

Column: A stainless steel column 4.6 mm in inside diameter
and 25 cm in length, packed with octadecyldsilanized silica
gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about
25°C.

Flow rate: 1 mL/min.
length: 214 nm). Column: A stainless steel column 7.5 mm in inside diameter and 60 cm in length, packed with porous silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.6 g of sodium dihydrogen phosphate dihydrate and 16.1 g of sodium sulfate decahydrate in water to make 1000 mL, and adjust to pH 6.8 with a solution, prepared by dissolving 16.1 g of sodium sulfate decahydrate in 0.01 mol/L sodium hydroxide TS to make 1000 mL.

Flow rate: Adjust so that the retention time of epoetin beta is about 18 minutes.

Time span of measurement: About 2 times as long as the retention time of epoetin beta.

System suitability—

Test for required detectability: When the procedure is run with 20 μL of diluted Epoetin Beta RS with water containing 0.05 vol% polysorbate 20 for epoetin beta (1 in 1000) under the above conditions, the peak of epoetin beta is detectable.

System performance: When the procedure is run with Epoetin Beta RS under the above conditions, the number of theoretical plates of the peak of epoetin beta is not less than 600.

System repeatability: When the test is repeated 6 times with 20 μL of Epoetin Beta RS under the above operating conditions, the relative standard deviation of the peak area of epoetin beta is not more than 1.0%.

(2) Host cell proteins—Being specified separately when a 50 μL of the standard solution, respectively. Perform the test as directed under Liquid Chromatography (5 μm particle diameter), and determine the total area, A₁ and A₃, of the main peak and the sub-peak of epoetin beta in each solution.

Amount (mg) of protein in 1 mL of Epoetin Beta (Genetical Recombination) = C₅ × A₁/A₃

C₅: Protein concentration (mg/mL) of Epoetin Beta RS

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with butylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of water, acetonitrile for liquid chromatography and trifluoroacetic acid for epoetin beta (400:100:1).

Mobile phase B: A mixture of acetonitrile for liquid chromatography, water and trifluoroacetic acid for epoetin beta (400:100:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

</tbody>
</table>

Flow rate: Adjust so that the retention time of the main peak of epoetin beta is about 22 minutes.

System suitability—

System performance: When the procedure is run with 15 μL of the standard solution under the above operating conditions, the main peak and the sub-peak of epoetin beta are eluted in this order, and the number of theoretical plates of the main peak is not less than 600.

System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the total area of the main peak and the sub-peak of epoetin beta is not more than 4.0%.

(2) Specific activity—To Epoetin Beta (Genetical Recombination) add 0.1 w/v% bovine serum albumin-sodium chloride-phosphate buffer solution to make three solutions so that each mL contains epoetin beta equivalent to 5, 10 and 20 units (estimate), and use these solutions as the sample solutions (1), (2) and (3), respectively. Separately, to Epoetin Beta RS add 0.1 w/v% bovine serum albumin-sodium chloride-phosphate buffer solution to make three solutions so that each mL contains epoetin beta equivalent to 5, 10 and 20 units, and use these solutions as the standard solutions (1), (2) and (3), respectively. Divide ICR strain mice into 6 equal groups of not less than 5 mice. Inject exactly 0.2 mL each of the sample solutions and the standard solutions to ICR strain mice of each group subcutaneously on the 1st, 2nd and 3rd days. On the 4th day, collect the blood from the mice, put 20 μL each of the collected blood in 9.94 mL of blood dilution liquid, mix, and use these mixtures as the dilute blood solution. To each of the dilute blood solution add 100 μL of a hemolytic agent, mix gently to hemolyze, and count the particles of hemolytic agent-resistant red cell by using a particle counter.

Determine the potency ratio (Pₛ) of the sample solution to the standard solution, and calculate the unit per mg protein of Epoetin Beta (Genetical Recombination) by the following equation.

$$Pₛ = 10^9$$

$$M = 4 \times 3 \times i \times Tₛ/Tᵦ$$

$$i = \log 2$$

$$Tₛ = -S₁ - S₂ - S₃ + U₁ + U₂ + U₃$$

$$Tᵦ = -S₁ + S₂ - U₁ + U₃$$

$$U₁: \text{Sum of the responses obtained from the sample solution (1)}$$

$$U₂: \text{Sum of the responses obtained from the sample solution (2)}$$

$$U₃: \text{Sum of the responses obtained from the sample solution (3)}$$

$$S₁: \text{Sum of the responses obtained from the standard solution (1)}$$

$$S₂: \text{Sum of the responses obtained from the standard solution (2)}$$

$$S₃: \text{Sum of the responses obtained from the standard solution (3)}$$

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Specific activity (unit/mg of protein) of Epoetin Beta (Genetical Recombination)

\[ S = P_1 \times D_1 / D_2 \]

S: Potency (unit/mL) of Epoetin Beta RS

D1: Dilution factor for the sample solution (3)

D2: Dilution factor for the standard solution (3)

C: Protein amount (mg/mL) of Epoetin Beta (Genetical Recombination)

Purity  Ergosterol—Dissolve 10 mg of Ergocalciferol in 2.0 mL of diluted ethanol (9 in 10), add a solution of 20 mg of digitonin in 2.0 mL of diluted ethanol (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

Assay  Weigh accurately about 30 mg each of Ergocalciferol and Ergocalciferol RS, and dissolve each in isooctane to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 3 mL each of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 to 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of ergocalciferol to that of the internal standard. Perform the procedure rapidly avoiding contact with air or other oxidizing agents and using light-resistant containers.

Amount (mg) of ergocalciferol (C_{38}H_{46}O) = M_s × Q_1 / Q_2

\( M_s \): Amount (mg) of Ergocalciferol RS taken

Internal standard solution—A solution of dimethyl phthalate in isooctane (1 in 100).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with a silica gel for liquid chromatography (10 \( \mu \)m particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase: A mixture of hexane and n-amylalcohol (99:7:3).

Flow rate: Adjust so that the retention time of ergocalciferol is about 25 minutes.

System suitability—

System performance: Dissolve 15 mg of Ergocalciferol RS in 25 mL of isooctane. Transfer this solution to a flask, heat in an oil bath under a reflux condenser for 2 hours, and cool immediately to room temperature. Transfer the solution to a quartz test tube, and irradiate with a short-wave lamp (main wavelength: 254 nm) and a long-wave lamp (main wavelength: 365 nm) for 3 hours. To 10 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10 \( \mu \)L of this solution under the above operating conditions, the ratios of the retention time of previtamin D₂, trans-vitamin D₂ and tachysterol to that of ergocalciferol are about 0.5, about 0.6 and about 1.1, respectively, and the resolution between previtamin D₂ and trans-vitamin D₂ is not less than 0.7, and that between ergocalciferol and tachysterol is not less than 1.0.

System repeatability: When the test is repeated 6 times with 10 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ergocalciferol to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Light-resistant, under nitrogen atmosphere, and in a cold place.
Ergometrine Maleate

エルゴメトリンマレイン酸塩

C₉H₁₈N₂O₄·C₄H₄O₄·441.48

(8R)-N-[(2S)-1-Hydroxypropan-2-yl]-6-methyl-9,10-didehydroergoline-8-carboxamide monomaleate

[129-51-1]

Ergometrine Maleate, when dried, contains not less than 98.0% of ergometrine maleate (C₁₉H₂₃N₂O₄·C₂H₄O₄).

Description Ergometrine Maleate occurs as a white to pale yellow crystalline powder. It is odorless.

It is sparingly soluble in water, slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

It gradually changes to yellow in color on exposure to light.

Melting point: about 185°C (with decomposition).

Identification (1) Prepare a solution of Ergometrine Maleate (1 in 50): the solution shows a blue fluorescence.

(2) Dissolve 1 mg of Ergometrine Maleate in 5 mL of water. To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, shake, and allow to stand for 5 to 10 minutes: a deep blue color develops.

(3) To 5 mL of a solution of Ergometrine Maleate (1 in 500) add 1 drop of potassium permanganate TS: the red color of the solution disappears immediately.

Optical rotation <2,49> [α]D 20 +48° to +57° (after drying, 0.25 g, water, 25 mL, 100 mm).

pH <2,54> Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water. The pH of the solution is between 3.0 and 5.0.

Purity (1) Clarity and color of solution—Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Ergotamine and ergotoxine—To 0.02 g of Ergometrine Maleate add 2 mL of a solution of sodium hydroxide (1 in 10), and heat to boiling: the gas evolved does not change moistened red litmus paper to blue.

(3) Related substances—Dissolve 5.0 mg each of Ergometrine Maleate and Ergometrine Maleate RS in 1.0 mL of methanol, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2,07>. Spot 10 μL each of the sample solution and standard solution on a plate, prepared with silica gel for thin-layer chromatography and dilute sodium hydroxide TS. Develop the plate with a mixture of chloroform and methanol (4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate: the spots obtained from the sample solution and the standard solution show a red-purple color and the same Rf value, and any spot from the sample solution other than that corresponding to the spot from the standard solution does not appear.

Loss on drying <2,4I> Not more than 2.0% (0.2 g, silica gel, 4 hours).

Assay Weigh accurately about 10 mg each of Ergometrine Maleate and Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 250 mL, and use these solutions as the sample solution and the standard solution, respectively. Pipet 2 mL of each solution into a separate brown glass-stoppered tube. To each tube add 4 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, exactly measured, while cooling in an ice bath, then warm at 45°C for 10 minutes. Allow to stand at room temperature for 20 minutes, and perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2,24>, using a solution, prepared with 2 mL of water in the same manner, as the blank. Determine the absorbances, AT and AS, of the subsequent solutions of the sample solution and the standard solution at 550 nm, respectively.

Amount (mg) of ergometrine maleate (C₁₉H₂₃N₂O₄·C₂H₄O₄) = M5 × Aₜ/Aₜ

M5: Amount (mg) of Ergometrine Maleate RS taken

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Ergometrine Maleate Injection

エルゴメトリンマレイン酸塩注射液

Ergometrine Maleate Injection is an aqueous injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of ergometrine maleate (C₁₉H₂₃N₂O₄·C₂H₄O₄·441.48).

Method of preparation Prepare as directed under Injections, with Ergometrine Maleate.

Description Ergometrine Maleate Injection is a clear, colorless to pale yellow liquid.

pH: 2.7 – 3.5

Identification (1) Measure a volume of Ergometrine Maleate Injection, equivalent to 3 mg of Ergometrine Maleate, if necessary, dilute with water or evaporate on a water bath to make 15 mL, and use this solution as the sample solution. The sample solution shows a blue fluorescence.

(2) To 1 mL of the sample solution obtained in (1) add 1 mL of ammonia TS, and extract with 20 mL of diethyl ether. To the diethyl ether extract add 1 mL of dilute sulfuric acid, shake, and warm to remove diethyl ether in a water bath. Cool, to the residue obtained add 2 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, and allow to stand for 5 to 10 minutes: a deep blue color develops.

(3) To 5 mL of the sample solution obtained in (1) add 1 drop of potassium permanganate TS: a red color disappears immediately.

Bacterial endotoxins <4,01> Less than 1500 EU/mg.

Extractable volume <6,05> It meets the requirement.

Foreign insoluble matter <6,06> Perform the test according to Method 1; it meets the requirement.

Insoluble particulate matter <6,07> It meets the requirement.
Ergometrine Maleate Tablets

**Method of preparation** Prepare as directed under Tablets, with Ergometrine Maleate.

**Identification** To a quantity of powdered Ergometrine Maleate Tablets, equivalent to 3 mg of Ergometrine Maleate, add 15 mL of warm water, shake, and filter: the filtrate shows a blue fluorescence. Proceed with this solution as directed in the Identification (2) and (3) under Ergometrine Maleate.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Transfer 1 tablet of Ergometrine Maleate Tablets to a brown glass-stoppered centrifuge tube, and add exactly 10 mL of a solution of L-tartaric acid (1 in 100) so that each mL contains about 40 μg of ergometrine maleate (C₁₉H₂₃N₂O₂·C₄H₂O₄). Stopper the tube, shake for 30 minutes vigorously, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 4 mg of Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in a solution of L-tartaric acid (1 in 100) to make exactly 50 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and standard solution, proceed as directed in the Assay under Ergometrine Maleate.

Amount (mg) of ergometrine maleate (C₁₉H₂₃N₂O₂·C₄H₂O₄) = \( M_S \times \frac{A_T}{A_S} \times \frac{V}{100} \)

Where:
- \( M_S \): Amount (mg) of Ergometrine Maleate RS taken
- \( A_T \): Absorbance of the sample solution
- \( A_S \): Absorbance of the standard solution
- \( V \): Volume of the sample solution (10 mL)

**Containers and storage** Containers—Well-closed containers, and colored containers may be used.

**Storage**—Light-resistant, and in a cold place.

Ergotamine Tartrate

**Description** Ergotamine Tartrate occurs as colorless crystals, or a white to pale yellow-white or grayish white crystalline powder.

**Melting point** about 180°C (with decomposition).

**Identification** (1) Dissolve 1 mg of Ergotamine Tartrate in 10 mL of a mixture of acetic acid (100) and ethyl acetate (1:1). To 0.5 mL of this solution add slowly 0.5 mL of sulfuric acid, with shaking in cold water, and allow to stand: a
Weigh accurately about 0.2 g of Ergotamine Tartrate and add 0.298 mg of C_{9}H_{2}N_{2}O_{2} per 0.05 mL of perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction. Calculate the specific rotation of the Ergotamine base from the consumed volume of 0.05 mL of perchloric acid VS and the optical rotation.

Each mL of 0.05 mol/L perchloric acid VS = 29.08 mg of C_{9}H_{2}N_{2}O_{2}

**Purity**
Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. To 40 mg of Ergotamine Tartrate add 10 mL of a solution of L-tartaric acid in diluted methanol (1 in 2) (1 in 1000), dissolve with thorough shaking, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a solution of L-tartaric acid in diluted methanol (1 in 2) (1 in 1000) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography.<2.07>; Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying**<2.41> Not more than 5.0% (0.1 g, in vacuum, 60°C, 4 hours).

**Assay**
Weigh accurately about 0.2 g of Ergotamine Tartrate, dissolve in 15 mL of a mixture of acetic acid (100) and acetic anhydride (50:3), and titrate<2.50> with 0.05 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 32.84 mg of (C_{13}H_{2}(N=O)_{3}), C_{6}H_{12}O_{6}

**Containers and storage**
Containers—Tight containers.
Storage—Light-resistant, and almost well-filled, or under nitrogen atmosphere, and not exceeding 5°C.

---

**Eribulin Mesilate**

**Elibrin Mesilate**

Eribulin Mesilate contains not less than 95.0% and not more than 102.0% of eribulin mesilate (C_{6}H_{12}NO_{11}, CH_{3}O_{2}S), and not less than 9.8% and not more than 12.2% of methanesulfonic acid (CH_{3}O_{2}S), calculated on the anhydrous basis.

**Manufacture**
Eribulin Mesilate has 19 chiral carbons, and its purity tests can not estimate all isomers derived from them. Therefore, based on sound science and the understanding of the product and the manufacturing process, control and manage the isomers and related substances during manufacturing process, and ensure the three-dimensional structure of eribulin mesilate. In the quality control strategy of Eribulin Mesilate, control the related substances including the principal isomers in the drug substance or starting materials and intermediates in upstream process. The acceptance values are not more than 0.22% and not more than 0.68% for the related substances B and C, which are the isomers at position C34 and controlled in the drug substance, and are not more than the identification threshold (0.10%) for the related substances including other isomers. When Eribulin Mesilate is manufactured through the compounds 1 and 2, control as follows.

In the compound 1, control so that the isomers at positions C3 and C11, C12 cis-olefin, and other related substances are not more than the identification threshold (0.10%). In the compound 2, control so that the isomers at positions C17 and C29 are not more than 0.30%, and the isomer at position C20 is not more than 0.50%, the isomer at position C25 is not more than 0.40%, and the isomers at positions C23, C27, C34 and C18/C19 endo-olefin and the other related substances are not more than the identification threshold (0.10%).

Furthermore, ensure that the isomers at positions C17, C20, C25 and C29 are not more than the identification threshold (0.10%) in the processes after the compounds 1 and 2, and the other related substances are not more than the qualification threshold (0.15%).

When manufactured without reaction using the compounds 1 and 2, perform the control based on the control mentioned above.
The position numbers of eribulin mesilate used in this Manufacture are as follows. The numbers are used commonly for the related substances, but are not related to the position numbers prescribed by the chemical names.

Position numbers of Eribulin Mesilate in Manufacture

**Description** Eribulin Mesilate occurs as a white powder. It is freely soluble in water, in methanol, in ethanol (99.5%) and in dimethylsulfoxide.

It is hygroscopic.

**Identification** (1) Determine the \(^1\)H spectrum of a solution of Eribulin Mesilate in deuterated methanol for nuclear magnetic resonance spectroscopy (1 in 200), as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using light hydrogen contaminated in deuterated methanol for nuclear magnetic resonance spectroscopy as an internal reference compound and the chemical shift of methyl group of deuterated methanol as \(\delta = 3.3\) ppm: it exhibits a doublet signal A at around \(\delta = 1.1\) ppm, a multiplet signal B at around \(\delta = 2.7\) ppm and a singlet signal C at around \(\delta = 2.7\) ppm, a singlet signal D at around \(\delta = 3.4\) ppm, a doublet signal E at around \(\delta = 3.7\) ppm, a doublet signal F at around \(\delta = 4.5\) ppm, a triplet signal G at around \(\delta = 4.6\) ppm, and a triplet signal H at around \(\delta = 4.7\) ppm. The ratio of integrated intensity of these signals, A:B + C:D:F:G:H, is about 3:5:3:1:1:1:1. (When measured with a nuclear magnetic resonance spectrometer having \(^1\)H resonance frequency of not less than or equal to 400 MHz.)

(2) Perform the test with 15 \(\mu\)L of each sample solution and standard solution obtained in the Assay (2) as directed under Liquid Chromatography <2.01> according to the following conditions: the retention times of the peaks of methanesulfonic acid in the chromatograms obtained from the sample solution and standard solution are the same.

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay (2).

**System suitability**—

Proceed as directed in the system suitability in the Assay (2).

**Optical rotation** <2.49> \([\alpha]\)\(D\) \(_{589nm}\): \(-160\) to \(-210\)° (50 mg calculated on the anhydrous and solvent-free basis, dimethylsulfoxide, 10 mL, 100 mm).

**Purity** (1) Heavy metals—Being specified separately when the drug is granted approval based on the Law.

(2) Related substances—Weigh accurately about 20 mg of Eribulin Mesilate, dissolve in the dissolving solution to make exactly 5 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Eribulin Mesilate RS (separately determine the water <2.48> in the same manner as Eribulin Mesilate), dissolve each in the dissolving solution to make exactly 5 mL. Pipet 1 mL of this solution, add the dissolving solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area, \(A_1\), of the related substances in the sample solution and the peak area, \(A_5\), of eribulin in the standard solution by the automatic integration method, and calculate the amounts of the related substances by the following formula: the amounts of related substance A having the relative retention time of about 0.29 to eribulin, related substance B having the relative retention time of about 0.87, related substance C having the relative retention time of about 1.07, related substance D having the relative retention time of about 1.37, and related substance F having the relative retention time of about 1.67, are not more than 0.15%, 0.22%, 0.68%, 0.50%, 0.15%, and 0.19%, respectively, and other related substances are not more than 0.10%. Furthermore, the total amount of these related substances is not more than 3.0%.

Amount (\(\%\)) of related substance = \(\frac{M_1}{M_5} \times \frac{A_1}{A_5}\)

**M\(_5\):** Amount (mg) of Eribulin Mesilate RS taken, calculated on the anhydrous basis

**M\(_1\):** Amount (mg) of Eribulin Mesilate taken, calculated on the anhydrous basis

**Dissolving solution**—A mixture of water, acetonitrile for liquid chromatography and phosphoric acid (6500:3500:7) adjusted to pH 6.9 – 7.1 with diluted ammonium water (28) (1 in 5) or 1 mol/L hydrochloric acid TS.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay (1).

Time span of measurement: For 85 minutes after injection, beginning after the solvent peak.

**System suitability**—

System performance: Proceed as directed in the system suitability in the Assay (1).

Test for required detectability: Pipet 1 mL of the standard solution, and add the dissolving solution to make exactly 20 mL. Confirm that the peak area of eribulin obtained with 5 \(\mu\)L of this solution is equivalent to 3.5 to 6.5\% of that with 5 \(\mu\)L of the standard solution.

System repeatability: When the test is repeated 5 times with 5 \(\mu\)L of the solution for system suitability test obtained in the Assay (1) under the above operating conditions, the relative standard deviation of the peak area of eribulin is not more than 1.0%.

(3) Residual solvent—Being specified separately when the drug is granted approval based on the Law.

**Water** <2.48> Not more than 3.0\% (Weigh accurately 15-25 mg of Eribulin Mesilate, dissolve in 2.5 mL of methanol for water determination, and perform the test with exactly 1 mL of this solution; coulometric titration).

**Assay** (1) Eribulin Mesilate—Weigh accurately about 20 mg each of Eribulin Mesilate and Eribulin Mesilate RS (separately determine the water <2.48> in the same manner as Eribulin Mesilate), dissolve each in the dissolving solution to make exactly 5 mL, and use these solutions as the sample solution and the standard solution. Perform the test with exactly 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,
A<sub>T</sub> and A<sub>S</sub>, of eribulin in each solution.

Amount (mg) of eribulin mesilate (C<sub>45</sub>H<sub>58</sub>NO<sub>15</sub>, CH<sub>2</sub>O<sub>2</sub>S) = M<sub>S</sub> × A<sub>T</sub>/A<sub>S</sub>

M<sub>S</sub>: Amount (mg) of Eribulin Mesilate RS taken, calculated on the anhydrous basis

**Dissolving solution**—A mixture of water, acetonitrile for liquid chromatography and phosphoric acid (6500:3500:7) adjusted to pH 6.9 – 7.1 with diluted ammonia water (28) (1 in 5) or 1 mol/L hydrochloric acid TS.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 200 nm).

Column: A stainless steel column 3 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Dissolve 7.0 g of ammonium trifluoromethanesulfonate in 760 mL of water, add 3.0 mL of a solution of tetrabutylammonium dihydrogen phosphate (17 in 50) and 240 mL of acetonitrile for liquid chromatography, and adjust to pH 6.9 – 7.1 with diluted ammonium water (28) (1 in 5) or 1 mol/L hydrochloric acid TS.

Mobile phase B: Dissolve 7.0 g of ammonium trifluoromethanesulfonate in 300 mL of water, add 3.0 mL of a solution of tetrabutylammonium dihydrogen phosphate (17 in 50), 700 mL of acetonitrile for liquid chromatography and 20 mL of 2-propanol for liquid chromatography, and adjust to pH 6.9 – 7.1 with diluted ammonium water (28) (1 in 5) or 1 mol/L hydrochloric acid TS.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>

**System suitability**—

System performance: Dissolve 2 mg of Eribulin Mesilate Related Substance C for System Suitability RS in the dissolving solution to make exactly 50 mL. To 0.2 mL of this solution add 4 mg of Eribulin Mesilate RS, dissolve in the dissolving solution to make exactly 1 mL, and use this solution as the solution for system suitability test. When the procedure is run with 5 μL of the solution for system suitability test under the above operating conditions, eribulin and the related substance C are eluted in this order with the resolution between these peaks being not less than 1.5. The number of theoretical plates and the symmetry factor of the peak of eribulin are not less than 13,500 and not more than 1.5, respectively.

System repeatability: When the test is repeated 5 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of eribulin is not more than 1.0%.

(2) Methanesulfonic acid—Weigh accurately about 50 mg of Eribulin Mesilate, dissolve in a mixture of the mobile phase and acetonitrile for liquid chromatography (13:7) to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of methanesulfonic acid, dissolve in a mixture of the mobile phase and acetonitrile for liquid chromatography (13:7) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas, A<sub>T</sub> and A<sub>S</sub>, of methanesulfonic acid in each solution. Calculate the content of methanesulfonic acid by the following formula.

Content (%) of methanesulfonic acid (CH<sub>4</sub>O<sub>3</sub>S) = M<sub>S</sub> × A<sub>T</sub>/A<sub>S</sub> × 1/10

M<sub>S</sub>: Amount (mg) of methanesulfonic acid taken

**Operating conditions**—

Detector: An electric conductivity detector.

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 2.8 g of sodium dihydrogen phosphate monohydrate in 950 mL of water, add 11 μL of phosphoric acid, adjust to pH 4.2 – 4.3 with phosphoric acid if necessary, and add 50 mL of acetonitrile for liquid chromatography.

Flow rate: Adjust so that the retention time of methanesulfonic acid is about 6.5 minutes.

**System suitability**—

System performance: When the procedure is run with 15 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of methanesulfonic acid are not less than 12,000 and not more than 0.7 – 1.5, respectively.

System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of methanesulfonic acid is not more than 3.0%.

**Containers and storage**—Containers—Tight containers.

Storage—Light-resistant, at a temperature not exceeding –65°C.

**Others**—

Compound 1: Methyl[(2R,4aS,6S,7R,8S,8aS)-7,8-bis{[(1,1-dimethylethyl)dimethylsilyloxy]-6-[(1S,2E)-1-((1,1-dimethylethyl)dimethylsilyloxy)-3-iodoprop-2-en-1-yl]octahydroprano[3,2-b]pyran-2-yl}acetate

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Erythromycin occurs as a white to light yellowish powder.

It is freely soluble in methanol and in ethanol (95), and moderately soluble in water.

**Description**

Erythromycin occurs as a white to light yellowish粉末.

It is freely soluble in methanol and in ethanol (95), and very slightly soluble in water.

**Identification (1)**

Determine the infrared absorption spectrum of Erythromycin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Erythromycin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)**

Heavy metals <1.07>—Proceed with 1.0 g of Erythromycin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Erythromycin in 2 mL of methanol, add a mixture of phosphate buffer solution (pH 7.0) and methanol (15:1) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 16 mg of Erythromycin RS in 2 mL of methanol, add a mixture of phosphate buffer solution (pH 7.0) and methanol (15:1) to make exactly 10 mL, and use this solution as the standard stock solution. Dissolve 5 mg each of erythromycin B and erythromycin C in 2 mL of methanol, add exactly 2 mL of the standard stock solution, add a mixture of phosphate buffer solution (pH 7.0) and methanol (15:1) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of erythromycin B and erythromycin C obtained from the sample solution are not larger than those of erythromycin B and erythromycin C from the standard solution, respectively, and the area of the peaks other than erythromycin, erythromycin B and erythromycin C from the sample solution is not larger than the peak area of erythromycin from the standard solution.

**Operating conditions**

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (8 μm in particle diameter).

Column temperature: A constant temperature of about 70°C.

Mobile phase: Dissolve 3.5 g of dipotassium hydrogen phosphate in water to make 100 mL, and adjust the pH to 9.0 with diluted phosphoric acid (1 in 10). To 50 mL of this solution add 190 mL of t-butyl alcohol, 30 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust so that the retention time of erythromycin is about 20 minutes.

Time span of measurement: About 4 times as long as the retention time of erythromycin, beginning after the solvent peak.

**System suitability**

System performance: Dissolve 2 mg of N-demethylerythromycin in 10 mL of the standard solution. When the procedure is run with 100 μL of this solution under the above operating conditions, N-demethylerythromycin, erythromycin C, erythromycin and erythromycin B are eluted in this order, with the resolution between the peaks of N-demethylerythromycin and erythromycin C being not less than 0.8 and with the resolution between the peaks of N-demethylerythromycin and erythromycin being not less than 5.5.

System repeatability: When the test is repeated 3 times with 100 μL of the standard solution under the above operat-
ing conditions, the relative standard deviation of the peak area of erythromycin is not more than 3.0%.

**Water**<sup>2.42</sup> Not more than 10.0% (0.2 g, volumetric titration, direct titration).

**Residue on ignition**<sup>2.42</sup> Not more than 0.2% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics<sup>4.02</sup> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin RS, equivalent to about 25 mg (potency), dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin, equivalent to about 25 mg (potency), dissolve in 25 mL of methanol, and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

**Erythromycin Delayed-release Tablets**

エリスロマイシン腸溶錠

Erythromycin Delayed-release Tablets contain not less than 90.0% and not more than 110.0% of the labeled potency of erythromycin (C<sub>37</sub>H<sub>67</sub>NO<sub>13</sub>: 733.93).

**Method of preparation** Prepare as directed under Tablets, with Erythromycin.

**Identification** To a quantity of powdered Erythromycin Delayed-release Tablets, equivalent to 10 mg (potency) of Erythromycin, add 1 mL of methanol, shake well, filter, and use the filtrate as the sample solution. Separately, dissolve 10 mg of Erythromycin RS in 1 mL of methanol, and use this solution as the standard solution. Then, proceed as directed in the Identification (2) under Erythromycin.

**Loss on drying**<sup>2.41</sup> Not more than 10.0% (0.2 g, in vacuum not exceeding 0.67 kPa, 60°C, 3 hours).

**Uniformity of dosage units**<sup>6.02</sup> It meets the requirement of the Mass variation test.

**Disintegration**<sup>6.09</sup> It meets the requirement. For the test with 2nd fluid for disintegration test, use the disk.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics<sup>4.02</sup> according to the following conditions.

(i) Test organism, culture medium, and standard solutions—Proceed as directed in the Assay under Erythromycin.

(ii) Sample solutions—Weigh accurately the mass of not less than 20 Erythromycin Delayed-release Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg (potency) of Erythromycin, add 25 mL of methanol, shake vigorously, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and filter. Take exactly an appropriate volume of the filtrate, add 0.1 mol/L phosphate buffer solution (pH 8.0) to prepare solutions containing 20 µg (potency) and 5 µg (potency) per mL, and use these solutions as the high and the low concentration sample solutions, respectively.

**Erythromycin Ethylsuccinate**

エリスロマイシンエチルコハク酸エステル

C<sub>43</sub>H<sub>72</sub>NO<sub>15</sub>: 862.05

Erythromycin Ethylsuccinate is a derivative of erythromycin.

It contains not less than 780 µg (potency) and not more than 900 µg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Ethylsuccinate is expressed as mass (potency) of erythromycin (C<sub>37</sub>H<sub>67</sub>NO<sub>13</sub>): 733.93.

**Description** Erythromycin Ethylsuccinate occurs as a white powder.

It is freely soluble in methanol and in acetone, soluble in ethanol (95), and practically insoluble in water.

**Identification** (1) Dissolve 3 mg of Erythromycin Ethylsuccinate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to red to deep purple.

(2) Determine the infrared absorption spectrum of Erythromycin Ethylsuccinate, previously dried in a desiccator (reduced pressure, silica gel) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectro-
Perform the test according to the Cylinder-plate Containers—Tight containers.

To 3 mg of Erythromycin Lactobionate (0.5 g, volumetric titration, direct titration).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Staphylococcus aureus ATCC 6538 P
(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.
(iii) Standard solutions—Weigh accurately an amount of Erythromycin RS, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
(iv) Sample solutions—Weigh accurately an amount of Erythromycin Ethylsuccinate, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Erythromycin Lactobionate

Erythromycin Lactobionate is the lactobionate of erythromycin.

It contains not less than 590 μg (potency) and not more than 700 μg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Lactobionate is expressed as mass (potency) of erythromycin (C_{37}H_{67}NO_{13}·C_{3}H_{2}O_{2})·1092.22 (2R,3S,4S,5R,6R,8R,10R,11R,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-hexopyranosylxyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide mono(4-O-β-D-galactopyranosyl-D-glucosyl)

Erythromycin Lactobionate is the lactobionate of erythromycin.

C_{37}H_{67}NO_{13}·C_{3}H_{2}O_{2}: 1092.22 (2R,3S,4S,5R,6R,8R,10R,11R,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-hexopyranosylxyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide mono(4-O-β-D-galactopyranosyl-D-glucosyl)

[3847-29-8]

Erythromycin Lactobionate is the lactobionate of erythromycin. It is freely soluble in water, in methanol and in ethanol (99.5), and very slightly soluble in acetone.

Description Erythromycin Lactobionate occurs as a white powder.

It is freely soluble in water, in methanol and in ethanol (99.5), and very slightly soluble in acetone.

Identification (1) To 3 mg of Erythromycin Lactobionate add 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color is produced, and it changes immediately to red to deep purple.
(2) Transfer about 0.3 g of Erythromycin Lactobionate to a separator, add 15 mL of ammonia TS and 15 mL of chloroform, shake, and take the separated aqueous layer. Wash the aqueous layer with three 15-mL portions of chloroform, and evaporate the aqueous liquid on a water bath to dryness. Dissolve the residue in 10 mL of a mixture of methanol and water (3:2), and use this solution as the sample solution. Separately, dissolve 0.10 g of lactobionic acid in 10 mL of a mixture of methanol and water (3:2), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.02>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the upper layer obtained from a mixture of water, 1-butanol and acetic acid (100:3:3:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly dilute sulfuric acid, and heat at 105°C for 20 minutes: the principal spot obtained from the sample solution shows a deep brown and the Rf value which are the same as those of the principal spot from the standard solution.

pH <2.54> The pH of a solution obtained by dissolving 0.5 g of Erythromycin Lactobionate in 10 mL of water is between 5.0 and 7.5.

Water <2.48> Not more than 5.0% (0.5 g, volumetric titration, direct titration).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.
(i) Test organism—Staphylococcus aureus ATCC 6538 P
(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.
(iii) Standard solutions—Weigh accurately an amount of Erythromycin RS, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
(iv) Sample solutions—Weigh accurately an amount of Erythromycin Ethylsuccinate, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.
solution and the low concentration sample solution, respectively.

Containers and storage  Containers—Tight containers.

Erythromycin Stearate

エリスロマイシンステアリン酸塩

C_{37}H_{55}NO_{13}, C_{33}H_{52}O_{2}: 1018.40
(2R,3S,4S,5R,6R,8R,10R,11R,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylono-hexopyranosyl)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyl)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide monostearate

[643-22-1]

Erythromycin Stearate is the stearate of erythromycin. It contains not less than 600 µg (potency) and not more than 720 µg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Stearate is expressed as mass (potency) of erythromycin (C_{37}H_{55}NO_{13}): 733.93.

Description  Erythromycin Stearate occurs as a white powder. It is freely soluble in ethanol (95) and in acetone, soluble in methanol, and practically insoluble in water.

Identification (1)  Dissolve 3 mg of Erythromycin Stearate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to red to deep purple.

(2)  Determine the infrared absorption spectrum of Erythromycin Stearate, previously dried in a desiccator (reduced pressure, silica gel) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Water <2.40>  Not more than 5.0% (0.5 g, volumetric titration, direct titration).

Assay  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i)  Test organism—Staphylococcus aureus ATCC 6538 P

(ii)  Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii)  Standard solutions—Weigh accurately an amount of Erythromycin RS equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv)  Sample solutions—Weigh accurately an amount of Erythromycin Stearate equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage  Containers—Tight containers.

Estazolam

エスタゾラム

C_{16}H_{11}CIN_{4}: 294.74
8-Chloro-6-phenyl-4H-[1,2,4]triazolo[4,3-a][1,4]benzodiazepine
[29975-16-4]

Estazolam, when dried, contains not less than 98.5% of estazolam (C_{16}H_{11}CIN_{4}).

Description  Estazolam occurs as white to pale yellow-white, crystals or crystalline powder. It is odorless and has a bitter taste. It is soluble in methanol and in acetic anhydride, sparingly soluble in ethanol (95%), and practically insoluble in water and in diethyl ether.

Identification (1)  Dissolve 0.01 g of Estazolam in 3 mL of sulfuric acid: the solution shows a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm).

(2)  Determine the absorption spectrum of a solution of Estazolam in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3)  Perform the test with Estazolam as directed under Flame Coloration Test <1.05> (2): a green color appears.

Melting point <2.60> 229 – 233°C

Purity (1)  Clarity and color of solution—Dissolve 0.10 g of Estazolam in 10 mL of ethanol (95%): the solution is clear and colorless.

(2)  Chloride <1.05>—Dissolve 1.0 g of Estazolam in 10 mL of ethanol (95%) by heating, add 40 mL of water, cool
with shaking in ice water, allow to stand to attain ordinary temperature, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS and 6 mL of ethanol (95%) (not more than 0.015%).

3. Heavy metals <1.07>—Proceed with 1.0 g of Estazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

4. Arsenic <1.11>—Prepare the test solution with 1.0 g of Estazolam according to Method 3, and perform the test (not more than 2 ppm).

5. Related substances—Dissolve 0.20 g of Estazolam in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, chloroform and methanol (5:3:1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the principal spot from the standard solution.

**Estradiol Benzoate**

エストラジオール安息香酸エステル

\[
C_{25}H_{25}O_4: 376.49
\]

Estra-1,3,5(10)-triene-3,17β-diol 3-benzoate [50-56-0]

Estradiol Benzoate, when dried, contains not less than 97.0% of estradiol benzoate (C_{25}H_{25}O_4).

**Description** Estradiol Benzoate occurs as a white crystalline powder. It is odorless.

It is sparingly soluble in acetone, slightly soluble in methanol, in ethanol (95%) and in diethyl ether, and practically insoluble in water.

**Identification** (1) To 2 mg of Estradiol Benzoate add 2 mL of sulfuric acid: a yellowish green color with a blue fluorescence is produced, and the color of the solution changes to light orange on the careful addition of 2 mL of water.

(2) Determine the infrared absorption spectrum of Estradiol Benzoate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Estradiol Benzoate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> \[ [\alpha]_D^{20} = +54 ± 58° \) (after drying, 0.1 g, acetone, 10 mL, 100 mm).

**Melting point** <2.60> 191 – 198°C

**Purity** (1) 3,17α-Estradiol—Dissolve 5.0 mg each of Estradiol Benzoate and Estradiol Benzoate RS in acetone to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Place exactly 2 mL each of the sample solution and standard solution in separate glass-stoppered test tube, add boiling stones, evaporate the acetone by heating in a water bath, and dry the residue in a desiccator (in vacuum, phosphorus (V) oxide) for 1 hour. Add 1.0 mL of dilute iron-pheno1 TS to each test tube. Stopper the test tubes loosely, heat for 30 seconds in a water bath, shake in a water bath for several seconds, and heat for 2 minutes. Cool the solutions in ice for 2 minutes, add 4.0 mL of diluted sulfuric acid (7 in 20), and mix well: the solution obtained from the sample solution has no more color than that from the standard solution.

(2) Related substances—Dissolve 40 mg of Estradiol Benzoate in 2 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and diethylamine (19:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.47> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately about 0.25 g of Estazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration), until the solution changes to the second equivalence point. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 14.74 mg of C_{25}H_{25}O_4

Containers and storage Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Internal standard solution—A solution of progesterone in methanol (13 in 80,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 230 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase: A mixture of acetonitrile and water (7:3).
Flow rate: Adjust so that the retention time of estradiol benzoate is about 10 minutes.

System suitability—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the internal standard and estradiol benzoate are eluted in this order with the resolution between these peaks being not less than 9.
System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peaks of estradiol benzoate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Estradiol Benzoate Injection (Aqueous Suspension)

エストラジオール安息香酸エステル水性懸濁注射液

Estradiol Benzoate Injection (Aqueous Suspension) is an aqueous suspension for injection. It contains not less than 90.0% and not more than 110.0% of the labeled amount of estradiol benzoate (C₂₈H₃₄O₃): 376.49.

Method of preparation Prepare as directed under Injec-
tion, with Estradiol Benzoate.

Description Estradiol Benzoate Injection (Aqueous Suspension) produces a white turbidity on shaking.

Identification Extract a volume of Estradiol Benzoate Injection (Aqueous Suspension), equivalent to 1 mg of Estradiol Benzoate, with 5 mL of chloroform, and use this extract as the sample solution. Separately, dissolve 1 mg of Estradiol Benzoate RS in 5 mL of chloroform, and use this solution as the standard solution. Perform the test with these solutions as directed in the Assay under Estradiol Benzoate.

Assay Measure exactly a volume of well-mixed Estradiol Benzoate Injection (Aqueous Suspension), equivalent to about 2 mg of estradiol benzoate (C₂₈H₃₄O₃), dissolve the crystals with an appropriate quantity of methanol, and add methanol to make exactly 20 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Estradiol Benzoate RS, previously dried in desiccator (reduced pressure, phosphorus (V) oxide) for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and methanol to make 100 mL, and use this solution as the standard solution. Proceed with these solutions as directed in the Assay under Estradiol Benzoate.

Amount (mg) of estradiol benzoate (C₂₈H₃₄O₃)

\[
M_s = M_b \times \frac{Q_1}{Q_b} \times \frac{1}{5}
\]

M_b: Amount (mg) of Estradiol Benzoate RS taken

Internal standard solution—A solution of progesterone in methanol (13 in 100,000).

Containers and storage Containers—Hermetic containers.

Estriol

エストリオール

C₁₀H₁₅O₃: 288.38
Estra-1,3,5(10)-triene-3,16α,17β-triol [50-27-1]

Estriol, when dried, contains not less than 97.0% and not more than 102.0% of estriol (C₁₀H₁₅O₃).

Description Estriol occurs as a white crystalline powder. It is odorless.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

Identification (1) Dissolve 0.01 g of Estriol in 100 mL of ethanol (95) by warming, and use this solution as the sample solution. Evaporate 1 mL of the sample solution on a water bath to dryness, add 5 mL of a solution of sodium p-phenol-sulfonate in diluted phosphoric acid (1 in 50), heat at 150°C for 10 minutes, and cool: a red-purple color develops.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Estriol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Estriol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Estriol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation 2.49 \[ [\alpha]_{D}^{25} = +55^\circ - +65^\circ \] (after drying, 40
mg, ethanol (99.5), 10 mL, 100 mm).

Melting point 2.60 > 281 – 286°C

Purity (1) Heavy metals 1.07 – Proceed with 1.0 g of Estriol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Estriol in 10 mL of ethanol (95) by warming, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and acetic acid (100) (18:1:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly diluted sulfuric acid (1 in 2) on the plate, and heat at 105°C for 15 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying 2.41 Not more than 0.5% (0.5 g, 105°C, 3 hours).

Residue on ignition 2.44 Not more than 0.1% (0.5 g).

Assay Weigh accurately about 25 mg each of Estriol and Estriol RS, previously dried and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and calculate the ratios, 18 and 24, of the peak area of estriol to that of the internal standard.

Amount (mg) of estriol (C18H24O3) = \( M_s \times \frac{Q_s}{Q_r} \)

\( M_s \): Amount (mg) of Estriol RS taken

Internal standard solution—A solution of methyl benzoate for estriol test in methanol (1 in 1000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (51:49).

Flow rate: Adjust so that the retention time of estriol is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, estriol and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of estriol to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

---

**Estriol Tablets**

エストリオール錠

Estriol Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of estriol (C18H24O3: 288.38).

Method of preparation Prepare as directed under Tablets, with Estriol.

Identification (1) Weigh a portion of powdered Estriol...
Tablets, equivalent to 2 mg of Estriol, add 20 mL of ethanol (95), shake for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Proceed with the sample solution as directed in the Identification (1) under Estriol.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>:

- It exhibits a maximum between 279 nm and 283 nm.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Estriol Tablets add exactly 5 mL of water, disperse the fine particles by sonicating, add exactly 15 mL of methanol, and shake for 15 minutes. Centrifuge this solution for 10 minutes, pipet a definite amount of the supernatant liquid, and add methanol to make exactly a definite amount of solution so that each mL of the solution contains about 5 µg of estriol (C_{18}H_{22}O_3). Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the sample solution. Proceed with 20 µL of the sample solution as directed in the Assay under Estriol. Use a solution of methyl benzoate for estriol test in methanol (1 in 40,000) as the internal standard solution. Calculate the mean value from each ratio of peak areas of 10 samples: the samples conform to the requirements if the deviation (%) of the mean value and each ratio of peak areas is within 15%. If the deviation (%) exceeds 15%, and 1 sample shows deviation within 25%, repeat the test with 20 samples. Calculate the deviation (%) of the mean value from each ratio of peak areas of the 30 samples used in the 2 tests and each ratio of peak areas: the samples conform to the requirements if the deviation exceeds 15%, not more than 1 sample shows deviation within 25%, and no sample shows deviation exceeding 25%.

**Dissolution <6.10>** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Estriol Tablets is not less than 80%.

Start the test with 1 tablet of Estriol Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 µm. Discard not less than 10 mL of the first filtrate, pipet 1 mL of the subsequent filtrate, add water to make exactly 20 mL so that each mL contains about 0.1 µg of estriol (C_{18}H_{22}O_3), and use this solution as the sample solution. The test with the sample solution is performed in a water bath for 10 minutes: a deviation of about 5% occurs. After cooling, add 1 mL of chromotropic acid TS, and heat in a water bath for 3 minutes. After cooling, add 2 mL of the solution, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 µL each of the sample solution and standard solution as directed under Liquid chromatography <2.01> according to the following conditions, and determine the peak areas, A_T and A_S, of estriol.

Dissolution rate (%) with respect to the labeled amount of estriol (C_{18}H_{22}O_3) = M_S × A_T/A_S × V'/V × 1/C × 9/10

M_S: Amount (mg) of Estriol RS taken
C: Labeled amount (mg) of estriol (C_{18}H_{22}O_3) in 1 tablet

Operating conditions— Proceed as directed in the operating conditions in the Assay under Estriol.

**System suitability**— Proceed as directed in the system suitability in the Assay under Estriol.

**Assay** Weigh accurately and powder not less than 20 Estriol Tablets. Weigh accurately a portion of the powder, equivalent to about 1 mg of estriol (C_{18}H_{22}O_3), add exactly 5 mL of water, disperse the fine particles by sonication, shake with 25 mL of methanol for 10 minutes, centrifuge, and take the supernatant liquid. Add 25 mL of methanol, repeat the above procedure twice, combine the supernatant liquid, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estriol RS, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the standard solution. Proceed with 20 µL each of the sample solution and standard solution as directed in the Assay under Estriol.

Amount (mg) of estriol (C_{18}H_{22}O_3) = M_S × Q_1/Q_2 × 1/25

M_S: Amount (mg) of Estriol RS taken

**Internal standard solution—** A solution of methyl benzoate for estriol test in methanol (1 in 5000).

**Containers and storage** Containers—Tight containers.

**Etacrynic Acid**

エタクリン酸

![Etacrynic Acid Structural Formula](attachment:image.png)

C_{13}H_{12}Cl_{2}O_3: 303.14

[2,3-Dichloro-4-(2-ethylacryloyloxy)phenox]acetic acid [58-34-8]

Etacrynic Acid, when dried, contains not less than 98.0% of etacrynic acid (C_{13}H_{12}Cl_{2}O_3).

**Description**

Etacrynic Acid occurs as a white crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in methanol, freely soluble in ethanol (95), in acetic acid (100) and in diethyl ether, and very slightly soluble in water.

**Identification (1)**

- Dissolve 0.2 g of Etacrynic Acid in 10 mL of acetic acid (100), and to 5 mL of this solution add 0.1 mL of bromine TS: the color of the test solution disappears. To the remaining 5 mL of the solution add 0.1 mL of potassium permanganate TS: the color of the test solution changes to light orange immediately.
- To 0.01 g of Etacrynic Acid add 1 mL of sodium hydroxide TS, and heat in a water bath for 3 minutes. After cooling, add 1 mL of chromotropic acid TS, and heat in a water bath for 10 minutes: a deep purple color develops.
- Determine the absorption spectrum of a solution of Etacrynic Acid in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
(4) Perform the test with Etacrylic Acid as directed under Flame Coloring Test <1.04> (2): a green color appears.

**Melting point** <2.60> 121 - 125°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Etacrylic Acid in 10 mL of methanol: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Etacrylic Acid according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Etacrylic Acid according to Method 3, and perform the test. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95% in 50), then add 1.5 mL of hydrogen peroxide (30%), and fire to burn (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Etacrylic Acid in 10 mL of ethanol (95%), and use this solution as the sample solution. Pipet 3 mL of the sample solution, add ethanol (95%) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-Layer Chromatography <2.08>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethyl acetate and acetic acid (100) (6:5:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.4I> Not more than 0.25% (1 g, in vacuum, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.1 g of Etacrylic Acid, previously dried, place in an iodine bottle, dissolve in 20 mL of acetic acid (100), and add exactly 20 mL of 0.05 mol/L bromine VS. To this solution add 3 mL of hydrochloric acid, stopper tightly at once, shake, and allow to stand in a dark place for 60 minutes. Add carefully 50 mL of water and 15 mL of potassium iodide TS, stopper tightly at once, shake well, and titrate <2.50> the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner.

Each mL of 0.05 mol/L bromine VS = 15.16 mg of C₃H₂Cl₂O₃

**Containers and storage** Containers—Well-closed containers.

**Etacrylic Acid Tablets**

エタクリン酸錠

Etacrylic Acid Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of etacrylic acid (C₃H₂Cl₂O₃: 303.14).

**Method of preparation** Prepare as directed under Tablets, with Etacrylic Acid.

**Identification** (1) Weigh a quantity of powdered Etacrylic Acid Tablets, equivalent to 0.3 g of Etacrylic Acid, add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with 50 mL of dichloromethane. Filter the dichloromethane extract, and evaporate the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1), (2) and (4) under Etacrylic Acid.

(2) Prepare a solution of the residue obtained in (1), equivalent to a solution of Etacrylic Acid in methanol (1 in 20,000), and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 268 nm and 272 nm.

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Etacrylic Acid Tablets is not less than 70%. Start the test with 1 tablet of Etacrylic Acid Tablets, withdraw not less than 20 mL of the medium at the specified time after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 10 mL so that each mL contains about 28 μg of etacrylic acid (C₃H₂Cl₂O₃), and use this solution as the sample solution. Separately, weigh accurately about 55 mg of etacrylic acid for assay, previously dried in vacuum at 60°C for 2 hours, dissolve in 10 mL of methanol, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₂, at 277 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

**Dissolution rate** (%) with respect to the labeled amount of etacrylic acid (C₃H₂Cl₂O₃) = M₁ × A₁/A₂ × V'/V × 1/C × 45

M₁: Amount (mg) of etacrylic acid for assay taken
C: Labeled amount (mg) of etacrylic acid (C₃H₂Cl₂O₃) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 Etacrylic Acid Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of etacrylic acid (C₃H₂Cl₂O₃), add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with three 30-mL portions of dichloromethane. Filter the dichloromethane extracts through a pledget of absorbent cotton into an iodine bottle. Wash the pledget of absorbent cotton with a small amount of dichloromethane, and combine the washing with the extracts. Evaporate this solution on a water bath to dryness in a current of air, to the residue add 20 mL of acetic acid (100), and proceed as directed in the Assay under Etacrylic Acid.

Each mL of 0.05 mol/L bromine VS = 15.16 mg of C₃H₂Cl₂O₃

**Containers and storage** Containers—Well-closed containers.
Ethambutol Hydrochloride

エタンブトール塩酸塩

C₁₆H₂₃N₂O₅·2HCl: 277.23
(2S,2'S)-2,2'-(Ethane-1,2-diylidimino)bis(butan-1-ol) dihydrochloride

[1070-11-7]

Ethambutol Hydrochloride, when dried, contains not less than 98.5% of ethambutol hydrochloride (C₁₆H₂₃N₂O₅·2HCl).

Description Ethambutol Hydrochloride occurs as white, crystals or crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in water, soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution prepared by dissolving 1.0 g of Ethambutol Hydrochloride in 20 mL of water is between 3.4 and 4.0.

Identification (1) To 10 mL of a solution of Ethambutol Hydrochloride (1 in 100) add 0.5 mL of copper (II) sulfate TS and 2 mL of sodium hydroxide TS: a deep blue color is produced.

(2) Dissolve 0.1 g of Ethambutol Hydrochloride in 40 mL of water, add 20 mL of 2,4,6-trinitrophenol TS, and allow to stand for 1 hour. Collect the precipitate, wash with 50 mL of water, and dry at 105°C for 2 hours: the precipitate melts at 200–204°C.

(3) A solution of Ethambutol Hydrochloride (1 in 30) responds to Qualitative Tests <1.09> for chloride.

Optical rotation <2.49> [α]D: +5.5° – +6.1° (after drying, 5 g, water, 50 mL, 200 mm).

Melting point <2.60> 200–204°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Ethambutol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g Ethambutol Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.15>—Prepare the test solution with 1.0 g of Ethambutol Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(4) 2-Aminobutanol—Dissolve 5.0 g of Ethambutol Hydrochloride in methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve 0.05 g of 2-amino-1-butanol in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.68>. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100), hydrochloric acid and water (11:7:1:1) to a distance of about 10 cm, air-dry the plate, and heat at 105°C for 5 minutes. Cool, spray evenly ninhydrin-α-ascorbic acid TS upon the plate, air-dry the plate, and heat at 105°C for 5 minutes: the spot obtained from the sample solution, corresponding to that from the standard solution, has no more color than that from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ethambutol Hydrochloride, previously dried, dissolve in 20 mL of water, and add 1.8 mL of copper (II) sulfate TS. To the solution add 7 mL of sodium hydroxide TS with shaking, add water to make exactly 50 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add 10 mL of ammonia-ammonium chloride buffer solution (pH 10.0) and 100 mL of water, and titrate <2.56> with 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from blue-purple through light red to light yellow (indicator: 0.15 mL of Cu-PAN TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 2.772 mg of C₁₆H₂₃N₂O₅·2HCl

Containers and storage Containers—Tight containers.

Ethanol

エタノール

C₂H₅O: 46.07
Ethanol [64-17-5]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The parts of the text that are not harmonized are marked with symbols ( ).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Ethanol contains not less than 95.1 vol% and not more than 96.9 vol% (by specific gravity) of ethanol (C₂H₅O) at 15°C.

Description Ethanol is a clear, colorless liquid.

It is miscible with water.

It is flammable and burns with a light blue flame on ignition.

It is volatile.

Identification Determine the infrared absorption spectrum of Ethanol as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Specific gravity <2.56> d₁⁰: 0.80872 – 0.81601

Purity (1) Clarity and color of solution—Ethanol is clear and colorless. To 1.0 mL of Ethanol add water to make 20 mL, and allow to stand for 5 minutes: the resulting liquid is clear.
Anhydrous Ethanol

Dehydrated Alcohol

無水エタノール

C₂H₅O: 46.07
Ethanol

[64-17-5]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia.

The parts of the text that are not harmonized are marked with symbols (◆ ◆).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopoeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Anhydrous Ethanol contains not less than 99.5 vol% (by specific gravity) of ethanol (C₂H₅O) at 15°C.

◆Description Anhydrous Ethanol is a clear, colorless liquid.

It is miscible with water.

It is flammable and burns with a light blue flame on ignition.

It is volatile.

Boiling point: 78 – 79°C◆

Identification Determine the infrared absorption spectrum of Anhydrous Ethanol as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Specific gravity <2.56> d₁⁵: 0.79422 – 0.79679

Purity (1) Clarity and color of solution—Anhydrous Ethanol is clear and colorless. To 1.0 mL of Anhydrous Ethanol add water to make 20 mL, and allow to stand for 5 minutes: the resulting liquid is clear.

Control solution: water
(2) Acidity or alkalinity—To 20 mL of Anhydrous Ethanol add 20 mL of freshly boiled and cooled water and 0.1 mL of a solution obtained by addition of 7.0 mL of ethanol (95) and 2.0 mL of water to 1.0 mL of phenolphthalein TS: no color develops. Add 1.0 mL of 0.01 mol/L sodium hydroxide VS to this solution: pink color develops.

(3) Volatile impurities—Pipet 500 mL of Anhydrous Ethanol, add 150 μL of 4-methylpentan-2-ol, and use this solution as the sample solution. Separately, to 100 μL of anhydrous methanol add Anhydrous Ethanol to make exactly 50 mL. Pipet 5 mL of this solution, add Anhydrous Ethanol to make exactly 50 mL, and use this solution as the standard solution (1). Separately, to 50 μL each of anhydrous methanol and acetaldehyde add Anhydrous Ethanol to make exactly 50 mL. To 100 μL of this solution add Anhydrous Ethanol to make exactly 10 mL, and use this solution as the standard solution (2). Separately, to 150 μL of acetal add Anhydrous Ethanol to make exactly 50 mL. To 100 μL of this solution add Anhydrous Ethanol to make exactly 10 mL, and use this solution as the standard solution (3). Separately, to 100 μL of benzene add Anhydrous Ethanol to make exactly 100 mL. To 100 μL of this solution add Anhydrous Ethanol to make exactly 50 mL, and use this solution as the standard solution (4). Perform the test with exactly 1 μL each of Anhydrous Ethanol, the sample solution and standard solutions (1), (2), (3) and (4) as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak areas of acetaldehyde, A_A, benzene, B_B and acetal, C_C obtained with Anhydrous Ethanol, and the peak area of methanol with the standard solution (1), the peak area of acetaldehyde, A_A with the standard solution (2), the peak area of acetal, C_C with the standard solution (3) and the peak area of benzene, B_B with the standard solution (4) by the automatic integration method: the peak area of methanol obtained with Anhydrous Ethanol is not larger than 1/2 times the peak area of methanol with the standard solution (1). When calculate the amounts of the volatile impurities by the following equation, the total amount of acetaldehyde and acetal is not more than 10 vol ppm as acetaldehyde, and the amount of benzene is not more than 2 vol ppm. The total area of the peaks other than the peak mentioned above with the sample solution is not larger than the peak area of 4-methylpentan-2-ol. For this calculation the peak having the area not more than 3% of that of 4-methylpentan-2-ol is excluded.

Total amount (vol ppm) of acetaldehyde and acetal = \((10 \times A_A)/(A_T - A_A) + (30 \times C_C \times 44.05)/(C_T - C_C) \times 118.2\)

Amount (vol ppm) of benzene = \(2B_B/(B_T - B_B)\)

If necessary, identify the peak of benzene by using a different stationary liquid phase and suitable chromatographic conditions.

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A fused silica column 0.32 mm in inside diameter and 30 m in length, coated with 6% cyanopropyl phenyl-94% dimethyl silicone polymer for gas chromatography in 1.8 μm thickness.
Column temperature: Inject at a constant temperature of about 40°C, maintain the temperature for 12 minutes, then raise to 240°C at a rate of 10°C per minute, and maintain at a constant temperature of about 240°C for 10 minutes.
Injection port temperature: 200°C.
Detector temperature: 280°C.
Carrier gas: Helium.

Flow rate: 35 cm per second.

System suitability—
System performance: When the procedure is run with 1 μL of the standard solution (2) under the above operating conditions, acetaldehyde and methanol are eluted in this order with the resolution between these peaks being not less than 1.5.

(4) Other impurities (absorbance)—Determine the absorption spectrum of Anhydrous Ethanol between 235 nm and 340 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, in a 5-cm cell using water as a blank: the absorbances at 240 nm, between 250 nm and 260 nm and between 270 nm and 340 nm are not more than 0.40, 0.30, and 0.10, respectively, and the spectrum shows a steadily descending curve with no observable peaks or shoulders.

(5) Residue on evaporation—Evaporate 100 mL of Anhydrous Ethanol, exactly measured, in a tared dish on a water bath, and dry at 105°C for 1 hour: the mass of the residue does not exceed 2.5 mg.

Containers and storage —Containers—Tight containers.
Storage—Without exposure to light.

Sheelf life In not glass containers: Unless otherwise specified, 24 months after preparation.

Ethanol for Disinfection

Alcohol for Disinfection

消毒用エタノール

Ethanol for Disinfection contains not less than 76.9 vol% and not more than 81.4 vol% (by specific gravity) of ethanol (C_H_2_O: 46.07) at 15°C.

Method of preparation

<table>
<thead>
<tr>
<th>Ethanol</th>
<th>830 mL</th>

<tbody>
<tr>
<td>Purified Water or Purified Water in Containers</td>
<td>a sufficient quantity</td>
</tr>
</tbody>
</table>

To make 1000 mL

Prepare by mixing the above ingredients.

Description Ethanol for Disinfection is a colorless, clear liquid.
It is miscible with water.
It burns with a light blue flame on ignition.
It is volatile.

Identification (1) To 1 mL of Ethanol for Disinfection add 2 mL of iodine TS and 1 mL of sodium hydroxide TS, and mix: light yellow precipitates appear.

(2) To 1 mL of Ethanol for Disinfection add 1 mL of acetic acid (100) and 3 drops of sulfuric acid, and heat: the odor of ethyl acetate is produced.

Specific gravity <2.50> d_15^2: 0.86027 – 0.87264

Purity Proceed as directed in the Purity under Ethanol, with the expection of (4), which is changed as follows.

(4) Other impurities (absorbance)—Perform the test with Ethanol for Disinfection as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbances at 240 nm, between 250 nm and 260 nm and between 270 nm and 340 nm are not more than 0.40, 0.30, and 0.10, respectively. The absorption spectrum determined in a 5-cm cell using water as a
blank shows a smooth absorption curve between 235 nm and 340 nm.

Containers and storage  Containers—Tight containers.
Storage—Light-resistant.

Ethenzamide

エテンザミド

C₈H₁₅NO₃: 165.19
2-Ethoxybenzamide
[938-73-8]

Ethenzamide, when dried, contains not less than 98.0% of ethenzamide (C₈H₁₅NO₃).

Description  Ethenzamide occurs as white, crystals or crystalline powder.
It is soluble in methanol, in ethanol (95), and in acetone, and practically insoluble in water.
It begins to sublime slightly at about 105°C.

Identification (1) Determine the absorption spectrum of a solution of Ethenzamide in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ethenzamide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.
(2) Determine the infrared absorption spectrum of Ethenzamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ethenzamide RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point 2.60 131 – 134°C

Purity (1) Chloride 1.07—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone, add 6 mL of dilute nitric acid, and dilute with water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.7 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone and 6 mL of dilute nitric acid, and dilute with water to make 50 mL (not more than 0.050%).
(2) Sulfate 1.14—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone, add 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL. Prepare the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 30 mL of acetone and 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL (not more than 0.048%).
(3) Heavy metals 1.07—Proceed with 2.0 g of Ethenzamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
(4) Arsenic 1.11—To 0.40 g of Ethenzamide add 0.3 g of potassium nitrate and 0.5 g of anhydrous sodium carbonate, mix thoroughly, ignite the mixture gradually, and cool. Dissolve the residue in 10 mL of dilute sulfuric acid, and heat the solution until white fumes begin to evolve. After cooling, add water carefully to make 5 mL, use this solution as the test solution, and perform the test (not more than 5 ppm).
(5) Salicylamide—Dissolve 0.20 g of Ethenzamide in 15 mL of diluted ethanol (95) (2 in 3), and add 2 to 3 drops of dilute iron (III) chloride TS: no purple color develops.

Loss on drying 2.47 Not more than 1.0% (1 g, silica gel, 3 hours).

Residue on ignition 2.44 Not more than 0.1% (1 g).

Assay  Weigh accurately about 20 mg each of Ethenzamide and Ethenzamide RS, previously dried, and dissolve each in 70 mL of ethanol (95) by warming, and after cooling, add ethanol (95) to make exactly 100 mL. Pipet 5 mL each of these solutions, add ethanol (95) to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Determine the absorbances, A₁ and A₂, of the sample solution and standard solution at 290 nm as directed under Ultraviolet-visible Spectrophotometry <2.25>, using ethanol (95) as the blank.
Amount (mg) of ethenzamide (C₈H₁₅NO₃) = Mₛ × A₁/A₂
Mₛ: Amount (mg) of Ethenzamide RS taken

Containers and storage  Containers—Well-closed containers.

Ether

エーテル

C₆H₁₄O: 74.12
Diethyl ether
[60-29-7]

Ether contains not less than 96% and not more than 98% (by specific gravity) of ether (C₆H₁₄O).
It contains a small quantity of ethanol and water.
It cannot be used for anesthesia.

Description  Ether is a colorless, clear, mobile liquid, having a characteristic odor.
It is miscible with ethanol (95).
It is soluble in water.
It is highly volatile and flammable.
It is slowly oxidized by the action of air and light, with the formation of peroxides.
Its vapor, when mixed with air and ignited, may explode violently.

Boiling point: 35 – 37°C

Specific gravity 2.50 d₄₂₀: 0.718 – 0.721

Purity (1) Foreign odor—Place 10 mL of Ether in an evaporating dish, and allow it to evaporate spontaneously to a volume of about 1 mL: no foreign odor is perceptible. Drop this residue onto a piece of clean, odorless filter paper to evaporate the ether: no foreign odor is perceptible.
(2) Acidity—Place 10 mL of diluted ethanol (95) (4 in 5) and 0.5 mL of phenolphthalein TS in a 50-mL glass-stoppered flask, and add 0.02 mol/L sodium hydroxide VS dropwise to produce a red color which persists after shaking for 30 seconds. Add 25 mL of Ether, stopper the flask, shake gently, and add 0.40 mL of 0.02 mol/L sodium hydroxide VS with shaking: a red color develops.
(3) Aldehyde—Place 10 mL of Ether in a Nessler tube, add 1 mL of potassium hydroxide TS, and allow the mixture
to stand for 2 hours, protecting from light, with occasional shaking: no color is produced in the ether layer and the aqueous layer.

(4) Peroxide—Place 10 mL of Ether in a Nessler tube, add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), shake for 1 minute, then add 1 mL of starch TS, and shake well: no color is produced in the ether layer and in the aqueous layer.

(5) Residue on evaporation—Evaporate 140 mL of Ether, and dry the residue at 105°C for 1 hour: the mass of the residue is not more than 1.0 mg.

Containers and storage Containers—Tight containers.

Storage—Without fill up, light-resistant, remote from fire, and not exceeding 25°C.

### Anesthetic Ether

麻酔用エーテル

C₉H₈O₂: 74.12
Diethyl ether
[60-29-7]

Anesthetic Ether contains not less than 96% and not more than 98% (by specific gravity) of ether (C₉H₈O₂).

It contains small quantities of ethanol and water. Suitable stabilizers may be added.

It is not to be used for anesthesia if it has been removed from the original container for more than 24 hours.

Description Anesthetic Ether occurs as a colorless, clear, mobile liquid, having a characteristic odor. It is miscible with ethanol (95%). It is soluble in water. It is highly volatile and flammable. It is slowly oxidized by the action of air and light, with the formation of peroxides.

Its vapor, when mixed with air and ignited, may explode violently.

Boiling point: 35 – 37°C

Specific gravity <2.56> d₄¹⁰ ≈ 0.718 – 0.721

Purity (1) Foreign odor—Place 10 mL of Anesthetic Ether in an evaporating dish, and allow it to evaporate spontaneously to a volume of about 1 mL: no foreign odor is perceptible. Drop this residue onto a piece of clean, odorless filter paper to evaporate the ether: no foreign odor is perceptible.

(2) Acidity—Place 10 mL of diluted ethanol (95) (4 in 5) and 0.5 mL of phenolphthalein TS in a 50-mL glass-stoppered flask, and add 0.02 mol/L sodium hydroxide VS dropwise to produce a red color which persists after shaking for 30 seconds. Add 25 mL of Anesthetic Ether, stopper the flask, shake gently, and add 0.40 mL of 0.02 mol/L sodium hydroxide VS with shaking: a red color develops.

(3) Aldehyde—To 100 mL of water in a 200-mL glass-stoppered flask add 10 mL of Anesthetic Ether and 1 mL of a solution of sodium hydroxide sulfite (1 in 1000), stopper tightly, shake vigorously for 10 seconds, and allow the mixture to stand in a cool place for 30 minutes, protected from light. Add 2 mL of starch TS, and add dropwise 0.01 mol/L iodine VS until a pale blue color develops. Shake with about 2 g of sodium hydrogen carbonate to decolorize the solution, and add 1 mL of diluted 0.01 mol/L iodine VS (9 in 40): a blue color develops. Keep the temperature of the solution below 18°C during the procedure.

(4) Peroxide—Place 10 mL of Anesthetic Ether in a Nessler tube, add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), shake occasionally for 1 hour, protecting from light, then add 1 mL of starch TS, and shake well: no color is produced and in the aqueous layer and in the ether layer.

(5) Residue on evaporation—Evaporate 50 mL of Anesthetic Ether, and dry the residue at 105°C for 1 hour: the mass of the residue is not more than 1.0 mg.

Containers and storage Containers—Tight containers.

Storage—Without fill up, light-resistant, remote from fire, and not exceeding 25°C.

### Ethinylestradiol

エチニルエストラジオール

C₂₉H₃₂O₆: 296.40
19-Nor-17α-pregna-1,3,5(10)-triene-20-yne-3,17-diol
[57-63-6]

Ethinylestradiol, when dried, contains not less than 98.0% of ethinylestradiol (C₂₉H₃₂O₆).

Description Ethinylestradiol occurs as white to pale yellow, crystals or crystalline powder. It is odorless.

It is freely soluble in pyridine and in tetrahydrofuran, soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 2 mg of Ethinylestradiol in 1 mL of a mixture of sulfuric acid and ethanol (95) (1:1): a purplish red color develops with a yellow-green fluorescence. Add carefully 2 mL of water to this solution: the color of the solution changes to red-purple.

(2) Transfer 0.02 g of Ethinylestradiol to a glass-stoppered test tube, dissolve in 10 mL of a solution of potassium hydroxide (1 in 20), add 0.1 g of benzoyl chloride, and shake. Collect the resulting precipitate, recrystallize from methanol, and dry in a desiccator (in vacuum, phosphorus (V) oxide): the precipitate melts 22.60 at 200°C and 202°C.

Optical rotation <2.49> [α]D → 26 – 31° (after drying, 0.1 g, pyridine, 25 mL, 100 mm).

Melting point <2.60> 180 – 186°C or 142 – 146°C

Purity Estrone—Dissolve 5 mg of Ethinylestradiol in 0.5 mL of ethanol (95), and add 0.05 g of 1,3-dinitrobenzene. Add 0.5 mL of freshly prepared dilute potassium hydroxide-ethanol TS, allow to stand in a dark place for 1 hour, and add 10 mL of ethanol (95): the solution has no more color than the following control solution.

Control solution: Proceed in the same manner as mentioned above, omitting Ethinylestradiol.

Loss on drying <2.47> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).
Residue on ignition Not more than 0.1% (0.5 g).

Assay Weigh accurately about 0.2 g of Ethinylestradiol, previously dried, and dissolve in 40 mL of tetrahydrofuran. Add 10 mL of a solution of silver nitrate (1 in 20), and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration).

Each mL of 0.1 mol/L sodium hydroxide VS = 29.64 mg of C$_{18}$H$_{22}$O$_{2}$

Containers and storage Containers—Tight containers. Storage—Light-resistant.

**Ethinylestradiol Tablets**

エチニルエストラジオール錠

Ethinylestradiol Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of ethinylestradiol (C$_{18}$H$_{22}$O$_{2}$: 296.40).

**Method of preparation** Prepare as directed under Tablets, with Ethinylestradiol.

**Identification** (1) Evaporate to dryness 5 mL of the sample solution obtained in Assay, and add 2 mL of a mixture of sulfuric acid and ethanol (95) (2:1) to the residue: a light red color with a yellow fluorescence develops. To the solution add carefully 4 mL of water: the color of the solution changes to red-purple.

(2) Evaporate to dryness 10 mL of the sample solution obtained in Assay, add 0.2 mL of acetic acid (31) and 2 mL of phosphoric acid to the residue, and heat on a water bath for 5 minutes: a red color with a yellow-green fluorescence develops.

**Uniformity of dosage units** Not more than 0.1% of the labeled amount of ethinylestradiol (0.5 g).

Containers and storage Containers—Well-closed containers.
Ethionamide

エチオナミド

C₇H₁₀N₃S: 166.24
2-Ethylpyridine-4-carbothioamide
[536-33-4]

Ethionamide, when dried, contains not less than 98.5% and not more than 101.0% of ethionamide (C₇H₁₀N₃S).

**Description** Ethionamide occurs as yellow, crystals or crystalline powder, having a characteristic odor.

It is soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (99.5) and in acetone, and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Ethionamide in methanol (3 in 160,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethionamide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 161 - 165°C

**Purity** (1) Acidity—Dissolve 3.0 g of Ethionamide in 30 mL of methanol by warming, add 90 mL of water, allow to stand in ice water for 1 hour, and filter. To 80 mL of the filtrate add 0.8 mL of cresol red TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Ethionamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1>—Prepare the test solution with 1.0 g of Ethionamide according to Method 3. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), then add 1.5 mL of hydrogen peroxide (30), and fire to burn (not more than 2 ppm).

(4) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 0.20 g of Ethionamide in 10 mL of acetone, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (1). Separately, pipet exactly 0.2 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.02>. Spot 10 µL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop with a mixture of ethyl acetate, hexane and methanol (6:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution (1), and number of the spot other than the principal spot from the sample solution which is more intense than the spot from the standard solution (2) is not more than one.

**Loss on drying** <2.4> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.4> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Ethionamide, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.5> with 0.1 mol/L perchloric acid VS until the color of the solution changes from orange-red to dark orange-brown (indicator: 2 mL of p-naphtholbenzenes TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 16.62 mg of C₇H₁₀N₃S

**Containers and storage** Containers—Well-closed containers.

---

**Ethosuximide**

エトスクシミド

C₇H₁₃NO₂: 141.17
(2RS)-2-Ethyl-2-methylsuccinimide
[77-67-8]

Ethosuximide contains not less than 98.5% of ethosuximide (C₇H₁₃NO₂), calculated on the anhydrous basis.

**Description** Ethosuximide occurs as a white, paraffin-like solid or powder. It is odorless or has a slight, characteristic odor.

It is very soluble in methanol, in ethanol (95), in diethyl ether, and in N,N-dimethylformamide, and freely soluble in water.

Melting point: about 48°C

**Identification** (1) To 0.2 g of Ethosuximide add 10 mL of sodium hydroxide TS, and boil: the gas evolved turns a moistened red litmus paper blue.

(2) Dissolve 0.05 g of Ethosuximide in 1 mL of ethanol (95), add 3 drops of a solution of copper (II) acetate monohydrate (1 in 100), warm slightly, and add 1 to 2 drops of sodium hydroxide TS: a purple color is produced.

(3) Determine the absorption spectrum of a solution of Ethosuximide in ethanol (95) (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Ethosuximide in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.0>—With 1.0 g of Ethosuximide, perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).
Ethyl Aminobenzoate

Anesthamine

Benzocaine

エチル安息香酸エチル

CH₃

C₆H₅NO₂: 165.19
Ethyl 4-aminobenzoate
[94-09-7]

Ethyl Aminobenzoate, when dried, contains not less than 99.0% of ethyl aminobenzoate (C₆H₅NO₂).

Description Ethyl Aminobenzoate occurs as white, crystals or crystalline powder. It is odorless. It has a slightly bitter taste, numbing the tongue.

It is freely soluble in ethanol (95) and in diethyl ether, and very slightly soluble in water.

It dissolves in dilute hydrochloric acid.

Identification (1) Dissolve 10 mg of Ethyl Aminobenzoate in 1 mL of dilute hydrochloric acid and 4 mL of water.

This solution responds to Qualitative Tests <1.09> for primary aromatic amines.

(2) Dissolve 0.1 g of Ethyl Aminobenzoate in 5 mL of water with the aid of dilute hydrochloric acid added dropwise, and add iodine TS dropwise: a brown precipitate is produced.

(3) Warm 50 mg of Ethyl Aminobenzoate with 2 drops of acetic acid (31) and 5 drops of sulfuric acid: the odor of ethyl acetate is perceptible.

Melting point <2.60> 89 – 91°C

Purity (1) Acidity—Dissolve 1.0 g of Ethyl Aminobenzoate in 10 mL of neutralized ethanol, and add 10 mL of water, 2 drops of phenolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide VS: a red color is produced.

(2) Chloride—Dissolve 0.20 g of Ethyl Aminobenzoate in 5 mL of ethanol (95), add 2 to 3 drops each of dilute nitric acid and of silver nitrate TS: no change occurs immediately.

(3) Heavy metals <1.07>—Dissolve 2.0 g of Ethyl Aminobenzoate in 20 mL of ethanol (95), add 2 mL of dilute acetic acid and ethanol (95) to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and sufficient ethanol (95) to make 50 mL (not more than 10 ppm).

(4) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Ethyl Aminobenzoate: the solution has no more color than Matching Fluid A.

Assay

Weigh accurately about 0.2 g of Ethosuximide, dissolve in 20 mL of N,N-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 14.12 mg of C₆H₈NO₂.

Containers and storage Containers—Tight containers.

Ethylcellulose

エチルセルロース

[9004-57-3]

This monograph is harmonized with the European Pharmacopoeia and the U. S. Pharmacopoeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (●), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◇).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopoeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Ethylcellulose is a partly O-ethylated cellulose. It contains not less than 44.0% and not more than 51.0% of ethoxy group (-OC₃H₇: 45.06), calculated on...
the dried basis.

It may contain a suitable antioxidant.

The viscosity of Ethylcellulose is shown in millipascal second (mPa·s) on the label.

**Description** Ethylcellulose occurs as a white to yellowish white, amorphous powder or grains.

It is soluble in dichloromethane.

It forms a slightly white-turbid or white-turbid, viscous liquid upon addition of ethanol (95).

To 1 g of Ethylcellulose add 100 mL of hot water, shake to become turbid, cool to room temperature, and add freshly boiled and cooled water to make 100 mL: the solution is neutral.

**Identification** Spread 2 drops of a solution of Ethylcellulose in dichloromethane (1 in 25) between sodium chloride plates, then remove one of the plates to evaporate the solvent, and determine the infrared absorption spectrum of the plate as directed in the film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the reference spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Viscosity** <2.53> Weigh exactly a quantity of Ethylcellulose, equivalent to 5.00 g calculated on the dried basis, add 95 g of a mixture of 80 g of toluene and 20 g of ethanol (95), and shake to dissolve. Perform the test with this solution at 25°C as directed in Method I: not less than 80.0% and not more than 120.0% of the labeled viscosity for a nominal viscosity of 6 mPa·s, and not less than 75.0% and not more than 140.0% of the labeled viscosity for a nominal viscosity not more than 6 mPa·s.

**Purity** (1) Acidity or alkalinity—To 0.5 g of Ethylcellulose add 25 mL of freshly boiled and cooled water, shake for 15 minutes, filter through a glass filter (G3), and use the filtrate as the sample solution. To 10 mL of the sample solution add 0.001 mL of dilute phenolphthalein TS and 0.005 mL of 0.01 mol/L sodium hydroxide VS: a light red color develops. To 10 mL of the sample solution add 0.001 mL of methyl red solution and 0.005 mL of 0.01 mol/L hydrochloric acid VS: a red color develops.

(2) Chloride—Disperse 0.250 g of Ethylcellulose in 50 mL of water, and boil with occasional shaking. Allow to cool, and filter. Discard the first 10 mL of the filtrate, to 10 mL of the subsequent filtrate add water to make 15 mL, and use this solution as the sample solution. Separately, to 10 mL of Standard Chloride Solution add 5 mL of water, and use this solution as the control solution. To 15 mL each of the sample solution and control solution add 1 mL of 2 mol/L nitric acid TS, transfer to test tubes containing 1 mL of a solution of silver nitrate (17 in 1000), allow to stand for 5 minutes. After cooling, add water to make 25 mL, and compare the color of the solutions: the sample solution is not more intensely colored than the control solution (not more than 10 mg).

Amount (%) of chlorides in the sample solution

\[
\text{Amount} = \frac{M_1 \times z}{M_2} \times \frac{Q_1}{Q_2} \times 28.89
\]

\[
M_1: \text{Amount (mg) of Ethylcellulose taken, calculated on the dried basis}
\]

\[
M_2: \text{Amount (mg) of iodoethane for assay taken}
\]

\[
Q_1, Q_2: \text{Amount of the peak area of iodoethane to that of the internal standard}
\]

\[
\text{Internal standard solution—A solution of 0.1\% of iodoethane in} \quad \text{Chromatography}<2.02\text{ according to the following conditions, and calculate the ratios, } Q_1 \text{ and } Q_2, \text{ of the peak area of iodoethane to that of the internal standard.}
\]

\[

\]

**Residue on Ignition** <2.44> Not more than 0.5% (1 g).

**Assay** Weigh accurately about 30 mg of Ethylcellulose, transfer to a 5-mL pressure-tight serum vial, add exactly 60 mg of adipic acid, 2 mL of the internal standard solution and 1 mL of hydroiodic acid, seal the vial immediately with a septum coated with fluororesin and an aluminum cap or any other sealing system providing a sufficient air-tightness, and weigh accurately the vial. Take care not to mix the contents in the vial before heating. Place the vial in an oven or heat in a suitable heater with continuous stirring, maintaining an internal temperature of about 115 ± 2°C for 70 min. Allow to cool, and weigh accurately the vial. If the difference of the mass between before heating and after heating is more than 10 mg, prepare a new sample solution. If the difference of the mass between before heating and after heating is not more than 10 mg, after phase separation, pierce through the septum of the vial with a cooled syringe, and withdraw a sufficient volume of the upper phase as the sample solution. Separately, place exactly 60 mg of adipic acid, 2 mL of the internal standard solution and 1 mL of hydroiodic acid in another serum vial, and seal immediately. Weigh accurately the vial, inject 25 μL of iodoethane for assay through the septum in the vial, and weigh again accurately. Shake thoroughly, after phase separation, pierce through the septum of the vial with a cooled syringe, withdraw a sufficient volume of the upper phase, and use this solution as the standard solution. Perform the test with 1 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of iodoethane to that of the internal standard.

Detector: A hydrogen flame-ionization detector.

Column: A fused silica column 0.5 mm in inside diameter and 30 m in length, coated with dimethylpolysiloxane for gas chromatography in 3 μm thickness.

Column temperature: Maintain the temperature at 50°C for 3 minutes, raise to 100°C at a rate of 10°C per minute, then to 250°C at a rate of 35°C per minute, and maintain at 250°C for 8 minutes.

Injection port temperature: A constant temperature of about 250°C.

Detector temperature: A constant temperature of about 280°C.
Ethyl L-Cysteine Hydrochloride

C₄H₁₅NO₅S.HCl: 185.67
Ethyl (2R)-2-amino-3-sulfanylpropanoate monohydrochloride
[868-59-7]

Ethyl L-Cysteine Hydrochloride, when dried, contains not less than 98.5% of ethyl cysteine hydrochloride (C₄H₁₅NO₅S.HCl).

Description Ethyl L-Cysteine Hydrochloride occurs as white, crystals or crystalline powder. It has a characteristic odor, and has a bitter taste at first with a burning aftertaste. It is very soluble in water, and freely soluble in ethanol (95).

Melting point: about 126°C (with decomposition).

Identification (1) Determine the infrared absorption spectrum of Ethyl L-Cysteine Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelength numbers.

(2) A solution of Ethyl L-Cysteine Hydrochloride (1 in 20) responds to Qualitative Tests (1.09) (1) for chloride.

Optical rotation (2.49) [α]₂₅°: −10.0° to −13.0° (after drying, 2.0 g, 1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

Purity (1) Sulfate (1.14)—Perform the test with 0.6 g of Ethyl L-Cysteine Hydrochloride. Prepare the solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(2) Heavy metals (1.07)—Proceed with 1.0 g of Ethyl L-Cysteine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure rapidly. Dissolve 0.05 g each of Ethyl L-Cysteine Hydrochloride and N-ethylmaleimide in 5 mL of mobile phase, allow to stand for 30 minutes, and use this solution as the sample solution.

Pipet 3 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 2 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of these solutions by the automatic integration method; a peak area obtained from the sample solution with the relative retention time to ethyl L-cysteine-N-ethylmaleimide complex from the standard solution being about 0.7 is not larger than the peak area of ethyl L-cysteine-N-ethylmaleimide complex from the standard solution. Each area of all peaks other than ethyl L-cysteine-N-ethylmaleimide complex and N-ethylmaleimide from the sample solution is not larger than 1/3 times the peak area of ethyl L-cysteine N-ethylmaleimide complex from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column about 6 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogenphosphate TS and acetonitrile (2:1).

Flow rate: Adjust so that the retention time of ethyl L-cysteine-N-ethylmaleimide complex is about 4 minutes.

Selection of column: Dissolve 0.05 g of Ethyl L-Cysteine Hydrochloride, 0.01 g of L-cysteine hydrochloride and 0.05 g of N-ethylmaleimide in 25 mL of the mobile phase, and allow to stand for 30 minutes. Proceed with 2 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of L-cysteine-N-ethylmaleimide complex, ethyl L-cysteine-N-ethylmaleimide complex and N-ethylmaleimide in this order, complete resolution of each component, and the resolution of the peaks of L-cysteine-N-ethylmaleimide complex and ethyl L-cysteine-N-ethylmaleimide complex being not less than 3.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of ethyl L-cysteine-N-ethylmaleimide complex obtained from 2 μL of the standard solution is between 10 mm and 20 mm.

Time span of measurement: About 3 times as long as the retention time of ethyl L-cysteine-N-ethylmaleimide complex.

Loss on drying (2.41) Not more than 0.5% (1 g, in vacuum, phosphorus oxide (V), 5 hours).

Residue on ignition (2.44) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Ethyl L-Cysteine Hydrochloride, previously dried, transfer into a glass-stoppered flask, and dissolve in 10 mL of water previously freshly boiled and cooled to a temperature not exceeding 5°C in a stream of nitrogen. Add exactly 20 mL of 0.05 mol/L iodine VS, previously cooled to a temperature not exceeding 5°C, and allow to stand for 30 seconds, then titrate (2.50) with 0.1 mol/L sodium thiosulfate VS, on cooling below 5°C (indicator: 1 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 18.57 mg of C₄H₁₅NO₅S.HCl

Containers and storage Containers—Well-closed containers.
Ethylenediamine

エチレンジアミン

C₂H₄N₂: 60.10
Ethane-1,2-diamine
[107-15-3]

Ethylenediamine contains not less than 97.0% of ethylenediamine (C₂H₄N₂).

**Description** Ethylenediamine is a clear, colorless to pale yellow liquid. It has an ammonia-like odor.

- It is miscible with water, with ethanol (95%) and with diethyl ether.
- It has a caustic nature and an irritating property.
- It is gradually affected by air.

**Specific gravity** $d_{20}^{20}$ about 0.898

**Identification** (1) A solution of Ethylenediamine (1 in 500) is alkaline.

(2) To 2 mL of copper (II) sulfate TS add 2 drops of Ethylenediamine: a blue-purple color develops.

(3) To 0.04 g of Ethylenediamine add 6 drops of benzoyl chloride and 2 mL of a solution of sodium hydroxide (1 in 10), warm for 2 to 3 minutes with occasional shaking, collect the white precipitate formed, and wash with water. Dissolve the precipitate in 8 mL of ethanol (95%) by warming, promptly add 8 mL of water, cool, filter the crystals, wash with water, and dry at 105°C for 1 hour: it melts $<2.60$ between 247°C and 251°C.

**Purity** (1) Heavy metals $<1.07$—Place 1.0 g of Ethylenediamine in a porcelain crucible, evaporate to dryness on a water bath, cover loosely, ignite at a low temperature until charred, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Residue on evaporation—Pipet 5 mL of Ethylenediamine, heat on a water bath to dryness, and dry to constant mass at 105°C: the mass of the residue does not exceed 3.0 mg.

**Distilling range** $<2.57$ 114 – 119°C, not less than 95 vol%.

**Assay** Weigh accurately about 0.7 g of Ethylenediamine in a glass-stoppered conical flask, add 50 mL of water, and titrate $<2.50$ with 1 mol/L hydrochloric acid VS (indicator: 3 drops of bromophenol blue TS).

Each mL of 1 mol/L hydrochloric acid VS = 30.05 mg of C₂H₄N₂

**Containers and storage** Containers—Tight containers. Storage—Light-resistant, and almost well-filled.

Ethyl Icosapentate

イコサペント酸エチル

C₂₂H₃₄O₂: 330.50
Ethyl (5Z,8Z,11Z,14Z,17Z)-icos-5,8,11,14,17-pentaenioate
[86227-47-6]

Ethyl Icosapentate contains not less than 96.5% and not more than 101.0% of ethylicosapentate (C₂₂H₃₄O₂).

It may contain a suitable antioxidant.

**Description** Icosapentate is a colorless or pale yellow, clear liquid. It has a faint, characteristic odor.

It is miscible with ethanol (99.5), with acetic acid (100) and with hexane. It is practically insoluble in water and in ethyleneglycol.

**Identification** (1) To 20 mg of Ethyl Icosapentate add 3 mL of a solution of potassium hydroxide in ethylene glycol (21 in 100), stopper tightly while passing a current of nitrogen, and heat at 180°C for 15 minutes. After cooling, add methanol to make 100 mL. To 4 mL of this solution add methanol to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, using a solution, prepared in the same manner as the sample solution with 3 mL of the solution of potassium hydroxide in ethylene glycol (21 in 100), as a control, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ethyl Icosapentate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethyl Icosapentate as directed in the liquid film method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum or the spectrum of Ethyl Icosapentate RS: both spectra exhibit similar intensities of absorption at the same wave lengths.

**Refractive index** $<2.45>$ $n_2^0$: 1.481 – 1.491

**Specific gravity** $<2.50> d_2^0$: 0.905 – 0.915

**Acid value** $<1.13>$ Not more than 0.5.

**Saponification value** $<1.13>$ 165 – 175

**Iodine value** $<1.13>$ 365 – 395 Perform the test with 20 mg of Ethyl Icosapentate.

**Purity** (1) Heavy metals $<1.07>$—Mix 1.0 g of Ethyl Icosapentate with ethanol (99.5), and add 2 mL of dilute acetic acid and ethanol (99.5) to make 50 mL. Perform the test with this solution as the test solution.

Control solution: To 1.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and ethanol (99.5) to make 50 mL (not more than 10 ppm).

(2) Arsenic $<1.17>$—Prepare the test solution with 1.0 g of Ethyl Icosapentate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—To 0.40 g of Ethyl Icosapentate add hexane to make 50 mL, and use this solution as the sample solution. Perform the test with 1.5 μL of the sample solu-
tion as directed under Gas Chromatography ≤ 2.02% according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of these peaks by the area percentage method: the amount of the peak, having the relative retention time of about 0.53 to ethyl icosapentate, is not more than 0.5%, the amount of each peak, having the relative retention time of about 0.80 and 0.93, is not more than 1.0%, the amount of each peak other than the principal peak and the peak mentioned above is not more than 1.0%, and the total amount of these peaks other than the principal peak is not more than 3.5%.

Operating conditions—

Detector, column, column temperature, carrier gas and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of ethyl icosapentate, beginning after the solvent peak.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To exactly 1 mL of the sample solution add hexane to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add hexane to make exactly 10 mL. Confirm that the peak area of ethyl icosapentate obtained with 1.5 μL of this solution is equivalent to 7 to 13% of that with 1.5 μL of the solution for system suitability test.

System repeatability: When the test is repeated 6 times with 1.5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ethyl icosapentate is not more than 2.0%.

(4) Peroxide—Weigh accurately about 1 g of Ethyl Icosapentate, put in a 200-mL glass-stoppered conical flask, add 25 mL of a mixture of acetic acid (100) and chloroform (3:2), and dissolve by gentle shaking. Add 1 mL of saturated potassium iodide solution TS, immediately stopper tightly, shake gently, and allow to stand in a dark place for 10 minutes. Then add 30 mL of water, shake vigorously for 5 to 10 seconds, and titrate <2.30> with 0.01 mol/L sodium thiosulfate VS until the blue color of the solution disappears after addition of 1 mL of starch TS. Calculate the amount of peroxide by the following equation: not more than 2 mEq/kg.

Amount (mEq/kg) of peroxide = \( V / M \times 10 \)

\( V \): Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed

\( M \): Amount (g) of Ethyl Icosapentate taken

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Ethyl Icosapentate, and add hexane to make exactly 50 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 80 mg of Ethyl Icosapentate RS, and add hexane to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 3 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios, \( Q_s \) and \( Q_e \), of the peak area of ethyl icosapentate to that of the internal standard.

\[
\text{Amount (mg) of ethyl icosapentate (C}_{22}\text{H}_{34}\text{O}_{2}) = M_s \times Q_e/Q_s \times 5
\]

\( M_s \): Amount (mg) of Ethyl Icosapentate RS taken

Internal standard solution—A solution of methyl docosanate in hexane (1% in 125).

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A glass column in 4 mm inside diameter and 1.8 m in length, packed with siliceous earth for gas chromatography (175 to 246 μm in particle diameter), coated with diethylene glycol succinate polyester for gas chromatography in the ratio of 25%.

Column temperature: A constant temperature of about 190°C.

Carrier gas: Nitrogen.

Flow rate: Adjust so that the retention time of ethyl icosapentate is about 30 minutes.

System suitability—

System performance: When the procedure is run with 3 μL of the standard solution under the above operating conditions, the internal standard and ethyl icosapentate are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl icosapentate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Being fully filled, or replacing the air with Nitrogen.

Ethyl Icosapentate Capsules

イコサペント酸エチルカプセル

Ethyl Icosapentate Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of ethyl icosapentate (C22H34O2): 330.50.

Method of preparation Prepare as directed under Capsules, with Ethyl Icosapentate.

Identification Take out the content of Ethyl Icosapentate Capsules, to a quantity of the contents, equivalent to 20 mg of Ethyl Icosapentate, add 3 mL of a solution of potassium hydroxide ethylene glycol (21 in 100), stopper the vessel tightly while passing a current of nitrogen, and heat at 180°C for 15 minutes. After cooling, add methanol to make 100 mL. To 1 mL of this solution add methanol to make 25 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.20> using a solution, obtained by proceeding as above with 3 mL of a solution of potassium hydroxide in ethylene glycol (21 in 100), as a blank: it exhibits maxima between 298 nm and 302 nm, between 311 nm and 315 nm, between 325 nm and 329 nm, and between 343 nm and 347 nm.

Purity Peroxide—Take out the content of Ethyl Icosapentate Capsules. Weigh accurately about 1 g of the content, dissolve in 25 mL of a mixture of acetic acid (100) and isoc-tane (3:2), replace the air of the inside gently with Nitrogen, then add 1 mL of saturated potassium iodide TS under a current of Nitrogen, stopper immediately and shake gently, and allow to stand in a dark place for 10 minutes. Then, add...
30 mL of water, shake vigorously, and titrate \( \leq 2.50 \) with 0.01 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction. The amount of peroxide calculated by the following formula is not more than 20 mEq/kg.

\[
\text{Amount (mEq/kg) of peroxide} = \frac{V}{M} \times 10
\]

\( V \): Amount (mL) of 0.01 mol/L sodium thiosulfate VS consumed

\( M \): Amount (g) of Ethyl Icosapentate Capsules taken

Uniformity of dosage units <6.02> It meets the requirements of the Mass variation test.

Disintegration <6.09> Perform the test using the disk: it meets the requirements. However, for the preparations in single-dose packages, carry out the test for 10 minutes.

Assay Weigh accurately the mass of an amount of not less than 20 Ethyl Icosapentate Capsules, then open the capsules and take out the contents. Wash the empty capsules with a little amount of hexane, volatilize the hexane by allowing them to stand at the room temperature, and weigh the mass of the total empty capsules accurately. Weigh accurately a portion of the content, equivalent to about 0.4 g of ethyl icosapentate (C\(_{22}\)H\(_{34}\)O\(_2\)), add exactly 40 mL of the internal standard solution, then add hexane to make 200 mL, and use this solution as the sample solution. For the preparations in single-dose packages, weigh accurately the mass of the total capsules of not less than 20 packages, and mix them well. Weigh accurately a portion of the capsules, equivalent to about 0.4 g of ethyl icosapentate (C\(_{22}\)H\(_{34}\)O\(_2\)), add 15 mL of hexane, then extract the content by opening the capsules. Separate the hexane extract from the residual solids, wash the residues with three 10-mL portions of hexane, combine the washings and the hexane extract, add exactly 40 mL of the internal standard solution, then add hexane to make 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Ethyl Icosapentate RS, add exactly 5 mL of the internal standard solution, then add hexane to make 25 mL, and use this solution as the standard solution. Perform the test with 4 \( \mu \)L each of the sample solution and standard solution as directed under ultraviolet-visible spectrophotometry <2.24>, and compare the spectrum with the reference spectrum or the spectrum of a solution of Ethyl Loflazepate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethyl Loflazepate, previously dried, as directed in the potassium bromide disk method under infrared spectrophotometry <2.25>, and compare the spectrum with the reference spectrum or the spectrum of dried Ethyl Loflazepate RS: both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) Soluble halides—To 1.0 g of Ethyl Loflazepate add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Discard the first 10 mL of the filtrate, transfer 25 mL of the subsequent filtrate to a Nessler tube, add 6 mL of dilute nitric acid and water to make 50 mL, and use this solution as the test solution. Proceed as directed under Chloride Limit Test <1.07>. Prepare the control solution as follows: to 0.20 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Ethyl Loflazepate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.10>—Prepare the test solution with 1.0 g of Ethyl Loflazepate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 20 mg of Ethyl Loflazepate in 20 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solu-
tion, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine each peak area by the automatic integration method: the peak area of the related substance A, having the relative retention time of about 1.15 to ethyl loflazepate, obtained from the sample solution is not larger than 1/5 times the peak area of ethyl loflazepate from the standard solution, the peak area of the related substance B, having the relative retention time of about 1.38, from the sample solution is not larger than 7/10 times the peak area of ethyl loflazepate from the standard solution, and the area of the peak other than ethyl loflazepate and the peaks mentioned above from the sample solution is not larger than 1/10 times the peak area of ethyl loflazepate from the standard solution. Furthermore, the total area of the peaks other than ethyl loflazepate from the sample solution is not larger than the peak area of ethyl loflazepate from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 3.9 g of sodium dihydrogen phosphate dihydrate in water to make 1000 mL, and adjust to pH 6.0 with a solution prepared by dissolving 9.0 g of disodium hydrogen phosphate dodecahydrate in water to make 1000 mL. To 500 mL of this solution add 500 mL of acetonitrile for liquid chromatography.
Flow rate: Adjust so that the retention time of ethyl loflazepate is about 10 minutes.
Time span of measurement: About 3 times as long as the retention time of ethyl loflazepate.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of ethyl loflazepate obtained with 5 μL of this solution is equivalent to 4 to 6% of that with 5 μL of the standard solution.
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ethyl loflazepate are not less than 2500 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ethyl loflazepate is not more than 2.0%.

Loss on drying 2.41 Not more than 0.2% (0.2 g, 105°C, 3 hours).
Residue on ignition 2.44 Not more than 0.1% (0.5 g, platinum crucible).
Assay Weigh accurately about 10 mg each of Ethyl Loflazepate and Ethyl Loflazepate RS, both previously dried, add the internal standard solution to dissolve to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, Q₁ and Q₃, of the peak area of ethyl loflazepate to that of the internal standard.

Amount (mg) of ethyl loflazepate (C₁₈H₁₄ClFN₃O₃)

\[ M_S = \frac{Q_1}{Q_3} \]

Amount (mg) of Ethyl Loflazepate RS taken

Internal standard solution—A solution of methyl parahydroxybenzoate in acetonitrile for liquid chromatography (1 in 3000).
Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 229 nm).
Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water, acetonitrile for liquid chromatography and ethanol (95) (2:1:1).
Flow rate: Adjust so that the retention time of ethyl loflazepate is about 13 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ethyl loflazepate are eluted in this order with the resolution between these peaks being not less than 6.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl loflazepate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Others
Related substance A:
Ethyl 7-chloro-2-oxo-5-phenyl-2,3-dihydro-1H-1,4-benzodiazepine-3-carboxylate

Related substance B:
Propyl 7-chloro-5-(2-fluorophenyl)-2-oxo-2,3-dihydro-1H-1,4-benzodiazepine-3-carboxylate
Ethyl Loflazepate Tablets

Ethyl Loflazepate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃; 360.77).

Method of preparation
Prepare as directed under Tablets, with Ethyl Loflazepate.

Identification
To a quantity of powdered Ethyl Loflazepate Tablets, equivalent to 1 mg of Ethyl Loflazepate, add 10 mL of acetonitrile, shake for 15 minutes, and centrifuge. To 1 mL of the supernatant liquid add acetonitrile to make 10 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.2.32); it exhibits a maximum between 227 nm and 231 nm.

Uniformity of dosage units (6.02)
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ethyl Loflazepate Tablets add exactly 0.5 mL of water, sonicate to disintegrate the tablet, add exactly 10 mL of the internal standard solution, shake for 20 minutes, and centrifuge. Pipet V mL of the supernatant liquid, add water so that each mL contains 48 μL of water, and add the internal standard solution to make exactly V’ mL so that each mL contains about 95 μg of Ethyl Loflazepate (C₁₈H₁₈ClFN₂O₃), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃) = Mₛ × Q₁/Qₛ × V’/V × 1/10

Mₛ: Amount (mg) of Ethyl Loflazepate RS taken

Internal standard solution—A solution of methyl parahydroxybenzoate in acetonitrile for liquid chromatography (1 in 3000).

Dissolution (6.10)
When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Ethyl Loflazepate Tablets is not less than 80%.

Start the test with 1 tablet of Ethyl Loflazepate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 1.1 μg of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Ethyl Loflazepate RS, previously dried at 105°C for 3 hours, and dissolve in ethanol (95) to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.2.32) according to the following conditions, and determine the peak areas, Aₛ and Aₛ, of ethyl loflazepate in each solution.

Dissolution rate (%) with respect to the labeled amount of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃) = Mₛ × Aₛ/Aₛ × V’/V × 1/C × 9/2

Mₛ: Amount (mg) of Ethyl Loflazepate RS taken

C: Labeled amount (mg) of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃) in 1 tablet

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 230 nm).
Column: A stainless steel column 4.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water, acetonitrile and ethanol (99.5) (2:1:1).
Flow rate: Adjust so that the retention time of ethyl loflazepate is about 7 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ethyl loflazepate are not less than 1500 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ethyl loflazepate is not more than 3.0%.

Assay
Weigh accurately the mass of not less than 20 tablets of Ethyl Loflazepate Tablets, and weigh accurately about 22 mg of Ethyl Loflazepate Tablets, previously dried at 105°C for 3 hours, and add the internal standard solution to make exactly 100 mL. To 10 mL of this solution add 0.5 mL of water, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.2.32) according to the following conditions, and calculate the ratios, Qₛ and Qₛ, of the peak area of ethyl loflazepate to that of the internal standard.

Amount (mg) of ethyl loflazepate (C₁₈H₁₈ClFN₂O₃) = Mₛ × Qₛ/Qₛ × 1/10

Mₛ: Amount (mg) of Ethyl Loflazepate RS taken

Internal standard solution—A solution of methyl parahydroxybenzoate in acetonitrile for liquid chromatography (1 in 3000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 229 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water, acetonitrile for liquid chromatography and ethanol (95) (2:1:1).
Flow rate: Adjust so that the retention time of ethyl loflazepate is about 13 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ethyl loflazepate are eluted in this order with the resolution between these peaks being not less than 6.
System repeatability: When the test is repeated 6 times.
with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl loflazepate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

**Ethylmorphine Hydrochloride Hydrate**

Ethylmorphine Hydrochloride Hydrate contains not less than 98.0% of ethylmorphine hydrochloride \((C_{19}H_{22}N_2O_2.HCl): 349.85\), calculated on the anhydrous basis.

**Description** Ethylmorphine Hydrochloride Hydrate occurs as white to pale yellow, crystals or crystalline powder.

It is very soluble in methanol and in acetic acid (100), freely soluble in water, soluble in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is affected by light.

**Melting point**: about 123°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Ethylmorphine Hydrochloride Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \((2.24)\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethylmorphine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \((2.25)\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Ethylmorphine Hydrochloride Hydrate (1 in 50) responds to Qualitative Tests \((1.09)\) (2) for chloride.

**Optical rotation** \((2.49)\) \([\alpha]_D^{20} = -103 - 106^\circ (0.4 g \text{ calculated on the anhydrous basis, water, 20 mL, 100 mm})\).

**pH** \((2.54)\) Dissolve 0.10 g of Ethylmorphine Hydrochloride Hydrate in 10 mL of water: the pH of this solution is between 4.0 and 6.0.

**Purity** Related substances—Dissolve 0.20 g of Ethylmorphine Hydrochloride Hydrate in 10 mL of diluted ethanol (1 in 2), and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add diluted ethanol (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \((2.05)\). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Water** \((2.48)\) 8.0 – 10.0% (0.25 g, volumetric titration, direct titration).

**Residue on ignition** \((2.44)\) Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.5 g of Ethylmorphine Hydrochloride Hydrate, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7.3), and titrate \((2.50)\) with 0.1 mol/L perchloric acid VS (potentiometric titration).

Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

\[\text{mL} \times 34.99 \text{mg} = \text{mg}\]

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

**Ethyl Parahydroxybenzoate**

Ethyl 4-hydroxybenzoate \([120-47-8]\)

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The parts of the text that are not harmonized are marked with symbols (◆).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Ethyl Parahydroxybenzoate contains not less than 98.0% and not more than 102.0% of ethyl parahydroxybenzoate \((C_{19}H_{10}O_3)\).

**Description** Ethyl Parahydroxybenzoate occurs as colorless crystals or a white crystalline powder.

It is freely soluble in methanol, in ethanol (95) and in acetone, and very slightly soluble in water.

**Identification** Determine the infrared absorption spectrum of Ethyl Parahydroxybenzoate as directed in the potassium bromide disk method under Infrared Spectrophotometry \((2.25)\), and compare the spectrum with the Reference Spectrum or the spectrum of Ethyl Parahydroxybenzoate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** \((2.60)\) 115 – 118°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Ethyl Parahydroxybenzoate in ethanol (95) to make 10 mL: the solution is clear and not more intensely colored than
Etidronate Disodium

**Assay**
Weigh accurately about 50.0 mg each of Ethyl Parahydroxybenzoate and Ethyl Parahydroxybenzoate RS, dissolve separately in 2.5 mL each of methanol, and add the mobile phase to make exactly 50 mL. Pipet 10 mL each of these solutions, add the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and Aₙ, of ethyl parahydroxybenzoate in each solution.

\[
M_g = 
\frac{M_g}{A_1 \div A_n}
\]

**Residue on ignition** 2.44 Not more than 0.1% (1 g).

**Containers and storage**
Containers—Well-closed containers.

**Etidronate Disodium**

エチドロン酸二ナトリウム

\[
\text{C}_7\text{H}_4\text{Na}_2\text{O}_7\text{P}_2 = 249.99
\]

Disodium dihydrogen 1-hydroxyethane-1,1-diyldiphosphonate [7444-83-7]

Etidronate Disodium, when dried, contains not less than 98.0% and not more than 101.0% of etidronate disodium (C₇H₄Na₂O₇P₂).

**Description**
Etidronate Disodium occurs as a white powder.

It is freely soluble in water, and practically insoluble in the following control solution.

Control solution: To 5.0 mL of Cobalt (II) Chloride CS, 12.0 mL of Iron (III) Chloride CS and 2.0 mL of Copper (II) Sulfate CS add diluted dilute hydrochloric acid (1 in 10) to make 1000 mL.

(2) Acidity—To 2 mL of the solution of Ethyl Parahydroxybenzoate obtained in (1) add 3 mL of ethanol (95), add 5 mL of freshly boiled and cooled water and 0.1 mL of bromocresol green-sodium hydroxide-ethanol TS, then add 0.1 mol/L sodium hydroxide VS until the solution shows a blue color: the volume of 0.1 mol/L sodium hydroxide VS used does not exceed 0.1 mL.

(3) Heavy metals <1.07>—Dissolve 1.0 g of Ethyl Parahydroxybenzoate in 25 mL of acetic acid, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 25 mL of acetic acid, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm).•

(4) Related substances—Dissolve 50.0 mg of Ethyl Parahydroxybenzoate in 2.5 mL of methanol, and add the mobile phase to make exactly 50 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of parahydroxybenzoic acid having a relative retention time of about 0.5 to ethyl parahydroxybenzoate obtained from the sample solution is not larger than the peak area of ethyl parahydroxybenzoate from the standard solution (0.5%). For the peak area of parahydroxybenzoic acid, multiply its correction factor, 1.4. Furthermore, the area of the peak other than ethyl parahydroxybenzoate and parahydroxybenzoic acid from the sample solution is not larger than the peak area of ethyl parahydroxybenzoate from the standard solution (0.5%), and the total area of the peaks other than ethyl parahydroxybenzoate is not larger than 2 times the peak area of ethyl parahydroxybenzoate from the standard solution (1.0%). For this calculation the peak area not larger than 1/5 times the peak area of ethyl parahydroxybenzoate from the standard solution is excluded (0.1%).

**System performance:**
Proceed as directed in the system suitability in the Assay.

Time span of measurement: About 4 times as long as the retention time of ethyl parahydroxybenzoate.

**System suitability**—
System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of ethyl parahydroxybenzoate obtained with 10 μL of this solution is equivalent to 14 to 26% of that with 10 μL of the standard solution.♦

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ethyl parahydroxybenzoate is not more than 2.0%.◆

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of methanol and potassium dihydrogen phosphate solution (17 in 2500) (13:7).

Flow rate: 1.3 mL per minute.

**System suitability**—
System performance: Dissolve 5 mg each of Ethyl Parahydroxybenzoate, methyl parahydroxybenzoate and parahydroxybenzoic acid in the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, and add the mobile phase to make exactly 10 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, parahydroxybenzoic acid, methyl parahydroxybenzoate and ethyl parahydroxybenzoate are eluted in this order, the relative retention times of parahydroxybenzoic acid and methyl parahydroxybenzoate to ethyl parahydroxybenzoate are about 0.5 and about 0.8, respectively, and the resolution between the peaks of methyl parahydroxybenzoate and ethyl parahydroxybenzoate is not less than 2.0.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ethyl parahydroxybenzoate is not more than 0.85%.

**Containers and storage**
Containers—Well-closed containers.◆
ethanol (99.5). The pH of a solution prepared by dissolving 0.10 g of Etidronate Disodium in 10 mL of water is between 4.4 and 5.4. It is hygroscopic.

**Identification**

1. To 5 mL of a solution of Etidronate Disodium (1 in 100) add 1 mL of copper (II) sulfate TS, and mix for 10 minutes: a blue precipitate is formed.

2. Determine the infrared absorption spectrum of Etidronate Disodium, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

3. A solution of Etidronate Disodium (1 in 100) corresponds to Qualitative Tests <1.09> for sodium salt.

**Purity**

Heavy metals <1.07>—Proceed with 1.0 g of Etidronate Disodium according to Method 4, and perform the test using the supernatant liquid obtained by centrifuging after addition of 2 mL of dilute acetic acid. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Phosphite—Weigh accurately about 3.5 g of Etidronate Disodium, dissolve in 100 mL of 0.1 mol/L sodium dihydrogen phosphate TS adjusted the pH to 8.0 with sodium hydroxide TS, add exactly 20 mL of 0.05 mol/L iodine VS, and immediately stopper tightly. Allow to stand in a dark place for 30 minutes, add 1 mL of acetic acid (100), and titrate <2.50> the excess of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner. The amount of phosphite (NaH₂PO₃) is not more than 1.0%.

Each mL of 0.05 mol/L iodine VS = 5.199 mg of NaH₂PO₃

Methanol—Weigh accurately about 0.5 g of Etidronate Disodium, dissolve in water to make exactly 5 mL, and use this solution as the sample solution. Separately, pipet 1 mL of methanol, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 1 μL of each of the sample solution and standard solution as directed under Gas Chromatography (2.02) according to the following conditions, and determine the peak areas, A₁ and A₅, of methanol in each solution and determine the amount of methanol (CH₂O) by the following equation: not more than 0.1%.

\[
\text{Amount (％) of methanol (CH}_2\text{O)} = \frac{1}{M} \times \frac{A_1}{A_5} \times 1 / 20 \times 0.79
\]

\[M: \text{Amount (g) of Etidronate Disodium taken 0.79: Density (g/mL) of methanol}\]

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 2 m in length, packed with porous copolymer beads for gas chromatography (180 – 250 μm in particle diameter).

Column temperature: A constant temperature of about 130°C.

Carrier gas: Nitrogen.

Flow rate: Adjust so that the retention time of methanol is about 2 minutes.

**System suitability**—

System performance: To 1 mL of methanol and 1 mL of ethanol (99.5) add water to make 100 mL. To 1 mL of this solution add water to make 100 mL. When the procedure is run with 1 μL of this solution under the above operating conditions, methanol and ethanol are eluted in this order with the resolution between these peaks not being less than 2.0.

System repeatability: When the test is repeated 6 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of methanol is not more than 5.0%.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, 210°C, 2 hours).

**Assay**

Weigh accurately about 0.5 g of Etidronate Disodium, previously dried, and dissolve in water to make exactly 50 mL. Transfer exactly 15 mL of this solution to a chromatographic column of 10 mm in internal diameter containing 5 mL of strongly acidic ion exchange resin for column chromatography (H type), allow to flow at a flow rate of about 1.5 mL per minute, and wash the column with two 25-mL portions of water. Combine the eluate and the washings, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 12.30 mg of C₂H₆Na₂O₅P₂

**Containers and storage**

Containers—Tight containers.

**Etidronate Disodium Tablets**

エチドロン酸二ナトリウム錠

Etidronate Disodium Tablets contain not less than 93.0%, and not more than 107.0% of the labeled amount of etidronate disodium (C₂H₆Na₂O₅P₂·249.99).

**Method of preparation**

Prepare as directed under Tablets, with Etidronate Disodium.

**Identification**

Shake an amount of powdered Etidronate Disodium Tablets, equivalent to 0.2 g of Etidronate Disodium, with 20 mL of water, and filter. Proceed with the filtrate as directed in the Identification (1) under Etidronate Disodium.

Shake an amount of powdered Etidronate Disodium Tablets, equivalent to 0.4 g of Etidronate Disodium, with 10 mL of water, and filter. Evaporate total amount of the filtrate to dryness under reduced pressure, shake the residue with 15 mL of ethanol (99.5), centrifuge, and dry the precipitate at 150°C for 4 hours. Determine the infrared absorption spectrum of the precipitate as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25); it exhibits absorption at the wave numbers of about 1170 cm⁻¹, 1056 cm⁻¹, 916 cm⁻¹ and 811 cm⁻¹.

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 60 minutes of Etidronate Disodium Tablets is not less than 85%.
Etilefrine Hydrochloride

Etiléfrine Hydrochloride.

Etiléfrine Hydrochloride occurs as white, crystalline powder.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Etilefrine Hydrochloride Tablets

エチレフリン塩酸塩

Etilefrine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl: 217.69).

Method of preparation Prepare as directed under Tablets, with Etilefrine Hydrochloride.

Identification To a quantity of powdered Etilefrine Hydrochloride Tablets, equivalent to 5 mg of Etilefrine Hydrochloride, add 60 mL of diluted hydrochloric acid (1 in 1000), shake well, add 40 mL of diluted hydrochloric acid (1 in 1000), and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>, using diluted hydrochloric acid (1 in 1000) as the blank: it exhibits a maximum between 271 nm and 275 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Etilefrine Hydrochloride Tablets add 60 mL of diluted hydrochloric acid (1 in 1000), and proceed as directed in the Assay.

Amount (mg) of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl)

\[ M_S = M_A \times A_1 / A_S \times 1/10 \]

Where:
- \( M_A \): Amount (mg) of etilefrine hydrochloride for assay taken
- \( A_1 \): Labeled amount (mg) of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl) in 1 tablet.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Etilefrine Hydrochloride Tablets is not less than 70%.

Start the test with 1 tablet of Etilefrine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet \( V \) mL of the subsequent filtrate, add water to make exactly \( V' \) mL so that each mL contains about 5 μg of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of etilefrine hydrochloride for assay, previously dried at 105°C for 4 hours, and dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and filter. Discard the first 20 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of etilefrine hydrochloride for assay, previously dried at 105°C for 4 hours, and dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 100 mL. Pipet 10 mL of this solution, add diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as direct under Liquid Chromatography <2.01D> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of etilefrine in each solution.

Amount (mg) of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl)

\[ M_S = M_A \times A_1 / A_S \times 1/10 \]

Where:
- \( M_A \): Amount (mg) of etilefrine hydrochloride for assay taken
- \( A_1 \): Labeled amount (mg) of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl) in 1 tablet.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of etilefrine are not less than 8000 and 0.9 – 1.2, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etilefrine is not more than 2.0%.

Assay Weigh accurately the mass of not less than 20 Etilefrine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of etilefrine hydrochloride (C₁₀H₁₅NO₂HCl), add 60 mL of diluted hydrochloric acid (1 in 1000), shake for 10 minutes, add diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and filter. Discard the first 20 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of etilefrine hydrochloride for assay, previously dried at 105°C for 4 hours, and dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 100 mL. Pipet 10 mL of this solution, add diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as direct under Liquid Chromatography <2.01D> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of etilefrine in each solution.

Comparing the ratio of the area of the peak of etilefrine and the area of the peak of etilefrine in the mobile phase, the system suitability shall meet the requirements of each method.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 5 g of sodium lauryl sulfate in 940 mL of water and 500 mL of acetonitrile, and adjust the pH to 2.3 with phosphoric acid.
Flow rate: Adjust so that the retention time of etilefrine is about 6 minutes.

System suitability—
System performance: Dissolve 4 mg of bamethan sulfate and 4 mg of etilefrine hydrochloride in the mobile phase to make 50 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, etilefrine and bamethan are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etilefrine is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.
Etizolam

エチゾラム

\[
\text{C}_{17}\text{H}_{15}\text{ClN}_{2}\text{S}: 342.85
\]

4-(2-Chlorophenyl)-2-ethyl-9-methyl-6H-thieno[3,2-f][1,2,4]triazolo[4,3-a][1,4]diazepine

[40054-69-1]

Etizolam, when dried, contains not less than 98.5% and not more than 101.0% of etizolam (C\(_{17}\)H\(_{15}\)ClN\(_2\)S).

**Description** Etizolam occurs as a white to pale yellow-white crystalline powder.

It is soluble in ethanol (99.5), sparingly soluble in acetonitrile and in acetic anhydride, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Etizolam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Identification (2)** Determine the infrared absorption spectrum of Etizolam as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** \(<2.60\rangle\) 147 - 151°C

**Purity (1)** Heavy metals \(<1.07\rangle\)—Proceed with 2.0 g of Etizolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Residue on ignition** \(<2.44\rangle\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Etizolam, previous dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) \((7:3)\), and titrate \(<2.50\rangle\) with 0.1 mol/L perchloric acid VS (potentiometric titration). The end point is the second equivalent point. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 17.14 mg of C\(_{17}\)H\(_{15}\)ClN\(_2\)S

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Etizolam Fine Granules**

エチゾラム細粒

Etizolam Fine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of etizolam (C\(_{17}\)H\(_{15}\)ClN\(_2\)S: 342.85).

**Method of preparation** Prepare as directed under Granules, with Etizolam.

**Identification (1)** To a quantity of powdered Etizolam Fine Granules, equivalent to 5 mg of Etizolam, add 10 mL of methanol, shake, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Evaporate the filtrate to dryness on a water bath, cool, and then dissolve the residue in 2 mL of sulfuric acid. The solution gives off a light yellow-green fluorescent when exposed to ultraviolet light (main wavelength: 365 nm).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.5 with diluted phosphoric acid (1 in 10). To 550 mL of this solution add 450 mL of acetonitrile.

Flow rate: Adjust so that the retention time of etizolam is about 6 minutes.

Time span of measurement: About 5 times as long as the retention time of etizolam, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Measure exactly 2 mL of the standard solution, and add acetonitrile to make exactly 20 mL. Confirm that the peak area of etizolam obtained with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the standard solution.

System performance: Dissolve 0.02 g each of Etizolam and ethyl parahydroxybenzoate in the mobile phase to make 50 mL. To 1 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, ethyl parahydroxybenzoate and etizolam are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etizolam is not more than 2%.

**Loss on drying** \(<2.41\rangle\) Not more than 0.5% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.3 g of Etizolam, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) \((7:3)\), and titrate \(<2.50\rangle\) with 0.1 mol/L perchloric acid VS (potentiometric titration). The end point is the second equivalent point. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 17.14 mg of C\(_{17}\)H\(_{15}\)ClN\(_2\)S

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.
Uniformity of dosage units <6.02> The Granules in single-dose packages meet the requirement of the Mass variation test.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Etizolam Fine Granules is not less than 75%.

Start the test with an accurately weighed amount of Etizolam Fine Granules, equivalent to about 1 mg of etizolam (C₁₇H₁₄ClN₂S), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of first filtrate, pipet 2 mL of the subsequent filtrate, add exactly 2 mL of acetonitrile, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of etizolam for assay, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Pipet 4 mL of this solution, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 2 mL of acetonitrile, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and Aₛ, of etizolam in each solution.

\[
\text{Dissolution rate } (\%) = \frac{Mₛ/Mᵢ}{A₁/Aₛ} \times \frac{1}{C} \times 18/5
\]

Mₛ: Amount (mg) of etizolam for assay taken
Mᵢ: Amount (g) of Etizolam Fine Granules taken
C: Labeled amount (mg) of etizolam (C₁₇H₁₄ClN₂S) in 1 g

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 243 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeylsilsilane silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of water and acetonitrile (1:1).
Flow rate: Adjust so that the retention time of etizolam is about 7 minutes.

System suitability—
System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of etizolam are not less than 3000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etizolam is not more than 2.0%.

Assay Weigh accurately an amount of powdered Etizolam Fine Granules, equivalent to about 4 mg of etizolam (C₁₇H₁₄ClN₂S), add 30 mL of water, and stir. Add 60 mL of methanol, stir for 20 minutes, add methanol to make exactly 100 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add diluted methanol (7 in 10) to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of etizolam for assay, previously dried at 105°C for 3 hours, and dissolve in diluted methanol (7 in 10) to make exactly 100 mL. Pipet 2 mL of this solution, and add diluted methanol (7 in 10) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add diluted methanol (7 in 10) to make 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Qₛ, of the peak area of etizolam to that of the internal standard.

\[
\text{Amount (mg) of etizolam } (\text{C₁₇H₁₄ClN₂S}) = Mₛ \times Q₁/Qₛ \times 1/25
\]

Mₛ: Amount (mg) of etizolam for assay taken

Internal standard solution—A solution of ethyl parahydroxybenzoate in diluted methanol (7 in 10) (1 in 50,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeylsilsilane silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.5 with diluted phosphoric acid (1 in 10). To 550 mL of this solution add 450 mL of acetonitrile.
Flow rate: Adjust so that the retention time of etizolam is about 6 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and etizolam are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of etizolam to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.
Storage—Light-resistant.

Etizolam Tablets
エチゾラム錠

Etizolam Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of etizolam (C₁₇H₁₄ClN₂S: 342.85).

Method of preparation Prepare as directed under Tablets, with Etizolam.

Identification (1) To a quantity of powdered Etizolam Tablets, equivalent to 5 mg of Etizolam, add 10 mL of methanol, shake, and filter. Evaporate the filtrate to dryness on a water bath, and dissolve the residue in 2 mL of sulfuric acid. The solution gives off a light yellow-green fluorescence when exposed to ultraviolet light (main wavelength: 365 nm).

(2) To a quantity of powdered Etizolam Tablets, equivalent to 1 mg of Etizolam, add 80 mL of 0.1 mol/L hydrochloric acid TS, shake, and then filter through a membrane filter with a pore size not exceeding 0.45 μm. Deter-
mine the absorption spectrum of this filtrate as directed under Ultraviolet-visible Spectrophotometry <2.2.4>; it exhibits its absorption maxima between 249 nm and 253 nm, and between 292 nm and 296 nm when performing the measurement within 10 minutes.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Etizolam Tablets add 2.5 mL of water, and stir until the tablet is disintegrated. Add 20 mL of methanol, stir for 20 minutes, add methanol to make exactly 25 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 2 mL of the internal standard solution, add diluted methanol (9 in 10) to make 25 mL so that each mL contains about 8 μg of etizolam (C₈H₁₂ClN₂S), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of etizolam (C₈H₁₂ClN₂S)

\[ M_S = M \times Q_T \times Q_s \times 1/V \times 1/20 \]

**Internal standard solution**—A solution of ethyl para-hydroxybenzoate in diluted methanol (9 in 10) (1 in 10,000).

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate is not less than 70%.

Start the test with 1 tablet of Etizolam Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 0.28 μg of etizolam (C₈H₁₂ClN₂S). Pipet 2 mL of this solution, add exactly 2 mL of acetonitrile, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of etizolam for assay, previously dried at 105°C for 3 hours, and dissolve in diluted methanol (9 in 10) to make exactly 100 mL. Pipet 2 mL of this solution, and add diluted methanol (9 in 10) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution, add diluted methanol (9 in 10) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> as follows: according to the following conditions, and calculate the ratios, Qₜ and Qₛ, of the peak area of etizolam to that of the internal standard.

Amount (mg) of etizolam (C₈H₁₂ClN₂S)

\[ M_S = M \times Q_T \times Q_s \times 1/500 \]

System suitability—

**System performance**—When the procedure is run with 100 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of etizolam are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etizolam is not more than 2.0%.

**Assay** To 20 Etizolam Tablets add 50 mL of water, and stir until they disintegrate. Add 400 mL of methanol, stir for 20 minutes, add methanol to make exactly 500 mL, and centrifuge. Pipet an amount of the supernatant liquid, equivalent to about 0.2 mg of etizolam (C₈H₁₂ClN₂S), add exactly 2 mL of the internal standard solution, add diluted methanol (9 in 10) to make exactly 100 mL. Pipet 2 mL of this solution, and add diluted methanol (9 in 10) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution, add diluted methanol (9 in 10) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Qₜ and Qₛ, of the peak area of etizolam to that of the internal standard.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.5 with diluted phosphoric acid (1 in 10). To 550 mL of this solution add 450 mL of acetonitrile.

Flow rate: Adjust so that the retention time of etizolam is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and etizolam are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of etizolam to that of the internal standard is not more than 1.0%.

**Containers and storage**—

Containers—Tight containers.

Storage—Light-resistant.
**Etodolac**

![Etodolac structure](image)

**Eto**

Etodolac, when dried, contains not less than 98.5% and not more than 101.0% of etodolac (C₁₇H₁₅NO₃).

**Description** Etodolac occurs as white to pale yellow, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

A solution of Etodolac in methanol (1 in 50) shows no optical rotation.

**Melting point:** about 147°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Etodolac in ethanol (99.5) (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Etodolac as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Etodolac according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.5 g of Etodolac in 10 mL of methanol, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 4 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Previously develop a plate of silica gel with fluorescent indicator for thin-layer chromatography in a developing container containing 2 cm depth of a solution of 1-ascorbic acid in a mixture of methanol and water (4:1) (1 in 200 mL) to the distance of 3 cm, and air-dry for 30 minutes. Spot 10 μL each of the sample solution and standard solutions (1) and (2) on the plate 2.5 cm away from the bottom of the plate, then immediately develop with a mixture of toluene, ethanol (95) and acetic acid (100) (140:60:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); any spot other than the principal spot obtained with the sample solution is not more intense than the spot with the standard solution (1), and the number of spots which are more intense than the spot with the standard solution (2) is not more than 2.

**Loss on drying <2.47>** Not more than 0.5% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition <2.47>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Etodolac, previously dried, dissolve in 50 mL of ethanol (99.5), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 28.74 mg of C₁₇H₁₅NO₃

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Etoposide**

![Etoposide structure](image)

**Etoposide**

Etoposide contains not less than 98.0% and not more than 102.0% of etoposide (C₂₉H₂₇NO₁₃), calculated on the anhydrous basis.

**Description** Etoposide occurs as white, crystals or crystalline powder.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and very slightly soluble in water.

**Melting point:** about 260°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Etoposide in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Etoposide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Etoposide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Etoposide RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation <2.49>** [α]₀°²⁵ —100 – —105° (0.1 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Etoposide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Sol-
lution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Etoposide in 10 mL of methanol, add the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than etoposide obtained from the sample solution is not larger than 1/5 times the peak area of etoposide from the standard solution, and the total area of the peaks other than etoposide is not larger than 1/2 times the peak area of etoposide from the standard solution.

**Operating conditions**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of etoposide, beginning after the solvent peak.

**System suitability**

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of etoposide obtained with 50 \( \mu \)L of this solution is equivalent to 7 to 13\% of that with 50 \( \mu \)L of the standard solution.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etoposide is not more than 2.0\%.

**Water** \(<2.46\) Not more than 4.0\% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** \(<2.46\) Not more than 0.1\% (1 g).

**Assay** Weigh accurately about 25 mg each of Etoposide and Etoposide RS (previously determined the water \(<2.46\) in the same manner as Etoposide) dissolve separately in methanol to make exactly 25 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 50 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of etoposide to that of the internal standard.

\[
Amount (mg) \text{ of etoposide} = M_S \times \frac{Q_T}{Q_S}
\]

\( M_S \): Amount (mg) of Etoposide RS taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of 2,6-dichlorophenol in methanol (3 in 2500).

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 290 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with phenylsilylated silica gel for liquid chromatography (10 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 35\°C.

Mobile phase: Dissolve 6.44 g of sodium sulfate dehydrate in diluted acetic acid (100) (1 in 100) to make 1000 mL, and add 250 mL of acetonitrile.

Flow rate: Adjust so that the retention time of etoposide is about 20 minutes.

**System suitability**

System performance: Dissolve 10 mg of Etoposide in 2 mL of methanol, add 8 mL of the mobile phase, and mix well. Add 0.1 mL of diluted acetic acid (100) (1 in 25) and 0.1 mL of phenolphthalein TS, and add sodium hydroxide TS until the color of the solution changes to faintly red. After allowing to stand for 15 minutes, add 0.1 mL of diluted acetic acid (100) (1 in 25). When the procedure is run with 10 \( \mu \)L of this solution under the above operating conditions, the resolution between the peak of etoposide and the peak having the relative retention time of about 1.3 to etoposide is not less than 3.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of etoposide to that of the internal standard is not more than 1.0\%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

---

**Famotidine**

ファモチジン

\[
C_{15}H_{15}N_3O_3S_2: \ 337.45
\]

\( \text{N-Aminosulfonyl-3-[2-(diaminomethyleneamino)-1,3-thiazol[4-yl][methylsulfanyl]propanimidamide} \) [76824-35-6]

Famotidine, when dried, contains not less than 98.5\% of famotidine (\( C_{15}H_{15}N_3O_3S_2 \)).

**Description** Famotidine occurs as white to yellowish white crystals.

It is freely soluble in acetic acid (100), slightly soluble in ethanol (95), and very slightly soluble in water.

It dissolves in 0.5 mol/L hydrochloric acid TS.

It is gradually colored by light.

Melting point: about 164\°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Famotidine in 0.05 mol/L potassium dihydrogen phosphate TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Famotidine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Famotidine in 10 mL of 0.5 mol/L hydrochloric acid TS: the solution is clear and colorless to pale yellow.

(2) Heavy metals \(<1.07\)—Proceed with 2.0 g of Famotidine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.20 g of Famotidine in
10 mL of acetic acid (100), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetic acid (100) to make exactly 100 mL. Pipet 1 mL, 2 mL and 3 mL of this solution, add acetic acid (100) to make exactly 10 mL, respectively, and use these solutions as the standard solution (1), the standard solution (2) and the standard solution (3). Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 5 μL each of the sample solution and standard solutions (1), (2) and (3) on a plate of silica gel (5 to 7 μm) with fluorescent indicator for thin-layer chromatography, and dry in a stream of nitrogen. Develop the plate with a mixture of ethyl acetate, methanol, toluene and ammonia solution (28) (40:25:20:2) to a distance of about 8 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution (3). Total intensity of the spots other than the principal spot and the spot of the starting point from the sample solution is not more than 0.5% calculated on the basis of intensities of the spots from the standard solution (1) and the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Famotidine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 16.87 mg of C,H,N,O,S

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Famotidine Injection**

ファモチジン注射液

Famotidine Injection is an aqueous injection. It contains not less than 92.0% and not more than 108.0% of the labeled amount of famotidine (C,H,N,O,S: 337.45).

**Method of preparation** Prepare as directed under Injections, with Famotidine.

**Description** Famotidine Injection is a colorless or light yellow, clear liquid.

**Identification** To an amount of Famotidine Injection, equivalent to 10 mg of Famotidine, add water to make 100 mL. Run 1 mL of this solution on a column prepared by filling about 1 cm inside diameter chromatography tube with about 0.4 g of 55 – 105 μm octadecylsylanized silica gel for pretreatment. Wash the column with 15 mL of water, followed by elution with 5 mL of methanol. To the eluate add methanol to make 10 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 285 nm and 289 nm.

**Osmotic pressure ratio** Being specified separately when the drug is granted approval based on the Law.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity** Related substances—To an exact amount of Famotidine Injection, equivalent to 25 mg of Famotidine, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of famotidine for assay, dissolve in methanol, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak area of each solution by the automatic integration method, and calculate the amounts of the related substances by the following equation: the amounts of related substances, having the relative retention time about 1.3 and about 1.5 to famotidine are not more than 3.0% respectively, and the amount of other related substances except the above substances is not more than 0.5%, and the total amount of the related substances is not more than 5.0%.

Amount (%) of related substances = M₅ × A₁/A₃ × 1/10

| M₅: Amount (mg) of famotidine for assay taken |
| A₃: Peak area of famotidine in the standard solution |
| A₁: Peak area of related substances in the sample solution |

**Operating conditions**—

Detector, column and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase: Dissolve 1.74 g of sodium 1-pentane sulfonate in 900 mL of water, adjust to pH 4.0 with diluted acetic acid (100) (1 in 10), and add water to make 1000 mL. To 840 mL of this solution add 80 mL of methanol and 40 mL of acetonitrile.

Flow rate: Adjust so that the retention time of famotidine is about 17 minutes.

Time span of measurement: About 4 times as long as the retention time of famotidine, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 5 mL of the standard solution, add the mobile phase to make exactly 50 mL. Confirm that the peak area of famotidine obtained with 20 μL of this solution is equivalent to 8 to 12% of that with 20 μL of the standard solution.

System performance: To 20 mg of famotidine for assay add 2 mL of a solution of methyl parahydroxybenzoate in acetonitrile (1 in 500), and add methanol to make 20 mL. To 5 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, famotidine and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 19.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operations conditions, the relative standard deviation of the peak area of famotidine is not more than 2.0%.

**Bacterial endotoxins** <4.01> Less than 15 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according
Famotidine for Injection

Famotidine for Injection is a preparation for injection which is dissolved before use. It contains not less than 94.0% and not more than 106.0% of the labeled amount of famotidine \((C_{6}H_{12}N_{2}O_{3}S)\); 337.45.

**Method of preparation** Prepare as directed under Injection, with Famotidine.

**Description** Famotidine for Injection occurs as white, porous masses or powder.

**Identification** Dissolve an amount of Famotidine for Injection, equivalent to 0.01 g of Famotidine, in 50 mL of 0.05 mol/L potassium dihydrogen phosphate TS. To 5 mL of this solution add 0.05 mol/L potassium dihydrogen phosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.01>\): it exhibits a maximum between 263 nm and 267 nm.

**pH** \(<2.5>\) Dissolve an amount of Famotidine for Injection, equivalent to 0.02 g of Famotidine, in 1 mL of water: the pH of this solution is between 4.9 and 5.5.

**Purity** (1) Clarity of color of solution—Dissolve an amount of Famotidine for Injection, equivalent to 0.02 g of Famotidine, in 1 mL of water: the solution is clear and colorless.

(2) Related substances—Take a number of Famotidine for Injection, equivalent to about 0.1 g of famotidine \((C_{6}H_{12}N_{2}O_{3}S)\), dissolve each content in water, wash the inside of the container with water, combine the solutions of the contents with the washings, add water to the combined solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than famotidine obtained from the sample solution is not larger than peak area of famotidine from the standard solution.

**Operating conditions**—Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay. Time span of measurement: About 2 times as long as the retention time of famotidine, beginning after the solvent peak.

**System suitability**—System performance: Proceed as directed in the system suitability in the Assay. Test for required detectability: To exactly 2 mL of the standard solution add the water to make exactly 20 mL. Confirm that the peak area of famotidine obtained with 5 \(\mu\)L of this solution is equivalent to 8 to 12% of that with 5 \(\mu\)L of the standard solution.

System repeatability: When the test is repeated 6 times with 5 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of famotidine is not more than 2.0%.

**Containers and storage** Containers—Hermetic containers.
**Famotidine Powder**

ファモチジン散

Famotidine Powder contains not less than 94.0% and not more than 106.0% of the labeled amount of famotidine (C$_{8}$H$_{13}$N$_{2}$O$_{5}$S$_{2}$; 337.45).

**Method of preparation** Prepare as directed under Granules or Powders, with Famotidine.

**Identification** Weigh a portion of Famotidine Powder, equivalent to 0.01 g of Famotidine, add 50 mL of 0.05 mol/L potassium dihydrogen phosphate TS, shake well, and centrifuge. To 5 mL of the supernatant liquid add 0.05 mol/L potassium dihydrogen phosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: Famotidine Powder in single-dose packages meets the requirement of the Content uniformity test.

Take the total content of 1 package of Famotidine Powder, add 10 mL of water per 10 mg of famotidine (C$_{8}$H$_{13}$N$_{2}$O$_{5}$S$_{2}$), shake well, add 10 mL of methanol, shake well, and methanol to make exactly $V$ mL so that each mL contains about 0.4 mg of famotidine (C$_{8}$H$_{13}$N$_{2}$O$_{5}$S$_{2}$), and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

**System suitability**

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution (pH 4.0) as the dissolution medium, the dissolution rates in 15 minutes of a 20-mg/g powder and a 100-mg/g powder are not less than 80% and not less than 85%, respectively.

Start the test with an accurately weighed amount of Famotidine Powder, equivalent to about 20 mg of famotidine (C$_{8}$H$_{13}$N$_{2}$O$_{5}$S$_{2}$), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 $\mu$m. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of famotidine for assay, previously dried in vacuum on phosphorus (V) oxide at 80°C for 4 hours, dissolve in the dissolution medium to make exactly 100 mL, and proceed with the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of famotidine for assay, previously dried in vacuum on phosphorus (V) oxide at 80°C for 4 hours, dissolve in the dissolution medium to make exactly 100 mL, and proceed with the subsequent filtrate as the sample solution. Determine the absorbances, $A_I$ and $A_S$, of the sample solution and standard solution at 266 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) with respect to the labeled amount of famotidine (C$_{8}$H$_{13}$N$_{2}$O$_{5}$S$_{2}$) = $M_S/M_T \times A_I/A_S \times 1/C \times 45$

$M_S$: Amount (mg) of famotidine for assay taken

$M_T$: Amount (mg) of famotidine for assay taken

Internal standard solution—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

Operating conditions—

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).
- Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust so that the retention time of famotidine is about 6 minutes.

System suitability—

System performance: When the procedure is run with 5 $\mu$L of the standard solution under the above operating conditions, famotidine and the internal standard are eluted in this order with the resolution between these peaks not less than 11.

System repeatability: When the test is repeated 6 times with 5 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Hermetic containers.
Famotidine Tablets

**Famotidine Tablets**

Famotidine Tablets contain not less than 94.0% and not more than 106.0% of the labeled amount of famotidine (C_{10}H_{15}N_{2}O_{3}S_{3}: 337.45).

**Method of preparation** Prepare as directed under Tablets, with Famotidine.

**Identification** Weigh a portion of powdered Famotidine Tablets, equivalent to 0.01 g of Famotidine, add 50 mL of 0.05 mol/L potassium dihydrogen phosphate TS, shake well, and centrifuge. To 5 mL of the supernatant liquid add 0.05 mol/L potassium dihydrogen phosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>:
it exhibits a maximum between 263 nm and 267 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Famotidine Tablets add 2 mL of water, shake to disintegrate, then add a suitable amount of methanol, and shake well. Add methanol to make exactly 10 mL, and centrifuge. To 5 mL of this solution add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_3 and Q_5, of the peak area of famotidine to that of the internal standard.

Amount (mg) of famotidine (C_{10}H_{15}N_{2}O_{3}S_{3}) = M_5 \times Q_3/Q_5 \times 1/5

M_5: Amount (mg) of famotidine for assay taken

Internal standard solution—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust so that the retention time of famotidine is about 6 minutes.

System suitability—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, famotidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
the test with 5 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> to determine the following conditions, and calculate the ratios, $Q_2$ and $Q_3$, of the peak area of famotidine to that of the internal standard.

$$
\text{Amount (mg) of famotidine (C}_9\text{H}_13\text{N}_2\text{O}_3\text{S}_3) = M_2 \times Q_2 / Q_3 \times 2
$$

$M_3$: Amount (mg) of famotidine for assay taken

**Internal standard solution**—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Operating conditions**—
2. Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
3. Column temperature: A constant temperature of about 25°C.
4. Mobile phase: Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.
5. Flow rate: Adjust so that the retention time of famotidine is about 6 minutes.

**System suitability**—
1. System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, famotidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.
2. System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.

**Faropenem Sodium Hydrate**

ファロペネムナトリウム水和物

\[
\text{C}_9\text{H}_13\text{NNaO}_5\text{S}_2\cdot\frac{1}{2}\text{H}_2\text{O}: 352.34
\]

Monosodium (5R,6S)-6-[(1R)-1-hydroxyethyl]-7-oxo-3,[(2R)-tetrahydrofuran-2-yl]-4-thia-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylate hemipentahydrate \[122547-49-3, \text{ anhydride}\]

Faropenem Sodium Hydrate contains not less than 870 μg (potency) and not more than 943 μg (potency) per mg, calculated on the anhydrous basis. The potency of Faropenem Sodium Hydrate is expressed as mass (potency) of faropenem (C₁₂H₁₃N₂O₅S₂: 285.32).

**Description**—Faropenem Sodium Hydrate occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification**—
1. Dissolve 5 mg of Faropenem Sodium Hydrate in 1 mL of hydroxylammonium chloride-ethanol TS, allow to stand for 3 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS, and shake: a red-brown to brown color develops.
2. Determine the absorption spectra of solutions of Faropenem Sodium Hydrate and Faropenem Sodium RS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.
3. Determine the infrared absorption spectra of Faropenem Sodium Hydrate and Faropenem Sodium RS as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation**—
\[\text{Faropenem Sodium Hydrate}: +145 - +150^\circ \text{ (0.5 g calculated as the anhydrous basis, water, 50 mL, 100 mm)}\]

**Purity**—

1. **Heavy metals**—Proceed with 2.0 g of Faropenem Sodium Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
2. **Related substances**—Dissolve a quantity of Faropenem Sodium Hydrate equivalent to 0.10 g (potency) in 200 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> to determine the following conditions, and determine each peak area by the automatic integration method: the peak area of the epimer, having the relative retention time of about 1.1 to faropenem, obtained from the sample solution is not larger than 3/10 times the peak area of faropenem from the standard solution, and the total area of the peaks other than faropenem from the sample solution is not larger than 1/2 times the peak area of faropenem from the standard solution.

**Operating conditions**—
1. Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 6 times as long as the retention time of faropenem, beginning after the solvent peak.

**System suitability**—
1. Test for required detectability: To exactly 2 mL of the standard solution add water to make exactly 20 mL. Confirm that the peak area of faropenem obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.
2. System performance: When the procedure is run with 20 μL of the standard solution obtained in the Assay under the above operating conditions, the internal standard and faropenem are eluted in this order with the resolution between these peaks being not less than 1.5.
3. System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of faropenem is not more than 2.0%.

**Water**—
\[\text{Faropenem Sodium Hydrate}: \text{Not less than 12.6% and not more than 13.1%} (20 mg, coulometric titration)\]

**Assay**—Weigh accurately an amount of Faropenem Sodium
Hydrate and Faropenem Sodium RS, equivalent to about 25 mg (potency), add exactly 10 mL each of the internal standard solution, add water to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Qₕ and Qₛ, of the peak area of faropenem to that of the internal standard.

\[
\text{Amount [μg (potency)] of faropenem (C₁₉H₁₅NO₃S) = Mₛ × Qₕ/Qₛ × 1000}
\]

\[
Mₛ: \text{amount [μg (potency)] of Faropenem Sodium RS taken}
\]

Internal standard solution—Dissolve 0.5 g of m-hydroxycetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 305 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 4.8 g of potassium dihydrogen phosphate, 5.4 g of disodium hydrogen phosphate dodecahydrate and 1.0 g of tetrabutyl ammonium bromide in water to make 1000 mL. To 870 mL of this solution add 130 mL of acetonitrile.

Flow rate: Adjust so that the retention time of faropenem is about 11 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and faropenem are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of faropenem to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Faropenem Sodium for Syrup

シロップ用ファロペネムナトリウム

Faropenem Sodium for Syrup is a preparation for syrup, which is dissolved before use.

It contains not less than 93.0% and not more than 106.0% of the labeled potency of faropenem (C₁₉H₁₅NO₃S: 285.32).

Method of preparation Prepare as directed under Preparations for Syrups, with Faropenem Sodium Hydrate.

Identification Dissolve an amount of powdered Faropenem Sodium for Syrup, equivalent to 25 mg (potency) of Faropenem Sodium Hydrate, in water to make 50 mL. To 5 mL of this solution add water to make 50 mL, filter, if necessary, and determine the absorption spectrum of the solution so obtained as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits maxima between 254 nm and 258 nm, and between 304 nm and 308 nm.

Purity Related substances—Powder Faropenem Sodium for Syrup, if necessary. To a part of the powder, equivalent to about 25 mg (potency) of Faropenem Sodium Hydrate, add about 10 mL of water, shake well, then add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area of both solutions by the automatic integration method; the area of the peak of cleaved derivative, having the relative retention time of about 0.71 to faropenem, obtained from the sample solution is not larger than 1.5 times the peak area of faropenem from the standard solution, and the total area of the peaks other than faropenem from the sample solution is not larger than 2 times the peak area of faropenem from the standard solution. For the area of the peak, having the relative retention time of about 0.71 to faropenem, multiply its correction factor 0.37.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Dissolve 6.12 g of potassium dihydrogen phosphate, 1.79 g of disodium hydrogen phosphate dodecahydrate and 1.61 g of tetrabutyl ammonium bromide in water to make 1000 mL.

Mobile phase B: A mixture of the mobile phase A and acetonitrile (1:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 54</td>
<td>84 → 30</td>
<td>16 → 70</td>
</tr>
</tbody>
</table>

Flow rate: 1.5 mL per minute.

Time span of measurement: 2.5 times as long as the retention time of faropenem, beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 2 mL of the standard solution add water to make exactly 20 mL. Confirm that the peak area of faropenem obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution obtained in the Assay under the above operating conditions, the internal standard and faropenem are eluted in this order with the resolution between these peaks being not less than 11.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of faropenem is not more than 3.0%.

Water <2.48> Not less than 1.5% and not more than 2.1% (80 mg, coulometric titration).
Uniformity of dosage units <6.02> Faropenem Sodium for Syrup in single-dose packages meet the requirement of the Mass variation test.

Assay Powder, if necessary, and weigh accurately an amount of Faropenem Sodium for Syrup, equivalent to about 25 mg (potency) of faropenem (C₁₁ₓH₁₄₂N₅O₁₀S), add exactly 10 mL of the internal standard solution and a suitable amount of water, shake well, and add water to make 50 mL. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium RS, add exactly 10 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Faropenem Sodium Hydrate.

\[
\text{Amount [mg (potency)] of faropenem (C₁₁ₓH₁₄₂N₅O₁₀S)} = M_s \times \frac{Q_t}{Q_s}
\]

\[
M_s: \text{Amount [mg (potency)] of Faropenem Sodium RS taken}
\]

Internal standard solution—Dissolve 0.5 g of m-hydroxycetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Faropenem Sodium Tablets

ファロペネムナトリウム錠

Faropenem Sodium Tablets contain not less than 94.0% and not more than 106.0% of the labeled potency of faropenem (C₁₁ₓH₁₄₂N₅O₁₀S: 285.32).

Method of preparation Prepare as directed under Tablets, with Faropenem Sodium Hydrate.

Identification To powdered Faropenem Sodium Tablets, equivalent to 70 mg (potency) of Faropenem Sodium Hydrate, add water to make 100 mL. To 5 mL of this solution add water to make 100 mL, filter, if necessary, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits maxima between 254 nm and 258 nm and between 304 nm and 308 nm.

Purity Related substances—Powder not less than 5 Faropenem Sodium Tablets. To a part of the powder, equivalent to about 25 mg (potency) of Faropenem Sodium Hydrate, add about 10 mL of water, shake, then add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL of the standard solution and standard solution as directed under Liquid Chromatography 2.07: according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the area of the peak of cleaved derivative, having the relative retention time of about 0.71 to faropenem, obtained from the sample solution is not larger than 1.5 times the peak area of faropenem from the standard solution, and the total area of the peaks other than faropenem from the sample solution is not larger than 2.5 times the peak area of faropenem from the standard solution. For the area of the peak, having the relative retention time of about 0.71 to faropenem, multiply its correction factor 0.37.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Dissolve 6.12 g of potassium dihydrogen phosphate, 1.79 g of disodium hydrogen phosphate dodecahydrate and 1.61 g of tetra n-butylammonium bromide in water to make 1000 mL.

Mobile phase B: A mixture of the mobile phase A and acetonitrile (1:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection (sample)</th>

</tbody>
</table>

Flow rate: 1.5 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of faropenem, beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 2 mL of the standard solution add water to make exactly 20 mL. Confirm that the peak area of faropenem obtained with 20 µL of this solution is equivalent to 7 to 13% of that with 20 µL of the standard solution.

System performance: When the procedure is run with 20 µL of the standard solution obtained in the Assay under the above operating conditions, the internal standard and faropenem are eluted in this order with the resolution between these peaks being not less than 11.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of faropenem is not more than 3.0%.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Faropenem Sodium Tablets add 130 mL of water, shake vigorously until the tablets are disintegrated, and add water to make exactly 1 V’mL so that each mL contains about 1 mg (potency) of Faropenem Sodium Hydrate. Pipet 5 mL of this solution, add water to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium RS, and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₁₂₇₅, A₁₃₂₅, A₂₇₅₄, A₃₂₇₅₄, and A₅₃₅₄ of the sample solution and standard solution at 275 nm, 305 nm and 354 nm as directed under Ultraviolet-visible Spectrophotometry 2.24, and calculate A₁ and A₃, using the following equations.

\[
A_1 = A_{1275} - (49 \times A_{1275} + 30 \times A_{1325})/79
\]

\[
A_3 = A_{5354} - (49 \times A_{5354} + 30 \times A_{5354})/79
\]
Amount [mg (potency)] of faropenem (C_{12}H_{15}NO_3S) 
= M_5 \times A_T/A_S \times V/25 

M_5: Amount [mg (potency)] of Faropenem Sodium RS taken

Dissolution C6.10D When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Faropenem Sodium Tablets is not less than 85%.

Start the test with 1 tablet of Faropenem Sodium Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 56 μg (potency) of Faropenem Sodium Hydrate, and use this solution as the sample solution. Separately, weigh accurately an amount of Faropenem Sodium RS, equivalent to about 18 mg (potency), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A_T and A_S, at 306 nm.

Dissolution rate (%) with respect to the labeled amount of faropenem (C_{12}H_{15}NO_3S) 
= M_5 \times A_T/A_S \times V'/V \times 1/C \times 225 

M_5: Labeled amount [mg (potency)] of Faropenem Sodium RS taken
C: Labeled amount [mg (potency)] of faropenem (C_{12}H_{15}NO_3S) in 1 tablet

Assay Weigh accurately the mass of not less than 5 Faropenem Sodium Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg (potency) of faropenem (C_{12}H_{15}NO_3S), add exactly 10 mL of the internal standard solution, shake well, and add water to make 50 mL. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium RS, add exactly 10 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Faropenem Sodium Hydrate.

Amount [mg (potency)] of faropenem (C_{12}H_{15}NO_3S) 
= M_5 \times Q_T/Q_S 

M_5: Amount [mg (potency)] of Faropenem Sodium RS taken

Internal standard solution—Dissolve 0.5 g of \( m \)-hydroxyacetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

Containers and storage Containers—Tight containers.

Felbinac

Felbinac, when dried, contains not less than 98.5% and not more than 101.0% of felbinac (C_{14}H_{12}O_3).

Description Felbinac occurs as white to pale yellow-white, crystals or crystalline powder.

It is soluble in methanol and in acetonitrile, sparingly soluble in ethanol (95), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Felbinac in ethanol (95) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Felbinac as directed in the potassium bromide disc method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point \( 2.60 \) 163 - 166°C

Purity (1) Chloride <1.05>—Dissolve 1.0 g of Felbinac in 40 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution by combining 0.30 mL of 0.01 mol/L hydrochloric acid VS, 40 mL of acetone and 6 mL of dilute nitric acid, and add water to make 50 mL (not more than 0.011%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Felbinac according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Felbinac in 10 mL of acetone, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add acetone to make exactly 100 mL. Pipet 5 mL of the sample solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.09>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of heptane, acetone, and acetic acid (100) (50:25:1) to a distance of about 12 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.3% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Felbinac, previously dried, dissolve in 30 mL of methanol, add 15 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS
Felbinac Cataplasm

Felbinac Cataplasm contains not less than 90.0% and not more than 110.0% of the labeled amount of felbinac (C_{14}H_{12}O_{2} 212.24).

**Method of preparation** Prepare as directed under Cataplasms/Gel Patches, with Felbinac.

**Identification** Weigh a quantity of Felbinac Cataplasm, equivalent to 10 mg of Felbinac, cut into minute pieces, add 20 mL of methanol, shake for 30 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 1 mg of felbinac for assay in 2 mL of methanol and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, acetone and acetic acid (100) (50:25:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the Rf value of the principal spot obtained from the sample solution and the spot from the standard solution is the same.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Adhesiveness** Being specified separately when the drug is granted approval based on the Law.

**Drug release** Being specified separately when the drug is granted approval based on the Law.

**Assay** Take exactly a quantity of Felbinac Cataplasm, equivalent to 70 mg of felbinac (C_{14}H_{12}O_{2}), cut into minute pieces, add 150 mL of methanol, and heat under a reflux condenser. After cooling, separate the extraction liquid, add 20 mL of water to the residue, heat in a water bath at 75°C for 10 minutes, then add 150 mL of methanol, and heat under a reflux condenser. After cooling, separate the extraction liquid, add 150 mL of methanol to the residue, and heat under a reflux condenser. After cooling, separate the extraction liquid, wash the residue and vessels with a small amount of methanol, combine the extraction liquids and washings, and add methanol to make exactly 500 mL. Pipet 6 mL of this solution, add exactly 3 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_1 and Q_2, of the peak area of felbinac to that of the internal standard.

**Containers and storage** Containers—Tight containers.

---

Felbinac Tape

Felbinac Tape contains not less than 90.0% and not more than 110.0% of the labeled amount of felbinac (C_{14}H_{12}O_{2} 212.24).

**Method of preparation** Prepare as directed under Tapes/Plasters, with Felbinac.

**Identification** Cut up a quantity of Felbinac Tape, equivalent to 5 mg of Felbinac, add 30 mL of ethanol (95), and heat under a reflux condenser. After cooling, separate the ethanol extract, add ethanol (95) to make 50 mL, and filter. To 5 mL of the filtrate add ethanol (95) to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 251 nm and 255 nm.

**Adhesiveness** Being specified separately when the drug is granted approval based on the Law.

**Drug release** Being specified separately when the drug is granted approval based on the Law.

**Assay** Take exactly a quantity of Felbinac Tape, equivalent to 35 mg of felbinac (C_{14}H_{12}O_{2}), cut up them, add 60 mL of acetone, sonicate, and heat under a reflux condenser. After cooling, separate the acetone extract, and repeat the extraction twice more with 60 mL each of acetone by heating under a reflux condenser. After cooling, separate the extract, wash the residue and vessel with a small volume of acetone, combine the washings and the extracts, and add acetone to
make exactly 250 mL. Pipet 6 mL of this solution, add exactly 2 mL of the internal standard solution and mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 14 mg of felbinac for assay, previously dried at 105°C for 3 hours, and dissolve in acetonitrile to make exactly 100 mL. Pipet 6 mL of this solution, add exactly 2 mL of the internal standard solution and mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography to compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

A solution of Felodipine in methanol (1 in 20) shows no optical rotation.

Identification

(1) Determine the absorption spectrum of a solution of Felodipine in methanol (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Felodipine as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity

(1) Heavy metals—Being specified separately when the drug is granted approval based on the Law.

(2) Related substances—Dissolve 25 mg of Felodipine in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than felodipine, related substance B having the relative retention time of about 0.7 to felodipine, and related substance C having the relative retention time of about 1.4 obtained from the sample solution is not larger than the peak area of felodipine from the standard solution. Furthermore, the total area of the peaks of related substances B and C from the sample solution is not larger than 10 times the peak area of felodipine from the standard solution, and the total area of the peaks other than felodipine and related substances mentioned above from the sample solution is not larger than 3 times the peak area of felodipine from the standard solution. For this calculation the peak area less than 1/5 times the peak area of felodipine from the standard solution is excluded.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water, acetonitrile and phosphoric acid (500:500:1).

Flow rate: Adjust so that the retention time of felodipine is about 7 minutes.

System performance:

When the procedure is run with 20 μL of the standard solution under the above operating conditions, felbinac and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of felodipine to that of the internal standard is not more than 1.0%.

Containers and storage

Containers—Well-closed containers.

Felodipine

葯物名:

Felodipine occurs as pale yellow-white to light yellow-white, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

A solution of Felodipine in methanol (1 in 20) shows no optical rotation.

Identification

(1) Determine the absorption spectrum of a solution of Felodipine in methanol (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Felodipine as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Containers—Well-closed containers.

Felodipine

Felodipine contains not less than 99.0% and not more than 101.0% of felodipine (C_{18}H_{15}ClNO_{3}), calculated on the dried basis.

Description

Felodipine occurs as pale yellow-white to light yellow-white, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

A solution of Felodipine in methanol (1 in 20) shows no optical rotation.
μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of felodipine are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of felodipine is not more than 2.0%.

Loss on drying <2.41> Not more than 0.2% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.16 g of Felodipine, dissolve in 25 mL of t-butyl alcohol and 25 mL of diluted perchloric acid (17 in 200), and titrate <2.50> with 0.1 mol/L cerium (IV) sulfate VS (indicator: 50 μL of 1,10-phenanthroline TS) until the color of the solution changes from orange to colorless. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L cerium (IV) sulfate VS = 19.21 mg of C_{19}H_{18}Cl_{3}NO_{4}.

Containers and storage Containers—Well-closed containers.

"..."
Fenbufen

フェンブフェン

C_{16}H_{18}O_3: 254.28
4-(Biphenyl-4-yl)-4-oxobutanoic acid
[36370-85-5]

Fenbufen, when dried, contains not less than 98.0% of fenbufen (C_{16}H_{18}O_3).

**Description** Fenbufen occurs as a white crystalline powder. It has a bitter taste.

It is sparingly soluble in acetone, slightly soluble in methanol, in ethanol (95) and in diethyl ether, and practically insoluble in water.

Melting point: about 188°C (with decomposition).

**Identification**

(1) Determine the absorption spectrum of a solution of Fenbufen in ethanol (95) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry \( <2.41 > \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Fenbufen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25 > \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity**

(1) Heavy metals \( <1.07 > \)—Take 2.0 g of Fenbufen, add 2 mL of sulfuric acid, and carbonize by gentle heating, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic \( <1.12 > \)—Prepare the test solution with 1.0 g of Fenbufen according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.1 g of Fenbufen in 20 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.01 > \). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (80:20:3) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \( <2.41 > \) Not more than 0.3% (1 g, 105°C, 3 hours).

**Residue on ignition** \( <2.44 > \) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Fenbufen, previously dried, dissolve in 100 mL of ethanol (95), and titrate \( <2.50 > \) with 0.1 mol/L potassium hydroxide-ethanol VS (potentiometric titration). Perform a blank determination in...
the same manner, and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 25.43 mg of C_{29}H_{43}O_{3}

**Containers and storage** Containers—Tight containers.

**Fenofibrate**

フェノフィブラート

\[
\text{C}_{29}\text{H}_{43}\text{ClO}_{4}: 360.83
\]

1-Methylethyl 2-[(4-chlorobenzoyl)phenoxy]-2-methylpropanoate [49562-28-9]

Fenofibrate, when dried, contains not less than 98.5% and not more than 101.0% of fenofibrate (C_{29}H_{43}ClO_{4}).

**Description** Fenofibrate occurs as a white to pale yellow-white crystalline powder.

It is soluble in ethanol (99.5), and practically insoluble in water.

It shows crystal polymorphism.

**Identification (1)** Determine the absorption spectrum of a solution of Fenofibrate in ethanol (99.5) (1 in 80,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fenofibrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Fenofibrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of dried Fenofibrate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Fenofibrate as directed under Flame Coloration Test \(<1.06\rangle\): a green color appears.

**Melting point** \(2.60\) to \(80 - 83°C\)

**Purity (1)** Heavy metals \(<1.07\rangle\)—Produce with 1.0 g of Fenofibrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 0.10 g of Fenofibrate in a mixture of acetonitrile and water (7:3) to make 100 mL. To 5 mL of this solution add a mixture of acetonitrile and water (7:3) to make 25 mL, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add a mixture of acetonitrile and water (7:3) to make exactly 50 mL. Pipet 2.5 mL of this solution, add a mixture of acetonitrile and water (7:3) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and determine each peak area by the automatic integration method: the peak area of related substance A having the relative retention time of about 1.4 to fenofibrate, obtained from the sample solution is not larger than 4/5 times the peak area of fenofibrate from the standard solution, and the total area of the peaks other than fenofibrate from the sample solution is not larger than the peak area of fenofibrate from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of fenofibrate, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 5 mL of the standard solution, and add a mixture of acetonitrile and water (7:3) to make exactly 25 mL. Confirm that the peak area of fenofibrate obtained with 20 \(\mu\)L of this solution is equivalent to 15 to 25% of that with 20 \(\mu\)L of the standard solution.

System performance: Dissolve 0.10 g each of Fenofibrate and 4-chlorobenzophenon in 100 mL of a mixture of acetonitrile and water (7:3). To 2 mL of this solution add a mixture of acetonitrile and water (7:3) to make 50 mL. To 1 mL of this solution add a mixture of acetonitrile and water (7:3) to make 50 mL. When the procedure is run with 20 \(\mu\)L of this solution under the above operating conditions, 4-chlorobenzophenon and fenofibrate are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fenofibrate is not more than 5%.

**Loss on drying** \(<2.41\rangle\) Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Residue on ignition** \(<2.44\rangle\) Not more than 0.1% (1 g).

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately about 50 mg each of Fenofibrate and Fenofibrate RS, both previously dried, dissolve each in a mixture of acetonitrile and water (7:3) to make exactly 50 mL. Pipet 2 mL each of these solutions, add exactly 2 mL of the internal standard solution to each, add a mixture of acetonitrile and water (7:3) to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and calculate the ratios, \(Q_f\) and \(Q_s\), of the peak area of fenofibrate to the internal standard.

**Amount (mg) of fenofibrate (C_{29}H_{43}ClO_{4})**

\[
M_5 = M_s \times \frac{Q_f}{Q_s}
\]

\(M_5\): Amount (mg) of Fenofibrate RS taken

**Internal standard solution**—A solution of 4-chlorobenzophenon in a mixture of acetonitrile and water (7:3) (11 in 10,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 286 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeucysilansilated silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of acetonitrile and 0.02 mol/L phosphate buffer solution (pH 3.0) (7:3).

Flow rate: Adjust so that the retention time of fenofibrate
is about 8 minutes.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and fenofibrate are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of fenofibrate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Light-resistant.

Storage—Light-resistant.

**Others**

**Method of preparation** Prepare as directed under Tablets, with Fenofibrate.

**Identification** To a quantity of powdered Fenofibrate Tablets, equivalent to 10 mg of Fenofibrate, add 10 mL of a mixture of acetonitrile and water (7:3), shake, and centrifuge. To 1 mL of the supernatant liquid add a mixture of acetonitrile and water (7:3) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 285 nm and 289 nm.

**Purity** Related substances—Conduct this procedure using light-resistant vessels. To 4 mL of the supernatant liquid obtained in the Assay add a mixture of acetonitrile and water (7:3) to make 100 mL, and use this solution as the sample solution. Pipet 5 mL of this solution, add a mixture of acetonitrile and water (7:3) to make exactly 20 mL. Pipet 5 mL of this solution, add a mixture of acetonitrile and water (7:3) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than fenofibrate and related substance A having the relative retention time of about 1.4 to fenofibrate obtained from the sample solution, is not larger than 2.5 times the peak area of fenofibrate from the standard solution, and the total area of the peaks other than fenofibrate from the sample solution is not larger than the peak area of fenofibrate from the standard solution.

**Fenofibrate Tablets**

フェノフィブラート錠

Fenofibrate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of fenofibrate (C20H21ClO4, 360.83).

**Method of preparation** Prepare as directed under Tablets, with Fenofibrate.

**Identification** To a quantity of powdered Fenofibrate Tablets, equivalent to 10 mg of Fenofibrate, add 10 mL of a mixture of acetonitrile and water (7:3), shake, and centrifuge. To 1 mL of the supernatant liquid add a mixture of acetonitrile and water (7:3) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 285 nm and 289 nm.

**Uniformity of dosage units** <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

Conduct this procedure using light-resistant vessels. To 1 tablet of Feno-fibrate Tablets add exactly 20 mL of a mixture of acetonitrile and water (7:3), and shake until the tablet is disintegrated. Centrifuge this solution, pipet 1 mL of the supernatant liquid, equivalent to about 20 mg of fenofibrate (C20H21ClO4), and add a mixture of acetonitrile and water (7:3) to make exactly 20 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add a mixture of acetonitrile and water (7:3) to make 50 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of a solution prepared by dissolving 1 g of polysorbate 80 in water to make 100 mL as the dissolution medium, the dissolution rate in 30 minutes of Fenofibrate Tablets is not less than 75%.

Conduct this procedure using light-resistant vessels. Start the test with 1 tablet of Fenofibrate Tablets, withdraw not less than 10 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 5 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 50 μg of fenofibrate (C20H21ClO4), and use this solution as the sample solution. Separately, weigh accurately about 12 mg of Fenofibrate RS, previously dried in vacuum over phosphorus (V) oxide at 60°C for 4 hours, and dissolve in a mixture of acetonitrile and water (7:3) to make exactly 20 mL. Pipet 2 mL of this solution add the dissolution medium to make exactly 20 mL, and use this solution as the standard solution. Perform the test with ex-
Dissolve 0.10 g of Fentanyl Citrate in 10 mL of 

Dissolve 0.05 g of Fentanyl Citrate in

Q

A

Q

Fentanyl Citrate occurs as white, crystals or

and conditions in the Assay under

M

—A solution of 4-chloroben-

Fentanyl Citrate is freely soluble in methanol and in acetic acid (100), sparingly soluble in water and in ethanol (95), and very slightly soluble in diethyl ether.

Identification (1) Dissolve 0.05 g of Fentanyl Citrate in 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Fentanyl Citrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Fentanyl Citrate (1 in 100) responds to Qualitative Tests <1.09> (1) for citrate.

pH <2.54> Dissolve 0.10 g of Fentanyl Citrate in 10 mL of water: the pH of this solution is between 3.0 and 5.0.

Melting point <2.60> 150 – 154°C

Purity (1) Heavy metals <1.07>—Proceed with 0.5 g of Fentanyl Citrate according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.10 g of Fentanyl Citrate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot obtained from...
the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.4> Not more than 0.5% (0.2 g, in vacuum, silica gel, 60°C, 2 hours).

Residue on ignition <2.4> Not more than 0.2% (0.5 g).

Assay Weigh accurately about 75 mg of Fentanyl Citrate, dissolve in 50 mL of acetic acid (100), and titrate <2.5> with 0.02 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS = 10.57 mg of C$_2$H$_5$N$_2$O$_3$C$_6$H$_{12}$O$_6$.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

**Ferrous Sulfate Hydrate**

硫酸鉄水和物

FeSO$_4$$\cdot$7H$_2$O: 278.01

Ferrous Sulfate Hydrate contains not less than 98.0% and not more than 104.0% of ferrous sulfate hydrate (FeSO$_4$$\cdot$7H$_2$O).

**Description** Ferrous Sulfate Hydrate occurs as pale green, crystals or crystalline powder. It is odorless, and has an astringent taste.

It is freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is efflorescent in dry air, and its surface becomes yellowish brown in moist air.

**Identification** A solution of Ferrous Sulfate Hydrate (1 in 10) responds to Qualitative Tests <1.09> for ferrous salt and for sulfate.

**Purity** (1) Clarity of solution—Dissolve 1.0 g of Ferrous Sulfate Hydrate in 20 mL of water and 1 mL of dilute sulfuric acid: the solution is clear.

(2) Acidity—To 5.0 g of powdered Ferrous Sulfate Hydrate add 50 mL of ethanol (95), shake well for 2 minutes, and filter the mixture. To 25 mL of the filtrate add 50 mL of water, 3 drops of bromothymol blue TS and 0.5 mL of dilute sodium hydroxide TS: a blue color develops.

(3) Heavy metals <1.07>—Take 1.0 g of Ferrous Sulfate Hydrate in a porcelain dish, add 3 mL of aqua regia, and dissolve. Then evaporate on a water bath to dryness. To the residue add 5 mL of 6 mol/L hydrochloric acid TS, and dissolve. Transfer this solution to a separator. Wash the porcelain dish with two 5-mL portions of 6 mol/L hydrochloric acid TS, and combine the washings and the solution in the separator. Pour two 40-mL portions and one 20-mL portion of diethyl ether in the separator, shaking each time to mix. Allow to stand, and discard each separated diethyl ether layer. To the aqueous layer add 0.05 g of hydroxyammonium chloride, dissolve, and heat on a water bath for 10 minutes. Cool, adjust the solution to a pH of 3 to 4 by dropping ammonia solution (28), add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: take 2.5 mL of Standard Lead Solution in a porcelain dish, add 3 mL of aqua regia, and proceed as directed for the preparation of the test solution (not more than 25 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ferrous Sulfate Hydrate according to Method 1, and perform the test (not more than 2 ppm).

**Assay** Dissolve about 0.7 g of Ferrous Sulfate Hydrate, accurately weighed, in a mixture of 20 mL of water and 20 mL of dilute sulfuric acid, add 2 mL of phosphoric acid, and immediately titrate <2.5> with 0.02 mol/L potassium permanganate VS.

Each mL of 0.02 mol/L potassium permanganate VS = 27.80 mg of FeSO$_4$$\cdot$7H$_2$O.

Containers and storage Containers—Tight containers.

**Fexofenadine Hydrochloride**

フェキソフェナジン塩酸塩

C$_{15}$H$_{19}$NO$_4$·HCl: 538.12

2-(4-[(1RS)-1-Hydroxy-4-[4-(hydroxydiphenylmethyl)piperidin-1-yl]butyl]phenyl)-2-methylpropanoic acid monohydrochloride [153439-40-8]

Fexofenadine Hydrochloride contains not less than 98.0% and not more than 102.0% of fexofenadine hydrochloride (C$_{15}$H$_{19}$NO$_4$·HCl), calculated on the anhydrous basis.

**Description** Fexofenadine Hydrochloride occurs as a white crystalline powder.

It is very soluble in methanol, soluble in ethanol (99.5), and slightly soluble in water.

A solution of Fexofenadine Hydrochloride in methanol (3 in 100) shows no optical rotation.

Fexofenadine Hydrochloride shows crystal polymorphism.

**Identification** (1) Determine the absorption spectrum of a solution of Fexofenadine Hydrochloride in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fexofenadine Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Fexofenadine Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Fexofenadine Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, recrystallize the sample and the RS according to the method otherwise specified, filter and dry the crystals, and perform the test with the crystals.

(3) A solution of Fexofenadine Hydrochloride in a mixture of water and methanol (1:1) (3 in 200) responds to Qualitative Tests <1.09> (2) for chloride.
Purity (1) Heavy metals <1.0%—Proceed with 2.0 g of Fexofenadine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 7.51 g of sodium dihydrogen phosphate dihydrate and 0.84 g of sodium perchlorate in 1000 mL of water, and adjust to pH 2.0 with phosphoric acid. In a mixture of this solution and acetonitrile for liquid chromatography (1:1) dissolve 25 mg of Fexofenadine Hydrochloride to make 25 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.02> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the area of the peak other than fexofenadine obtained from the sample solution is not larger than the peak area of fexofenadine from the standard solution. For the areas of the peaks, having the relative retention time of about 1.8 and about 3.3 to fexofenadine, multiply their correction factor, 1.5 and 0.9, respectively.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 6 times as long as the retention time of fexofenadine, beginning after the solvent peak.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fexofenadine are not less than 8000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fexofenadine is not more than 2.0%.

Water <2.48> Not more than 0.5% (0.25 g, coulometric titration).

Residue on ignition <2.49> Not more than 0.1% (1 g).

Assay Dissolve 7.51 g of sodium dihydrogen phosphate dihydrate and 0.84 g of sodium perchlorate in 1000 mL of water, and adjust to pH 2.0 with phosphoric acid. In a mixture of this solution and acetonitrile for liquid chromatography (1:1) dissolve accurately weighed about 25 mg each of Fexofenadine Hydrochloride and Fexofenadine Hydrochloride RS (separately determine the water <2.48> in the same manner as Fexofenadine Hydrochloride), to make exactly 25 mL each. Pipet 3 mL each of these solutions, add the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.02> according to the following conditions, and determine the peak areas, A1 and A2, of fexofenadine in each solution.

\[
\text{Amount (mg) of fexofenadine hydrochloride} = \frac{M_s \times A_2}{A_1} \\
M_s: \text{Amount (mg) of Fexofenadine Hydrochloride RS taken, calculated on the anhydrous basis}
\]

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 650 mL of a solution, prepared by dissolving 7.51 g of sodium dihydrogen phosphate dihydrate and 0.84 g of sodium perchlorate in 1000 mL of water and adjusting to pH 2.0 with phosphoric acid, add 350 mL of acetonitrile for liquid chromatography and 3 mL of triethylamine.

Flow rate: Adjust so that the retention time of fexofenadine is about 9 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fexofenadine are not less than 8000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fexofenadine is not more than 1.0%.

Containers and storage Containers—Well-closed containers.

Fexofenadine Hydrochloride Tablets

フェキソフェナジン塩酸塩錠

Fexofenadine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of fexofenadine hydrochloride (C32H39NO4.HCl: 538.12).

Method of preparation Prepare as directed under Tablets, with Fexofenadine Hydrochloride.

Identification To an amount of powdered Fexofenadine Hydrochloride Tablets, equivalent to 40 mg of Fexofenadine Hydrochloride, add 100 mL of methanol, and shake well. Filter, discard the first 10 mL of the filtrate, and determine the absorption spectrum of the subsequent filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 257 nm and 261 nm.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method; it meets the requirement.

To 1 tablet of Fexofenadine Hydrochloride Tablets add V/5 mL of diluted acetic acid (100) (17 in 10,000), shake until the tablet is disintegrated. Add 3V/5 mL of acetonitrile for liquid chromatography, shake well, add a mixture of acetonitrile for liquid chromatography and diluted acetic acid (100) (17 in 10,000) (3:1) to make exactly V mL so that each mL contains about 0.3 mg of fexofenadine hydrochloride (C32H39NO4.HCl). Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and filter this solution through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the
subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of Fexofenadine Hydrochloride RS (separately determine the water 2.49 in the same manner as Fexofenadine Hydrochloride), and dissolve in a mixture of acetonitrile for liquid chromatography and diluted acetic acid (100) (17 in 10,000) (3:1) to make exactly 200 mL. Pipet 6 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Then, proceed as described in the Assay.

**Amount (mg) of fexofenadine hydrochloride**

\[ \text{Amount (mg)} = M_S \times \frac{A_T}{A_S} \times \frac{3V}{500} \]

**Operating conditions**

**Detector:** An ultraviolet absorption photometer (wave-length: 220 nm).

- **Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature:** A constant temperature of about 35°C.

- **Mobile phase:** Dissolve 1.1 g of sodium dihydrogen phosphate dihydrate, 0.3 mL of phosphoric acid and 0.5 g of sodium perchlorate in 300 mL of water, add 700 mL of acetonitrile for liquid chromatography.
- **Flow rate:** Adjust so that the retention time of fexofenadine is about 3.5 minutes.

**System suitability**

- **System performance:** When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fexofenadine are not less than 3000 and not more than 2.0, respectively.
- **System repeatability:** When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fexofenadine is not more than 2.0%.

**Assay**

To 20 Fexofenadine Hydrochloride Tablets add V/5 mL of diluted acetic acid (100) (17 in 10,000), and shake until the tablets are disintegrated. Then, add 3V/5 mL of acetonitrile for liquid chromatography, shake well, and add a mixture of acetonitrile for liquid chromatography and diluted acetic acid (100) (17 in 10,000) (3:1) to make exactly V mL so that each mL contains about 1.2 mg of fexofenadine hydrochloride (C₁₂H₁₈NO₄.HCl). Pipet 15 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 45 mg of Fexofenadine Hydrochloride RS (separately determine the water 2.49 in the same manner as Fexofenadine Hydrochloride), and dissolve in a mixture of acetonitrile for liquid chromatography and diluted acetic acid (100) (17 in 10,000) (3:1) to make exactly 200 mL. Pipet 20 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine the peak areas, A₁ and A₃, of fexofenadine in each solution.

\[ \text{Amount (mg) of fexofenadine hydrochloride} = M_S \times \frac{A_T}{A_S} \times \frac{5V}{750} \]

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wave-length: 220 nm).

- **Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylated silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature:** A constant temperature of about 35°C.

- **Mobile phase:** To 1000 mL of diluted acetic acid (100) (17 in 10,000) add 15 mL of a mixture of triethylamine and acetonitrile for liquid chromatography (1:1), and adjust to pH 5.25 with phosphoric acid. To 16 volumes of this solution add 9 volumes of acetonitrile for liquid chromatography.

**Flow rate:** Adjust so that the retention time of fexofenadine is about 6 minutes.

**System suitability—**

**System performance:** When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fexofenadine are not less than 7000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fexofenadine is not more than 1.0%.

**Containers and storage**

Containers—Tight containers.
Filgrastim
(Generical Recombination)

フィルグラスチム (遺伝子組換え)

Filgrastim (Genetical Recombination) is an aqueous solution in which a desired product is a recombinant N-methionyl human granulocyte colony-stimulating factor consisting of 175 amino acid residues.

It contains not less than 0.45 mg and not more than 0.55 mg of protein per mL, and not less than 1.0 × 10⁸ units per mg of protein.

**Description**

Filgrastim (Genetical Recombination) occurs as a clear and colorless liquid.

**Identification (1)** Take a volume of Filgrastim (Genetical Recombination), equivalent to 5 to 10 μg of protein depending on the size of polyacrylamide gel for filgrastim, and add 10 μL of water. To 3 volumes of this solution add 1 volume of buffer solution for filgrastim sample, and use this solution as the sample solution. Separately, take a volume of Filgrastim RS which contains equal amount of protein to Filgrastim (Genetical Recombination) used above, proceed as directed for the sample solution, and use the solution so obtained as the standard solution. Set a polyacrylamide gel for filgrastim up to the electrophoresis apparatus, and put a necessary amount of buffer solution for SDS-polyacrylamide gel electrophoresis in the upper and lower reservoirs. Pipet the all amount of the sample solution and standard solution into each well of the gel, and start the electrophoresis setting the electrode of the lower reservoir as the anode. Stop the electrophoresis when the bromophenol blue band has been migrated to about the lower end of the gel. When stain the gel with a staining solution, which is prepared by dissolving 1.25 g of Coomassie brilliant blue R250 in a mixture of 450 mL of methanol, 100 mL of acetic acid (100) and water to make 1000 mL, stained bands obtained from the sample solution appear as similar migrating image at the same position as those from the standard solution.

Flow rate: 0.20 mL per minute.

**System suitability**—

System performance: When the procedure is run with 70 μL of the standard solution under the above operating conditions, the resolutions between each adjacent peak of the major 8 peaks, which are eluted after the solvent peak appeared within 10 minutes, are not less than 1.5.

**pH** 2.54 – 3.7 – 4.3

**Purity (1)**

Multimeters—Perform the test with 250 μL of Filgrastim (Genetical Recombination) as directed under Liquid Chromatography 2.07 according to the following conditions, and determine each peak area by the automatic integration method. Calculate their amounts of the peaks by the area percentage method; the total amount of the peaks other than filgrastim is not more than 2%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 7.5 mm in inside diameter and 60 cm in length, packed with hydrophilic silica gel for liquid chromatography.

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.8 g of sodium chloride in 10 mL of dilute acetic acid and 900 mL of water, adjust to pH 5.5 with sodium hydroxide TS, then add 250 mg of sodium laurel sulfate, and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of filgrastim is about 17 minutes.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion column to the time when the elution of filgrastim is completed.

**System suitability**—

Test for required detectability: Measure exactly 10 μL of Filgrastim (Genetical Recombination), and add the mobile phase to make exactly 1000 μL. Confirm that the peak area of filgrastim obtained with 250 μL of this solution is 0.7 to 1.3% of that with 250 μL of Filgrastim (Genetical Recombination).

System performance: When the procedure is run with 10 μL of a solution containing 12.5 mg of egg albumin and 12.5 mg of myoglobin in 5 mL of water under the above operat-
ing conditions, egg albumin and myoglobin are eluted in this order with the resolution between these peaks being not less than 1.7.

System repeatability: When the test is repeated 6 times with 250 μL of Filgrastim (Genetical Recombination) under the above operating conditions, the relative standard deviation of the peak area of filgrastim is not more than 2.5%.

(2) Charge isomer—Perform the test with 100 μL of Filgrastim (Genetical Recombination) as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the each peak area by the automatic integration method. Calculate their amounts of the peaks by the area percentage method; the amount of charge isomer, having the relative retention time of about 0.87 to filgrastim, is not more than 3%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 35 mm in length, packed with strongly acidic ion-exchange non-porous resin for liquid chromatography (2.5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: To 900 mL of water add 1.14 mL of acetic acid (100), adjust to pH 5.4 with sodium hydroxide TS, and add water to make 1000 mL.
Mobile phase B: Dissolve 5.84 g of sodium chloride in 1.14 mL of acetic acid (100) and 900 mL of water, adjust to pH 5.4 with sodium hydroxide TS, and add water to make 1000 mL.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Flow rate: Adjust so that the retention time of filgrastim is about 14 minutes.

Time span of measurement: From 6 minutes to 17 minutes.

System suitability—
Test for required detectability: Confirm that when perform the test with 100 μL of the system suitability test solution for filgrastim under the above operating conditions, the content of charge isomer is between 1.4 to 2.6%.
System performance: When the procedure is run with 100 μL of the system suitability test solution for filgrastim under the above operating conditions, charge isomer peak and filgrastim are eluted in this order with the resolution between these peaks being not less than 1.5.
System repeatability: When the test is repeated 6 times with 100 μL of Filgrastim (Genetical Recombination) under the above operating conditions, the relative standard deviation of the peak area of filgrastim is not more than 2.5%.

(3) Host cell proteins—Being specified separately when the drug is granted approval based on the Law.

(4) Host cell DNA—Being specified separately when the drug is granted approval based on the Law.

Bacterial endotoxins <4.01> Less than 0.25 EU/mL.

Assay (1) Protein content—Perform the test with exactly 200 μL each of Filgrastim (Genetical Recombination) and Filgrastim RS as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of filgrastim.

\[ \text{Amount (mg) of protein in 1 mL of Filgrastim (Genetical Recombination)} = C \times A₁/A₅ \]

C: Protein concentration (mg/mL) of Filgrastim RS

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: A mixture of water, 1-propanol and trifluoroacetic acid (699:300:1).
Mobile phase B: A mixture of 1-propanol, water and trifluoroacetic acid (800:199:1).
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>

</table>

Flow rate: Adjust so that the retention time of filgrastim is about 15 minutes.

System suitability—
System performance: When the procedure is run with 200 μL of a solution prepared by dissolving 1 mg of uracil and 2 mg of diphenyl in 100 mL of a mixture of water, 1-propanol and trifluoroacetic acid (649:350:1) under the above operating conditions, uracil and diphenyl are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 200 μL of Filgrastim RS under the above operating conditions, the relative standard deviation of the peak area of filgrastim is not more than 2.5%.

(2) Specific activity—
(i) Test cell: 32D clone3 cell.
(ii) Sample dilution solution for assay: To Iscove's modified Dulbecco's fluid medium for filgrastim add 200 mmol/L L-glutamine solution and fetal calf serum to make 1 vol% and 5 vol% solution, respectively, and sterilize by filtration.
(iii) Standard solutions Dilute Filgrastim RS by the sample dilution solution for assay to prepare not less than 5 serial dilutions started from any concentration S₀ so that all of their protein concentrations are within the range of 0.5 to 6 mg/mL, and use them as the standard solutions.
(iv) Sample solutions Dilute Filgrastim (Genetical Recombination) by the sample dilution solution for assay to prepare not less than 5 serial dilutions in equal ratio started from any concentration U₀ so that all of their protein concentrations are within the range of 0.5 to 6 mg/mL, and use them as the sample solutions.
(v) Procedure The procedure before stopping the incubation should be performed under aseptic condition.
Transfer exactly 100 μL of each concentration of the standard solutions and sample solutions to the wells of 96-well flat bottom microplates. Not less than three plates are prepared for both standard solutions and sample solutions. Add exactly 100 μL of a test cell suspension containing 1 × 10⁶ cells per mL in the sample dilution solution for assay to each well, and incubate under atmosphere of 5% carbon dioxide at 37 ± 2°C for 21 to 27 hours. After incubation, add 40 μL of fluorogenic substrate TS to each well, incubate under the same conditions as above for 21 to 51 hours, and measure fluorescence intensities at excitation wavelength 530 to 560 nm and at measurement wavelength 590 nm, using fluorescence microplate reader. Use the data from at least 3 plates and not less than 3 concentrations of the standard solution and sample solution for the calculation.

(vi) Calculation Transform each concentration of the sample solutions and standard solutions to common logarithm, and name them as x₁ and xₖ, respectively, and their totals are named as Xₓ and Xₛ, respectively. The fluorescence intensities obtained from the sample solution and the standard solution are named as y₁ and yₖ, and their totals are named as Yₓ and Yₛ, respectively. The numbers of the concentrations of the sample solution and the standard solution are named as n₁ and nₖ, respectively, the number of the plate is r. Calculate the specific activity of Filgrastim (Genetical Recombination) by the following equation, using the protein content (mg/mL) obtained in (1).

Specific activity (unit/mg) of Filgrastim (Genetical Recombination) = \frac{\text{antilog } \log M \times \text{biological activity of Filgrastim RS}}{\text{dilution factor for } U_{\text{U}} \times \text{dilution factor for } S_{\text{H}} / 1} \times \text{protein content (mg/mL) obtained in the Assay 1)}

\begin{align*}
M & = X_{x}/n_{x} - X_{x}/n_{x} - (\Sigma Y_{x}/n_{x} - \Sigma Y_{x}/n_{x})/b \\
b & = (x_{x} + x_{y})/(S_{x} + S_{x}) \\
x_{x} & = X_{x} - X_{r} \Sigma Y_{x}/n_{x} \\
x_{y} & = X_{y} - X_{r} \Sigma Y_{y}/n_{y} \\
x_{rs} & = x_{x} - x_{y} \\
x_{rs} & = (S_{x} \Sigma x_{y} - x_{x} \Sigma Y_{x}/n_{x})/n_{x} \\
x_{rs} & = (S_{x} \Sigma x_{y} - x_{x} \Sigma Y_{x}/n_{y})/n_{y} \\
S_{x} & = x_{x} - x_{y} \\
S_{y} & = x_{x} - x_{y}
\end{align*}

The necessary requirements for validity of the test are following three items:
1) \( F_S \) is not less than \( F_I \) against \( m = n_{5} \) (r - 1) shown in the table below, and \( F_U \) is not less than \( F_I \) against \( m = n_{5} \) (r - 1) shown in the table.

\begin{align*}
F_S & = V_{ES}/V_{CS} \\
V_{ES} & = S_{x}x_{y}/x_{x}, y_{x} \Sigma x_{y}/x_{x} \\
V_{CS} & = \Sigma x_{y}^{2} - (\Sigma Y_{x}/r)/n_{x}(r - 1) \\
F_U & = V_{EU}/V_{EU} \\
V_{EU} & = S_{x}x_{y}/x_{x}, y_{x} \Sigma x_{y}/x_{x} \\
V_{EU} & = \Sigma x_{y}^{2} - (\Sigma Y_{x}/r)/n_{x}(r - 1)
\end{align*}

2) \( F \) is smaller than \( F_I \) against \( m = (n_{5} + n_{5})(r - 1) \) shown in the table below.

\begin{align*}
F' & = V_{F}/V_{F} \\
V_{F} & = S_{x}x_{y}^{2}/x_{x}, y_{x} S_{x}x_{y}/x_{x} - (S_{x}x_{y} + S_{y}x_{y})/ \\
& (S_{x}x_{y} + S_{x}x_{y}) \\
V_{F} & = \Sigma x_{y}^{2} + (\Sigma Y_{x}/r) - (\Sigma Y_{x}/r)/n_{x}(r - 1)
\end{align*}

3) \( L \neq 0.3 \)

\begin{align*}
L & = \frac{2(b(1 - g)/V_{F})[(1 - g)(Y_{x}/n_{x}) + 1/n_{y}]}{\Sigma Y_{x}/n_{x} - \Sigma Y_{x}/n_{y}(r - 1)/b^{2}(S_{x}x_{y} + S_{x}x_{y})}
\end{align*}

\( F_I \): Value against \( m = (n_{5} + n_{5})(r - 1) \) shown in the table.

\( g = V_{F}/b^{2}(S_{x}x_{y} + S_{x}x_{y}) \)

Value of \( F_I \) against \( m \)

Containers and storage

Containers—Hermetic containers.
Storage—Not exceeding 10°C, avoiding freezing.

Filtrastim (Genetical Recombination) Injection
フィルグラスチム（遺伝子組換え）注射液

Filtrastim (Genetical Recombination) Injection is an aqueous injection.
It contains not less than 90.0% and not more than 110.0% of the labeled amount of Filgrastim (genetical recombination) \((C_{84}H_{132}O_{22}N_{22}O_{22}Se_{24}: 18798.61)\).

Method of preparation
Prepare as directed under Injections, with Filgrastim (Genetical Recombination).

Description
Filtrastim (Genetical Recombination) Injection is a clear and colorless liquid.

Identification
Take a volume of Filgrastim (Genetical Recombination) Injection, equivalent to 5 to 10 μg of Filgrastim (Genetical Recombination) depending on the size of polycrylamide gel for filgrastim, and add 0 to 16 μL of water. To 3 volumes of this solution add 1 volume of buffer solution for filgrastim sample so that each mL contains about 0.19 mg of protein, and use this solution as the sample solution. Then, proceed as directed in the Identification (1) under Filgrastim (Genetical Recombination).

Osmotic pressure ratio
Being specified separately when the drug is granted approval based on the Law.

pH
Being specified separately when the drug is granted approval based on the Law.

Purity
Multimers—Proceed as directed in the Purity (1) under Filgrastim (Genetical Recombination) using a volume of Filgrastim (Genetical Recombination) Injection, equivalent to about 125 μg of Filgrastim (Genetical Recombination). Where, the test for required detectability and the system repeatability under the system suitability are tested using Filgrastim RS.

Bacterial endotoxins
Less than 0.25 EU/mL.

Extractable volume
It meets the requirement.

Foreign insoluble matter
Perform the test according to
Insoluble particulate matter <5.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Biological activity Calculate the biological activity in 1 ampoule or syringe of Filgrastim (Genetical Recombination) Injection by the following equation, using the biological activity in 1 mL of Filgrastim (Genetical Recombination) Injection determined as directed in the Assay (2) under Filgrastim (Genetical Recombination) and the labeled volume of Filgrastim (Genetical Recombination) Injection: it is not less than 70% and not more than 140% of the target biological activity (unit).

Biological activity (unit) in 1 ampoule or syringe of Filgrastim (Genetical Recombination) Injection

\[
= \text{antilog } M \times \text{biological activity (unit/mL) of Filgrastim (Genetical Recombination) Injection} \\
= S_H \times U_H \times \text{dilution factor for } S_H \times U_H \times \text{labeled volume (mL) of Filgrastim (Genetical Recombination) Injection}
\]

where, the target biological activity (unit) is calculated by the following formula.

Target biological activity (unit)

\[
= 1.5 \times 10^6 \times \text{dilution factor for } U_H \times \text{dilution factor for } S_H \times \text{labeled amount (mg) of Filgrastim (Genetical Recombination) in labeled volume (mL)}
\]

Assay Perform the test with an exact volume each of Filgrastim (Genetical Recombination) Injection and Filgrastim RS, equivalent to about 100 µg of Filgrastim (Genetical Recombination), as directed in the Assay (1) under Filgrastim (Genetical Recombination). Calculate the amount of filgrastim in 1 mL of Filgrastim (Genetical Recombination) Injection by following formula.

\[
\text{Amount (mg) of filgrastim in 1 mL} = C \times A_T / A_S \times V_S / V_T
\]

C: Protein concentration (mg/mL) of Filgrastim RS

V_S: Amount (µL) of Filgrastim RS taken

V_T: Amount (µL) of Filgrastim (Genetical Recombination) Injection taken

Containers and storage Containers—Hermetic containers. Storage—Light-resistant, not exceeding 10°C avoiding freezing.

Flavin Adenine Dinucleotide Sodium

フラビンアデニンジヌクレオチドナトリウム

\[
C_2H_3N_2Na_2O_2P_2: \quad 829.51
\]

Disodium adenosine 5’-[2R,3S,4S]-5-(7,8-dimethyl-2,4-dioxo-3,4-dihydrobenzof[3]pteridin-10(2H)-yl)-2,3,4-trihydroxypentyl diphosphate

[84366-81-4]

Flavin Adenine Dinucleotide Sodium contains not less than 93.0% of flavin adenine dinucleotide sodium (C2H3N2Na2O15P2), calculated on the anhydrous basis.

Description Flavin Adenine Dinucleotide Sodium occurs as an orange-yellow to light yellow-brown powder. It is odorless or has a slight, characteristic odor, and has a slightly bitter taste.

It is freely soluble in water, and practically insoluble, in methanol, in ethanol (95), in ethyleneglycol and in diethyl ether.

It is hygroscopic.

It is decomposed by light.

Identification (1) A solution of Flavin Adenine Dinucleotide Sodium (1 in 100,000) is light yellow-green in color, and shows a strong yellow-green fluorescence. To 5 mL of the solution add 0.02 g of hydrosulfite sodium: the color and the fluorescence of the solution disappear, and gradually reappear when the solution is shaken in air. Add dilute hydrochloric acid or sodium hydroxide TS dropwise: the fluorescence of the solution disappears.

(2) Determine the infrared absorption spectrum of Flavin Adenine Dinucleotide Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.1 g of Flavin Adenine Dinucleotide Sodium add 10 mL of nitric acid, evaporate on a water bath to dryness, and ignite. To the residue add 10 mL of diluted nitric acid (1 in 50), boil for 5 minutes, and after cooling, neutralize with ammonia TS, then filter the solution if necessary: the optical rotation <2.49>, [α]D20: −21.0 – −25.5° (0.3 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Flavin Adenine Dinucleotide Sodium in 100 mL of water: the pH of this solution is between 5.5 and 6.5.

Purity (1) Clarity and color of solution—Dissolve 0.20 g of Flavin Adenine Dinucleotide Sodium in 10 mL of water:
the solution is clear and orange-yellow in color.

(2) Free phosphoric acid—Weigh accurately about 0.02 g of Flavin Adenine Dinucleotide Sodium, dissolve in 10 mL of water, and use this solution as the sample solution. Separately, measure exactly 2 mL of Standard Phosphoric Acid Solution, add 10 mL of water, and use this solution as the standard solution. To each of the sample solution and standard solution add 2 mL of diluted perchloric acid (100 in 117), then add 1 mL of hexammonium heptamolybdate TS and 2 mL of 2,4-diaminophenol dihydrochloride TS, respectively, shake, add water to make exactly 25 mL, and allow to stand at 20±1°C for 30 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared in the same manner with 2 mL of water, as the blank, and determine the absorbances, A_U and A_S, of the subsequent solutions of the sample solution and the standard solution at 730 nm, respectively: the amount of free phosphoric acid is less than 0.25%.

\[
\text{Amount (\%)} = \frac{M \times A_U}{A_S \times 5.16}
\]

M: Amount (mg) of flavin adenosine dinucleotide taken, calculated on the anhydrous basis

(3) Heavy metals <1.07>—Proceed with 1.0 g of Flavin Adenine Dinucleotide Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 0.1 ppm).

(4) Arsenic <1.17>—Prepare the test solution with 2.0 g of Flavin Adenine Dinucleotide Sodium according to Method 3, and perform the test (not more than 1 ppm).

(5) Related substances—Dissolve 0.10 g of Flavin Adenine Dinucleotide Sodium in 200 mL of the mobile phase, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak area, A, of flavin adenosine dinucleotide and the total area, S, of peaks other than flavin adenosine dinucleotide by the automatic integration method: S/(A + S) is not more than 0.10.

Operating conditions—
Column, column temperature, mobile phase, flow rate, and time span of measurement: Proceed as directed in the operating conditions in the Procedure (i) under the Assay (1).

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

System suitability—
System performance: Proceed as directed in the system suitability in the Procedure (ii) under the Assay (1).

Test for required detectability: To exactly 2 mL of the sample solution add the mobile phase to make exactly 20 mL, and use this solution as the solution for system suitability test. Confirm that the peak area of flavin adenosine dinucleotide obtained with 20 μL of the solution for system suitability test is equivalent to 8 to 12% of that with 20 μL of the sample solution.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of flavin adenosine dinucleotide is not more than 1.0%.

Water <2.48> Take 50 mL of a mixture of methanol for water determination and ethylene glycol for water determination (1:1) into a dry titration flask, and titrate with Karl Fischer TS for water determination until end point. Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, transfer quickly to the titration flask, add an excess and constant volume of Karl Fischer TS for water determination, dissolve by stirring for 10 minutes, and perform the test: the water content is not more than 10.0%.

Assay (1) Procedure (i) Total flavin content—Conduct this procedure without exposure to light, using light-resistant vessels. Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, and dissolve in water to make exactly 200 mL. Pipet 5 mL of this solution, add 5 mL of zinc chloride TS, and heat in a water bath for 30 minutes. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Riboflavin RS, previously dried at 105°C for 2 hours, dissolve in 200 mL of diluted acetic acid (100) (1 in 100) by warming, cool, add water to make exactly 500 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_U and A_S, of the sample solution and standard solution at 450 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

\[
\text{Total amount (mg of flavin) = } M_S \times A_U/A_S \times 4/5
\]

M_S: Amount (mg) of Riboflavin RS taken

(ii) Peak area ratio of flavin adenine dinucleotide—Dissolve 0.1 g of Flavin Adenine Dinucleotide Sodium in 200 mL of water, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under the Liquid Chromatography <2.01> according to the following conditions. Determine the peak area, A, of flavin adenine dinucleotide, and the total area, S, of the peaks other than flavin adenine dinucleotide by the automatic integration method.

Peak area ratio of flavin adenine dinucleotide = 1.08A/(1.08A + S)

Operating conditions—
Detector: A visible spectrophotometer (wavelength: 450 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilaized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of a solution of potassium hydrogen phosphate (1 in 500) and methanol (4:1).

Flow rate: Adjust so that the retention time of flavin adenine dinucleotide is about 10 minutes.

Time span of measurement: About 4.5 times as long as the retention time of flavin adenine dinucleotide.

System suitability—
Test for required detectability: To exactly 2 mL of the sample solution add water to make exactly 20 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add water to make exactly 20 mL. Confirm that the peak area of flavin adenine dinucleotide obtained with 5 μL of this solution is equivalent to 8 to 12% of that with 5 μL of the solution for system suitability test.

System performance: Dissolve 20 mg each of Flavin Adenine Dinucleotide Sodium and riboflavin sodium phosphate in 100 mL of water. When the procedure is run with 5 μL of this solution under the above operating conditions, flavin adenine dinucleotide and riboflavin phosphate are eluted in this order with the resolution between these peaks being not
Flavoxate Hydrochloride

цион имеет белый цвет, кристалл или кристаллическую форму. 

Описание: Flavoxate Hydrochloride имеет белый цвет, кристаллы или кристаллическую форму. 

Идентификация (1): Определите спектр поглощения раствора Flavoxate Hydrochloride в 0,01 mol/L гидроксиламин с TS (1 в 50,000) при помощи УФ-видимого спектрофотометра <2,24>, и сравните с спектром, полученным с помощью спектрометра с образцом: оба спектра имеют схожие интенсивности поглощения при одинаковых волнах.

(2): Определите инфракрасный спектр поглощения Flavoxate Hydrochloride, предварительно сухой, как указано в методике спектрометрии инфракрасного излучения <2,25>, и сравните с спектром, полученным с помощью спектрометра с образцом: оба спектра имеют схожие интенсивности поглощения при одинаковых волнах.

(3): Состав Flavoxate Hydrochloride (1 в 100) соответствует качественным тестам <1.09> для хлорида.

Очистка (1): Взвешите точно около 0,6 г Flavoxate Hydrochloride и разведите в 10 мЛ хлороформа, и используйте этот раствор как образец.

Устойчивость к перегреву <2,41>: Не более 1,0% (1 г, низкое давление, силикон гель, 2 часов).

Остаток на сгорании <2,44>: Не более 0,1% (1 г).

Анализ: Сухое Flavoxate Hydrochloride, 17 г (2)-пиридин-1-илэтил 3-метил-4-оксо-2-фенил-4-хромен-8-карбоксилат моноплата.

[3717-88-2]

Flecainide Acetate

Напрягательная кислота

C_{25}H_{32}NO_{3}.HCl: 427,92
2-(Пиридин-1-ил)этил 3-метил-4-оксонафтен-4Н-хромен-8-карбоксилат моноплата [3717-88-2]

Flecainide Acetate, когда сущий, не менее 99,0% от массы Flavoxate Hydrochloride (C_{25}H_{32}NO_{3}.HCl).

Описание: Flecainide Acetate имеет белый цвет, кристаллы или кристаллическую форму. 

Она растворима в метаноле (100) и в хлороформе, слабо растворима в воде и эфире (95), и практически не растворима в ацетонитриле и диэтиловом эфире.

Идентификация (1): Определите спектр поглощения раствора Flecainide Acetate в 0,01 моль/Л гидроксида натрия с TS (1 в 50,000) при помощи УФ-видимого спектрофотометра <2,24>, и сравните с спектром, полученным с помощью спектрометра с образцом: оба спектра имеют схожие интенсивности поглощения при одинаковых волнах.

(2): Определите инфракрасный спектр поглощения Flecainide Acetate, предварительно сухой, как указано в методике спектрометрии инфракрасного излучения <2,25>, и сравните с спектром, полученным с помощью спектрометра с образцом: оба спектра имеют схожие интенсивности поглощения при одинаковых волнах.

(3): Состав Flecainide Acetate (1 в 100) соответствует качественным тестам <1.09> для хлорида.
under Ultraviolet-visible Spectrophotometry \(<2.24\) and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

3. Determine the infrared absorption spectrum of Flecainide Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

4. Flecainide Acetate responds to Qualitative Tests \(<1.0\text{\(d\)}}\) (1) for acetate.

\text{pH} \,<2.540\quad \text{The pH of a solution of 0.5 g of Flecainide Acetate in 20 mL of water is 6.7 to 7.1.}

\textbf{Purity} (1) Clarity and color of solution—Dissolve 0.25 g of Flecainide Acetate in 10 mL of water: the solution is clear and colorless.

2. Heavy metals \(<1.0\text{\(d\)}}—Transfer 1.0 g of Flecainide Acetate in a porcelain crucible, and heat gently to carbonize. After cooling, add 2 mL of sulfuric acid, heat carefully until white fumes are no longer evolved, then proceed according to Method 2 to prepare the test solution, and perform the test. Prepare the control solution as follows: Place 2 mL each of sulfuric acid and hydrochloric acid in a porcelain crucible, evaporate on a water bath, then evaporate to dryness on a sand bath, add to the residue 3 drops of hydrochloric acid, then proceed in the same manner as for the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

3. 2-Aminomethylpiperidine—Dissolve exactly 0.25 g of Flecainide Acetate in exactly 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve exactly 50 mg of 2-aminomethylpiperidine in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.0\text{\(d\)}}. Spot 5 \mu L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone and ammonia solution (28) (20:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in methanol (1 in 500), and heat at 105°C for 2 to 5 minutes: the spot obtained from the sample solution, corresponding to the spot obtained from the standard solution, is not more intense than the spot from the standard solution.

4. Related substances—Dissolve 0.25 g of Flecainide Acetate in 25 mL of a mixture of water and acetonitrile \((7:1)\), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of water and acetonitrile \((7:1)\) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of water and acetonitrile \((7:1)\) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu L\) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.0\text{\(d\)}} according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the area of the peak other than flecainide obtained from the sample solution is not larger than the peak area of flecainide obtained from the standard solution, and the total area of the peaks other than flecainide from the sample solution is not larger than 2.5 times the peak area of flecainide from the standard solution. For the areas of the peaks, having the relative retention time of about 1.5 and about 2.9 to flecainide, multiply their correction factors, 0.3 and 1.7, respectively.

\textbf{Operating conditions—}

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography \((5 \mu m \text{ in particle diameter})\).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water, acetonitrile, acetic acid \((100)\) and tetrabutylammonium hydroxide-methanol TS \((142:58:2:1)\), adjusted to pH 5.8 with ammonia solution \((28)\).

Flow rate: Adjust so that the retention time of flecainide is about 4 minutes.

Time span of measurement: About 5 times as long as the retention time of flecainide, beginning after the solvent peak.

\textbf{System suitability—}

Test for required detectability: To exactly 1 mL of the standard solution add a mixture of water and acetonitrile \((7:29)\) to make exactly 10 mL. Confirm that the peak area of flecainide obtained with 20 \(\mu\text{L}\) of this solution is equivalent to 7 to 13% of that with 20 \(\mu\text{L}\) of the standard solution.

System performance: When the procedure is run with 20 \(\mu\text{L}\) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of flecainide are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 \(\mu\text{L}\) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flecainide is not more than 2.0%.

\textbf{Loss on drying} \(<2.4\text{\(d\)}}—Not more than 0.5% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 2 hours).

\textbf{Residue on ignition} \(<2.4\text{\(d\)}}—Not more than 0.2% (1 g).

\textbf{Assay} Weigh accurately about 0.6 g of Flecainide Acetate, previously dried, dissolve in 100 mL of acetic acid \((100)\), and titrate \(<2.5\text{\(d\)}} with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform the blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 47.44 mg of \(C_{17}H_{32}F_{2}N_{2}O_{5}\). \(C_3H_2O_2\).

\textbf{Containers and storage} Containers—Tight containers. Storage—Light-resistant.

\textbf{Flecainide Acetate Tablets}

フレカイニド酢酸塩錠

Flecainide Acetate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of flecainide acetate \((C_{17}H_{32}F_{2}N_{2}O_{5}; C_3H_2O_2; 474.39)\).

\textbf{Method of preparation} Prepare as directed under Tablets, with Flecainide Acetate.

\textbf{Identification} To an amount of powdered Flecainide Acetate Tablets, equivalent to 0.2 g of Flecainide Acetate, add 4 mL of methanol, shake for 20 minutes, then centrifuge and use the supernatant liquid as the sample solution. Separately, dissolve 0.1 g of flecainide acetate in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.0\text{\(d\)}}. Spot 5 \mu L each of the sample solution and
standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone and ammonia solution (28:20:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from standard solution show the same Rf value.

**Uniformity of dosage units** Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

Completely disintegrate 1 tablet of Flomecin Ace A Tablets in 4 V/5 mL of a solution of lactic acid (1 in 500) by sonication. After allowing to stand for 30 minutes while swirling occasionally, add a solution of lactic acid (1 in 500) to make exactly V mL so that each mL contains about 1 mg of flomecin ace acetate (C17H20F2N2O5.C2H6O3), and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add a solution of lactic acid (1 in 500) to make exactly 50 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of flomecin acetate (C17H20F2N2O5.C2H6O3) = Mx \times A1/A2 \times V/25

Mx: Amount (mg) of flomecin acetate for assay taken

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Flomecin Ace A Tablets is not less than 70%.

Start the test with 1 tablet of Flomecin Ace A Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 56 μg of flomecin acetate (C17H20F2N2O5.C2H6O3), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of flomecin acetate for assay, previously dried under reduced pressure not exceeding 0.67 kPa at 60°C for 2 hours, and dissolve in water to make exactly 50 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, A1 and A3, of the sample solution and standard solution at 296 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.2.

Dissolution rate (%) with respect to the labeled amount of flomecin acetate (C17H20F2N2O5.C2H6O3) = Mx \times A1/A3 \times V’/V \times 1/C \times 180

Mx: Amount (mg) of flomecin acetate for assay taken

C: Labeled amount (mg) of flomecin acetate (C17H20F2N2O5.C2H6O3) in 1 tablet

**Assay** Accurately weigh the mass of not less than 20 Flomecin Ace A Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g of flomecin acetate (C17H20F2N2O5.C2H6O3), add 80 mL of a solution of lactic acid (1 in 500), sonicate for 5 minutes, then add a solution of lactic acid (1 in 500) to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add a solution of lactic acid (1 in 500) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of flomecin acetate for assay, previously dried under reduced pressure not exceeding 0.67 kPa at 60°C for 2 hours, dissolve in a solution of lactic acid (1 in 500) to make exactly 50 mL. Pipet 10 mL of this solution, add a solution of lactic acid (1 in 500) to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A1 and A3, of the sample solution and standard solution at 296 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.2.

Amount (mg) of flomecin acetate (C17H20F2N2O5.C2H6O3) = Mx \times A1/A3 \times 4

Mx: Amount (mg) of flomecin acetate for assay taken

**Flomecin Sodium**

フロモキセフナトリウム

![Flomecin Sodium](Image)

C17H17F2N2NaO6S2: 518.45

Monosodium (6R,7R)-7-[(difluoromethylsulfonyl)acetyl]amino]-3-[1-(2-hydroxyethyl)-1H-tetrazol-5-ylsulfanyl methyl]-7-methoxy-8-oxo-5-oxa-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

Flomecin Sodium contains not less than 870 μg (potency) and not more than 985 μg (potency) per mg, calculated on the anhydrous basis. The potency of Flomecin Sodium is expressed as mass (potency) of flomecin ace acetate (C17H20F2N2O5.S2): 496.47.

**Description** Flomecin Sodium occurs as white to light yellow-white, powder or masses. It is very soluble in water, freely soluble in methanol, and sparingly soluble in ethanol (99.5).

**Identification** (1) Decompose 0.01 g of Flomecin Sodium as directed under Oxygen Flask Combustion Method 1.06.5, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. To 2 mL of the test solution so obtained add 1.5 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium (III) nitrate TS (1:1:1): blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Flomecin Sodium (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24.2, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Flomecin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25.2, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Determine the H' spectrum of a solution of Flomecin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy 2.21.3, using sodium 3-trimethyl-
Flomoxef Sodium responds to Qualitative Tests

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Flomoxef Sodium in 10 mL of water: the solution is clear and has no more color than the following control solution.

Control solution: To a mixture of 3.0 mL of Cobalt (II) Chloride CS and 12 mL of Iron (III) Chloride CS add 35 mL of diluted dilute hydrochloric acid (1 in 10). To 5.0 mL of this solution add 5.0 mL of diluted dilute hydrochloric acid (1:10).

(2) Heavy metals. Proceed with 1.0 g of Flomoxef Sodium in a quartz crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic. To 1.0 g of Flomoxef Sodium 5 mL of sulfuric acid and 5 mL of nitric acid, heat carefully until the solution changes to colorless to light yellow with occasional addition of 2 mL of nitric acid. After cooling, add 10 mL of ammonium oxalate TS, heat until white fumes evolve, and concentrate to 2 to 3 mL. After cooling, add water to make 10 mL, and perform the test using this solution as the test solution: the color is not darker than that of the control solution.

Control solution: Proceed to prepare a solution in the same manner as the test solution without Flomoxef Sodium, and transfer 10 mL of the solution so obtained to the generator bottle, add exactly 2 mL of Standard Arsenic Solution, and proceed in the same manner as the test solution (not more than 2 ppm).

(4) 1-(2-Hydroxyethyl)-1H-tetrazol-5-thiol—Use the sample solution obtained in the Assay as the sample solutions. Weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Q₇ and Q₉, of the peak area of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol to that of the internal standard: the amount of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol is not more than 1.0% of the amount of Flomoxef Sodium calculated on the anhydrous basis.

Amount (mg) of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol (C₈H₁₅N₃O₄S) = M₅ × Q₇/Q₉ × 1/10

M₅: Amount (mg) of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol taken

Internal standard solution—A solution of m-cresol (3 in 1000).

Operating conditions—
Proceed as directed in the operating conditions in the Assay.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 20 mL. Confirm that the peak area of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol obtained with 5 μL of this solution is equivalent to 3.5 to 6.5% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of flomoxef to that of the internal standard is not more than 1.0%.

System repeatability: When the test is repeated 3 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of flomoxef to that of the internal standard is not more than 1.0%.

Water. Not more than 1.5% (0.5 g, volumetric titration, back titration).

Assay—Weigh accurately an amount of Flomoxef Sodium and Flomoxef Triethylammonium RS, equivalent to about 50 mg (potency), and dissolve each in exactly 50 mL of the internal standard solution, add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Q₇ and Q₉, of the peak area of flomoxef to that of the internal standard.

Amount [μg (potency)] of flomoxef (C₁₅H₂₃F₂N₄O₇S₂) = M₅ × Q₇/Q₉ × 1000

M₅: Amount (mg [potency]) of Flomoxef Triethylammonium RS taken

Internal standard solution—A solution of m-cresol (3 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 - 10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.94 g of potassium dihydrogen phosphate, 3.22 g of disodium hydrogen phosphate dodecahydrate and 1.60 g of tetra-n-butylammonium bromide in water to make 1000 mL. To 750 mL of this solution add 250 mL of methanol.

Flow rate: Adjust so that the retention time of flomoxef is about 9 minutes.

System suitability—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, flomoxef and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 3 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of flomoxef to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.
Flomoxef Sodium for Injection

Flomoxef Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of flomoxef (C₁₆H₁₄F₆N₂O₇S₂: 496.47).

Method of preparation Prepare as directed under Injections, with Flomoxef Sodium.

Description Flomoxef Sodium for Injection occurs as white to light yellow-white, friable masses or powder.

Identification Proceed as directed in the Identification (3) under Flomoxef Sodium.

pH <2.54> The pH of a solution obtained by dissolving an amount of Flomoxef Sodium for Injection, equivalent to 0.5 g (potency) of Flomoxef Sodium, in 5 mL of water is between 4.0 and 5.5.

Purity (1) Clarity and color of solution—Dissolve an amount of Flomoxef Sodium for Injection, equivalent to 1.0 g (potency) of Flomoxef Sodium, in 10 mL of water: the solution is clear and colorless or pale yellow.

(2) 1-(2-Hydroxyethyl)-1H-tetrazol-5-thiol—Use the sample solution obtained in the Assay as the sample solution. Weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.00> according to the following conditions, and calculate the ratios, \( Q_7 \) and \( Q_8 \), of the peak area of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol to that of the internal standard. Calculate the amount of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol per 1 g (potency) of Flomoxef Sodium for Injection by the following formula: not more than 10 mg.

\[
\text{Amount (mg) of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol (C₁₆H₁₄F₆N₂O₇S₂)} = \frac{M_8 \times Q_7}{Q_8} \times 1/10
\]

\( M_8 \): Amount (mg) of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol taken

Internal standard solution—A solution of m-cresol (3 in 1000).

Operating conditions—

Proceed as directed in the operating conditions in the Assay under Flomoxef Sodium.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 20 mL. Confirm that the peak area of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol obtained with 5 µL of this solution is equivalent to 3.5–6.5% of that with 5 µL of the standard solution.

System performance: When the procedure is run with 5 µL of the standard solution under the above operating conditions, 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol and the internal standard are eluted in this order with the resolution between these peaks being not less than 20.

System repeatability: When the test is repeated 3 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol to that of the internal standard is not more than 1.0%.

Water <2.48> Not more than 1.5% (0.5 g, volumetric titration, back titration).

Bacterial endotoxins <4.01> Less than 0.025 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06> Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Weigh accurately the mass of the contents of not less than 10 Flomoxef Sodium for Injection, and calculate the average mass of the content. Spread out thinly about 1 g of the content in a petri dish, allow the dish to stand in a desiccator containing a saturated solution of magnesium bromide without light exposure to equilibrate the sample to constant water content. Determine the water content, separately, with about 0.1 g of the sample according to the method described in Water. Weigh accurately an amount of the sample, equivalent to about 50 mg (potency) of Flomoxef Sodium, add exactly 50 mL of the internal standard solution to dissolve, add water to make 100 mL, and use this solution as the sample solution. Separately weigh accurately about 50 mg (potency) of Flomoxef Triethylammonium RS, add exactly 50 mL of the internal standard solution to dissolve, add water to make 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Flomoxef Sodium.

\[
\text{Amount [µg (potency)] of flomoxef (C₁₆H₁₄F₆N₂O₇S₂)} = \frac{M_8 \times Q_7}{Q_8} \times 1000
\]

\( M_8 \): Amount [µg (potency)] of Flomoxef Triethylammonium RS taken

Internal standard solution—A solution of m-cresol (3 in 1000).

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injection may be used.
Flopropione

フロプロピオン

![Chemical Structure](image)

C₆H₁₀O₂: 182.17
1-(2,4,6-Trihydroxyphenyl)propan-1-one
[2295-56-7]

Flopropione occurs as a white to pale yellow-brown crystalline powder.

Description
Flopropione is very soluble in N,N-dimethylformamide, freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Flopropione in ethanol (99.5) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flopropione as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.60> 177 – 181°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Flopropione according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Flopropione in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.04> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than flopropione obtained from the sample solution is not larger than 1/10 times the peak area of flopropione from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 267 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeccysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of acetonitrile, water and phosphoric acid (114:86:1).

Flow rate: Adjust so that the retention time of flopropione is about 3 minutes.

Time span of measurement: About 7 times as long as the retention time of flopropione.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of flopropione obtained with 20 μL of this solution is equivalent to 7 to 13% of that with from 20 μL of the standard solution.

System performance: Dissolve 25 mg of ethyl parahydroxybenzoate in 30 mL of acetonitrile, and add the mobile phase to make 50 mL. To 2.5 mL of this solution add 2 mL of the sample solution and the mobile phase to make 50 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, flopropione and ethyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flopropione is not more than 1.0%.

Water <2.48> Not more than 4.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay
Weigh accurately about 0.3 g of Flopropione, dissolve in 30 mL of N,N-dimethylformamide, and titrate with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS

= 18.22 mg of C₆H₁₀O₂

Containers and storage  Containers—Tight containers.

Storage—Light-resistant.

Flopropione Capsules

フロプロピオンカプセル

Flopropione Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of flopropione (C₆H₁₀O₂: 182.17).

Method of preparation
Prepare as directed under the Capsules, with Flopropione.

Identification (1) Powder the contents of Flopropione Capsules. To a portion of the powder, equivalent to 60 mg of Flopropione, add 40 mL of water, shake well, and filter. To 5 mL of the filtrate add 1 mL of iron (III) nitrate TS: a red-purple color appears.

(2) Powder the contents of Flopropione Capsules. To a portion of the powder, equivalent to 90 mg of Flopropione, add 100 mL of ethanol (99.5), shake well, and filter. To 5 mL of the filtrate add ethanol (99.5) to make 50 mL. To 5 mL of this solution add ethanol (99.5) to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Flopropione Capsules add 43 mL of a mixture of water and phosphoric acid (86:1), and disintegrate the capsule in a water bath at 50°C. After cooling, add
a suitable amount of acetonitrile to make exactly V mL of a solution containing about 0.4 mg of flopropione (C₇H₁₀O₃) per mL. Stir the solution for 10 minutes, centrifuge a part of the solution at 3000 rpm for 5 minutes, and use the supernatant liquid as the sample solution. Proceed as directed in the Assay.

Amount (mg) of flopropione (C₇H₁₀O₃)  
\[ M_s = M_x \times A_T / A_S \times V/100 \]

\( M_S \): Amount (mg) of flopropione for assay taken, calculated on the anhydrous basis

**Dissolution** (6.10) When the test is performed at 100 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Flopropione Capsules is not less than 80%.

Start the test with 1 capsule of Flopropione Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly V’ mL so that each mL contains about 8.8 μg of flopropione (C₇H₁₀O₃), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of flopropione for assay (separately determine the water \(< 2.48\) in the same manner as Flopropione), and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₅, at 284 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \(< 2.24\), using 0.1 mol/L hydrochloric acid TS as the blank.

Dissolution rate (%) with respect to the labeled amount of flopropione (C₇H₁₀O₃)  
\[ = M_s \times A_T / A_S \times V'/V \times 1/C \times 36 \]

\( M_S \): Amount (mg) of flopropione for assay taken, calculated on the anhydrous basis

\( C \): Labeled amount (mg) of flopropione (C₇H₁₀O₃) in 1 capsule

**Assay** Take out the contents of not less than 20 Flopropione Capsules, weigh accurately the mass of the contents, and power. Weigh accurately a part of the powder, equivalent to about 40 mg of flopropione (C₇H₁₀O₃), and add the mobile phase to make exactly 100 mL. Stir the solution for 10 minutes, centrifuge a part of this solution for 5 minutes at 3000 rpm, use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of flopropione for assay (previously determine the water \(< 2.48\) in the same manner as Flopropione), add 70 mL of the mobile phase, and dissolve by sonication for 10 minutes. Add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 mL each of the sample solution and standard solution as directed under Liquid chromatography \(< 2.01\) according to the following conditions, and determine the peak areas, A₁ and A₅, of flopropione in each solution.

Amount (mg) of flopropione (C₇H₁₀O₃)  
\[ = M_s \times A_T / A_S \]

\( M_S \): Amount (mg) of flopropione for assay taken, calculated on the anhydrous basis

**Operating conditions**
- Detector: An ultraviolet absorption photometer (wavelength: 267 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 35°C.
- Mobile phase: A mixture of acetonitrile, water and phosphoric acid (114:86:1).
- Flow rate: Adjust so that the retention time of flopropione is about 3 minutes.

**System suitability**
- System performance: Dissolve 50 mg of flopropione in 50 mL of the mobile phase. To 20 mL of the solution add 25 mL of a solution prepared by dissolving 25 mg of ethyl parhydroxybenzoate in 30 mL of acetonitrile and add water to make 50 mL, and then add the mobile phase to make 50 mL. When the procedure is run with 5 μL of this solution under the above operating conditions, Flopropione and ethyl parhydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 2.0.
- System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flopropione is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

**Fluconazole**

フルコナゾール

C₉H₁₂F₂N₂O: 306.27
2-(2,4-Difluorophenyl)-1,3-bis(1H-1,2,4-triazol-1-yl)propan-2-ol [86586-73-4]

Fluconazole, when dried, contains not less than 99.0% and not more than 101.0% of fluconazole (C₁₅H₁₅F₂N₅O).

**Description** Fluconazole occurs as a white to pale yellow-white crystalline powder.

It is soluble in ethanol (99.5), and slightly soluble in water.

It dissolves in dilute hydrochloric acid.

**Identification** (1) Dissolve 0.1 g of Fluconazole in 10 mL of dilute hydrochloric acid, and add 1 mL of Reinecke’s salt TS: a light red precipitate is formed.

(2) Determine the absorption spectrum of a solution of Fluconazole in 0.01 mol/L hydrochloric acid-methanol TS (1 in 4000) as directed under Ultraviolet-visible Spectrophotometry \(< 2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fluconazole as directed in the potassium bromide disk method under Infrared Spectrophotometry \(< 2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.
JP XVIII

Melting point <2.60> 137 - 141°C

Purity (1) Clarity and color of solution—A solution obtained by dissolving 0.10 g of Fluconazole in 50 mL of water is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Fluconazole according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 30 mg of Fluconazole in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the peak area of related substance I, having the relative retention time about 0.60 to fluconazole obtained from the sample solution is not larger than 6 times the peak area of fluconazole from the standard solution, the area of the peak other than fluconazole and the related substance I from the sample solution is not larger than the peak area of fluconazole from the standard solution, and the total area of the peaks other than fluconazole from the sample solution is not larger than 8 times the peak area of fluconazole from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of water and acetonitrile (4:1).
Flow rate: Adjust so that the retention time of fluconazole is about 10 minutes.
Time span of measurement: About 3 times as long as the retention time of fluconazole, beginning after the solvent peak.
System suitability—

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of fluconazole obtained with 20 μL of this solution is equivalent to 35 to 65% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fluconazole are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fluconazole is not more than 2.0%.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.25 g of Fluconazole, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform the blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 15.31 mg of C13H12F2N2O

Containers and storage Containers—Tight containers.

Fluconazole Capsules

フルコナゾールカプセル

Fluconazole Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of fluconazole (C13H12F2N2O: 306.27).

Method of preparation Prepare as directed under Capsules, with Fluconazole.

Identification To an amount of powdered contents of Fluconazole Capsules, equivalent to 25 mg of Fluconazole, add 0.01 mol/L hydrochloric acid-methanol TS to make 100 mL, shake for 30 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.92>—it exhibits maxima between 259 nm and 263 nm and between 265 nm and 269 nm.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To the total amount of the content of 1 capsule of Fluconazole Capsules add the mobile phase to make exactly 100 mL. Disperse the particles by sonication, stir for 30 minutes, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V’ mL so that each mL contains about 50 μg of fluconazole (C13H12F2N2O), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of fluconazole (C13H12F2N2O) = M3 × A7/A3 × V’/V × 1/5

M3: Amount (mg) of fluconazole for assay taken

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rates in 90 minutes of 50-mg capsule and 100-mg capsule are not less than 80% and not less than 70%, respectively.

Start the test with 1 capsule of Fluconazole Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V’ mL so that each mL contains about 28 μg of fluconazole (C13H12F2N2O), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of fluconazole for assay, previously dried at 105°C for 4 hours, and dissolve in the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A7 and A3, of fluconazole in each solution.
Dissolution rate (%) with respect to the labeled amount of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O) \[ M_S = \frac{A_T}{A_S} \times \frac{V'}{V} \times 1/C \times 90 \] 

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fluconazole are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fluconazole is not more than 1.0%.

Assay

Take out the contents from not less than 20 Fluconazole Capsules, weigh accurately, and powder, if necessary. Weigh accurately a quantity of the contents, equivalent to about 50 mg of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O), and add the mobile phase to make exactly 100 mL. Disperse the particles by sonicating, stir for 30 minutes, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu m \). Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of fluconazole for assay, previously dried at 105\( ^\circ \)C for 4 hours, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 mL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of fluconazole in each solution.

Amount (mg) of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O) \[ M_S = \frac{A_T}{A_S} \times 2 \] 

M\textsubscript{S}: Amount (mg) of fluconazole for assay taken

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 261 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadeceansilanized silica gel for liquid chromatography (4 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 35\( ^\circ \)C.

Mobile phase: Dissolve 0.82 g of anhydrous sodium acetate in 1000 mL of water, and adjust to pH 5.0 with acetic acid (100). To 700 mL of this solution add 200 mL of methanol and 100 mL of acetonitrile.

Flow rate: Adjust so that the retention time of fluconazole is about 4 minutes.

System suitability—

System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fluconazole are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fluconazole is not more than 1.0%.

Containers and storage

Containers—Tight containers.

Fluconazole Injection

フルコナゾール注射液

Fluconazole Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O: 306.27).

Method of preparation

Prepare as directed under Injections, with Fluconazole.

Description

Fluconazole Injection occurs as a clear and colorless liquid.

Identification (1) Take a volume of Fluconazole Injection, equivalent to 0.1 g of Fluconazole, and evaporate to dryness on a water bath. To the residue add 10 mL of dilute hydrochloric acid, shake, and filter. Add 1 mL of Reinecke salt TS to the filtrate: a light red precipitate is produced.

(2) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\): it exhibits maxima between 259 nm and 263 nm, and between 264 nm and 268 nm.

pH

Being specified separately when the drug is granted approval based on the Law.

Bacterial endotoxins \(<4.01>\)

Less than 0.75 EU/mg.

Extractable volume \(<6.05>\)

It meets the requirement.

Foreign insoluble matter \(<6.06>\)

Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \(<6.07>\)

It meets the requirement.

Sterility \(<4.06>\)

Perform the test according to the Membrane filtration method: it meets the requirement.

Assay

Pipe up a volume of Fluconazole Injection, equivalent to 10 mg of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O), add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of fluconazole for assay, previously dried at 105\( ^\circ \)C for 4 hours, and dissolve in a solution of sodium chloride (9 in 1000) to make exactly 50 mL. Pipet 10 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and standard solution at 261 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\).

Amount (mg) of fluconazole (C\textsubscript{13}H\textsubscript{12}F\textsubscript{2}N\textsubscript{2}O) \[ M_S = \frac{A_T}{A_S} \times 1/5 \] 

M\textsubscript{S}: Amount (mg) of fluconazole for assay taken

Containers and storage

Containers—Hermetic containers.
Flucytosine

フルシトシン

C₇H₈FN₃O: 129.09
5-Fluorocytosine

[2022-85-7]

Flucytosine, when dried, contains not less than 98.5% of flucytosine (C₇H₈FN₃O), and not less than 14.0% and not more than 15.5% of fluorine (F: 19.00).

Description

Flucytosine occurs as a white crystalline powder. It is odorless.

It is sparingly soluble in water, slightly soluble in methanol, in ethanol (95), in acetic anhydride and in acetic acid (100), and practically insoluble in diethyl ether.

It dissolves in 0.1 mol/L hydrochloric acid TS.

The pH of a solution of 1.0 g of Flucytosine in 100 mL of water is between 5.5 and 7.5.

It is slightly hygroscopic.

Melting point: about 295°C (with decomposition).

Identification (1) Add 0.2 mL of bromine TS to 5 mL of a solution of Flucytosine (1 in 500); a yellow-brown color of bromine TS is immediately discharged. Further add 2 mL of barium hydroxide TS: a purple precipitate is formed.

(2) Proceed with 0.1 g of Flucytosine as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. The solution responds to Qualitative Tests <1.09> (2) for fluoride.

(3) Determine the absorption spectrum of a solution of Flucytosine in 0.1 mol/L hydrochloric acid TS (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Flucytosine in 100 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Flucytosine in 80 mL of water by heating on a water bath. After cooling, to 40 mL of this solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.2 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(3) Fluoride—Dissolve 0.10 g of Flucytosine in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution to a 20-mL volumetric flask, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerrous nitrate TS (1:1:1), and add water to make 20 mL. Allow the mixture to stand for 1 hour, and use this solution as the sample solution. Separately, transfer 4.0 mL of Standard Fluorine Solution to a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerrous nitrate TS (1:1:1). Proceed in the same manner as directed in the preparation of the sample solution, and use this solution as the standard solution. Transfer 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) to a 20-mL volumetric flask, proceed in the same manner as directed in the preparation of the standard solution, and use this solution as the blank solution. Determine the absorbances, A₉ and A₈, of the sample solution and standard solution at 600 nm, using the blank solution as the control as directed under Ultraviolet-visible Spectrophotometry <2.24>: A₉ is not larger than A₈ (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Flucytosine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Flucytosine according to Method 2, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 50 mg of Flucytosine in 5 mL of diluted methanol (1 in 2), and use this solution as the sample solution. Measure accurately 1 mL of the sample solution, add dilute perchloric acid (1 in 2) to make exactly 25 mL. Measure accurately 1 mL of this solution, add dilute perchloric acid (1 in 2) to make exactly 20 mL, and use this solution as the standard solution. Prepare the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and water (5:3:2) to a distance of about 12 cm, air-dry the plate, and observe the spots under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay (1) Flucytosine—Weigh accurately about 0.2 g of Flucytosine, previously dried, dissolve in 40 mL of acetic acid (100), add 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 12.91 mg of C₇H₈FN₃O

(2) Fluorine—Weigh accurately about 10 mg of Flucytosine, previously dried, and proceed as directed in the determination of fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide VS and 20 mL of water as the absorbing liquid.

Containers and storage—Containers—Tight containers.

Storage—Light-resistant.
Fludiazepam

フルジアゼパム

\[
\text{C}_{16}\text{H}_{12}\text{ClFNO}_2: 302.73 \\
7\text{-Chloro-5-(2-fluorophenyl)-1-methyl-1,3-dihydro-} \\
2\text{H}-1,4\text{-benzodiazepin-2-one} \\
[3900-31-0]
\]

Fludiazepam, when dried, contains not less than 99.0% of fludiazepam (C_{16}H_{12}ClFNO_2).

**Description** Fludiazepam occurs as white to light yellow, crystals or crystalline powder.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetic acid (100) and in diethyl ether, and practically insoluble in water.

**Identification** (1) Prepare the test solution with 0.01 g of Fludiazepam as directed under Oxygen Flask Combustion Method \(<1.06>\), using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests \(<1.09>(2)\) for fluoride.

(2) Determine the absorption spectrum of a solution of Fludiazepam in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Fludiazepam in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fludiazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Fludiazepam as directed under Flame Coloration Test \(<1.04>(2)\): a green color appears.

**Melting point** \(<2.60>\ 91 - 94°C\)

**Purity** (1) Chloride \(<1.03>\)—Dissolve 1.0 g of Fludiazepam in 50 mL of diethyl ether, add 50 mL of water, and shake. Separate the water layer, wash it with two 20-mL portions of diethyl ether, and filter the water layer. To 20 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals \(<1.07>\)—Proceed with 2.0 g of Fludiazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Fludiazepam in 20 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 50 mL. Pipet 2 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.05>\). Spot 20 \(\mu\)L of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethyl acetate (10:7) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41>\) Not more than 0.30% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** \(<2.44>\) Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Fludiazepam, previously dried, dissolve in 50 mL of acetic acid (100), and titrate \(<2.50>\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
\[= 30.28 \text{ mg of } C_{16}H_{12}ClFNO_2\]

**Containers and storage** Containers—Tight containers.

**Fludiazepam Tablets**

フルジアゼパム錠

Fludiazepam Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of fludiazepam (C_{16}H_{12}ClFNO_2: 302.73).

**Method of preparation** Prepare as directed under Tablets, with Fludiazepam.

**Identification** To a quantity of powdered Fludiazepam Tablets, equivalent to 2 mg of Fludiazepam, add 40 mL of methanol, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\): it exhibits a maximum between 315 nm and 319 nm. Therefore, to 5 mL of the filtrate add methanol to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\): it exhibits a maximum between 229 nm and 233 nm.

**Uniformity of dosage units** \(<6.02>\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Fludiazepam Tablets add 2V/25 mL of water, disintegrate the fine particles by sonication, add 3V/25 mL of acetonitrile, and shake for 10 minutes. Add a mixture of acetonitrile and water (3:2) to make exactly V mL so that each mL contains about 5 μg of fludiazepam (C_{16}H_{12}ClFNO_2), centrifuge, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of fludiazepam (C}_{16}\text{H}_{12}\text{ClFNO}_2) = M_S \times A_T/A_S \times V/5000
\]

M_S: Amount (mg) of fludiazepam for assay taken

**Dissolution** \(<6.10>\) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900
mL of water as the dissolution medium, the dissolution rate in 15 minutes of Fludiazepam Tablets is not less than 80%.

Start the test with 1 tablet of Fludiazepam Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 0.28 μg of fludiazepam (C_{16}H_{12}ClF_{3}N_{3}O), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of fludiazepam for assay, previously dried at 60°C for 3 hours under reduced pressure, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( \leq 2.0 \) according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of fludiazepam in each solution.

Dissolution rate (\% with respect to the labeled amount of fludiazepam (C_{16}H_{12}ClF_{3}N_{3}O)

\[ = M_S \times \frac{A_T}{A_S} \times \sqrt{V/V} \times 1/C \times 9/10 \]

\( M_S \): Amount (mg) of fludiazepam for assay taken

\( C \): Labeled amount (mg) of fludiazepam (C_{16}H_{12}ClF_{3}N_{3}O) in 1 tablet

Operating conditions—

Detector, column temperature and flow rate: Proceed as directed in the operating conditions in the Assay.

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water and acetonitrile (1:1).

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fludiazepam are not less than 6000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fludiazepam is not more than 1.0%.

Containers and storage  Containers—Tight containers.

**Fludrocortisone Acetate**

フルドロコルチゾン酢酸エステル

\[ \text{C}_{23}\text{H}_{32}\text{FO}_{4} \quad 422.49 \]

9-Fluoro-11β,17,21-trihydroxyprogren-4-ene-3,20-dione

21-acetate

[514-36-3]

Fludrocortisone Acetate, when dried, contains not less than 97.5% and not more than 102.5% of fludrocortisone acetate (C_{23}H_{32}FO_{4}).

Description  Fludrocortisone Acetate occurs as a white to pale yellow, crystals or crystalline powder.

It is soluble in acetone, sparingly soluble in ethanol (95), and practically insoluble in water.

Melting point: about 220°C (with decomposition).

Identification (1) Prepare the test solution by proceeding with 10 mg of Fludrocortisone Acetate according to the Oxygen Flask Combustion Method \( \leq 1.0\% \), using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide VS and 20 mL of water as the absorbing liquid; the test solution responds to Qualitative Tests \( \leq 1.0\% \) for fluoride.

(2) Determine the absorption spectrum of a solution of Fludrocortisone Acetate in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.2\% \), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fludrocortisone Acetate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelength.
Determine the absorption spectrum of a
not more than 0.1 g of Flunitrazepam occurs as a white to pale yellow
tritium disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fludrocortisone Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> \(\alpha_d^{25}\): +131° to +138° (after drying, 0.1 g, acetone, 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 0.5 g of Fludrocortisone Acetate according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

**Related substances**—Dissolve 20 mg of Fludrocortisone Acetate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than fludrocortisone acetate obtained from the sample solution is not larger than 1/4 times the peak area of fludrocortisone acetate from the standard solution, and the total area of the peaks other than fludrocortisone acetate from the sample solution is not larger than 1/2 times the peak area of fludrocortisone acetate from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water and tetrahydrofuran (13:7).
Flow rate: Adjust so that the retention time of fludrocortisone acetate is about 10 minutes.
Time span of measurement: About 2 times as long as the retention time of fludrocortisone acetate, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 100 mL. Confirm that the peak area of fludrocortisone acetate obtained with 20 \(\mu\)L of this solution is equivalent to 4.0 to 6.0% of that with 20 \(\mu\)L of the standard solution.
System performance: Dissolve 2 mg each of Fludrocortisone Acetate and hydrocortisone acetate in 50 mL of the mobile phase. When the procedure is run with 20 \(\mu\)L of this solution under the above operating conditions, hydrocortisone acetate and fludrocortisone acetate are eluted in this order with the resolution between these peaks being not less than 1.5.
System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fludrocortisone acetate is not more than 2.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, 100°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 25 mg each of Fludrocortisone Acetate and Fludrocortisone Acetate RS, previously dried, and dissolve separately in ethanol (95) to make exactly 100 mL. Pipet 4 mL each of these solutions, add ethanol (95) to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, \(A_T\) and \(A_S\), at 238 nm.

Amount (mg) of fludrocortisone acetate (\(C_{21}H_{20}FO_4\))
\[
M_S = A_T \times A_S / A_S
\]

Amount (mg) of Fludrocortisone Acetate RS taken

**Containers and storage** Containers—Well-closed containers.
Storage—Light-resistant.

**Flunitrazepam**

フルニトラゼパム

C\(_{18}\)H\(_{22}\)FN\(_3\)O\(_3\): 313.28
5-(2-Fluorophenyl)-1-methyl-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one
[1622-62-4]

Flunitrazepam, when dried, contains not less than 99.0% of flunitrazepam (\(C_{18}H_{22}FN_3O_3\)).

**Description** Flunitrazepam occurs as a white to pale yellow crystalline powder.
It is freely soluble in acetic acid (100), soluble in acetic anhydride and in acetone, slightly soluble in ethanol (99.5) and in diethyl ether, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Flunitrazepam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point** <2.60> 168 – 172°C

**Purity (1)** Chloride <1.09>—To 1.0 g of Flunitrazepam add 50 mL of water, allow to stand for 1 hour with occasional stirring, and filter. To 20 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test with this solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.022%).

**Heavy metals** <1.07>—Proceed with 2.0 g of Flunitrazepam according to Method 4 using a platinum cru-
cible, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 50 mg of Flunitrazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add acetone to make exactly 20 mL. Pipet 1 mL of this solution, add acetone to make exactly 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane, diethyl ether and ammonia solution (28:200:100:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): number of the spots other than the principal spot obtained from the sample solution is not more than 2, and they are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flunitrazepam, previously dried, in 20 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.33 mg of C₁₉H₁₀F₃O₃

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Fluocinolone Acetonide

フルオシノロンアセトニド

C₂₃H₂₀F₂O₆: 452.49
6α,9-Difluoro-11β,21-dihydroxy-16α,17-(1-methylethylenedioxy)pregna-1,4-diene-3,20-dione [67-73-2]

Fluocinolone Acetonide, when dried, contains not less than 97.0% and not more than 102.0% of fluocinolone acetonide (C₂₃H₂₀F₂O₆).

Description Fluocinolone Acetonide occurs as white, crystals or crystalline powder.
It is freely soluble in acetic acid (100) and in acetone, soluble in ethanol (99.5), sparingly soluble in methanol, and practically insoluble in water.
Melting point: 266 – 274°C (with decomposition).
It shows crystal polymorphism.

Identification (1) To 2 mg of Fluocinolone Acetonide add 2 mL of sulfuric acid: a yellow color is produced.
(2) Dissolve 0.01 g of Fluocinolone Acetonide in 1 mL of methanol, add 1 mL of Fehling’s TS, and heat: a red precipitate is produced.
(3) Proceed with 0.01 g of Fluocinolone Acetonide as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests <1.09> for fluoride.
(4) Determine the infrared absorption spectrum of Fluocinolone Acetonide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fluocinolone Acetonide RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Fluocinolone Acetonide and Fluocinolone Acetonide RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

Optical rotation <2.49> [α]D: +98 – +108° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

Purity Related substances—Dissolve 15 mg of Fluocinolone Acetonide in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of each solution by the automatic integration method: the total area of the peaks other than fluocinolone acetonide obtained from the sample solution is not larger than the peak area of fluocinolone acetonide from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of water-saturated chloroform, methanol and acetic acid (100:200:3:2).
Flow rate: Adjust so that the retention time of fluocinolone acetonide is about 12 minutes.
Time span of measurement: About 2 times as long as the retention time of fluocinolone acetonide, beginning after the solvent peak.

System suitability—
Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of fluocinolone acetonide obtained with 20 μL of this solution is equivalent to 4 to 6% of that with 20 μL of the standard solution.

System performance: Dissolve 15 mg each of Fluocinolone Acetonide and triamcinolone acetonide in 25 mL of the mobile phase. To 5 mL of this solution add the mobile phase to make 20 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, triamcinolone acetonide and fluocinolone acetonide are eluted in this order with the resolution between these peaks being not less than 1.9.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak
areas of fluocinolone acetonide is not more than 1.0%.

Loss on drying <2.4> Not more than 1.0% (0.2 g, in vacuum, 105°C, 3 hours).

Residue on ignition <2.4> Not more than 0.1% (0.2 g, platinum crucible).

Assay Weigh accurately about 20 mg each of Fluocinolone Acetonide and Fluocinolone Acetonide RS, previously dried, and dissolve in 40 mL each of methanol, add exactly 10 mL each of the internal standard solution, then add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q2 and Q3, of the peak area of fluocinolone acetonide to that of the internal standard.

Amount (mg) of fluocinolone acetonide (C24H30F2O3)

\[
M_S = \frac{Q_2}{Q_3}
\]

M_S: Amount (mg) of Fluocinolone Acetonide RS taken

Internal standard solution—A solution of ethyl parahydroxybenzoate (1 in 2500).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecl-silanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and acetonitrile (7:3).

Flow rate: Adjust so that the retention time of fluocinolone acetonide is about 20 minutes.

System suitability—

System performance: Dissolve 5 mg each of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in 50 mL of acetonitrile, and add water to make 100 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, isopropyl parahydroxybenzoate and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 1.9.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of fluocinolone acetonide to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

**Fluocinonide**

フルオシノニド

C25H32F2O6: 494.52
6α,9- difluoro-11β,21-dihydroxy-16α,17α-(1-methylethylidenedioxy)pregna-1,4-diene-3,20-dione 21-acetate [356-12-7]

Fluocinonide, when dried, contains not less than 97.0% and not more than 103.0% of fluocinonide (C25H32F2O6).

Description Fluocinonide occurs as white, crystals or crystalline powder.

It is sparingly soluble in chloroform, slightly soluble in acetonitrile, in methanol, in ethanol (95) and in ethyl acetate, and practically insoluble in water.

It shows crystal polymorphism.

Identification (1) To 0.01 g of Fluocinonide add 4 mL of water and 1 mL of Fehling’s TS, and heat: a red precipitate is formed.

(2) Prepare the test solution with 0.01 g of Fluocinonide as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to Qualitative Tests <1.06> for fluoride.

(3) Determine the absorption spectrum of a solution of Fluocinonide in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fluocinonide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectra of Fluocinonide and Fluocinonide RS, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare both spectra: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears in the absorption spectra, dissolve the sample and the RS in ethyl acetate, respectively, evaporate the ethyl acetate, and perform the test with the residue in the same manner.

Optical rotation <2.4> [α]D24: +81° (after drying, 0.2 g, chloroform, 20 mL, 100 mm).

Purity Related substances—Dissolve 10 mg of Fluocinonide in 2 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (97:3)
to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying \(<2.41\) Not more than 1.0\% (0.5 g, 105\°C, 3 hours).

Residue on ignition \(<2.44\) Not more than 0.1\% (0.5 g, platinum crucible).

Assay Weigh accurately about 20 mg each of Fluocinonide and Fluocinonide RS, previously dried, dissolve each in 50 mL of acetonitrile, to each add exactly 8 mL of the internal standard solution and water to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07\) according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of fluocinonide to that of the internal standard, respectively. 

\[
\text{Amount (mg) of fluocinonide } (C_{20}H_{20}F_2O_7) \\
= M_S \times Q_2/Q_3
\]

\(M_S\): Amount (mg) of Fluocinonide RS taken

**Internal standard solution**—A solution of propyl benzoate in acetonitrile (1 in 100).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 40\°C.

Mobile phase: A mixture of water and acetonitrile (1:1).

Flow rate: Adjust so that the retention time of fluocinonide is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 20 \(\mu\)L of the standard solution under the above operating conditions, fluocinonide and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of fluocinonide to that of the internal standard is not more than 1.0\%.

**Containers and storage** Containers—Well-closed containers.
to a distance of about 10 cm, and air-dry the plate: any colored spot other than the principal spot does not appear.

**Loss on drying** <2.41> Not more than 10.0% (1 g, 105°C, constant mass).

**Assay** Transfer about 0.5 g of Fluorescein Sodium, accurately weighed, to a separator. Dissolve in 20 mL of water, add 5 mL of dilute hydrochloric acid, and extract with four 20-mL portions of a mixture of 2-methyl-1-propanol and chloroform (1:1). Wash each extract successively with the same 10 mL of water. Evaporate the combined extracts on a water bath with the aid of a current of air. Dissolve the residue in 10 mL of ethanol (99.5), evaporate the solution on a water bath to dryness, dry the residue at 105°C for 1 hour, and weigh as fluorescein (C₂₂H₂₈O₇: 332.31).

Amount (mg) of fluorescein sodium (C₂₂H₂₈O₇Na₂O₅) = amount (mg) of fluorescein (C₂₂H₂₈O₇) × 1.132

**Containers and storage** Containers—Tight containers.

### Fluorometholone

フルオメトロン

![Fluorometholone structure](image)

C₂₃H₂₅FO₄: 376.46
9-Fluoro-11β,17-dihydroxy-6α-methylpregna-1,4-diene-3,20-dione
[426-13-1]

Fluorometholone, when dried, contains not less than 97.0% and not more than 103.0% of fluorometholone (C₂₃H₂₅FO₄).

**Description** Fluorometholone occurs as a white to light yellow-white crystalline powder. It is odorless.

It is freely soluble in pyridine, slightly soluble in methanol, in ethanol (99.5) and in tetrahydrofuran, and practically insoluble in water and in diethyl ether.

**Identification** (1) Proceed with 7 mg of Fluorometholone as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the liquid responds to Qualitative Tests <1.09> (2) for fluoride.

(2) Determine the absorption spectrum of a solution of fluorometholone in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fluorometholone RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fluorometholone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fluorometholone RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D 22°: +52° to +60° (after drying, 0.1 g, pyridine, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Fluorometholone according to Method 3, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Fluorometholone in 10 mL of tetrahydrofuran, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add tetrahydrofuran to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer chromatography <2.02>.

Spot 25 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, acetone and methanol (45:5:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.2 g, platinum crucible).

**Assay** Weigh accurately about 0.1 g each of Fluorometholone and Fluorometholone RS, previously dried, and dissolve each in methanol to make exactly 100 mL. Pipet 5 mL of each of these solutions, and add diluted methanol (7 in 10) to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and diluted methanol (7 in 10) to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions and calculate the ratios, Q₁ and Q₅, of the peak area of fluorometholone to that of the internal standard.

Amount (mg) of fluorometholone (C₂₃H₂₅FO₄) = M₅ × Q₁/Q₅

M₅: Amount (mg) of Fluorometholone RS taken

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (1 in 10,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Diluted methanol (7 in 10).

Flow rate: Adjust so that the retention time of fluorometholone is about 8 minutes.

Selection of column: Proceed with 20 μL of the standard solution under the above operating conditions, and calculate the resolution. Use a column giving elution of fluorometholone and the internal standard in this order with the resolution between these peaks being not less than 4.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.
Fluorouracil

フルオロウラシル

C₅H₄F₂N₂O₂: 130.08

5-Fluorouracil
[51-21-8]

Fluorouracil, when dried, contains not less than 98.5% of fluorouracil (C₅H₄F₂N₂O₂), and not less than 13.1% and not more than 16.1% of fluorine (F: 19.00).

Description Fluorouracil occurs as white, crystals or crystalline powder. It is odorless.

It is freely soluble in N,N-dimethylformamide, sparingly soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 282°C (with decomposition).

Identification (1) Add 0.2 mL of bromine TS to 5 mL of a solution of Fluorouracil (1 in 500): the color of bromine TS is discharged. Further add 2 mL of barium hydroxide TS: a purple precipitate is formed.

(2) Proceed with 0.01 g of Fluorouracil as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests <1.09> for fluoride.

(3) Determine the absorption spectrum of a solution of Fluorouracil in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) Clarity and color of solution—Add 20 mL of water to 0.20 g of Fluorouracil, and dissolve by warming: the solution is clear and colorless.

(2) Fluoride—Dissolve 0.10 g of Fluorouracil in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution to a 20-mL volumetric flask, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium (III) nitrate TS (1:1:1), and add water to make 20 mL. Allow to stand for 1 hour, and use this solution as the sample solution. Separately, transfer 1.0 mL of Standard Fluorine Solution to a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), and add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium (III) nitrate TS (1:1:1). Proceed in the same manner as directed for the preparation of the sample solution, and use this solution as the standard solution. Perform the test as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared with 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in the same manner, as the blank: the absorbance of the sample solution at 600 nm is not larger than that of the standard solution (not more than 0.012%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Fluorouracil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 2 ppm).

(4) Arsenic <1.11>—To 1.0 g of Fluorouracil in a crucible add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), ignite the ethanol to burn, and incinerate by strong heating at 750°C to 850°C. If a carbonized substance remains in this method, moisten with a small amount of nitric acid, and incinerate by strong heating. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve it by warming on a water bath, use this solution as the test solution, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.10 g of Fluorouracil in 10 mL of water, and use this solution as the sample solution. Measure exactly 1 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.06>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetone and water (7:4:1) to a distance of about 12 cm, air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, 80°C, 4 hours).

Residue on ignition <2.45> Not more than 0.1% (1 g).

Assay (1) Fluorouracil—Weigh accurately about 0.2 g of Fluorouracil, previously dried, dissolve in 20 mL of N,N-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS until the color of the solution changes from yellow through blue-green to blue (indicator: 3 drops of thymol blue-dimethylformamide TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 13.01 mg of C₅H₄F₂N₂O₂

(2) Fluorine—Weigh accurately about 4 mg of Fluorouracil, previously dried, and proceed as directed in the determination of fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid.

Containers and storage Containers—Tight containers.
Fluphenazine Enanthate

フルフェナジンエナント酸エステル

C₂₉H₃₈F₃N₂O₅S: 549.69
2-(4-[3-[2-(Trifluoromethyl)-10H-phenothiazin-10-yl]propyl)piperazin-1-yl)ethyl heptanoate

[274-81-8]

Fluphenazine Enanthate, when dried, contains not less than 98.5% of fluphenazine enanthate (C₂₉H₃₈F₃N₂O₅S).

Description Fluphenazine Enanthate is a light yellow to yellowish orange viscous liquid. It is generally clear, and can be opaque by producing crystals.

It is freely soluble in methanol and in diethyl ether, soluble in ethanol (95) and in acetic acid (100), and practically insoluble in water.

Identification (1) Prepare the test solution with 0.01 g of Fluphenazine Enanthate as directed under Oxygen Flask Combustion Method <1.067>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests <1.069> for fluoride.

(2) Dissolve 2 mg of Fluphenazine Enanthate in 200 mL of a solution of hydrochloric acid in methanol (17 in 2000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fluphenazine Enanthate as directed in the liquid firm method under Infrared Spectrophotometry <2.25>., and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Fluphenazine Enanthate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.25 g of Fluphenazine Enanthate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, hexane and ammonia solution (28) (16:6:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Then spray evenly diluted sulfuric acid (1 in 2) on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.47> Not more than 1.0% (1 g, in vacuum, 60°C, 3 hours).

Residue on ignition <2.48> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Fluphenazine Enanthate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.5D> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 27.49 mg of C₂₉H₃₈F₃N₂O₅S

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Flurazepam Hydrochloride

フルラゼパム塩酸塩

C₃₂H₃₆ClFN₂O.HCl: 424.34
7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one monohydrochloride

[36105-20-1]

Flurazepam Hydrochloride, when dried, contains not less than 99.0% of flurazepam hydrochloride (C₃₂H₃₆ClFN₂O.HCl).

Description Flurazepam Hydrochloride occurs as white to yellowish white, crystals or crystalline powder.

It is freely soluble in water, in ethanol (95), in ethanol (99.5) and in acetic acid (100).

Melting point: about 197°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Flurazepam Hydrochloride in sulfuric acid-monohydrochloride (1 g, in vacuum-termination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 27.49 mg of C₂₉H₃₈F₃N₂O₅S

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Flurazepam Hydrochloride

フルラゼパム塩酸塩

C₃₂H₃₆ClFN₂O.HCl: 424.34
7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one monohydrochloride

[36105-20-1]

Flurazepam Hydrochloride, when dried, contains not less than 99.0% of flurazepam hydrochloride (C₃₂H₃₆ClFN₂O.HCl).

Description Flurazepam Hydrochloride occurs as white to yellowish white, crystals or crystalline powder.

It is freely soluble in water, in ethanol (95), in ethanol (99.5) and in acetic acid (100).

Melting point: about 197°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Flurazepam Hydrochloride in sulfuric acid-monohydrochloride (1 g, in vacuum-termination in the same manner, and make any necessary correction.

Related substances—Dissolve 0.05 g of Flurazepam Hydrochloride in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 50 mL. Pipet 1 mL of this solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 20 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Place the plate in a chamber filled with ammonia vapor, allow to stand for about 15 minutes, and immediately develop the plate with a mixture of diethyl ether and diethylamine (39:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): not more than 3 spots other than the principal spot and the spot on the starting point obtained from the sample solution appear, and are not more intense than the spot from the standard solution.

Loss on drying &lt;2.41&gt; Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition &lt;2.44&gt; Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Flurazepam Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate &lt;2.50&gt; with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 21.22 mg of C<sub>21</sub>H<sub>22</sub>ClF<sub>3</sub>NO.HCl

Containers and storage Containers—Tight containers.

Flurbiprofen

フルルビプロフェン

C<sub>15</sub>H<sub>13</sub>FO<sub>2</sub>: 244.26
(2RS)-2-(2-Fluorobiphenyl-4-yl)propanoic acid [5104-49-4]

Flurbiprofen, when dried, contains not less than 98.0% of flurbiprofen (C<sub>15</sub>H<sub>13</sub>FO<sub>2</sub>).

Description Flurbiprofen occurs as a white crystalline powder. It has a slightly irritating odor.

It is freely soluble in methanol, in ethanol (95), in acetone and in diethyl ether, soluble in acetonitrile, and practically insoluble in water.

A solution of Flurbiprofen in ethanol (95) (1 in 50) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Flurbiprofen in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flurbiprofen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point &lt;2.60&gt; 114 – 117°C

Purity (1) Chloride &lt;1.03&gt;—Dissolve 0.6 g of Flurbiprofen in 40 mL of acetic acid, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 40 mL of acetic acid, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.015%).

(2) Heavy metals &lt;1.07&gt;—Dissolve 2.0 g of Flurbiprofen in 30 mL of acetic acid, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 30 mL of acetic acid, 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

(3) Related substances—Dissolve 20 mg of Flurbiprofen in 10 mL of a mixture of water and acetonitrile (11:9), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of water and acetonitrile (11:9) to make exactly 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as directed under Liquid Chromatography 2.01 according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak other than flurbiprofen obtained from the sample solution is not larger than the peak area of flurbiprofen from the standard solution, and the total area of these peaks is not larger than 2 times the peak area of flurbiprofen from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of water, acetonitrile and acetic acid (100) (12:7:1).

Flow rate: Adjust so that the retention time of flurbiprofen is about 20 minutes.

Time span of measurement: About twice as long as the retention time of flurbiprofen, beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 5 mL of the standard solution add a mixture of water and acetonitrile (11:9) to make exactly 25 mL. Confirm that the peak area of flurbiprofen obtained with 20 µL of this solution is equivalent to 16 to 24% of that with 20 µL of the standard solution.

System performance: Dissolve 0.04 g of flurbiprofen and 0.02 g of butyl parahydroxybenzoate in 100 mL of a mixture
of water and acetonitrile (11:9). To 5 mL of this solution add a mixture of water and acetonitrile (11:9) to make 50 mL. When the procedure is run with 20 µL of this solution under the above operating conditions, butyl parahydroxybenzoate and flurbiprofen are eluted in this order with the resolution between these peaks being not less than 12.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flurbiprofen is not more than 2.0%.

Loss on drying <2.4.4> Not more than 0.10% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, silica gel, 4 hours).

Residue on ignition <2.4.4> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.6 g of Flurbiprofen, previously dried, dissolve in 50 mL of ethanol (95), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 24.43 mg of C₇H₆NO₂

Containers and storage Containers—Well-closed containers.

Flutamide

フルタミド

C₁₃H₁₈F₃N₂O₃: 276.21
2-Methyl-N-[4-(4-nitro-3-(trifluoromethyl)phenyl)propanamide
[13311-84-7]

Flutamide, when dried, contains not less than 98.5% and not more than 101.5% of flutamide (C₁₃H₁₈F₃N₂O₃).

Description Flutamide occurs as a light yellow crystalline powder.

It is freely soluble in methanol and in ethanol (95), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Flutamide in ethanol (95) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Flutamide RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flutamide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Flutamide RS; both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.6.6> 109 – 113°C

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Flutamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 40 mg of Flutamide in 50 mL of methanol, and use this solution as the sample solution. Perform the test with 10 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amounts of them by the area percentage method: the amount of each peak other than flutamide is not more than 0.3%, and the total amount of the peaks other than flutamide is not more than 0.5%.

Operating conditions—
Column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Time span of measurement: About 2 times as long as the retention time of flutamide, beginning after the solvent peak.

System suitability—
System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To 1 mL of the sample solution, add methanol to make 100 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add methanol to make exactly 20 mL. Confirm that the peak area of flutamide obtained with 10 µL of this solution is equivalent to 7 to 13% of that with 10 µL of the solution for system suitability test.

System repeatability: When the test is repeated 6 times with 10 µL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of flutamide is not more than 2.0%.

Loss on drying <2.4.4> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

Residue on ignition <2.4.4> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 40 mg each of Flutamide and Flutamide RS, previously dried, and dissolve separately in methanol to make exactly 25 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak height of flutamide to that of the internal standard.

Amount (mg) of flutamide (C₁₃H₁₈F₃N₂O₃) = M₁ × Q₁/Q₂

M₁: Amount (mg) of Flutamide RS taken

Internal standard solution—A solution of testosterone in methanol (9 in 10,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octade cyclohexylsilanized silica gel for liquid chromatography (10 µm in particle diameter).

Column temperature: A constant temperature of about
Flutoprazepam Tablets

フルトプラゼパム錠

Flutoprazepam Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of flutoprazepam (C₁₉H₁₆ClFN₂O: 342.79).

Method of preparation Prepare as directed under Tablets, with Flutoprazepam.

Identification To a quantity of powdered Flutoprazepam Tablets, equivalent to 10 mg of Flutoprazepam, add 20 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000), shake well, and add a solution of sulfuric acid in ethanol (99.5) (3 in 1000) to make 100 mL. Centrifuge this solution, to 10 mL of the supernatant liquid add a solution of sulfuric acid in ethanol (99.5) (3 in 1000) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits maxima between 240 nm and 244 nm, between 279 nm and 285 nm, and between 369 nm and 375 nm.

Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Flutoprazepam Tablets add 60 mL of the mobile phase, shake for 15 minutes to disintegrate, disperse the particle by sonicating, and add the mobile phase to make control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals (1.07)—Proceed with 1.0 g of Flutoprazepam according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Flutoprazepam in 20 mL of ethyl acetate, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethyl acetate to make exactly 50 mL. Pipet 1 mL of this solution, add ethyl acetate to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.05). Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (3:2) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying (2.41) Not more than 0.20% (1 g, 105°C, 2 hours).

Residue on ignition (2.44) Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flutoprazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.28 mg of C₁₉H₁₆ClFN₂O

Containers and storage Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)

Flutoprazepam

フルトプラゼパム

Flutoprazepam, when dried, contains not less than 99.0% and not more than 101.0% of flutoprazepam (C₁₉H₁₆ClFN₂O).

Description Flutoprazepam occurs as a white to light yellow, crystals or crystalline powder.

It is freely soluble in ethyl acetate, soluble in ethanol (99.5) and in acetic anhydride, and practically insoluble in water.

Identification (1) Dissolve 2 mg of Flutoprazepam in 200 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flutoprazepam as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Flutoprazepam as directed in Uniformity of dosage units (2.02). a green color appears.

Melting point (2.60) 118 – 122°C

Purity (1) Chloride (1.09)—To 1.0 g of Flutoprazepam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 20 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals (1.07)—Proceed with 1.0 g of Flutoprazepam according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Flutoprazepam in 20 mL of ethyl acetate, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethyl acetate to make exactly 50 mL. Pipet 1 mL of this solution, add ethyl acetate to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.05). Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (3:2) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying (2.41) Not more than 0.20% (1 g, 105°C, 2 hours).

Residue on ignition (2.44) Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flutoprazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.28 mg of C₁₉H₁₆ClFN₂O

Containers and storage Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)

Flutoprazepam Tablets

フルトプラゼパム錠

Flutoprazepam Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of flutoprazepam (C₁₉H₁₆ClFN₂O: 342.79).

Method of preparation Prepare as directed under Tablets, with Flutoprazepam.

Identification To a quantity of powdered Flutoprazepam Tablets, equivalent to 10 mg of Flutoprazepam, add 20 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000), shake well, and add a solution of sulfuric acid in ethanol (99.5) (3 in 1000) to make 100 mL. Centrifuge this solution, to 10 mL of the supernatant liquid add a solution of sulfuric acid in ethanol (99.5) (3 in 1000) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits maxima between 240 nm and 244 nm, between 279 nm and 285 nm, and between 369 nm and 375 nm.

Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Flutoprazepam Tablets add 60 mL of the mobile phase, shake for 15 minutes to disintegrate, disperse the particle by sonicating, and add the mobile phase to make control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals (1.07)—Proceed with 1.0 g of Flutoprazepam according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Flutoprazepam in 20 mL of ethyl acetate, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethyl acetate to make exactly 50 mL. Pipet 1 mL of this solution, add ethyl acetate to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.05). Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (3:2) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying (2.41) Not more than 0.20% (1 g, 105°C, 2 hours).

Residue on ignition (2.44) Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 0.5 g of Flutoprazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.28 mg of C₁₉H₁₆ClFN₂O

Containers and storage Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
exactly \( V \) mL so that each mL contains about 20 \( \mu \)g of flutoprazepam \( (C_{19}H_{18}ClFN_{2}O) \). Filter this solution through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m, discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Proceed as directed in the Assay.

\[
\text{Amount (mg) of flutoprazepam (} C_{19}H_{18}ClFN_{2}O \text{)} = M_S \times A_T/A_S \times V/1000
\]

\( M_S \): Amount (mg) of flutoprazepam for assay taken

**Dissolution 6.10** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 90 minutes of Flutoprazepam Tablets is not less than 70%.

Start the test with 1 tablet of Flutoprazepam Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard not less than 10 mL of the first filtrate, pipet \( V \) mL of the subsequent filtrate, add water to make exactly \( V' \) mL so that each mL contains about 2.2 \( \mu \)g of flutoprazepam \( (C_{19}H_{18}ClFN_{2}O) \), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of flutoprazepam for assay, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L of each of the sample solution and standard solution as directed under Liquid Chromatography 2.2.10 according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of flutoprazepam in each solution.

\[
\text{Dissolution rate (\%)} = M_S \times A_T/A_S \times V'/V \times 1/C \times 9
\]

\( M_S \): Amount (mg) of flutoprazepam for assay taken
\( C \): Labeled amount (mg) of flutoprazepam \( (C_{19}H_{18}ClFN_{2}O) \) in 1 tablet

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay.

**System suitability**—
System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of flutoprazepam are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flutoprazepam is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

**Fluvoxamine Maleate**

フルボキサミンマレイン酸塩

\[
\text{C}_{19}H_{19}F_3N_2O_2 \cdot C_7H_8O_4: 434.41
\]

5-Methoxy-1-[4-(trifluoromethyl)phenyl]pentan-1-one (E)-O-(2-aminoethyl)oxime monomaleate [61718-82-9]

Fluvoxamine Maleate contains not less than 98.0% and not more than 101.0% of fluvoxamine maleate \( (C_{19}H_{18}F_2N_2O_3 \cdot C_7H_8O_4) \), calculated on the dried basis.

**Description** Fluvoxamine Maleate occurs as a white crystalline powder.

It is freely soluble in ethanol (99.5), and sparingly soluble in water.

**Identification (1)** Dissolve 10 mg of Fluvoxamine Maleate in 5 mL of water, neutralize with dilute sodium hydroxide TS, then add 1 mL of ninhydrin TS, and heat in a water bath at 60 – 70°C for 5 minutes: a blue-purple color develops.

**(2)** Determine the absorption spectrum of a solution of Fluvoxamine Maleate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.24, and compare the spectrum with the Reference Spectrum or the spectrum of a...
solution of Fluvoxamine Maleate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fluvoxamine Maleate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Fluvoxamine Maleate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) To 5 mL of a solution of Fluvoxamine Maleate (1 in 500) add 1 drop of potassium permanganate TS: the red color of the TS disappears immediately.

**Melting point <2.60>** 120 – 124°C

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 0.5 g of Fluvoxamine Maleate in 30 mL of water is clear and colorless.

(2) Chloride <1.05>—Perform the test with 1.0 g of Fluvoxamine Maleate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.009%).

(3) Sulfate <1.14>—Perform the test with 1.0 g of Fluvoxamine Maleate. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.017%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Fluvoxamine Maleate according to Method 2, using alumina ceramic crucible, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Related substances—Dissolve 20 mg of Fluvoxamine Maleate in 20 mL of a mixture of methanol for liquid chromatography and water (7:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol for liquid chromatography and water (7:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the areas of the peaks, having the relative retention time of about 0.76, about 0.82, about 0.89, about 1.58 and about 1.66 to fluvoxamine, obtained from the sample solution are not larger than 1/5 times, 3/10 times, 7/10 times, 1/10 times and 1/10 times the peak area of fluvoxamine from the standard solution. For the areas of the peaks, having the relative retention time of about 0.76, about 0.89, about 1.58 and about 1.66 to fluvoxamine, multiply their correction factors, 0.87, 2.00, 0.67 and 2.76, respectively.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 12.67 g of diammonium hydrogen phosphate and 0.85 g of sodium 1-heptanesulfonate in 900 mL of water, adjust to pH 2.0 with phosphoric acid, and add water to make 1000 mL. To 300 mL of this solution add 700 mL of methanol for liquid chromatography.

Flow rate: Adjust so that the retention time of fluvoxamine is about 9 minutes.

**Time span of measurement:** About 2 times as long as the retention time of fluvoxamine, beginning after the peak of maleic acid.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution, add a mixture of methanol for liquid chromatography and water (7:3) to make exactly 20 mL. Confirm that the peak area of fluvoxamine obtained with 10 μL of this solution is equivalent to 3.5 to 6.5% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fluvoxamine are not less than 5000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fluvoxamine is not more than 2.0%.

**Loss on drying <2.47>** Not more than 0.1% (1 g, in vacuum, 50°C, 4 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 20 mg each of Fluvoxamine Maleate and Fluvoxamine Maleate RS (separately determine the loss on drying <2.47> under the same condition as Fluvoxamine Maleate), dissolve each in 10 mL of the mobile phase, add exactly 5 mL of the internal standard solution, then add the mobile phase to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of fluvoxamine to that of the internal standard.

\[
\text{Amount (mg) of fluvoxamine maleate} = M_x \times \frac{Q_2}{Q_1}
\]

\[
M_x: \text{Amount (mg) of Fluvoxamine Maleate RS taken, calculated on the dried basis}
\]

**Internal standard solution—** A solution of diphenylamine in methanol (7 in 2000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 3.8 g of diammonium hydrogen phosphate and 0.8 g of sodium 1-heptanesulfonate in water to make 300 mL, add 700 mL of methanol, and adjust to pH 3.5 with phosphoric acid.

Flow rate: Adjust so that the retention time of fluvoxamine is about 9 minutes.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, fluvoxamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times
with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of fluvoxamine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Fluvoxamine Maleate Tablets

フルボキサミンマレイン酸塩錠

Fluvoxamine Maleate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of fluvoxamine maleate \((C_{15}H_{23}F_2N_3O_2 \cdot C_6H_5O_7; \text{434.41})\).

### Method of preparation

Prepare as directed under Tablets, with Fluvoxamine Maleate.

### Identification

Powder Fluvoxamine Maleate Tablets. To a portion of the powder, equivalent to 0.1 g of Fluvoxamine Maleate, add 50 mL of water, shake, then allow to stand, and filter by sonicating the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 µm. To 0.5 mL of the filtrate add 50 mL of water, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

It exhibits a maximum between 243 nm and 247 nm.

### Uniformity of dosage units <5.02>

Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Fluvoxamine Maleate Tablets add 4 mL of water, disintegrate the tablet by sonication, add a mixture of methanol for liquid chromatography and water (7:3) to make exactly 50 mL, and filter. Pipet \(V\) mL of the filtrate, equivalent to about 6 mg of fluvoxamine maleate \((C_{15}H_{23}F_2N_3O_2 \cdot C_6H_5O_7)\), add exactly 2 mL of the internal standard solution, then add a mixture of methanol for liquid chromatography and water (7:3) to make 50 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

**Amount (mg) of fluvoxamine maleate**

\[
M = \frac{M_{c}}{Q_{c}} \times \frac{6}{V}
\]

**M3:** Amount (mg) of Fluvoxamine Maleate RS taken, calculated on the dried basis

### Internal standard solution

A solution of diphenylamine in methanol for liquid chromatography (3 in 1000).

### Dissolution <6.10>

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 20 minutes of Fluvoxamine Maleate Tablets is not less than 80%.

Start the test with 1 tablet of Fluvoxamine Maleate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard not less than 10 mL of the first filtrate, pipet \(V\) mL of the subsequent filtrate, add water to make exactly \(V'\) mL so that each mL contains about 20 µg of fluvoxamine maleate \((C_{15}H_{23}F_2N_3O_2 \cdot C_6H_5O_7)\), and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Fluvoxamine Maleate RS (separately determine the loss on drying <2.4I> under the same condition as Fluvoxamine Maleate), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, \(A_1\) and \(A_3\), at 245 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

**Dissolution rate (%)** with respect to the labeled amount of fluvoxamine maleate \((C_{15}H_{23}F_2N_3O_2 \cdot C_6H_5O_7)\)

\[
M_3 = \frac{M_{c} \times A_1}{M_{s} \times A_3} \times \frac{V}{V'} \times 100 \%
\]

**M3:** Amount (mg) of Fluvoxamine Maleate RS taken, calculated on the dried basis

**Internal standard solution**—A solution of diphenylamine in methanol for liquid chromatography (3 in 1000).

### Operating conditions—

Proceed as directed in the operating conditions in the Assay under Fluvoxamine Maleate.

### System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, fluvoxamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of fluvoxamine to that of the internal standard is not more than 1.0%.

### Containers and storage

Containers—Tight containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 6.)
Folic Acid

葉酸

C_{19}H_{19}N_{7}O_{8}: 441.40
N-[4-(2-Amino-4-hydroxypteridin-6-ylmethyl)amino]benzoyl]-L-glutamic acid
[59-30-3]

Folic Acid contains not less than 98.0% and not more than 102.0% of folic acid (C_{19}H_{19}N_{7}O_{8}), calculated on the anhydrous basis.

Description Folic Acid occurs as a yellow to orange-yellow crystalline powder. It is odorless.

It is practically insoluble in water, in methanol, in ethanol (95), in pyridine and in diethyl ether.

It dissolves in hydrochloric acid, in sulfuric acid, in dilute sodium hydroxide TS and in a solution of sodium carbonate decahydrate (1 in 100), and these solutions are yellow in color.

It is slowly affected by light.

Identification (1) Dissolve 1.5 mg of Folic Acid in dilute sodium hydroxide TS to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (2,24), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Folic Acid RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) To 10 mL of the solution obtained in (1) add 1 drop of potassium permanganate TS, and mix well until the color changes to blue, and immediately observe under ultraviolet light (main wavelength: 365 nm): a blue fluorescence is produced.

Purity (1) Clarity and color of solution—Dissolve 0.10 g of Folic Acid in 10 mL of dilute sodium hydroxide TS: the solution is clear and yellow in color.

(2) Free amines— Pipet 30 mL of the sample solution obtained in the Assay, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL, and use this solution as the sample solution. Separate, weigh accurately about 50 mg of p-Aminobenzoyl Glutamic Acid for Purity RS, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, dissolve in diluted ethanol (2 in 5) to make exactly 100 mL. Pipet 3 mL of this solution, add water to make exactly 1000 mL, and use this solution as the standard solution. Pipet 4 mL of each of the sample solution and standard solution, proceed as directed in the Assay, and perform the test as directed under Ultraviolet-visible Spectrophotometry (2,24), Determine the absorbances, A_{t} and A_{s}, of subsequent solutions of the standard solution and standard solution at 550 nm: the content of free amines is not more than 1.0%.

Content (%) of free amines = M_{s} × A_{t}/A_{s}

M_{s}: Amount (mg) of p-Aminobenzoyl Glutamic Acid for Purity RS taken
M_{t}: Amount (mg) of Folic Acid taken, calculated on the anhydrous basis

Water <2.48> Not more than 8.5% (10 mg, coulometric titration).

Residue on ignition <2.47> Not more than 0.5% (1 g).

Assay Weigh accurately about 50 mg each of Folic Acid and Folic Acid RS (separately, determine the water <2.48> in the same manner as Folic Acid). To each add 50 mL of dilute sodium hydroxide TS, mix well to dissolve, add dilute sodium hydroxide TS to make exactly 100 mL, and use these solutions as the sample solution and standard solution. To 30 mL of each of these solutions, accurately measured, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 60 mL each of these solutions and 0.5 g of zinc powder, and allow to stand with frequent shaking for 20 minutes. Filter each mixture through a dry filter paper, and discard the first 10 mL of the filtrate. Pipet 10 mL of the subseque filtrate, and add water to make exactly 100 mL. To 4 mL of each of these solutions, accurately measured, add 1 mL of water, 1 mL of dilute hydrochloric acid and 1 mL of a solution of sodium nitrite (1 in 1000), mix well, and allow to stand for 2 minutes. To each solution add 1 mL of a solution of ammonium amidosulfate (1 in 200), mix thoroughly, and allow to stand for 2 minutes. To each of these solutions, add 1 mL of a solution of N-(1-naphthyl)-N’-diethylthelyenediamine oxalate (1 in 1000), shake, allow to stand for 10 minutes, and add water to make exactly 20 mL. Separately, to 30 mL of the sample solution, accurately measured, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 10 mL of this solution, add 18 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 4 mL of this solution, and prepare the blank solution in the same manner as the sample solution. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry (2,24), using a solution prepared with 4 mL of water in the same manner as a blank. Determine the absorbances, A_{t}, A_{s}, and A_{c}, of subsequent solutions of the sample solution, the standard solution and the blank solution at 550 nm.

Amount (mg) of folic acid (C_{19}H_{19}N_{7}O_{8}) = M_{s} × (A_{t} - A_{c})/A_{s}

M_{s}: Amount (mg) of Folic Acid RS taken, calculated on the anhydrous basis

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Folic Acid Injection

葉酸注射液

Folic Acid Injection is an aqueous injection.

It contains not less than 95.0% and not more than 115.0% of the labeled amount of folic acid (C_{19}H_{19}N_{7}O_{8}: 441.40).

Method of preparation Dissolve Folic Acid in water with the aid of Sodium Hydroxide or Sodium Carbonate, and prepare as directed under Injections.

Description Folic Acid Injection is a yellow to orange-yellow, clear liquid.

pH: 8.0 – 11.0

Identification (1) To a volume of Folic Acid Injection, equivalent to 1.5 mg of Folic Acid, add dilute sodium hydroxide TS to make 100 mL. Proceed as directed in the Iden-

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
**Folic Acid Tablets**

**葉酸錠**

Folic Acid Tablets contain not less than 90.0% and not more than 115.0% of the labeled amount of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)) as determined under Ultraviolet-visible Spectrophotometry (2.2.4). A method of preparation is described below.

**Method of preparation**
Prepare as directed under Tablets, with Folic Acid.

**Identification**
(1) Take a sample of Folic Acid Tablets, equivalent to 1.5 mg of Folic Acid, and dissolve in dilute hydrochloric acid to make 100 mL. pipet 30 mL of this solution, add 20 mL of 50% of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 60 mL of this solution, add 0.5 g of zinc powder, shake frequently, allow to stand for 20 minutes, and filter the solution through a dried filter paper.

Discard the first 10 mL of the filtrate, pipet 1 VmL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 1 mg of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)), and use this as the sample solution. Separate, weigh accurately about 50 mg of Folic Acid RS (separately determine the water (2.48) in the same manner as Folic Acid), dissolve in dilute hydrochloric acid to make exactly 100 mL. Pipet 30 mL of this solution, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 60 mL of this solution, add 0.5 g of zinc powder, shake frequently, allow to stand for 20 minutes, and filter the solution through a dried filter paper.

Discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 4 mL each of the sample solution and standard solution, add 1 mL of water, 1 mL of dilute hydrochloric acid and 1 mL of sodium nitrite solution (1 in 1000) to them, mix, and allow to stand for 2 minutes. To these solutions add 1 mL of a solution of ammonium amidosulfate (1 in 200), shake, and allow them to stand for 2 minutes. To these solutions add 1 mL of a solution of N,N-diethyl-N'-1-naphthylmethyleneimine oxalate (1 in 1000), shake, allow to stand for 10 minutes, and add water to make exactly 20 mL. Separately, pipet 30 mL of the sample stock solution, add 20 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet V mL of this solution, and add water to make exactly V mL so that each mL contains about 15 mg of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)). With exactly 4 mL of this solution perform the same procedure described above for obtaining the sample solution, and use the solution so obtained as the blank solution. Determine the absorbances at 550 nm, A\(_1\), A\(_2\), and A\(_3\), of the solutions obtained from the sample solution and standard solution, and the blank solution as directed under Ultraviolet-visible Spectrophotometry (2.2.4), using a control solution obtained with 4 mL of water in the same manner as described above.

**Uniformity of dosage units**
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Folic Acid Tablets add 50 mL of dilute sodium hydroxide TS, shake frequently, and filter. Wash the residue with dilute sodium hydroxide TS, combine the filtrate and the washings, then add dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Pipet 30 mL of the sample solution, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 60 mL of this solution, add 0.5 g of zinc powder, shake frequently, allow to stand for 20 minutes, and filter the solution through a dried filter paper. Discard the first 10 mL of the filtrate, pipet 1 VmL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 15 mg of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)), and use this as the sample solution. Separately, weigh accurately about 50 mg of Folic Acid RS (separately determine the water (2.48) in the same manner as Folic Acid), dissolve in dilute hydrochloric acid to make exactly 100 mL. Pipet 30 mL of this solution, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 60 mL of this solution, add 0.5 g of zinc powder, shake frequently, allow to stand for 20 minutes, and filter the solution through a dried filter paper. Discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the standard solution. Pipet 4 mL each of the sample solution and standard solution, add 1 mL of water, 1 mL of dilute hydrochloric acid and 1 mL of sodium nitrite solution (1 in 1000) to them, mix, and allow to stand for 2 minutes. To these solutions add 1 mL of a solution of ammonium amidosulfate (1 in 200), shake, and allow them to stand for 2 minutes. To these solutions add 1 mL of a solution of N,N-diethyl-N'-1-naphthylmethyleneimine oxalate (1 in 1000), shake, allow to stand for 10 minutes, and add water to make exactly 20 mL. Separately, pipet 30 mL of the sample stock solution, add 20 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet V mL of this solution, and add water to make exactly V mL so that each mL contains about 15 mg of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)). With exactly 4 mL of this solution perform the same procedure described above for obtaining the sample solution, and use the solution so obtained as the blank solution. Determine the absorbances at 550 nm, A\(_1\), A\(_2\), and A\(_3\), of the solutions obtained from the sample solution and standard solution, and the blank solution as directed under Ultraviolet-visible Spectrophotometry (2.2.4), using a control solution obtained with 4 mL of water in the same manner as described above.

**Dissolution**
When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Folic Acid Tablets is not less than 75%.

Start the test with 1 tablet of Folic Acid Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 5.6 \(\mu\)g of folic acid (C\(_9\)H\(_{19}\)N\(_3\)O\(_4\)), and use this
solution as the sample solution. Separately, weigh accurately about 20 mg of Folic Acid RS (separately determine the water \( <2.4\% \) in the same manner as Folic Acid), and dissolve in the 2nd fluid for dissolution test to make exactly 100 mL. Pipet 2.5 mL of this solution, add the 2nd fluid for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), at 280 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \( <2.24\)
, using water as the blank.

Dissolution rate (%) with respect to the labeled amount of folic acid (\( C_{19}H_{22}N_{5}O_{4} \))

\[
M_S = \frac{M_T \times (A_T - A_C) / A_S}{M_S}
\]

\( M_S \): Amount (mg) of Folic Acid RS taken, calculated on the anhydrous basis

\( M_S \): Labeled amount (mg) of folic acid (\( C_{19}H_{22}N_{5}O_{4} \)) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 Folic Acid Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of folic acid (\( C_{19}H_{22}N_{5}O_{4} \)). Add 50 mL of dilute sodium hydroxide TS, shake frequently, then filter into a 100-mL volumetric flask, and wash with dilute sodium hydroxide TS. To the combined filtrate and washings add dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Folic Acid RS (separately, determine the water \( <2.4\% \) in the same manner as Folic Acid), dissolve in dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Proceed with exactly 30 mL each of the sample solution and standard solution as directed in the Assay under Folic Acid.

\[
\text{Amount (mg) of folic acid (}\ C_{19}H_{22}N_{5}O_{4}\text{)} \quad = M_S \times (A_T - A_C) / A_S
\]

\( M_S \): Amount (mg) of Folic Acid RS taken, calculated on the anhydrous basis

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

**Formalin**

ホルマリン

Formalin contains not less than 35.0% and not more than 38.0% of formaldehyde (CH\(_2\)O: 30.03.)

It contains 5% to 13% of methanol to prevent polymerization.

**Description** Formalin is a clear, colorless liquid. Its vapor is irritating to the mucous membrane.

It is miscible with water and with ethanol (95).

When stored for a long time, especially in a cold place, it may become cloudy.

**Identification** (1) Dilute 2 mL of Formalin with 10 mL of water in a test tube, and add 1 mL of silver nitrate-ammonia TS: a gray precipitate is produced, or a silver mirror is formed on the wall of the test tube.

(2) To 5 mL of sulfuric acid in which 0.1 g of salicylic acid has been dissolved add 2 drops of Formalin, and warm the solution: a persistent, dark red color develops.

**Purity** Acidity—Dilute 20 mL of Formalin with 20 mL of water, and add 5.0 mL of 0.1 mol/L sodium hydroxide VS and 2 drops of bromothymol blue TS: a blue color develops.

**Residue on ignition** \( <2.4\% \) Not more than 0.06 w/v% (5 mL, after evaporation).

**Assay** Weigh accurately a weighing bottle containing 5 mL of water, add about 1 g of Formalin, and weigh accurately again. Add water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 50 mL of 0.05 mol/L iodine VS and 20 mL of potassium hydroxide TS, and allow to stand for 15 minutes at an ordinary temperature. To this mixture add 15 mL of dilute sulfuric acid, and titrate \( <2.50\) the excess iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner.

Each mL of 0.05 mol/L iodine VS = 1.501 mg of CH\(_2\)O

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

**Formalin Water**

ホルマリン水

Formalin Water contains not less than 0.9 w/v% and not more than 1.1 w/v% of formaldehyde (CH\(_2\)O: 30.03.)

**Method of preparation**

<table>
<thead>
<tr>
<th>Formalin</th>
<th>30 mL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water, Purified Water or Purified Water in Containers</td>
<td>a sufficient quantity</td>
</tr>
</tbody>
</table>

To make 1000 mL

Prepare by mixing the above ingredients.

**Description** Formalin Water is a clear, colorless liquid. It has a slight odor of formaldehyde.

It is almost neutral.

**Assay** Transfer 20 mL of Formalin Water, measured exactly, to a 100-mL volumetric flask containing 2.5 mL of 1 mol/L sodium hydroxide VS, and add water to make 100 mL. Pipet 10 mL of this solution, and proceed as directed in the Assay under Formalin.

Each mL of 0.05 mol/L iodine VS = 1.501 mg of CH\(_2\)O

**Containers and storage** Containers—Tight containers.
Formoterol Fumarate Hydrate

ホルモテロールフマル酸塩水和物

\[
\text{Formoterol Fumarate Hydrate} \quad \text{(C}_{19}\text{H}_{22}\text{N}_2\text{O}_4)\text{.C}_2\text{H}_4\text{O}_4 \cdot \text{H}_2\text{O}: 840.91} \\
N-(2\text{-Hydroxy}-5-\{1(RS)-1\text{-hydroxy-}2\{-1(RS)-2\{-4\text{-methoxyphenyl}-1\text{-methyl}-2\text{H}\text{symethylamino}[ethyl][phenyl]formamidine hemifumarate monohydrate (43229-80-7, anhydride)}
\]

Formoterol Fumarate Hydrate contains not less than 98.5% of formoterol fumarate [(C\text{19}H\text{22}N_2O_4)\cdot C\text{2}H\text{4}O_4 \cdot H\text{2}O: 804.88], calculated on the anhydrous basis.

**Description** Formoterol Fumarate Hydrate occurs as a white to yellowish white crystalline powder.

- It is freely soluble in acetic acid (100), soluble in methanol, very slightly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.
- A solution of Formoterol Fumarate Hydrate in methanol (1 in 100) shows no optical rotation.
- Melting point: about 138°C (with decomposition).

**Identification (1)** Dissolve 0.5 g of Formoterol Fumarate Hydrate in 20 mL of 0.5 mol/L sulfuric acid TS, and extract with three 25-mL portions of diethyl ether. Wash the combined diethyl ether extracts with 10 mL of 0.5 mol/L sulfuric acid TS, and evaporate the ether layer under reduced pressure, and dry the residue at 105°C for 3 hours: the residue melts \(2.60\)\(\triangle\) at about 290°C (with decomposition, in a sealed tube).

**(2)** Determine the absorption spectrum of a solution of Formoterol Fumarate Hydrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry \(2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Formoterol Fumarate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals \(<1.0\)\%—Proceed with 1.0 g of Formoterol Fumarate Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related Substances—Dissolve 0.20 g of Formoterol Fumarate Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(2.08\). Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, 1,4-dioxane, ethanol (99.5) and ammonia solution (28) (20:20:10:3) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor: the spots other than the principal spot obtained from the sample solution are not more than intense than the spot from the standard solution.

**Water** \(<2.48\) Paracetamol (0.5 g, volumetric titration, direct titration).

**Residue on ignition** \(<2.48\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Formoterol Fumarate Hydrate, dissolve in 50 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 40.24 mg of (C\text{19}H\text{22}N\text{2}O\text{4})\cdot C\text{2}H\text{4}O\text{4}.

**Containers and storage** Containers—Tight containers.

Fosfomycin Calcium Hydrate

ホスホマインシルアルコル水和物

\[
\text{Fosfomycin Calcium Hydrate} \quad \text{(C}_{19}\text{H}_{22}\text{N}_2\text{O}_4)\text{.C}_2\text{H}_4\text{O}_4 \cdot \text{H}_2\text{O}: 194.14} \\
\text{Monocalcium (2R,3S)3-methyloxiran-2-ylphosphonate monohydrate (26016-98-8)}
\]

Fosfomycin Calcium Hydrate is the calcium salt of a substance having antibacterial activity produced by the growth of Streptomyces fradiae or by the chemical synthesis.

It contains not less than 725 µg (potency) and not more than 805 µg (potency) per mg, calculated on the anhydrous basis. The potency of Fosfomycin Calcium Hydrate is expressed as mass (potency) of fosfomycin (C\text{19}H\text{22}N\text{2}O\text{4}: 138.06).

**Description** Fosfomycin Calcium Hydrate occurs as a white crystalline powder.

- It is slightly soluble in water, and practically insoluble in methanol and in ethanol (99.5).

**Identification (1)** Determine the infrared absorption spectrum of Fosfomycin Calcium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(2)** Determine the infrared absorption spectrum of Fosfomycin Calcium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 300), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy \(2.21\): it exhibits a double signal at around \(\delta 1.5\) ppm, a double double signal at around \(\delta 2.9 \) ppm, a multiple signal at around \(\delta 3.3 \) ppm, and no signal at around \(\delta 1.4 \) ppm.

**(3)** A solution of Fosfomycin Calcium Hydrate (1 in 500) responds to Qualitative Tests \(<1.0\%\) (3) for calcium salt.

**Optical rotation** \(<2.48\) \([\alpha]_D^{20} +2.5\) to \(−5.4\)° (0.5 g calculated on the anhydrous bases, 0.4 mol/L disodium dihydrogen ethylendiamine tetraacetate TS (pH 8.5), 10 mL, 100 mm).
Phosphorus Content  Weigh accurately about 0.1 g of Fosfomycin Calcium Hydrate, add 40 mL of sodium periodate (107g in 10,000) and 2 mL of perchloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add 1 mL of potassium iodide TS. To this solution add sodium thiosulfate VS until the solution is colorless, add water to make exactly 100 mL, and use this solution as the sample stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogen phosphate, proceed with this solution in the same manner as directed for the preparation of the sample stock solution, and use the solution so obtained as the standard stock solution. Proceed and prepare a solution in the same manner for the preparation of the sample stock solution without using Fosfomycin Calcium Hydrate, and use the solution so obtained as the blank stock solution. Pipet 5 mL each of the sample stock solution, the standard stock solution, and the blank stock solution, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, mix, and add water to make exactly 25 mL, and use these solutions as the sample solution, the standard solution, and the blank solution, respectively. After allowing these solutions to stand at 20 ± 1 °C for 30 minutes, perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.2A>, using water as a blank, and determine the absorbances at 740 nm, A1, A2, and A3, of the sample solution, the standard solution, and the blank solution: the content of phosphorus is 15.2 – 16.7%.

Amount (mg) of phosphorus (P) = M<sub>3</sub> × (A<sub>1</sub> – A<sub>3</sub>)/(A<sub>2</sub> – A<sub>3</sub>) × 0.228

M<sub>3</sub>; Amount (mg) of potassium dihydrogen phosphate taken

Calcium Content  Weigh accurately about 0.2 g of Fosfomycin Calcium Hydrate, add 4 mL of 1 mol/L hydrochloric acid TS, and shake well until the sample is completely dissolved. To this solution add 100 mL of water, 9 mL of sodium hydroxide TS and 0.1 g of methylthymol blue-sodium chloride indicator, and titrate <2.5D> with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from clear blue to gray-purple: calcium content is 19.6 – 21.7%. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 2.004 mg of Ca

Purity  (1) Heavy metals <1.07>—To 1.0 g of Fosfomycin Calcium Hydrate add 40 mL of 0.25 mol/L acetic acid TS and water to make 50 mL. Proceed with this solution according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Fosfomycin Calcium Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Glycol substance—Weigh accurately about 0.2 g of Fosfomycin Calcium Hydrate, transfer into a 250-mL iodine flask, add 100 mL of water, and dissolve by sonication while cooling in ice. Add exactly 50 mL of phthalate buffer solution (pH 5.8) and exactly 5 mL of sodium periodate solution (107g in 100,000), stopper, stir, and add 1 mL of water in the receiving part. Avoid exposure to light, allow to stand in a water bath at 30°C for 60 minutes, add exactly 10 mL of a solution of potassium iodide (2 in 5) without haste, and titrate <2.5D> with 0.01 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction: amount of glycol substance (C<sub>H</sub><sub>Ca</sub><sub>O<sub>P</sub>) is not more than 1.5%.

Each mL of 0.01 mol/L sodium thiosulfate VS = 0.4854 mg of C<sub>H</sub><sub>Ca</sub><sub>O<sub>P</sub>)

Water <2.48> Not more than 12.0% (0.1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Assay  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Protexus sp. (MB838)

(ii) Culture medium—Dissolve 5.0 g of peptone, 3.0 g of meat extract, 2.0 g of yeast extract, and 15 g of agar in 1000 mL of water, sterilize, and use as the agar media for base layer and seed layer with the pH of between 6.5 and 6.6 after sterilization.

(iii) Seeded agar layer—Incubate the test organism on the slant of the agar medium for transferring test organisms at 37°C for 40 – 48 hours. Subcultures at least 3 times. Inoculate the grown organisms onto the surface of 300 mL of the agar medium for transferring test organisms in a Roux bottle, incubate at 37°C for 40 – 48 hours, and suspend the grown organisms in about 30 mL of water. To the suspension add water, and use this as the stock suspension of test organism. The amount of the water to be added is adjust so that the percent transmission at 560 nm of the suspension diluted ten times with water is 17%. Keep the stock suspension at 10°C or below and use within 7 days. Add 1.0 – 2.0 mL of the stock suspension of test organism to 100 mL of the agar medium for seed layer previously kept at 48°C, mix thoroughly, and use this as the seeded agar layer.

(iv) Standard solutions—Dissolve in 0.05 mol/L tris buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the standard stock solution. The standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L tris buffer solution (pH 7.0) to make solutions so that each mL contains 10 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(v) Sample solutions—Weigh accurately an amount of Fosfomycin Phenethylammonium RS equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L tris buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the standard stock solution. The standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L tris buffer solution (pH 7.0) to make solutions so that each mL contains 10 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

Containers and storage  Containers—Tight containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Fosfomycin Calcium for Syrup
シロップ用ホスホマイシンカルシウム

Fosfomycin Calcium for Syrup is a preparation for syrups which is suspended before use.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of fosfomycin (C₁₃H₁₈O₇P: 138.06).

Method of preparation  Prepare as directed under Syrups, with Fosfomycin Calcium Hydrate.

Identification  (1) To an amount of Fosfomycin Calcium for Syrup, equivalent to 40 mg (potency) of Fosfomycin Calcium Hydrate, add 10 mL of warm water, shake for 10 to 20 minutes, and collect the insoluble substances by filtration. Dissolve the substances in 3 mL of a solution of perchloric acid (1 in 4), add 1 mL of 0.1 M sodium periodate solution, and warm in a water bath at 60°C for 30 minutes. After cooling, add 50 mL of water, neutralize the solution with a saturated solution of sodium hydrogen carbonate, and add 1 mL of potassium iodide TS: the solution does not show a red color.

(2) To an amount of Fosfomycin Calcium for Syrup, equivalent to 40 mg (potency) of Fosfomycin Calcium Hydrate, add 10 mL of warm water, shake for 10 to 20 minutes, and collect the insoluble substances by filtration. Dissolve the substances in 3 mL of a solution of perchloric acid (1 in 4), add 2 mL of 0.1 M sodium periodate solution, and heat in a water bath for 10 minutes. After cooling, add 1 mL of hexaammonium heptamolybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, and allow to stand for 30 minutes: the solution shows a blue color.

(3) To an amount of Fosfomycin Calcium for Syrup, equivalent to 40 mg (potency) of Fosfomycin Calcium Hydrate, add 10 mL of warm water, shake for 10 to 20 minutes, and collect the insoluble substances by filtration. Dissolve the substances in 25 mL of water: the solution responds to Qualitative Tests under Solid samples (3) for calcium salt.

Loss on drying  Not more than 3.0% (2 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Uniformity of dosage units  Fosfomycin Calcium for Syrup in single-dose packages meets the requirement of the Mass variation test.

Dissolution  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Fosfomycin Calcium for Syrup is not less than 80%.

Start the test with an accurately weighed amount of Fosfomycin Calcium for Syrup, equivalent to about 0.5 g (potency) of Fosfomycin Calcium Hydrate, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Fosfomycin Phenethylammonium RS, equivalent to about 28 mg (potency), dissolve in water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine the peak areas, A₉ and A₈, of fosfomycin in each solution.

Dissolution rate (%) with respect to the labeled amount of fosfomycin (C₁₃H₁₈O₇P) = \( M_S / M_T \times A_T / A_S \times 1/C \times 1800 \)

\( M_S \): Amount [mg (potency)] of Fosfomycin Phenethylammonium RS taken
\( M_T \): Amount (g) of Fosfomycin Calcium for Syrup taken
\( C \): Labeled amount [mg (potency)] of fosfomycin (C₁₃H₁₈O₇P) in 1 g

Operating conditions—
Detector: A conductivity detector.
Column: A polyetheretherketone column 4.6 mm in inside diameter and 7.5 cm in length, packed with quaternary ammonium group introducing hydrophilic vinyl polymer gel for liquid chromatography (6 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: Dissolve 10.5 g of citric acid monohydrate in water to make 1000 mL. To 800 mL of this solution add 200 mL of acetonitrile.
Flow rate: Adjust so that the retention time of fosfomycin is about 8 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fosfomycin are not less than 2000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fosfomycin is not more than 2.0%.

Assay  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics according to the following conditions.
(i) Test organism, culture medium, agar media for seed and base layer, and standard solutions—Proceed as directed in the Assay under Fosfomycin Calcium Hydrate.
(ii) Sample solutions—Weigh accurately an amount of Fosfomycin Calcium for Syrup, equivalent to about 0.1 g (potency) of Fosfomycin Calcium Hydrate, dissolve in 0.05 mol/L tris buffer solution (pH 7.0) to make exactly 200 mL. Take exactly a suitable amount of this solution, add exactly 0.05 mol/L tris buffer solution (pH 7.0) to make solutions so that each mL contains 10 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage  Containers—Tight containers.
Fosfomycin Sodium

ホスホマイシンナトリウム

C₈H₁₂Na₂O₆P: 182.02
Disodium (2R,3S)-3-methyloxiran-2-ylphosphonate [26016-99-9]

Fosfomycin Sodium is the sodium salt of a substance having antibacterial activity produced by the growth of Streptomyces fradiae or by the chemical synthesis.

It contains not less than 725 μg (potency) and not more than 770 μg (potency) per mg, calculated on the anhydrous basis. The potency of Fosfomycin Sodium is expressed as mass (potency) of fosfomycin (C₈H₁₂O₆P: 138.06).

**Description**

Fosfomycin Sodium occurs as a white crystalline powder.

It is very soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (99.5).

**Identification**

(1) Determine the infrared absorption spectrum of Fosfomycin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the 1H spectrum of a solution of Fosfomycin Sodium in heavy water for nuclear resonance spectroscopy (1 in 300), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>: it exhibits a double signal at around δ 1.5 ppm, a double double signal at around δ 2.8 ppm, a multiple signal at around δ 3.3 ppm, and no signal at around δ 1.3 ppm.

(3) A solution of Fosfomycin Sodium (1 in 500) responds to Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]D → 3.5 – 5.5° (0.5 g calculated on the anhydrous bases, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.70 g of Fosfomycin Sodium in 10 mL of water: the pH of the solution is between 8.5 and 10.5.

**Phosphorus Content**

Weigh accurately about 0.1 g of Fosfomycin Sodium, add 40 mL of a solution of sodium periodate (107 in 10,000) and 2 mL of perchloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add 1 mL of potassium iodide TS. To this solution add sodium thiosulfate TS until the solution is colorless, add water to make exactly 100 mL, and use this solution as the sample stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogen phosphate, proceed with this solution in the same manner as directed for the preparation of the sample stock solution, and use the solution so obtained as the standard stock solution. Proceed and prepare a solution in the same manner for the preparation of the sample stock solution without using Fosfomycin Sodium, and use the solution so obtained as the blank stock solution. Pipet 5 mL each of the sample stock solution, the standard stock solution, and the blank stock solution, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, mix, and add water to make exactly 25 mL, and use these solutions as the sample solution, the standard solution, and the blank solution, respectively. After allowing these solutions to stand for 30 minutes at 20 ± 1°C, perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as a blank, and determine the absorbances at 740 nm, Aₕ, A₀, and A₈, of the sample solution, the standard solution, and the blank solution: the content of phosphorus is 16.2 – 17.9%.

Amount (mg) of phosphorus (P) = M × (Aₕ – A₀)/(A₈ – A₀) × 0.228

M: Amount (mg) of potassium dihydrogen phosphate taken

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Fosfomycin Sodium in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Fosfomycin Sodium according to Method 1, and perform the test. Prepare the control solution with 2.0 mL Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fosfomycin Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Glycol substance—Weigh accurately about 0.2 g of Fosfomycin Sodium, and dissolve in 100 mL of water in a 250-mL iodine flask. Add exactly 50 mL of phthalate buffer solution (pH 5.8) and exactly 5 mL of sodium periodate solution (107 in 100,000), stopper, stir, and add 1 mL of water in the receiving part. Allow to stand in a dark place for 90 minutes, add exactly 10 mL of a solution of potassium iodide (2 in 5) without haste, and titrate <2.50> with 0.01 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction: amount of glycol substance (C₈H₁₂Na₂O₆P) is not more than 0.5%.

Each mL of 0.01 mol/L sodium thiosulfate VS = 0.5001 mg of C₈H₁₂Na₂O₆P

**Water** <2.48> Not more than 3.0% (0.2 g, volumetric titration, direct titration).

**Assay**

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Proteus sp. (MB838)

(ii) Culture medium—Mix 5.0 g of peptone, 3.0 g of meat extract, 2.0 g of yeast extract, and 15 g of agar in 1000 mL of water, sterilize, and use as the agar media for base layer and seed layer with the pH of between 6.5 and 6.6 after sterilization.

(iii) Seeded agar layer—Incubate the test organism on the slant of the agar medium for transferring test organisms at 37°C for 40 – 48 hours. Subcultures at least 3 times. Inoculate the grown organisms onto the surface of 300 mL of the agar medium for transferring test organisms in a Roux bottle, incubate at 37°C for 40 – 48 hours, and suspend the grown organisms in about 30 mL of water. To the suspension add water, and use this as the stock suspension of test organism. The amount of the water to be added is adjust so that the percent transmission at 560 nm of the suspension diluted ten times with water is 17%. Keep the stock suspension at 10°C or below and use within 7 days. Add 1.0 – 2.0 mL of the stock suspension of test organism to 100 mL of the agar medium for seed layer previously kept at 48°C, mix thoroughly, and use this as the seeded agar layer.

Official Monographs / Fosfomycin Sodium 1043
Fosfomycin Sodium for Injection

注射用ホスホマイシンナトリウム

Fosfomycin Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of fosfomycin (C₇H₉O₇P: 138.06).

Method of preparation Prepare as directed under Injections, with Fosfomycin Sodium.

Description Fosfomycin Sodium for Injection occurs as a white crystalline powder.

Identification (1) Dissolve about 0.1 g of Fosfomycin Sodium for Injection in 3 mL of a solution of perchloric acid (1 in 4), add 1 mL of 0.1 mol/L sodium periodate solution, and heat in a water bath at 60°C for 30 minutes. After cooling, add 50 mL of water, neutralize with saturated sodium hydroxide carbonate solution, and add 1 mL of potassium iodide TS; the solution does not reveal a red color, while the blank solution reveals a red color.

(2) To 2 mL of a solution of Fosfomycin Sodium for Injection (1 in 250) add 1 mL of perchloric acid and 2 mL of 0.1 mol/L sodium periodate solution, and heat in a water bath for 10 minutes. After cooling, add 1 mL of hexammonium heptamolybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, and allow to stand for 30 minutes: a blue color develops.

(3) Dissolve an amount of Fosfomycin Sodium for Injection, equivalent to 0.1 g (potency) of Fosfomycin Sodium, in 50 mL of water. Perform the test with this solution as directed in the Identification (3) under Fosfomycin Sodium.

pH <2.48> The pH of a solution prepared by dissolving an amount of Fosfomycin Sodium for Injection, equivalent to 1.0 g (potency) of Fosfomycin Sodium, in 20 mL of water is between 6.5 and 8.5.

Purity Clarity and color of solution—Dissolve an amount of Fosfomycin Sodium for Injection, equivalent to 1.0 g (potency) of Fosfomycin Sodium, in 10 mL of water: the solution is clear and colorless.

Water <2.48> Not more than 4.0% (0.1 g, coulometric titration).

Bacterial endotoxins <4.01> Less than 0.025 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06> Perform the test according to the Method 2: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method; it meets the requirement.

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, seeded agar layer, and standard solutions—Proceed as directed in the Assay under Fosfomycin Sodium.

(ii) Sample solutions—Weigh accurately the mass of the contents of not less than 10 Fosfomycin Sodium for Injection. Weigh accurately an amount of the content, equivalent to about 20 mg (potency) of Fosfomycin Sodium, and dissolve in 0.05 mol/L tris buffer solution (pH 7.0) to make exactly 50 mL. Take exactly a suitable amount of this solution add 0.05 mol/L tris buffer solution (pH 7.0) to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Hermetic containers.
Fradiomycin Sulfate

Neomycin Sulfate

フラジオマイシン硫酸塩

C$_{23}$H$_{29}$N$_{5}$O$_{13}$·3H$_2$SO$_4$: 908.88
Fradiomycin B Sulfate
2,6-Diamino-2,6-dideoxy-α-D-glucopyranosyl(1→4)-
[2,6-diamino-2,6-dideoxy-β-L-idopyranosyl(1→3)-β-D-
ribofuranosyl(1→5)]-2-deoxy-D-streptamine trisulfate
[119-04-0, Neomycin B]

Fradiomycin C Sulfate
2,6-Diamino-2,6-dideoxy-α-D-glucopyranosyl(1→4)-
[2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl(1→3)-
β-D-ribofuranosyl(1→5)]-2-deoxy-D-streptamine trisulfate
[66-86-4, Neomycin C]
[1405-10-3, Neomycin Sulfate]

Fradiomycin Sulfate is the sulfate of a mixture of aminoglycoside substances having antibacterial activity produced by the growth of Streptomyces fradiae.

It, when dried, contains not less than 623 μg (potency) and not more than 740 μg (potency) per mg. The potency of Fradiomycin Sulfate is expressed as mass (potency) of fradiomycin (C$_{23}$H$_{29}$N$_{5}$O$_{13}$: 614.64).

Description Fradiomycin Sulfate occurs as a white to light yellow powder.

It is freely soluble in water, and practically insoluble in ethanol (95).

It is hygroscopic.

Identification (1) Dissolve 50 mg each of Fradiomycin Sulfate and Fradiomycin Sulfate RS in 1 mL of water, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia solution (28) and dichloromethane (3:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat the plate at 110°C for 15 minutes: the spot at around RT value 0.4 obtained from the standard solution is not more intense than the spot from the standard solution.

(2) A solution of Fradiomycin Sulfate (1 in 20) responds to Qualitative Tests <1.00> (1) for sulfate.

Optical rotation <2.44> [α]$_D^{20}$: +53.5° to +59.0° (1 g calculated on the dried basis, water, 10 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 1.0 g of Fradiomycin Sulfate in 10 mL of water is between 5.0 and 7.5.

Purity (1) Heavy metals <0.07>—Proceed with 1.0 g of Fradiomycin Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Fradiomycin Sulfate according to Method 1, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.63 g of Fradiomycin Sulfate in 5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia solution (28) and dichloromethane (3:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat the plate at 110°C for 15 minutes: the spot at around RT value 0.4 obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying <2.44> Not more than 8.0% (0.2 g, in vacuum, 60°C, 3 hours).

Residue on ignition <2.44> Not more than 0.3% (1 g).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Staphylococcus aureus ATCC 6538 P
(ii) Agar medium for seed and base layer

Glucose 1.0 g
Peptone 6.0 g
Meat extract 1.5 g
Yeast extract 3.0 g
Sodium chloride 2.5 g
Agar 15.0 g
Water 1000 mL

Mix all the ingredients and sterilize. Adjust the pH after sterilization to 7.8 - 8.0 with sodium hydroxide TS.

(iii) Standard solutions—Weigh accurately an amount of Fradiomycin Sulfate RS, previously dried, equivalent to about 50 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 14 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0) to make exactly 50 mL, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Fradiomycin Sulfate, previously dried, equivalent to about 50 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution for antibiotics (pH 8.0) to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L
phosphate buffer solution for antibiotics (pH 8.0) to make solutions so that each mL contains 80 μg (potency) and 20 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Fructose

果糖

![Fructose Structure](image)

C_{6}H_{12}O_{6}: 180.16
β-D-Fructopyranose
[57-48-7]

Fructose, when dried, contains not less than 98.0% of fructose (C_{6}H_{12}O_{6}).

Description Fructose occurs as colorless to white, crystals or crystalline powder. It is odorless and has a sweet taste.

It is very soluble in water, sparingly soluble in ethanol (95) and practically insoluble in diethyl ether.

It is hygroscopic.

Identification (1) Add 2 to 3 drops of a solution of Fructose (1 in 20) to 5 mL of boiling Fehling’s TS: a red precipitate is produced.

(2) Determine the infrared absorption spectrum of Fructose as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH <2.54> Dissolve 4.0 g of Fructose in 20 mL of water: the pH of the solution is between 4.0 and 6.5.

Purity (1) Clarity and color of solution—Dissolve 25.0 g of Fructose in 50 mL of water: the solution is clear and has no more color than the following control solution.

Control solution: To a mixture of 1.0 mL of Cobalt (II) Chloride CS, 3.0 mL of Iron (III) Chloride CS and 2.0 mL of Copper (II) Sulfate CS, and add water to make 10.0 mL. To 3.0 mL of the solution add water to make 50 mL.

(2) Acidity—Dissolve 5.0 g of Fructose in 50 mL of freshly boiled and cooled water, and add 3 drops of phenolphthalein TS and 0.60 mL of 0.01 mol/L sodium hydroxide VS: a red color develops.

(3) Chloride <1.03>—Perform the test with 2.0 g of Fructose. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(4) Sulfate <1.14>—Perform the test with 2.0 g of Fructose. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(5) Sulfite—Dissolve 0.5 g of Fructose in 5 mL of water, and add 0.25 mL of 0.02 mol/L iodine: the color of the solution is yellow.

(6) Heavy metals <1.07>—Proceed with 5.0 g of Fructose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).

(7) Calcium—Dissolve 0.5 g of Fructose in 5 mL of water, add 2 to 3 drops of ammonia TS and 1 mL of ammonium oxalate TS, and allow to stand for 1 minute: the solution is clear.

(8) Arsenic <1.17>—Dissolve 1.5 g of Fructose in 5 mL of water, heat with 5 mL of dilute sulfuric acid and 1 mL of bromine TS on a water bath for 5 minutes, concentrate to 5 mL, and cool. Perform the test with this solution as the test solution (not more than 1.3 ppm).

(9) 5-Hydroxymethylfurfurals—Dissolve 5.0 g of Fructose in 100 mL of water, and read the absorbance at 284 nm as directed under Ultraviolet-visible Spectrophotometry <2.25>: the absorbance is not more than 0.32.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, silica gel, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 4 g of Fructose, previously dried, dissolve in 0.2 mL of ammonia TS and 80 mL of water, and after standing for 30 minutes add water to make exactly 100 mL, and determine the optical rotation, α_{D} in a 100-mm cell at 20 ± 1°C as directed under Optical Rotation Determination <2.49>.

Amount (mg) of fructose (C_{6}H_{12}O_{6}) = |α_{D}| × 1087.0

Containers and storage Containers—Tight containers.

Fructose Injection

果糖注射液

Fructose Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of fructose (C_{6}H_{12}O_{6}: 180.16).

Method of preparation Prepare as directed under Injections, with Fructose. No preservative is added.

Description Fructose Injection is a colorless to pale yellow, clear liquid. It has a sweet taste.

Identification (1) Take a volume of Fructose Injection, equivalent to 1 g of Fructose, dilute with water or concentrate on a water bath to 20 mL, if necessary, and use this solution as the sample solution. Add 2 to 3 drops of the sample solution to 5 mL of boiling Fehling’s TS: a red precipitate is produced.

(2) To 10 mL of the sample solution obtained in (1) add 0.1 g of resorcinol and 1 mL of hydrochloric acid, and warm in a water bath for 3 minutes: a red color develops.

pH <2.54> 3.0–6.5 In the case where the labeled concentration of the injection exceeds 5%, dilute to 5% with water before the test.

Purity (1) Heavy metals <1.07>—Take a volume of Fructose Injection, equivalent to 5.0 g of Fructose, and evaporate on a water bath to dryness. With the residue, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution.

(2) Arsenic <1.17>—Take a volume of Fructose Injection, equivalent to 1.5 g of Fructose, dilute with water or concentrate on a water bath to 5 mL, if necessary, and add 5 mL of dilute sulfuric acid and 1 mL of bromine TS. Proceed as directed in the purity (8) under Fructose.

Residue on ignition <2.44> Measure exactly a volume of Fructose Injection, equivalent to 2 g of Fructose, evaporate on a water bath to dryness, and perform the test: the residue weighs not more than 2 mg.
Bacterial endotoxins \(<4.0\) Less than 0.5 EU/mL.

Extractable volume \(<6.0\) It meets the requirement.

Foreign insoluble matter \(<6.0\) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \(<6.0\) It meets the requirement.

Sterility \(<4.0\) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Fructose Injection, equivalent to about 4 g of fructose \((\text{C}_6\text{H}_12\text{O}_6)\), add 0.2 mL of ammonia TS, dilute with water to make exactly 100 mL, shake well, and after allowing to stand for 30 minutes, determine the optical rotation, \(\alpha_d\), in a 100-mm cell at 20 ± 1°C as directed under Optical Rotation Determination \(<2.49\).

Amount \((\text{mg})\) of fructose \((\text{C}_6\text{H}_12\text{O}_6) = |\alpha_d| \times 1087.0

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

### Fudosteine

フドステイン

\[
\text{C}_6\text{H}_13\text{NO}_5\text{S} : 179.24
\]

\((2\text{R})\)-2-Amino-3-(3-hydroxypropylsulfonyl)propanoic acid \([\text{I}1389-98-5]\)

Fudosteine, when dried, contains not less than 99.0% and not more than 101.0% of fudosteine \((\text{C}_6\text{H}_13\text{NO}_5\text{S})\).

**Description**

Fudosteine occurs as white, crystals or crystalline powder. It is freely soluble in water, slightly soluble in acetic acid (100), and practically insoluble in ethanol (99.5). It dissolves in 6 mol/L hydrochloric acid TS.

Melting point: about 200°C (with decomposition).

**Identification**

(1) To 5 mL of a solution of fudosteine (1 in 1000) add 2 mL of sodium hydroxide TS, shake well, add 0.3 mL of sodium pentacyanonitrosylferrate (III) TS, and shake well again. After allowing to stand at 40°C for 10 minutes, cool the solution in an ice bath for 2 minutes, add 2 mL of dilute hydrochloric acid, and shake: a red-orange color develops.

(2) Determine the infrared absorption spectrum of Fudosteine as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\)\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \(<2.49\> [\alpha]_D^2\text{C} = -7.4 - -8.9°\) (after drying, 1 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**Purity**

(1) Chloride \(<1.0\>)—Dissolve 0.20 g of Fudosteine in 10 mL of water and 20 mL of nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 20 mL of nitric acid and water to make 50 mL (not more than 0.044%).

(2) Heavy metals \(<1.07\) —Proceed with 2.0 g of Fudosteine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead solution (not more than 10 ppm).

(3) Arsenic \(<1.1\>—Prepare the test solution with 2.0 g of Fudosteine according to Method 3, and perform the test (not more than 1 ppm).

(4) L-Cystine—Dissolve exactly 0.25 g of Fudosteine in the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve exactly 25 mg of L-cystine in 2 mL of 1 mol/L hydrochloric acid TS, then add the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\)> according to the following conditions. Determine each peak area by the automatic integration method: the peak area of L-cystine obtained from the sample solution is not larger than the peak area of L-cystine from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeccysilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A solution of sodium 1-hexanesulfonate in diluted phosphoric acid (1 in 1000) (1 in 1250).

Flow rate: Adjust so that the retention time of fudosteine is about 8 minutes.

**System suitability**

System performance: Dissolve 25 mg of L-cystine in 2 mL of 1 mol/L hydrochloric acid TS, add 25 mg of Fudosteine, and add the mobile phase to make 50 mL. Take 2.5 mL of this solution, add the mobile phase to make 50 mL. When the procedure is run with 10 \(\mu\)L of this solution under the above operating conditions, L-cystine and fudosteine are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of L-cystine is not more than 2.0%.

(5) Related substances—Dissolve 0.25 g of Fudosteine in the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, pipet 2.5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\)> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than fudosteine obtained from the sample solution is not larger than the peak area of fudosteine from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeccysilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 55°C.

Mobile phase: Diluted phosphoric acid (1 in 1000).

---

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Flow rate: Adjust so that the retention time of fudosteine is about 3 minutes.

Time span of measurement: About 10 times as long as the retention time of fudosteine, beginning after the peak of fudosteine.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of fudosteine are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of fudosteine is not more than 2.0%.

Loss on drying <2.4%>—Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.4%>—Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Fudosteine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.5O> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 17.92 mg of C₆H₃NO₃S

Containers and storage Containers—Well-closed containers.

Fudosteine Tablets

フドステイン錠

Fudosteine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of fudosteine (C₆H₃NO₃S: 179.24).

Method of preparation Prepare as directed under Tablets, with Fudosteine.

Identification Powder Fudosteine Tablets. To a portion of the powder, equivalent to 88 mg of Fudosteine, add 10 mL of a mixture of water and methanol (1:1), shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 90 mg of fudosteine for assay in 10 mL of a mixture of water and methanol (1:1), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.8T>. Spot 2.5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 1000) to a distance of about 10 cm, and air-dry the plate. Spray the plate with a mixture of 1-butanol, water and acetic acid (100) (3:2:1) to a distance of about 10 cm, and air-dry the plate. Draw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 5 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V mL so that each mL contains about 55.6 μg of fudosteine (C₆H₃NO₃S), and use this solution as the sample solution. Separately, weigh accurately about 50 mg of fudosteine for assay, previously dried at 105°C for 3 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas, A₁ and A₂, of fudosteine in each solution.

Dissolution <6.1O> When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 20 minutes of Fudosteine Tablets is not less than 85%.

Start the test with 1 tablet of Fudosteine Tablets, with
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A solution of sodium 1-hexanesulfonate in dilute phosphoric acid (1 in 1000) (1 in 1250).

Flow rate: Adjust so that the retention time of fudosteine is about 8 minutes.

**System suitability—**
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, fudosteine and the internal standard are eluted in this order with the resolution between these peaks being not less than 12.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of fudosteine to that of the internal standard is not more than 1.0%.

**Containers and storage** containers—Tight containers.

---

**Furosemide**

フロセミド

\[ C_{12}H_{11}ClN_2O_3S: 330.74 \]

4-Chloro-2-[(furan-2-ylmethyl)amino]-5-sulfamoylbenzoic acid [54-31-9]

Furosemide, when dried, contains not less than 98.0% and not more than 101.0% of furosemide (C_{12}H_{11}ClN_2O_3S).

**Description** Furosemide occurs as white, crystals or crystal-line powder.

It is freely soluble in \( N,N \)-dimethylformamide, soluble in methanol, sparingly soluble in ethanol (99.5), slightly soluble in acetonitrile and in acetic acid (100), and practically insoluble in water.

It dissolves in dilute sodium hydroxide TS.

It is gradually colored by light.

Melting point: about 205°C (with decomposition).

**Identification (1)** Dissolve 25 mg of Furosemide in 10 mL of methanol. To 1 mL of this solution add 10 mL of 2 mol/L hydrochloric acid TS. Heat the solution under a reflux condenser on a water bath for 15 minutes, cool, and add 18 mL of sodium hydroxide TS to make weakly acidic: the solution responds to Qualitative Tests 1.09 for primary aromatic amines, producing a red to red-purple color.

**Identification (2)** Determine the absorption spectrum of a solution of Furosemide in dilute sodium hydroxide TS (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.4, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Furosemide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Identification (3)** Determine the infrared absorption spectrum of Furosemide as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum or the spectrum of Furosemide RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Furosemide in 10 mL of a solution of sodium hydroxide (1 in 50): the solution is clear and colorless.

**Chloride (2)**—Dissolve 2.6 g of Furosemide in 90 mL of dilute sodium hydroxide TS, add 2 mL of nitric acid, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.40 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.020%).

**Sulfate (3)**—To 20 mL of the filtrate obtained in (2) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the standard solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.030%).

**Heavy metals (4)**—Proceed with 2.0 g of Furosemide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Related substances—**Dissolve 25 mg of Furosemide in 25 mL of the dissolving solution, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the dissolving solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.06 according to the following conditions, and determine each peak area by the automatic integration method: the area of each peak appeared ahead of the peak of furosemide obtained from sample solution is not larger than 2/5 times the peak area of furosemide from the standard solution, the area of each peak appeared behind the peak of furosemide is not larger than 1/4 times the peak area of furosemide from the standard solution, and the total area of these peaks is not larger than 2 times the peak area of furosemide from the standard solution.

**Dissolving solution**—To 22 mL of acetic acid (100) add a mixture of water and acetonitrile (1:1) to make 1000 mL.

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 272 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, tetrahydrofuran and acetic acid (100) (70:30:1).

Flow rate: Adjust so that the retention time of furosemide is about 18 minutes.

Time span of measurement: About 2.5 times as long as the retention time of furosemide, beginning after the solvent peak.

**System suitability—**
Test for required detectability: Measure exactly 2 mL of the standard solution, and add the dissolving solution to make exactly 50 mL. Confirm that the peak area of furosemide obtained with 20 μL of this solution is equivalent to 3.2 to 4.8% of that with 20 μL of the standard solution.
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of furosemide is not less than 7000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of furosemide is not more than 2.0%.

**Loss on drying** Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Furosemide, previously dried, dissolve in 50 mL of N,N-dimethylformamide, and titrate with 0.1 mol/L sodium hydroxide VS until the color of the solution changes from yellow to blue (indicator: 3 drops of bromothymol blue TS). Perform a blank determination with a mixture of 50 mL of N,N-dimethylformamide and 15 mL of water in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 33.07 mg of C₇H₇ClN₂O₂S

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Furosemide Injection**

フロセミド注射液

Furosemide Injection is an aqueous injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of furosemide (C₇H₇ClN₂O₂S: 330.74).

**Method of preparation** Prepare as directed under Injection, with Furosemide.

**Description** Furosemide Injection is a colorless, clear liquid.

**Identification (1)** To a volume of Furosemide Injection, equivalent to 2.5 mg of Furosemide, add 10 mL of 2 mol/L hydrochloric acid TS, heat under a reflux condenser on a water bath for 15 minutes. After cooling, render the solution slightly acidic with 18 mL of sodium hydroxide TS: the solution responds to Qualitative Tests <1.09> for primary aromatic amines. The color of the solution is red to red-purple.

(2) To a volume of Furosemide Injection, equivalent to 20 mg of Furosemide, add water to make exactly 100 mL. To 2 mL of this solution add 0.01 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Furosemide RS, previously dried at 105°C for 4 hours, add 0.01 mol/L sodium hydroxide TS to make exactly 100 mL. Pipet 3 mL of this solution, add 0.01 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁ and A₅, at 271 nm.

\[
\text{Amount (mg) of furosemide (C₇H₇ClN₂O₂S)} = M₅ \times \frac{A₁}{A₅}
\]

M₅: Amount (mg) of Furosemide RS taken

**Containers and storage** Containers—Hermetic containers. Storage—Light-resistant.

**Furosemide Tablets**

フロセミド錠

Furosemide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of furosemide (C₇H₇ClN₂O₂S: 330.74).

**Method of preparation** Prepare as directed under Tablets, with Furosemide.

**Identification (1)** Shake well a quantity of powdered Furosemide Tablets, equivalent to 0.2 g of Furosemide, with 40 mL of acetone, and filter. To 0.5 mL of the filtrate add 10 mL of 2 mol/L hydrochloric acid TS, and heat under a reflux condenser on a water bath for 15 minutes. After cooling, add 18 mL of sodium hydroxide TS to make the solution slightly acidic: the solution responds to Qualitative Tests <1.09> for primary aromatic amines, producing a red to red-purple color.

(2) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima be-
between 227 nm and 231 nm, between 269 nm and 273 nm, and between 330 nm and 336 nm.

**Purity** To a quantity of powdered Furosemide Tablets, equivalent to 40 mg of Furosemide, add about 30 mL of acetone, shake well, and add acetone to make exactly 50 mL. Centrifuge the solution, add 3.0 mL of water to 1.0 mL of the supernatant liquid, cool in ice, add 3.0 mL of dilute hydrochloric acid and 0.15 mL of sodium nitrite TS, shake, and allow to stand for 1 minute. Add 1.0 mL of ammonium amidosulfate TS, shake well, allow to stand for 3 minutes, add 1.0 mL of N,N-diethyl-N'-1-naphthylethylendiamine oxalate TS, shake well, and allow to stand for 5 minutes. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry 2.24, using a solution prepared in the same manner with 1.0 mL of acetone as the blank: the absorbance at 530 nm is not more than 0.10.

**Uniformity of dosage units** (6.02) Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Furosemide Tablets add a suitable amount of 0.05 mol/L sodium hydroxide TS, shake to disintegrate, then add 0.05 mol/L sodium hydroxide TS to make exactly V mL so that each mL contains about 0.4 mg of furosemide (C_{12}H_{14}ClN_{2}O_{3}S). Filter the solution, discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of furosemide (C_{12}H_{14}ClN_{2}O_{3}S) = M_5 \times A_1/A_2 \times V/50

M_5: Amount (mg) of Furosemide RS taken

**Dissolution** (6.10) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rates of a 20-mg tablet in 15 minutes and a 40-mg tablet in 30 minutes are not less than 80%.

Start the test with 1 tablet of Furosemide Tablets, withdraw not less than 30 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 10 μg of furosemide (C_{12}H_{14}ClN_{2}O_{3}S), and use this solution as the sample solution. Separate, weigh accurately about 20 mg of Furosemide RS, previously dried at 105°C for 4 hours, and dissolve in 5 mL of methanol, and add the dissolution medium to make exactly 100 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_1 and A_2, of the sample solution and standard solution at 277 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.

Dissolution rate (%) with respect to the labeled amount of furosemide (C_{12}H_{14}ClN_{2}O_{3}S) = M_6 \times A_1/A_2 \times V/V \times 1/C \times 45

M_6: Amount (mg) of Furosemide RS taken

**Assay** Weigh accurately the mass of not less than 20 Furosemide Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 40 mg of furosemide (C_{12}H_{14}ClN_{2}O_{3}S), add about 70 mL of 0.05 mol/L sodium hydroxide TS, shake well, and add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL. Filter, discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Furosemide RS, previously dried at 105°C for 4 hours, and dissolve in 0.05 mol/L sodium hydroxide TS to make exactly 50 mL. Pipet 2 mL of this solution, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_1 and A_2, of the sample solution and standard solution at 271 nm as directed under the Ultraviolet-visible Spectrophotometry 2.24.

\[
\text{Amount (mg) of furosemide (C}_{12}\text{H}_{14}\text{ClN}_{2}\text{O}_{3}\text{S}) \quad = \frac{M_5 \times A_1}{A_2} \times 2
\]

M_5: Amount (mg) of Furosemide RS taken

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Fursultiamine Hydrochloride** フルスルチアミン塩酸塩

C_{17}H_{25}NO_{3}S_{2}.HCl: 435.00

N-(4-Amino-2-methylpyrimidin-5-ylmethyl)-N-[(1Z)-4-hydroxy-1-methyl-2-[(2RS)-tetrahydrofuran-2-ylmethyldifluorany]but-1-en-1-yl]formamide monohydrochloride [804-30-8, Fursultiamine]

Fursultiamine Hydrochloride contains not less than 98.5% of fursultiamine hydrochloride (C_{17}H_{25}NO_{3}S_{2}.HCl), calculated on the anhydrous basis.

**Description** Fursultiamine Hydrochloride occurs as white, crystals or crystalline powder. It is odorless or has a characteristic odor, and has a bitter taste.

It is freely soluble in water, in methanol and in ethanol (95).

It shows crystal polymorphism.

**Identification (I)** Dissolve 5 mg of Fursultiamine Hydrochloride in 6 mL of 0.1 mol/L hydrochloric acid TS, add 0.1 g of zinc powder, allow to stand for several minutes, and filter. To 3 mL of the filtrate, add 3 mL of sodium hydroxide TS and 0.5 mL of potassium hexacyanoferrate (III) TS, then add 5 mL of 2-methyl-1-propanol, shake vigorously for 2 minutes, allow to stand to separate the 2-methyl-1-propanol layer, and examine under ultraviolet light (main wavelength: 365 nm): the 2-methyl-1-propanol layer shows a blue-purple fluorescence. The fluorescence disappears by acidifying, and appears again by alkalinifying.

Determine the infrared absorption spectrum of Fursultiamine Hydrochloride, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum or the spectrum of Fursultiamine Hy-
Gabexate Mesilate / Official Monographs

1052

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Fursultiamine Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Proceed with 1.5 g of Fursultiamine Hydrochloride, and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.011%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Fursultiamine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Fursultiamine Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following condition. Determine each peak area of each solution by the automatic integration method: the total area of the peaks other than fursultiamine obtained from the sample solution is not larger than the peak area of fursultiamine from the standard solution.

**Operating conditions**—
Detector, column, column temperature, mobile phase, flow rate, and selection of column: Proceed as directed in the operating conditions in the Assay.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of fursultiamine from 10 μL of the standard solution is between 20 mm and 30 mm.

Time span of measurement: About 3 times as long as the retention time of fursultiamine.

**Water <2.48>** Not more than 5.0% (0.3 g, volumetric titration, direct titration).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 55 mg each of Fursultiamine Hydrochloride and Fursultiamine Hydrochloride RS (previously determined the water <2.48> in the same manner as Fursultiamine Hydrochloride) and dissolve each in 50 mL of water, and add exactly 10 mL each of the internal standard solution, then add water to make exactly 100 mL. To 8 mL each of the solution add water to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of fursultiamine to that of the internal standard.

\[
\text{Amount (mg) of fursultiamine hydrochloride (C}_{18}\text{H}_{23}\text{N}_{3}\text{O}_{4}\text{S}_{2}\text{HCl}) = M_s \times \frac{Q_1}{Q_2} 
\]

\( M_s: \) Amount (mg) of Fursultiamine Hydrochloride RS taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of isopropyl 4-aminobenzoate in ethanol (95) (3 in 400).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 1.01 g of sodium 1-heptane sulfonate in 1000 mL of 0.2 mol/L sulfuric acid solution (100) (1 in 100). To 675 mL of this solution add 325 mL of a mixture of methanol and acetonitrile (3:2).

Flow rate: Adjust so that the retention time of fursultiamine is about 9 minutes.

Selection of column: Proceed with 10 μL of the standard solution under the above operating conditions and calculate the resolution. Use a column giving elution of fursultiamine and the internal standard in this order with the resolution between these peaks being not less than 10.

**Containers and storage**—Containers—Tight containers.

---

**Gabexate Mesilate**

ガベキサートメシル酸塩

C_{16}H_{23}N_{3}O_{4}CH_{2}O_{3}S: 417.48

Ethyl 4-(6-guanidinohexanoyloxy)benzoate monomethanesulfonate [56974-61-9]

Gabexate Mesilate, when dried, contains not less than 98.5% and not more than 101.0% of gabexate mesilate (C_{16}H_{23}N_{3}O_{4}CH_{2}O_{3}S).

**Description** Gabexate Mesilate occurs as white, crystals or crystalline powder.

It is very soluble in water, freely soluble in ethanol (95).

**Identification (1)** To 4 mL of a solution of Gabexate Mesilate (1 in 2000) add 2 mL of 1-naphthol TS and 1 mL of diacetyl TS, and allow to stand for 10 minutes: a red color develops.

(2) Dissolve 1 g of Gabexate Mesilate in 5 mL of water, add 2 mL of sodium hydroxide TS, and heat in a water bath for 5 minutes. After cooling, add 2 mL of dilute nitric acid and 5 mL of ethanol (95), shake, add 5 drops of iron (III) chloride TS, and shake: a purple color develops.

(3) Determine the absorption spectrum of a solution of Gabexate Mesilate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Gabexate Mesilate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) A 0.1 g portion of Gabexate Mesilate responds to Qualitative Tests <1.09> (1) for mesilate.

**pH <2.54>** Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water: the pH of the solution is between 4.7 and 5.7.
Melting point $\leq 2.60 \rightarrow 90 - 93^\circ C$

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals $<1.07$—Proceed with 2.0 g of Gabexate Mesilate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic $<1.17$—Dissolve 2.0 g of Gabexate Mesilate in 20 mL of 1 mol/L hydrochloric acid TS by heating in a water bath, and continue the heating for 20 minutes. After cooling, centrifuge, and use 10 mL of the supernatant liquid as the test solution. Perform the test (not more than 2 ppm).

(4) Ethyl parahydroxybenzoate—Weigh 50 mg of Gabexate Mesilate, previously dried, and dissolve in dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, dissolve 5.0 mg of ethyl parahydroxybenzoate in dilute ethanol to make exactly 100 mL. Pipet 1 mL of this solution, and add dilute ethanol to make exactly 20 mL. To exactly 5 mL of this solution add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 3 mL each of the sample solution and standard solution as directed under Liquid Chromatography $\leq 2.01$ according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of the peak area of ethyl parahydroxybenzoate to that of the internal standard: $Q_T$ is not larger than $Q_S$.

\[
\text{Internal standard solution} = \text{A solution of butyl parahydroxybenzoate in dilute ethanol (1 in 5000)}.
\]

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

Proceed as directed in the system suitability in the Assay.

(5) Related substances—Dissolve 0.20 g of Gabexate Mesilate in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $\leq 2.03$. Spot 5 \( \mu \)L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate until it has no acetic odor. Spray evenly a solution of 8-quinolinol in acetone (1 in 1000) on the plate, and after air-drying, spray evenly bromine-sodium hydroxide TS: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying $\leq 2.41\%$ Not more than 0.30\% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition $\leq 2.41\%$ Not more than 0.1\% (1 g).

Assay Weigh accurately about 50 mg each of Gabexate Mesilate and Gabexate Mesilate RS, previously dried, and dissolve each in dilute ethanol to make exactly 100 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 3 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography $\leq 2.01$ according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of the peak area of gabexate to that of the internal standard.

\[
\text{Amount (mg) of gabexate mesilate (C}_{28}\text{H}_{27}\text{N}_{2}\text{O}_{5}\cdot\text{CH}_{3}\text{O}_{3}) = M_S \times Q_T/Q_S
\]

$M_S$: Amount (mg) of Gabexate Mesilate RS taken

\[\text{Internal standard solution} = \text{A solution of butyl parahydroxybenzoate in dilute ethanol (1 in 5000)}.
\]

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol, a solution of sodium lauryl sulfate (1 in 1000), a solution of sodium 1-heptane sulfonate (1 in 200) and acetic acid (100) (540:200:20:1).

Flow rate: Adjust so that the retention time of gabexate is about 13 minutes.

System suitability—

System performance: When the procedure is run with 3 \( \mu \)L of the standard solution under the above operating conditions, the internal standard and gabexate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 3 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of gabexate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

\[\beta\text{-Galactosidase (Aspergillus)}\]

$\beta$-ガラクトシダーゼ (アスペルギルス)

$[9031-11-2]$ \n
$\beta$-Galactosidase (Aspergillus) contains an enzyme produced by Aspergillus oryzae. It is an enzyme drug having lactose decomposition activity.

It contains 8,000 to 12,000 units per g.

Usually, it is diluted with a mixture of Maltose Hydroxide and Dextrin, Maltose Hydrate and D-Mannitol, or Maltose Hydrate, Dextrin and D-Mannitol.

Description $\beta$-Galactosidase (Aspergillus) occurs as a white to light yellow powder.

It is slightly soluble in water with a turbidity, and practically insoluble in ethanol (95) and in diethyl ether.

Identification (1) Dissolve 25 mg of $\beta$-Galactosidase (Aspergillus) in 100 mL of water, then to 1 mL of this solution add 9 mL of lactose substrate TS, and stand at 30°C for 10 minutes. To 1 mL of this solution add 6 mL of glucose detection TS, and stand at 30°C for 10 minutes: a red to red-purple color develops.

(2) Dissolve 0.1 g of $\beta$-Galactosidase (Aspergillus) in 100 mL of water, and filter the solution if necessary. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry $\leq 2.24\%$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1) Odor—$\beta$-Galactosidase (Aspergillus) has no
any rancid odor.

(2) Heavy metals \(<1.07\)—Proceed with 1.0 g of \(\beta\)-Galactosidase (Aspergillus) according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic \(<1.1D\)—Prepare the test solution with 1.0 g of \(\beta\)-Galactosidase (Aspergillus) according to Method 3, and perform the test (not more than 2 ppm).

Loss on drying \(<2.4\) Not more than 9.0% (0.5 g, in vacuum, 80°C, 4 hours).

Residue on ignition \(<2.4\) Not more than 3% (0.5 g).

Nitrogen weight Weigh accurately about 70 mg of \(\beta\)-Galactosidase (Aspergillus), and perform the test as directed under Nitrogen Determination \(<1.08\): the amount of nitrogen (N: 14.01) is between 0.5% and 5.0%, calculated on the dried basis.

Assay (i) Substrate solution—Dissolve 0.172 g of 2-nitrophenyl-\(\beta\)-D-galactopyranoside in disodium hydrogenphosphate-citric acid buffer solution (pH 4.5) to make 100 mL.

(ii) Procedure—Weigh accurately about 25 mg of \(\beta\)-Galactosidase (Aspergillus), dissolve in water to make exactly 100 mL, then pipet 2 mL of this solution, add water to make exactly 50 mL, and use this solution as the sample solution. Take exactly 3.5 mL of the substrate solution, stand at 30 ± 0.1°C for 5 minutes, add exactly 0.5 mL of the sample solution, immediately mix, and stand at 30 ± 0.1°C for exactly 10 minutes, then add exactly 1 mL of sodium carbonate TS and mix immediately. Perform the test as directed under Ultraviolet-visible Spectrophotometry \(<2.24\): absorbance of 1 \(\mu\)mol of 2-nitrophenyl-D-\(\beta\)-galactoside, and determine the absorbance, \(A_1\), of this solution at 420 nm using water as the control. Separately, take exactly 3.5 mL of the substrate solution, add exactly 1 mL of sodium carbonate TS and mix, then add exactly 0.5 mL of the sample solution and mix. Determine the absorbance, \(A_2\), of this solution in the same manner as above.

\[
\text{Units per g of } \beta\text{-Galactosidase (Aspergillus)} = \frac{1}{M} \times \frac{(A_1 - A_2)}{0.917} \times \frac{1}{0.5} \times \frac{1}{10}
\]

0.917: Absorbance of 1 \(\mu\)mol/5 mL of \(o\)-nitrophenol

\(M\): Amount (g) of \(\beta\)-Galactosidase (Aspergillus) in the sample solution per mL

Units: One unit indicates an amount of the enzyme which decomposes 1 \(\mu\)mol of 2-nitrophenyl-\(\beta\)-D-galactopyranoside in 1 minute under the above conditions.

Containers and storage Containers—Tight containers. Storage—In a cold place.

\section*{\(\beta\)-Galactosidase (Penicillium)

\(\beta\)-ガラクトシダーゼ（ペニシリウム）

[9031-11-2]

\(\beta\)-Galactosidase (Penicillium) contains an enzyme, having lactose decomposition activity, produced by \textit{Penicillium multicolor}.

It contains not less than 8500 units and not more than 11,500 units in each g.

Usually, it is diluted with D-Mannitol.

Description \(\beta\)-Galactosidase (Penicillium) occurs as a white to pale yellow-white, crystalline powder or powder.

It is soluble in water with a turbidity, and practically insoluble in ethanol (95%).

It is hygroscopic.

Identification (1) Dissolve 0.05 g of \(\beta\)-Galactosidase (Penicillium) in 100 mL of water, then to 0.2 mL of this solution add 0.2 mL of lactose substrate TS for \(\beta\)-galactosidase (penicillium), and allow to stand at 30°C for 10 minutes. To this solution add 3 mL of glucose detection TS for penicillium origin \(\beta\)-galactosidase, and allow to stand at 30°C for 10 minutes: a red to red-purple color develops.

(2) Dissolve 0.15 g of \(\beta\)-Galactosidase (Penicillium) in 100 mL of water, filter if necessary, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\): it exhibits a maximum between 278 nm and 282 nm.

Purity (1) Odor—\(\beta\)-Galactosidase (Penicillium) has no any rancid odor.

(2) Heavy metals \(<1.07\)—Proceed with 1.0 g of \(\beta\)-Galactosidase (Penicillium) according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic \(<1.1D\)—Prepare the test solution with 1.0 g of \(\beta\)-Galactosidase (Penicillium) according to Method 3, and perform the test (not more than 2 ppm).

(4) Nitrogen—Weigh accurately about 0.1 g of \(\beta\)-Galactosidase (Penicillium), and perform the test as directed under Nitrogen Determination \(<1.08\): not more than 3 mg of nitrogen (N: 14.01) is found for each labeled 1000 Units.

(5) Protein contaminants—Dissolve 0.15 g of \(\beta\)-Galactosidase (Penicillium) in 4 mL of water, and use this solution as the sample solution. Perform the test with 15 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak having retention time of about 19 minutes is not more than 75% of the total area of all peaks, and the areas of peaks other than the peaks having retention times of about 3, 16 and 19 minutes are not more than 15% of the total area of all peaks.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 7.5 mm in inside diameter and about 75 mm in length, packed with strongly acidic ion-exchange resin for liquid chromatography of sulfoethyl group-binding hydrophilic polymer (10 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase: A solution obtained by dissolving 2.83 g of sodium acetate in 1000 mL of water, and adjusting to \(pH\) 4.5 with acetic acid (100) (mobile phase A), and a solution obtained by dissolving 29.2 g of sodium chloride in 1000 mL of mobile phase A (mobile phase B).

Flow system: Adjust a linear concentration gradient from the mobile phase A to the mobile phase B immediately after injection of the sample so that the retention times of non-retaining protein and the enzyme protein are about 3 minutes and 19 minutes, respectively, when the flow runs 0.8 mL per minute, and then continue the running of the mobile phase B.

Selection of column: Dissolve 15 mg of \(\beta\)-lactoglobulin in 4.5 mL of water, add 0.5 mL of a solution of cytosine (1 in 5000), and use this solution as the column-selecting solution. Proceed with 15 \(\mu\)L of the column-selecting solution under
Determine the absorption spectrum of a

Determine the infrared absorption spectrum of

Loss on drying \(<2.4\%>\) Not more than 5.0\% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

Residue on ignition \(<2.4\%>\) Not more than 2\% (1 g).

Assay (i) Substrate solution—Dissolve 0.603 g of 2-nitrophenyl-β-D-galactopyranoside in disodium hydrogen phosphate-citric acid buffer solution for penicilliun origin β-galactosidase (pH 4.5) to make 100 mL.

(ii) Procedure—Weigh accurately about 0.15 g of β-Galactosidase (Penicillium), dissolve in water with thorough shaking to make exactly 100 mL, and allow to stand at room temperature for an hour. Pipet 2 mL of this solution, add disodium hydrogen phosphate-citric acid buffer solution for penicilliun origin β-galactosidase (pH 4.5) to make exactly 100 mL, and use this solution as the sample solution. Transfer exactly 0.5 mL of the sample solution to a test tube, stand at 30 ± 0.1°C for 10 minutes, add exactly 0.5 mL of the substrate solution previously kept at 30 ± 0.1°C, then immediately, and stand at 30 ± 0.1°C for exactly 10 minutes. Then add exactly 1 mL of sodium carbonate TS, mix immediately to stop the reaction. To this solution add exactly 8 mL of water, mix, and use as the colored sample solution. Separately, pipet 0.5 mL of disodium hydrogen phosphate-citric acid buffer solution for penicilliun origin β-galactosidase (pH 4.5), then proceed in the same manner as the sample solution, and use the solution so obtained as the colored blank solution. Perform the test with the colored sample solution and the colored blank solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), using water as the blank, and determine the absorbances, \(A_t\) and \(A_b\), at 420 nm.

\[
\text{Units per g of β-Galactosidase (Penicillium) = } \frac{1}{M} \times \frac{A_t - A_b}{0.459} \times \frac{1}{10}
\]

0.459: Absorbance of 1 μmol/10 mL of o-nitrophenol

\(M\): Amount (g) of β-Galactosidase (Penicillium) in 0.5 mL of the sample solution

Unit: One unit indicates an amount of the enzyme which decomposes 1 μmol of 2-nitrophenyl-β-D-galactopyranoside in 1 minute under the above conditions.

Containers and storage Containers—Tight containers.

Gallium (⁶⁷Ga) Citrate Injection ガンシカリウム (⁶⁷Ga) 注射液

Gallium (⁶⁷Ga) Citrate Injection is an aqueous injection containing gallium-6⁷ (⁶⁷Ga) in the form of gallium citrate.

It conforms to the requirements of Gallium (⁶⁷Ga) Citrate Injection in the Minimum Requirements for Radiopharmaceuticals.

Test for Extractable volume of Parenteral Preparations and Insoluble Particulate Matter Test for Injectables are not applied to this injection.

Description Gallium (⁶⁷Ga) Citrate Injection is a clear, colorless or light red liquid.

Gatifloxacin Hydrate ガチフロキサシン水和物

\[
\text{C}_{19}\text{H}_{22}\text{FN}_{6}\text{O}_{4}.1\frac{1}{2}\text{H}_{2}\text{O}: 402.42}
\]

1-Cyclopropyl-6-fluoro-8-methoxy-7-[3RS)-3-methylpiperazin-1-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid sesquihydrate [180200-66-2]

Gatifloxacin Hydrate contains not less than 98.5% and not more than 101.5% of gatifloxacin \((\text{C}_{19}\text{H}_{22}\text{FN}_{6}\text{O}_{4})\) calculated on the anhydrous basis.

Description Gatifloxacin Hydrate occurs as white to pale yellow, crystals or crystalline powder.

It is slightly soluble in methanol and in ethanol (99.5), and very slightly soluble in water.

It dissolves in sodium hydroxide TS.

It is gradually colored to pale yellow by light.

A solution of Gatifloxacin Hydrate in dilute sodium hydroxide TS (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Gatifloxacin Hydrate in dilute sodium hydroxide TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Gatifloxacin RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Gatifloxacin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\>\), and compare the spectrum with the Reference Spectrum or the spectrum of Gatifloxacin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Gatifloxacin Hydrate in 10 mL of sodium hydroxide TS: the solution is clear. Perform the test with the solution as directed under Methods for Color Matching \(<2.67\>\): the solution is not more colored than diluted Matching Fluid O (1 in 5).

(2) Heavy metals \(<1.07\>\)—Proceed with 1.0 g of Gatifloxacin Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 20 mg of Gatifloxacin Hydrate in 50 mL of the dissolving solution, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the dissolving solution to make exactly 100 mL. Pipet 2 mL of this solution, add the dissolving solution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07\>\) according to the following con-
itions. Determine each peak area by the automatic integration method: the peak area of the related substance \( A \), having the relative retention time of about 1.2 to gatifloxacin, obtained from the sample solution is not larger than 2 times the peak area of gatifloxacin from the standard solution, and the area of the peak other than gatifloxacin and the peak mentioned above from the sample solution is not larger than the peak area of gatifloxacin from the standard solution. Furthermore, the total area of the peaks other than gatifloxacin from the sample solution is not larger than 3 times the peak area of gatifloxacin from the standard solution.

Dissolving solution: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (4:1).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 325 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase A: A mixture of diluted triethylamine (1 in 100), adjusted to pH 4.3 with phosphoric acid, and acetonitrile (22:3).

Mobile phase B: A mixture of diluted triethylamine (1 in 100), adjusted to pH 4.3 with phosphoric acid, and acetonitrile (1:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 15</td>

<td>100</td>
</tr>
</tbody>
</table>

Flow rate: 1.0 mL per minute (the retention time of gatifloxacin is about 16 minutes).

Time span of measurement: About 2.5 times as long as the retention time of gatifloxacin, beginning after the solvent peak.

System suitability—
Test for required detectability: Pipet 5 mL of the standard solution, and add the dissolving solution to make exactly 10 mL. Confirm that the peak area of gatifloxacin obtained with 20 \( \mu \)L of this solution is equivalent to 40 to 60% of that with 20 \( \mu \)L of the standard solution.

System performance: Dissolve 20 mg of methyl 4-aminobenzoate in 50 mL of the dissolving solution. To 5 mL of this solution add 1 mL of the sample solution and the dissolving solution to make 100 mL. When the procedure is run with 20 \( \mu \)L of this solution under the above operating conditions, gatifloxacin and methyl 4-aminobenzoate are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of gatifloxacin is not more than 3.0%.

Water \( <2.48 \) 6.0 – 9.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition \( <2.48 \) Not more than 0.1% (1 g).

Assay Weigh accurately about 50 mg of Gatifloxacin Hydrate and Gatifloxacin RS (separately determine the water 
<2.48> in the same manner as Gatifloxacin Hydrate), and dissolve each in the dissolving solution to make exactly 100 mL. Pipet 2 mL of each of these solutions, add exactly 2 mL of the internal standard solution to them, and add the dissolving solution to make 25 mL, and use these solutions as the sample solution and standard solutions. Perform the test with 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01> \) according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of gatifloxacin to that of the internal standard.

Amount (mg) of gatifloxacin (\( \text{C}_{19}\text{H}_{22}\text{FN}_{3}\text{O}_{2} \))

\[
M_S = \frac{M_S \times Q_T}{Q_S}
\]

\( M_S \): Amount (mg) of Gatifloxacin RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of methyl 4-aminobenzoate in the dissolving solution (1 in 4000).

Dissolving solution: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (4:1).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 12.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of diluted triethylamine (1 in 100), adjusted to pH 4.5 with phosphoric acid, and acetonitrile (87:13).

Flow rate: Adjust so that the retention time of gatifloxacin is about 5 minutes.

System suitability—
System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, gatifloxacin and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of gatifloxacin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Light-resistant.

Storage—Light-resistant.

**Gefarnate**

ゲファルナート

\[
\text{C}_{27}\text{H}_{42}\text{O}_7: 400.64
\]

(2E)-3,7-Dimethyl-octa-2,6-dienyl(4E,8E)-5,9,13-trimethyltetradeca-4,8,12-trienoate

[51-77-4, 4E isomer]

Gefarnate is a mixture of 4E geometrical isomer. It contains not less than 98.0% and not more than 101.0% of gefarnate (C_{27}H_{42}O_7).

**Description**

Gefarnate is a light yellow to yellow, clear oily liquid.

- It is miscible with acetonitrile, with ethanol (99.5), and with cyclohexane.
- It is practically insoluble in water.

**Identification**

Determine the infrared absorption spectrum of Gefarnate as directed in the liquid film method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of Gefarnate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Specific gravity** [2.56] \( d_{40}^{20}: 0.906 - 0.914 \)

**Purity**

1. Acidity—To 1.0 g of Gefarnate add 30 mL of neutralized ethanol. To this solution add 1 drop of phenolphthalein TS and 0.40 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

2. Heavy metals [1.07]: Proceed with 2.0 g of Gefarnate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

3. Related substances—Use a solution of Gefarnate in acetonitrile (1 in 500) as the sample solution. Pipet 2 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 2 μL of the standard solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than the peak of gefarnate obtained from the sample solution is not larger than 1/2 times the peak area of gefarnate from the standard solution, and the total area of the peaks other than the peak of gefarnate from the sample solution is not larger than the peak area of gefarnate from the standard solution.

**Operating conditions**

- Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

**Time span of measurement:** About 2 times as long as the retention time of gefarnate, beginning after the solvent peak.

**System suitability**

- Test for required detectability: Pipet 2 mL of the standard solution, add acetonitrile to make exactly 20 mL. Confirm that the peak area of gefarnate obtained with 2 μL of this solution is equivalent to 7 to 13% of that of gefarnate with 2 μL of the standard solution.

- System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of gefarnate are not less than 4000, and between 0.9 and 1.2, respectively.

- System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of gefarnate is not more than 1.0%.

**Isomer ratio**

To 1 mL of Gefarnate add 100 mL of ethanol (99.5), and use this solution as the sample solution. Perform the test with 4 μL of the sample solution as directed under Gas Chromatography (2.02) according to the following conditions. Determine the areas of two adjacent peaks, \( A_1 \) and \( A_2 \), having the retention time of about 37 minutes, where \( A_1 \) is the peak area of shorter retention time and \( A_2 \) is the peak area of longer retention time: \( A_1/(A_1 + A_2) \) is between 0.2 and 0.3.

**Operating conditions**

- Detector: A hydrogen flame-ionization detector.
- Column: A glass column 3 mm in inside diameter and 160 cm in length, packed with polyethylene glycol 20M for gas chromatography coated at the ratio of 5% on acid-treated and silanized siliceous earth for gas chromatography (149 to 177 μm in particle diameter).
- Column temperature: A constant temperature of about 210°C.
- Carrier gas: Nitrogen.
- Flow rate: Adjust so that the reaction time of the peak showing earlier elution of the two peaks of gefarnate is about 35 minutes.

**System suitability**

- System performance: When the procedure is run with 4 μL of the sample solution under the above conditions: the resolution between the two peaks of gefarnate is not less than 1.0.
- System repeatability: When the test is repeated 6 times with 4 μL of the sample solution under the above operating conditions: the relative standard deviation of the peak area of gefarnate is not more than 1.0%.
Geftinib

**General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia.** (See the General Notices 5.)

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)

**Gefitinib**

![Gefitinib Structure](image)

C\textsubscript{22}H\textsubscript{24}ClFN\textsubscript{2}O\textsubscript{4}: 446.90

\(N\)-(3-Chloro-4-fluorophenyl)-7-methoxy-6-[3-(morpholin-4-yl)propoxy]quinazolin-4-amine

[184475-35-2]

Gefitinib contains not less than 98.0% and not more than 102.0% of gefitinib (C\textsubscript{22}H\textsubscript{24}ClFN\textsubscript{2}O\textsubscript{4}), calculated on the anhydrous basis.

**Description** Gefitinib occurs as a white powder.

It is slightly soluble in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Gefitinib in a mixture of trifluoroacetic acid solution (1 in 500) and acetonitrile (3:2) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Gefitinib RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Gefitinib as directed in the potassium bromide disk method under Infrared Spectrometry 2.25, and compare the spectrum with the Reference Spectrum or the spectrum of Gefitinib RS: both spectra exhibit similar intensities of absorption at the same wave numbers. Or, perform the test by the diffuse reflectance method, and compare the spectrum with the spectrum of Gefitinib RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals—Being specified separately when the drug is granted approval based on the Law.

(2) Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add a mixture of trifluoroacetic acid solution (1 in 500) and acetonitrile (3:2) to make exactly 10 mL. Pipet 1 mL of this solution, add a mixture of trifluoroacetic acid solution (1 in 500) and acetonitrile (3:2) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine each peak area by the automatic integration method: the peak area of related substance A having the relative retention time of about 0.13 to gefitinib obtained from the sample solution is not larger than the peak area of gefitinib from the standard solution, the peak area of related substance B having the relative retention time of about 0.3 from the sample solution is not larger than 2 times the peak area of gefitinib from the standard solution, and the area of the peak other than gefitinib and the peaks mentioned above from the sample solution is not larger than the peak area of gefitinib from the standard solution. Furthermore, the total area of the peaks other than gefitinib from the sample solution is not larger than 4 times the peak area of gefitinib from

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and under nitrogen atmosphere.

**Assay** Weigh accurately about 50 mg each of Gefarnate and Gefarnate RS, add exactly 5 mL of the internal standard solution and 20 mL of acetonitrile, and use these solutions as the sample solution and standard solution. Perform the test with 2 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of gefarnate to that of the internal standard.

Amount (mg) of gefarnate (C\textsubscript{22}H\textsubscript{24}O\textsubscript{3}N\textsubscript{4}S) = \(M_s \times Q_1/Q_2\)

\(M_s\): Amount (mg) of Gefarnate RS taken

**Internal standard solution**—A solution of tris (4-\(\beta\)-butylphenyl) phosphate in acetonitrile (1 in 400).

**Operating conditions**—

- Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
- Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with phenylsilanized silica gel for liquid chromatography (10 \(\mu\)m in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: A mixture of acetonitrile for liquid chromatography, water and phosphoric acid (700:300:1).
- Flow rate: Adjust so that the retention time of gefarnate is about 19 minutes.

**System suitability**—

- System performance: When the procedure is run with 2 \(\mu\)L of the standard solution under the above operating conditions, the internal standard and gefarnate are eluted in this order with the resolution between these peaks being not less than 2.0.
- System repeatability: When the test is repeated 6 times with 2 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of gefarnate to that of the internal standard is not more than 1.0%.

**containers and storage** Containers—Tight containers.

Storage—Light-resistant, and under nitrogen atmosphere.

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (● ●), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (○ ○).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Gelatin is a purified protein obtained from collagen of animals by partial alkaline and/or acid hydrolysis, and/or enzymatic hydrolysis or by thermal hydrolysis. The hydrolysis leads to gelling or non-gelling grades.

The label states the gel strength (Bloom value) for the gelling grade, and that it is a non-gelling grade for the non-gelling grade.

Description Gelatin occurs as colorless or white to light yellow-brown sheets, shreds, granules or powder.

It is freely soluble in hot water, and practically insoluble in ethanol (95).

The gelling grade does not dissolve in water, but slowly swells and softens when immersed in it, gradually absorbing water 5 to 10 times its own mass.

The gelling grade derived from an acid-treated collagen exhibits an isoelectric point between pH 7.0 and 9.0, and the gelling grade derived from an alkali-treated collagen exhibits an isoelectric point between pH 4.5 and 5.0.

The non-gelling grade is freely soluble in water.● Identification (1) Dissolve 1.00 g of Gelatin in freshly boiled and cooled water at about 55°C to make 100 mL, and use this solution as the sample solution. To 2 mL of the sample solution keeping at about 55°C add 0.05 mL of copper (II) sulfate TS. Mix and add 0.5 mL of 2 mol/L sodium hydroxide TS: a violet color is produced.

(2) In a test tube about 15 mm in internal diameter, place
0.5 g of Gelatin, add 10 mL of water, and allow to stand for 10 minutes. Heat at 60°C for 15 minutes, then keep the tube upright at 2 to 8°C for 6 hours, and invert the tube: the contents do not flow out immediately for the gelling grade. In the case of the non-gelling grade the contents flow out immediately.

(3) Apply to the non-gelling grade. Place 0.5 g of Gelatin in a 250-mL flask and add 10 mL of water and 5 mL of sulfuric acid. Cover with a watch glass or other instrument, avoiding complete closure, and heat at 105°C for 4 hours. Cool, add 200 mL of water, and then adjust to pH 6.0 to 8.0 with a sodium hydroxide solution (1 in 5). In a test tube, place 2 mL of this solution, add 2 mL of the oxidizing reagent, shake, and allow to stand for 20 minutes. Add 2 mL of the colored solution, shake, and warm in a water bath of 60°C for about 15 minutes: a red to purple color develops.

Oxidizing reagent: Dissolve 5.53 g of disodium hydrogen phosphate dodecahydrate and 0.48 g of citric acid monohydrate in water to make 100 mL. Dissolve 1.4 g of sodium toluenesulfonchloramide trihydrate in this solution. Prepare before use.

Colored solution: Dissolve 1.0 g of 4-dimethylaminobenzaldehyde in 3.5 mL of a solution of perchloric acid (1 in 2) and add slowly 6.5 mL of 2-propanol. Prepare before use.

**Gel strength (Bloom value)** Apply to the gelling grade. Determine the mass (g) necessary to produce the force which, applied to a plunger 12.7 mm in diameter, makes a depression 4 mm deep in a gel having a concentration of 6.67% and matured at 10°C.

(i) Apparatus: Texture analyzer or gelometer with a cylindrical piston 12.7 ± 0.1 mm in diameter with a plane pressure surface and a sharp bottom edge, and with a bottle 59 ± 1 mm in internal diameter and 85 mm high (jelly cup).

(ii) Procedure: Place 7.5 g of Gelatin in a jelly cup, add 105 mL of water, close the cup, and allow to stand for 1 to 4 hours. Heat in a water bath at 65 ± 2°C for 15 minutes. While heating, stir gently with a glass rod. Ensure that the solution is uniform and any condensed water on the inner walls of the cup is incorporated. Allow to cool at room temperature for 15 minutes and transfer the cup to a thermostatically controlled bath at 10.0 ± 0.1°C, and fitted with a device to ensure that the platform on which the cup stands is perfectly horizontal. Close the cup, and allow to stand for 17 ± 1 hours. Remove the sample cup from the bath and quickly wipe the water from the exterior of the cup. Center the cup on the platform of the apparatus so that the plunger contacts the sample as nearly at its midpoint as possible, and start the measurement with 4 mm depression distance and 0.5 mm per second test speed: 80 to 120% of the labeled nominal value.

**pH** $\text{<2.540}$ pH at 55°C of the sample solution obtained in Identification (1) is 3.8 to 7.6.

**Purity** (1) Heavy metals $<0.070$—Proceed with 0.5 g of Gelatin according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 50 ppm).

(2) Iron—To 5.00 g of Gelatin, in a glass-stoppered flask, add 10 mL of hydrochloric acid, close the flask, and heat in a water bath at 75 to 80°C for 2 hours. If necessary for proper solubilization, the gelatin may be allowed to swell after addition of the acid and before heating, the heating time may be prolonged and a higher temperature may be used. After cooling, adjust the content of the flask to 100 g with water, and use this solution as the sample solution. Separately, place 5.00 g each of Gelatin in three glass-stoppered flasks, proceed with them in the same manner as the sample solution, then add 10 mL, 20 mL and 30 mL of Standard Iron Solution (2) for Atomic Absorption Spectrophotometry exactly to each flask separately. Adjust the content of these flasks to 100.0 g each with water, and use these solutions as the standard solutions. The amount of the standard solution to be added may be adjusted according to the sensitivity of the instrument to be used. Perform the test with the sample solution and standard solutions as directed in the standard addition method under Atomic Absorption Spectrophotometry $<2.22>$ according to the following conditions, and determine the content of iron: not more than 30 ppm.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Iron hollow cathode lamp.

Wavelength: 248.3 nm.

(3) Chromium—Use the sample solution obtained in (2) as the sample solution. Separately, place 5.00 g each of Gelatin in three glass-stoppered flasks, proceed with them in the same manner as the sample solution, then add 0.25 mL, 0.50 mL and 0.75 mL of Standard Chromium Solution for Atomic Absorption Spectrophotometry exactly to each flask separately. Adjust the content of these flasks to 100.0 g each with water, and use these solutions as the standard solutions. The amount of the standard solution to be added may be adjusted according to the sensitivity of the instrument to be used. Perform the test with the sample solution and standard solutions as directed in the standard addition method under Atomic Absorption Spectrophotometry $<2.22>$ according to the following conditions, and determine the content of chromium: not more than 10 ppm.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Chromium hollow cathode lamp.

Wavelength: 357.9 nm.

(4) Zinc—Use the sample solution obtained in (2) as the sample solution. Separately, place 5.00 g each of Gelatin in three glass-stoppered flasks, proceed with them in the same manner as the sample solution, then add 7.5 mL, 15 mL and 22.5 mL of Standard Zinc Solution for Atomic Absorption Spectrophotometry exactly to each flask separately. Adjust the content of these flasks to 100.0 g each with water, and use these solutions as the standard solutions. The amount of the standard solution to be added may be adjusted according to the sensitivity of the instrument to be used. Perform the test with the sample solution and standard solutions as directed in the standard addition method under Atomic Absorption Spectrophotometry $<2.22>$ according to the following conditions, and determine the content of zinc: not more than 30 ppm.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Zinc hollow cathode lamp.

Wavelength: 213.9 nm.

(5) Arsenic $<1.10>$—Take 15.0 g of Gelatin in a flask, add 60 mL of dilute hydrochloric acid (1 in 5), and dissolve by heating. Add 15 mL of bromine TS, heat until the excess of bromine is expelled, neutralize with ammonia TS, add 1.5 g of disodium hydrogen phosphate dodecahydrate, and allow to cool. To this solution add 30 mL of magnesia TS, allow to stand for 1 hour, and collect the precipitates. Wash the precipitates with five 10-mL portions of diluted ammonia TS (1 in 4), and dissolve in diluted hydrochloric acid (1 in 4) to make exactly 50 mL. Perform the test with 5 mL of this solution: the solution has no more color than the following color standard.

Color standard: Proceed with 15 mL of Standard Arsenic...
Solution, instead of Gelatin, in the same manner (not more than 1 ppm).

(6) Peroxides—
   (i) Enzyme reaction: Peroxidase transfers oxygen from peroxides to an organic redox indicator which is converted to a blue oxidation product. The intensity of the color obtained is proportional to the quantity of peroxide and can be compared with a color scale provided with the test strips, to determine the peroxide concentration.

   (ii) Procedure: Weigh 20.0 ± 0.1 g of Gelatin in a beaker, add 80.0 ± 0.2 mL of water, and stir to moisten all the gelatin. Allow to stand at room temperature for 1 - 3 hours. Cover the beaker with a watch-glass, and heat the beaker for 20 ± 5 minutes in a water bath at 65 ± 2°C for dissolving the sample. Stir the contents of the beaker with a glass rod to achieve a homogeneous solution, and use this as the sample solution. Dip a peroxide test strip for 1 second into the sample solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid, and compare the reaction zone after 15 seconds with the color scale provided. Multiply the concentration read from the color scale by a factor of 5 to calculate the concentration of peroxide in the test substance: not more than 10 ppm.

   (iii) Suitability test: To exactly 10 mL of Standard Hydrogen Peroxide Solution add water to make exactly 300 mL. Pipet 2 mL of this solution, add water to make exactly 1000 mL (2 ppm). Dip a peroxide test strip for 1 second into this solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the color of the reaction zone after 15 seconds with the color scale: the color of the zone is equivalent to 2 ppm of the color scale.

(7) Sulfur dioxide—
   (i) Apparatus: Use as shown in the figure.

A: Three-necked round-bottomed flask (500 mL)
B: Cylindrical dropping funnel (100 mL)
C: Condenser
D: Test tube
E: Tap

(ii) Procedure: Introduce 150 mL of water into the three-necked round-bottomed flask and pass carbon dioxide through the whole system at a rate of 100 mL per minute. Place 10 mL of hydrogen peroxide-sodium hydroxide TS in the test tube. After 15 minutes, remove the cylindrical dropping funnel without interrupting the stream of carbon dioxide, and introduce through the opening into the three-necked round-bottomed flask about 25.0 g of Gelatin with the aid of 100 mL of water. Pour 80 mL of 2 mol/L hydrochloric acid TS into the funnel, open the tap to introduce the hydrochloric acid into the three-necked round-bottomed flask and close the tap while several mL of the hydrochloric acid remains, in order to avoid losing sulfur dioxide, and boil the mixture for 1 hour. Transfer the contents of the test tube with the aid of a little water to a 200 mL wide-necked conical flask. Heat the flask in a water bath for 15 minutes and cool. Add 0.1 mL of bromphenol blue TS and titrate <2.50> with 0.1 mol/L sodium hydroxide VS until the color changes from yellow to violet-blue lasting for at least 20 seconds. Perform a blank determination in the same manner, and make any necessary correction. Calculate the amount of sulfur dioxide from the following expression: it is not more than 50 ppm.

\[
\text{Amount (ppm) of sulfur dioxide} = \frac{V}{M} \times 1000 \times 3.203
\]

\[M: \text{Amount (g) of Gelatin taken}\]
\[V: \text{Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed}\]

Conductivity <2.51> Perform the test at 30 ± 1.0°C with the sample solution obtained in Identification (1), without temperature compensation: not more than 1 mS·cm⁻¹.

Loss on drying <2.41> Not more than 15.0% (5 g, 105°C, 16 hours).

Microbial limit <4.05> The acceptance criteria of TAMC and TYMC are 10³ CFU/g and 10² CFU/g, respectively. Escherichia coli and Salmonella are not observed.

Containers and storage °Containers—Tight containers.
Storage—Protect from heat and moisture.

Purified Gelatin

精製ゼラチン

Purified Gelatin is a purified protein obtained from collagen of animals by partial alkaline and/or acid hydrolysis, and/or enzymatic hydrolysis, or by thermal hydrolysis. The hydrolysis leads to gelling or nongelling grades.

The label states the gel strength (Bloom value) for the gelling grade, and that it is a non-gelling grade for the non-gelling grade.

Description Purified Gelatin occurs as colorless or white to light yellow-brown sheets, shreds, granules or powder. It is very soluble in hot water, and practically insoluble in ethanol (95).

The gelling grade does not dissolve in water. It slowly swells and softens when immersed in water, and absorbs water 5 to 10 times its own mass. The non-gelling grade is freely soluble in water.

Identification (1) To 5 mL of a solution of Purified Gelatin (1 in 100) add 2,4,6-trinitrophenol TS dropwise: a precipitate is formed.

(2) To 5 mL of a solution of Purified Gelatin (1 in 5000) add tannic acid TS dropwise: the solution becomes turbid.

(3) In a test tube about 15 mm in internal diameter, place 0.5 g of Purified Gelatin, add 10 mL of water, and allow to stand for 10 minutes. Heat at 60°C for 15 minutes, then keep the tube upright at 2 to 8°C for 6 hours, and invert the tube: the contents do not flow out immediately for the gelling grade. In case of the non-gelling grade the contents flow...
out immediately.

**Gel strength (Bloom value)** Apply to the gelling grade. Determine the mass (g) necessary to produce the force which, applied to a plunger 12.7 mm in diameter, makes a depression 4 mm deep in the surface of the gel having a concentration of 6.67% and matured at 10°C.

(i) Apparatus, instruments: Texture analyzer or geometer with a cylindrical piston 12.7 ± 0.1 mm in diameter with a plane bottom and a sharp bottom edge, and with a cup 59 ± 1 mm in internal diameter and 85 mm high (jelly cup).

(ii) Procedure: Place 7.5 g of Purified Gelatin in a jelly cup, add 105 mL of water, close the cup, and allow to stand for 1 to 4 hours. Heat in a water bath at 65 ± 2°C for 15 minutes. While heating, stir gently with a glass rod. Incorporate any condensed water on the inner wall of the cup into the solution, and ensure that the solution is uniform. Allow to cool at room temperature for 15 minutes and transfer the cup to a thermostatically controlled bath at 10.0 ± 0.1°C, and fitted with a device to ensure that the platform on which the cup stands is perfectly horizontal. Close the cup, and allow to stand for 17 ± 1 hours. Remove the sample cup from the bath and quickly wipe the water from the exterior of the cup. Put the cup on the platform of the apparatus so that the tip of plunger contacts the sample as nearly as at its midpoint as possible, and start the measurement with a 4 mm depression distance and 0.5 mm per second test speed: 80 to 120% of the labeled nominal value.

**pH** \(<2.54\)** Dissolve 1.00 g of Purified Gelatin in freshly boiled water and kept at about 55°C, to make 100 mL. pH at 55°C of this solution is 3.8 – 9.0.

**Purity (1)** Heavy metals<1.07>—Proceed with 1.0 g of Purified Gelatin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Iron—To 5.00 g of Purified Gelatin, in a glass-stoppered flask, add 10 mL of hydrochloric acid, close the flask, and place in a water bath at 75 – 80°C for 2 hours. If necessary for proper solubilization, the gelatin may be allowed to swell after addition of the acid and the heating time may be prolonged or a higher temperature may be used. After cooling, adjust the content of the flask to 100.0 g with water, and use this solution as the sample solution. Separately, place 5.00 g each of Purified Gelatin in three glass-stoppered flasks, proceed with them in the same manner as the sample solution, then add exactly 7.5 mL, 15 mL and 22.5 mL of Standard Iron Solution (2) for Atomic Absorption Spectrophotometry to each flask, respectively. Adjust the content of these flasks to 100.0 g each with water, and use these solutions as the standard solutions. The volume of Standard Iron Solution may be adjusted appropriately according to the sensitivity of the instrument to be used. Perform the test with the sample solution and standard solutions as directed in the standard addition method under Atomic Absorption Spectrophotometry <2,23> according to the following conditions, and determine the content of iron: not more than 30 ppm.

- Gas: Combustible gas—Acetylene.
- Supporting gas—Air.

- Lamp: Iron hollow cathode lamp.
  - Wavelength: 213.9 nm.

(5) Arsenic<1.11>—Place 15.0 g of Purified Gelatin in a flask, add 60 mL of diluted hydrochloric acid (1 in 5), and dissolve by heating. Add 15 mL of bromine TS, heat until the excess of bromine is expelled, neutralize with ammonia TS, add 1.5 g of disodium hydrogen phosphate dodecahydrate, and allow to cool. To this solution add 30 mL of magnesium TS, allow to stand for 1 hour, and collect the precipitates. Wash the precipitates with five 10-mL portions of diluted ammonia TS (1 in 4), and dissolve in diluted hydrochloric acid (1 in 4) to make exactly 50 mL. Perform the test with 5 mL of this solution: the solution has no more color than the following color standard.

- Color Standard: Proceed with 12 mL of Standard Arsenic Solution, instead of Purified Gelatin, in the same manner (not more than 0.8 ppm).

(6) Peroxides—

(i) Enzyme reaction: Peroxidase transfers oxygen atom at on from peroxides to an organic redox indicator which is converted to a blue oxidized form. The intensity of the color obtained is proportional to the quantity of peroxide. The peroxide concentration can be determined by comparing it with the color scale provided with the test strips employing this reaction.

(ii) Procedure: Weigh 20.0 ± 0.1 g of Purified Gelatin in a beaker, add 80.0 ± 0.2 mL of water, and stir to moisten all the gelatin. Allow to stand at room temperature for 1–3 hours. Cover the beaker with a watch-glass, and heat the beaker for 20 ± 5 minutes in a water bath at 65 ± 2°C to dissolve the sample. Stir the content of the beaker with a glass rod to achieve a homogeneous solution, and use this as the sample solution. Dip a peroxide test strip for 1 second into the sample solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid, and compare the reaction zone after 15 seconds with the
color scale provided. Multiply the concentration read from the color scale by a factor of 5 to calculate the concentration of peroxide in the test substance: not more than 10 ppm.

(iii) Sensitivity: To exactly 10 mL of Standard Hydrogen Peroxide Solution add water to make exactly 300 mL. Pipet exactly 2 mL of this solution, add water to make exactly 1000 mL (2 ppm). Dip a peroxide test strip for 1 second into this solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the color of the reaction zone after 15 seconds with the color scale: the color of the zone is equivalent to 2 ppm of the color scale.

(7) Sulfur dioxide—

(i) Apparatus: Use as shown in the figure.

A: Three-necked round-bottomed flask (500 mL)
B: Cylindrical dropping funnel (100 mL)
C: Condenser
D: Test tube
E: Tap

(ii) Procedure: Introduce 150 mL of water into the three-necked round-bottomed flask and pass carbon dioxide through the whole system at a rate of 100 mL per minute. Place 10 mL of hydrogen peroxide-sodium hydroxide TS in the test tube. After 15 minutes, remove the cylindrical dropping funnel from the flask without interrupting the stream of carbon dioxide, and introduce through the opening into the flask about 25.0 g of Purified Gelatin with the aid of 100 mL of water. Pour 80 mL of 2 mol/L hydrochloric acid TS into the funnel, open the tap to introduce the hydrochloric acid into the flask and close the tap while several mL of the hydrochloric acid remains, in order to avoid losing sulfur dioxide, and boil the mixture for 1 hour. Remove the test tube, and transfer the contents of the test tube to a 200-mL wide-necked conical flask, wash the test tube with a small amount of water, and add the washing to the conical flask. Heat the flask in a water bath for 15 minutes and cool. Add 0.1 mL of bromophenol blue TS, and titrate 2.50 with 0.1 mol/L sodium hydroxide VS until the color changes from yellow to violet-blue lasting for at least 20 seconds. Perform a blank determination in the same manner and make any necessary correction. Calculate the amount of sulfur dioxide from the following expression: it is not more than 20 ppm.

Amount (ppm) of sulfur dioxide = $\frac{V}{M} \times 1000 \times 3.203$

$M$: Amount (g) of Purified Gelatin taken
$V$: Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed

Conductivity <2.5I> Dissolve 1.00 g of Purified Gelatin in freshly boiled water and keep at about 55°C, to make 100 mL. Perform the test at 30 ± 1.0°C with this solution, without temperature compensation: not more than 1 mS·cm⁻¹.

Loss on drying <2.4I> Not more than 15.0% (5 g, 105°C, 16 hours).

Microbial limit <4.05> The acceptance criteria of TAMC and TYMC are 10⁵ CFU/g and 10⁶ CFU/g, respectively. Escherichia coli and Salmonella are not observed.

Containers and storage Containers—Tight containers.
Storage—Protect from heat and moisture.

Gentamicin Sulfate ゲンタマイシン硫酸塩

Gentamicin C₁ Sulfate
(6R)-2-Amino-2,3,4,6-tetrahydroxy-6-methylamino-6-methyl-α-D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-C-methyl-3-methylamino-6-methyl-2-deoxy-β-L-arabinopyranosyl-(1→6)]-2-deoxy-α-D-streptamine sulfate

Gentamicin C₂ Sulfate
(6R)-2,6-Diamino-2,3,4,6-tetrahydroxy-6-methyl-α-D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-C-methyl-3-methylamino-6-methyl-2-deoxy-α-D-streptamine sulfate

Gentamicin C₃ Sulfate
2,6-Diamino-2,3,4,6-tetrahydroxy-α-D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-C-methyl-3-methylamino-6-methyl-2-deoxy-α-D-streptamine sulfate

[1405-41-0, Gentamicin Sulfate]

Gentamicin Sulfate is the sulfate of a mixture of aminoglycoside substances having antibacterial activity produced by the growth of Micromonospora purpurea or Micromonospora echinospora.

It contains not less than 590 µg (potency) and not more than 775 µg (potency) per mg, calculated on the dried basis. The potency of Gentamicin Sulfate is expressed as mass (potency) of gentamicin C₁ (C₂₁H₂₃N₄O₇· 477.60).

Description Gentamicin Sulfate occurs as a white to light yellow-white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

It is hygroscopic.

Identification (1) Dissolve 50 mg each of Gentamicin Sul-
fate and Gentamicin Sulfate RS in 10 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( \text{<2.05>} \). Spot 20 \( \mu \text{L} \) of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Separately, shake a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) in a separator, and allow the mixture to stand for more than 1 hour. To 20 mL of the lower layer so obtained add 0.5 mL of methanol, and use this as the developing solvent. Develop the plate with the developing solvent to a distance of about 17 cm in a developing container with a cover, having an opening of about 20 mm\(^2\), and without putting a filter paper in the container, and air-dry the plate. Allow the plate to stand in iodine vapors: three principal spots obtained from the sample solution are the same with the corresponding spots from the standard solution in color tone and the \( R_f \) value, respectively.

(2) Dissolve 50 mg of Gentamicin Sulfate in 5 mL of water, and add 0.5 mL of barium chloride TS: a white precipitate is formed.

**Optical rotation** \( \text{<2.49>} \) \( [\alpha]_D^2 \text{cm}^2 + 107 + 121^\circ \) (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

**pH** \( \text{<2.5}\) The pH of a solution obtained by dissolving 0.20 g of Gentamicin Sulfate in 5 mL of water is between 3.5 and 5.5.

**Content ratio of the active principle** Dissolve 50 mg of Gentamicin Sulfate in water to make 10 mL, and use this solution as the sample solution. Perform the test with the sample solution as directed under Thin-layer Chromatography \( \text{<2.05>} \). Spot 20 \( \mu \text{L} \) of the sample solution on a plate of silica gel for thin-layer chromatography. Separately, shake a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) in a separator, and allow the mixture to stand for more than 1 hour. To 20 mL of the lower layer so obtained add 0.5 mL of methanol, and use this as the developing solvent. Develop the plate with the developing solvent to a distance of about 17 cm in a developing container with a cover, having an opening of about 20 mm\(^2\), and without putting a filter paper in the container, and air-dry the plate. Allow the plate to stand in iodine vapor, and compare the colored spots while covering with a glass plate: the spots other than the spots of gentamicin \( C_1 \) (\( R_f \) value: about 0.3), gentamicin \( C_2 \) (\( R_f \) value: about 0.2) and gentamicin \( C_{12} \) (\( R_f \) value: about 0.1) obtained from the sample solution are not more intense than the spot of gentamicin \( C_2 \) from the standard solution.

**Loss on drying** \( \text{<2.41>} \) Not more than 18.0\% (0.15 g, reduced pressure not exceeding 0.67 kPa, 110°C, 3 hours). Handle the sample avoiding absorption of moisture.

**Residue on ignition** \( \text{<2.44>} \) Not more than 1.0\% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics \( \text{<4.02>} \) according to the following conditions.

(i) Test organism—*Staphylococcus epidermidis* ATCC 12228

(ii) Agar media for seed and base layer—

- Glucose 1.0 g
- Peptone 6.0 g
- Meat extract 1.5 g
- Yeast extract 3.0 g
- Sodium chloride 10.0 g
- Agar 15.0 g
- Water 1000 mL

Mix all the ingredients, and sterilize. Adjust the pH of the solution so that it will be 7.8 to 8.0 after sterilization.

(iii) Agar medium for transferring test organisms—Use the medium ii in 2) Medium for other organisms under (2) Agar media for transferring test organisms.

(iv) Standard solutions—Weigh accurately an amount of Gentamicin Sulfate RS, equivalent to about 25 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 25 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 15°C or lower, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 4 \( \mu \text{g} \) (potency) and 1 \( \mu \text{g} \) (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(v) Sample solutions—Weigh accurately an amount of Gentamicin Sulfate, equivalent to about 25 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 25 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 4 \( \mu \text{g} \) (potency) and 1 \( \mu \text{g} \) (potency), and use these solutions as the high concentration sample solution and the low concentra-
Gentamicin Sulfate Injection

ゲンタマイシン硫酸塩注射液

Gentamicin Sulfate Injection is an aqueous injection.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of gentamicin C₁ (C₂₁H₃₃N₃O₇: 477.60).

**Method of preparation** Prepare as directed under Injections, with Gentamicin Sulfate.

**Description** Gentamicin Sulfate Injection is a clear and colorless liquid.

**Identification** To a volume of Gentamicin Sulfate Injection, equivalent to 40 mg (potency) of Gentamicin Sulfate, add water to make 10 mL, and use this solution as the sample solution. Separately, dissolve an amount of Gentamicin Sulfate RS, equivalent to 20 mg (potency), in 5 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the lower layer of a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat the plate at 100°C for 10 minutes: three principal spots obtained from the sample solution are the same with the corresponding spots from the standard solution in color tone and the Rf value, respectively.

**Osmotic pressure ratio** Being specified separately when the drug is granted approval based on the Law.

**pH** <2.54> 4.0 – 6.0

**Bacterial endotoxins** <4.01> Less than 0.50 EU/mg (potency).

**Extractable volume** <6.07> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.05> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, agar media for base and seed layer, agar medium for transferring test organisms, and standard solutions—Procede as directed in the Assay under Gentamicin Sulfate.

(ii) Sample solutions—Pipet a volume of Gentamicin Sulfate Injection, equivalent to about 40 mg (potency) of Gentamicin Sulfate, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 200 mL. Pipet a suitable volume of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 4 μg (potency) and 1 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

Gentamicin Sulfate Ointment

ゲンタマイシン硫酸塩軟膏

Gentamicin Sulfate Ointment contains not less than 90.0% and not more than 110.0% of the labeled potency of gentamicin C₁ (C₂₁H₃₃N₃O₇: 477.60).

**Method of preparation** Prepare as directed under Ointments, with Gentamicin Sulfate.

**Identification** To an amount of Gentamicin Sulfate Ointment, equivalent to 5 mg (potency) of Gentamicin Sulfate, add 10 mL of diethyl ether, and shake in lukewarm water, if necessary, to dissolve. Add 5 mL of water, shake for 10 minutes, centrifuge, and use the water layer as the sample solution. Separately, dissolve an amount of Gentamicin Sulfate RS, equivalent to 10 mg (potency), in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the lower layer of a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat the plate at 100°C for 10 minutes: three principal spots obtained from the sample solution are the same with the corresponding spots from the standard solution in color tone and the Rf value, respectively.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, agar media for base and seed layer, agar medium for transferring test organisms, and standard solutions—Procede as directed in the Assay under Gentamicin Sulfate.

(ii) Sample solutions—Weigh accurately an amount of Gentamicin Sulfate Ointment, equivalent to about 1 mg (potency) of Gentamicin Sulfate, transfer to a separator, add 50 mL of diethyl ether, and shake until the solution becomes uniform. Add 25 mL of 0.1 mol/L phosphate buffer solution (pH 8.0), shake, and collect the water layer. Repeat the same procedure with 25 mL of 0.1 mol/L phosphate buffer solution (pH 8.0), and combine the water layers. To this solution add 0.1 mol/L phosphate buffer solution (pH 8.0) to make exactly 100 mL. Pipet a suitable volume of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 4 μg (potency) and 1 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.
Gentamicin Sulfate Ophthalmic Solution

ゲンタマイシン硫酸塩点眼液

Gentamicin Sulfate Ophthalmic Solution is an aqueous ophthalmic preparation.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of expressed as mass of gentamicin C₁ (C₂₁H₆₇NO₃S: 477.60).

**Method of preparation** Prepare as directed under Ophthalmic Liquids and Solutions, with Gentamicin Sulfate.

**Description** Gentamicin Sulfate Ophthalmic Solution is a clear, colorless or pale yellow liquid.

**Identification** To a volume of Gentamicin Sulfate Ophthalmic Solution, equivalent to 10 mg (potency) of Gentamicin Sulfate, add water to make 5 mL, and use this solution as the sample solution. Separately, dissolve an amount of Gentamicin Sulfate RS, equivalent to 10 mg (potency), in 5 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the lower layer of a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-propanol, chloroform and diluted ammonia TS (4 in 5) butanol TS on the plate, and heat the plate at 100°C. The Rf values of the principal spots of the sample solution are the same with the corresponding spots from the standard solution in color tone and the Rf value, respectively.

**pH** 2.5 – 7.5

**Foreign insoluble matter** It meets the requirement.

**Insoluble particulate matter** It meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, agar media for seed and base layer, agar medium for transferring test organism, and standard solutions—Proceed as directed in the Assay under Gentamicin Sulfate.

(ii) Sample solutions—Pipet a volume of Gentamicin Sulfate Ophthalmic Solution, equivalent to about 12 mg (potency) of Gentamicin Sulfate, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make a solution so that each mL contains about 1 mg (potency). Pipet a suitable volume of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 4 μg (potency) and 1 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

**Shelf life** 24 months after preparation.

Glibenclamide

グリペンクラミド

C₂₃H₂₃ClN₂O₅S: 494.00
4-[2-(5-Chloro-2-methoxybenzoylamino)ethyl]-N-(cyclohexylcarbamoyl)benzenesulfonamide [10238-21-8]

Glibenclamide, when dried, contains not less than 98.5% of glibenclamide (C₂₃H₂₃ClN₂O₅S).

**Description** Glibenclamide occurs as white to pale yellowish white, crystals or crystalline powder.

It is freely soluble in dimethylformamide, sparingly soluble in chloroform, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Glibenclamide in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Glibenclamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Glibenclamide as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** 169 – 174°C

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Glibenclamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.20 g of Glibenclamide in 20 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-propanol, chloroform and diluted ammonia TS (4 in 5) (11:7:2) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** Not more than 0.5% (1 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.9 g of Glibenclamide, previously dried, dissolve in 50 mL of N,N-dimethylformamide,
Gliclazide

Gliclazide is a white crystalline powder. It is sparingly soluble in acetonitrile and in methanol, slightly soluble in ethanol (99.5) and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Gliclazide in methanol (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Gliclazide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.60> 165 – 169°C

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Gliclazide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure within 2 hours after preparation of the sample solution. Dissolve 50 mg of Gliclazide in 23 mL of acetonitrile, add water to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of water and acetonitrile (11:9) to make exactly 100 mL. Pipet 10 mL of this solution, add a mixture of water and acetonitrile (11:9) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than gliclazide obtained from the sample solution is not larger than 3 times the peak area of gliclazide from the standard solution. For the area of the peak, having the relative retention time of about 0.9 to gliclazide, multiply the correction factor 5.65.

Operating conditions—
- Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (4 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of water, acetonitrile, triethylamine and trifluoroacetic acid (550:450:1:1).
- Flow rate: Adjust so that the retention time of gliclazide is about 14 minutes.
- Time span of measurement: About 2 times as long as the retention time of gliclazide, beginning after the solvent peak.

System suitability—
- Test for required detectability: Pipet 4 mL of the standard solution, and add a mixture of water and acetonitrile (11:9) to make exactly 20 mL. Confirm that the peak area of gliclazide obtained with 20 μL of this solution is equivalent to 10 to 30% of that of gliclazide with 20 μL of the standard solution.
- System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of gliclazide are not less than 8000 and not more than 1.5, respectively.
- System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of gliclazide is not more than 2.0%.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Gliclazide, previously dried, dissolve in 30 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.34 mg of C₂₃H₂₂ClN₂O₇S

Containers and storage Containers—Well-closed containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Glimepiride

Glimepiride contains not less than 98.0% and not more than 102.0% of glimepiride (C₂₅H₂₄N₄O₅S), calculated on the anhydrous basis.

Description Glimepiride occurs as a white crystalline powder. It is slightly soluble in dichloromethane, very slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Melting point: about 202°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Glimepiride in methanol (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Glimepiride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Glimepiride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Glimepiride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Glimepiride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) cis-Isomer—Dissolve 10 mg of Glimepiride in 5 mL of dichloromethane, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak, having the relative retention time of about 0.9, is not larger than 1.5 times the peak area of glimepiride from the standard solution, the area of the peak, having the relative retention time of about 1.1, is not larger than 2 times the peak area of glimepiride from the standard solution, the area of the peak, having the relative retention time of about 0.32, is not larger than 1.5 times the peak area of glimepiride from the standard solution, the area of peak other than glimepiride and above mentioned peak from the sample solution is not larger than 5 times the peak area of glimepiride from the standard solution, the area of peak other than glimepiride and above mentioned peak from the sample solution is not larger than 5 times the peak area of glimepiride from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 228 nm).
Column: A stainless steel column 3 mm in inside diameter and 15 cm in length, packed with diol silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of heptane for liquid chromatography, 2-propanol for liquid chromatography, and acetic acid (100) (900:100:1).
Flow rate: Adjust so that the retention time of glimepiride is about 14 minutes.

System suitability—
Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of glimepiride obtained with 10 μL of this solution is equivalent to 35 to 65% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of glimepiride are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glimepiride is not more than 2.0%.

(3) Related substances—Keep the sample solution and standard solution below 4°C after preparing. Dissolve 20 mg of Glimepiride in 100 mL of a mixture of acetonitrile for liquid chromatography and water (4:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak, having the relative retention time of about 0.25 to glimepiride, obtained from the sample solution is not larger than 4 times the peak area of glimepiride from the standard solution, the area of the peak, having the relative retention time of about 1.1, is not larger than 2 times the peak area of glimepiride from the standard solution, the area of the peak, having the relative retention time of about 0.32, is not larger than 1.5 times the peak area of glimepiride from the standard solution, the area of peak other than glimepiride and above mentioned peak from the sample solution is not larger than 5 times the peak area of glimepiride from the standard solution, the area of peak other than glimepiride and above mentioned peak from the sample solution is not larger than 5 times the peak area of glimepiride from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of glimepiride, beginning after the solvent peak.

System suitability—
Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of glimepiride obtained with 20 μL of this solution is equivalent to 35 to 65% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of glimepiride are not less than 9000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times
with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glimepiride is not more than 2.0%.

**Water** <2.45> Not more than 0.5% (0.25 g, coulometric titration).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 20 mg each of Glimepiride and Glimepiride RS (separately determine the water <2.45> in the same manner as Glimepiride), dissolve each substance in a mixture of acetonitrile for liquid chromatography and water (4:1) to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_5 \), of glimepiride in each solution.

\[
M_5 = \frac{M_S \times A_1}{A_5}
\]

\( M_S \): Amount (mg) of Glimepiride RS taken, calculated on the anhydrous basis

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 228 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 0.5 g of sodium dihydrogen phosphate dihydrate in 500 mL of water, adjust to pH 2.5 with phosphoric acid, and add 500 mL of acetonitrile for liquid chromatography.

Flow rate: Adjust so that the retention time of glimepiride is about 17 minutes.

**System suitability**—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of glimepiride are not less than 9000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glimepiride is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

---

**Glimepiride Tablets**

Glimepiride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of glimepiride (C₁₈H₁₄N₂O₅S: 490.62).

**Method of preparation** Prepare as directed under Tablets, with Glimepiride.

**Identification** To a quantity of powdered Glimepiride Tablets, equivalent to 20 mg of Glimepiride, add 40 mL of acetonitrile, shake for 15 minutes, and centrifuge. Evaporate the supernatant liquid on a water bath under reduced pressure, suspend the residue with 1 mL of water, and filter under reduced pressure. Wash the residue with 1 mL of water, dry at 105°C for 1 hour. Determine the infrared absorption spectrum as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 3370 cm⁻¹, 3290 cm⁻¹, 2930 cm⁻¹, 1708 cm⁻¹, 1674 cm⁻¹, 1347 cm⁻¹, 1156 cm⁻¹ and 618 cm⁻¹.

**Purity** Related substances—Keep the sample solution and standard solution below 4°C after preparation. To a quantity of powder of Glimepiride Tablets, equivalent to 9 mg of Glimepiride, add with 0.5 mL of water, add a mixture of acetonitrile for liquid chromatography and water (4:1) to make 50 mL, shake, centrifuge, and use the supernatant liquid as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile for liquid chromatography and water (4:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak, having the relative retention time of about 0.3 to glimepiride, obtained from the sample solution is not larger than 2.6 times the peak area of glimepiride from the standard solution, the area of the peak other than glimepiride and the peak mentioned above from the sample solution is not larger than 3/10 times the peak area of glimepiride from the standard solution, and the total area of the peaks other than glimepiride and the peak mentioned above from the sample solution is not larger than the peak area of glimepiride from the standard solution, and the total area of the peaks other than glimepiride from the sample solution is not larger than 3 times the peak area of glimepiride from the standard solution.

**Operating conditions**—
Detector, column, column temperature, and mobile phase: Proceed as directed in the operating conditions in the Assay.

Flow rate: Adjust so that the retention time of glimepiride is about 12 minutes.

Time span of measurement: About 2 times as long as the retention time of glimepiride.

**System suitability**—
Test for required detectability: Pipet 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of glimepiride obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of glimepiride are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glimepiride is not more than 2.0%.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Glimepiride Tablets add V/10 mL of water, disintegrate, add V/2 mL of a mixture of acetonitrile for liquid chromatography and water (4:1), and shake. To this solution add exactly V/5 mL of the internal standard solution, add a mixture of acetonitrile for liquid chromatography and water (4:1) to make V mL so that each mL contains about
100 μg of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S), and centrifuge. To 2.5 mL of the supernatant liquid add a mixture of acetonitrile for liquid chromatography and water (4:1) to make 5 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Glimepiride RS (separately determine the water <2.4% in the same manner as Glimepiride), and dissolve in a mixture of acetonitrile for liquid chromatography and water (4:1) to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 2 mL of the internal standard solution, add a mixture of acetonitrile for liquid chromatography and water (4:1) to make 20 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S)} = M_s \times Q_s / Q_r \times V / 200
\]

**Internal standard solution**—A solution of butyl parahydroxybenzoate in a mixture of acetonitrile for liquid chromatography and water (4:1) (1 in 1000).

**Dissolution**—When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of disodium hydrogen phosphate-citric acid buffer solution (pH 7.5) as the dissolution medium, the dissolution rate in 15 minutes of 0.5-mg and 1-mg tablets is not less than 75%, and that in 30 minutes of 3-mg tablet is not less than 70%.

Start the test with 1 tablet of Glimepiride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 0.56 μg of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Glimepiride RS (separately determine the water <2.4% in the same manner as Glimepiride), and dissolve in a mixture of acetonitrile for liquid chromatography to make exactly 100 mL. Pipet 2 mL of this solution, add 8 mL of acetonitrile for liquid chromatography, and add the dissolution medium to make exactly 200 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0A> according to the following conditions, and determine the peak areas, A$_T$ and A$_S$, of glimepiride in each solution.

Dissolution rate (%) with respect to the labeled amount of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S) = M$_T$ × A$_T$ / A$_S$ × V / V × 1 / C × 9 / 4

**Operating conditions**—

Detector, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

**System suitability**—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of glimepiride are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glimepiride is not more than 1.5%.

**Assay**—Weigh accurately the mass of not less than 20 Glimepiride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 3 mg of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S), add 3 mL of water, and shake with 30 mL of a mixture of acetonitrile for liquid chromatography and water (4:1). Add exactly 6 mL of the internal standard solution, and add a mixture of acetonitrile for liquid chromatography and water (4:1) to make 50 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 20 mg of Glimepiride RS, (separately, determine the water <2.4% in the same manner as Glimepiride), dissolve in a mixture of acetonitrile for liquid chromatography and water (4:1) to make exactly 100 mL. Pipet 15 mL of this solution, add exactly 6 mL of the internal standard solution, add a mixture of acetonitrile for liquid chromatography and water (4:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0A> according to the following conditions, and calculate the ratios, Q$_T$ and Q$_S$, of the peak area of glimepiride to that of the internal standard.

\[
\text{Amount (mg) of glimepiride (C$_{12}$H$_{14}$N$_2$O$_3$S)} = M_s \times Q_s / Q_r \times 5 / 20
\]

**Internal standard solution**—A solution of butyl parahydroxybenzoate in a mixture of acetonitrile for liquid chromatography and water (4:1) (1 in 1000).

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and glimepiride are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of glimepiride to that of the internal standard is not more than 1.0%.
Glucagon (Genetical Recombination)

Glucagon (Genetical Recombination) is a recombinant human glucagon, and is a peptide consisting of 29 amino acid residues.

It contains not less than 92.5% and not more than 105.0% of glucagon, calculated on the anhydrous basis.

**Manufacture** Glucagon (Genetical Recombination) is manufactured by the process that has been properly validated to be able to manufacture the drug substance having predefined biological activity. When the residual amount of host cell proteins is determined by enzyme immunoassay as in-process tests, the amount should be not more than the control value. In addition, Glucagon (Genetical Recombination) is purified by the process that has been validated that the residual amount of host cell DNA is not more than the control value.

**Description** Glucagon (Genetical Recombination) occurs as a white lyophilized powder.

It is practically insoluble in water and in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Dissolve 5 mg of Glucagon (Genetical Recombination) in 1 mL of 0.01 mol/L hydrochloric acid TS. To 200 μL of this solution add 800 μL of 0.1 mol/L ammonium hydrogen carbonate TS and 25 μL of enzyme TS for glucagon, react at 37°C for 2 hours, add 120 μL of acetic acid (100) to stop the reaction, and use this solution as the sample solution. Separately, dissolve a suitable amount of Glucagon RS in 0.1 mol/L ammonium hydrogen carbonate TS so that each mL contains 1 mg of glucagon. To 1000 μL of this solution add 25 μL of enzyme TS for glucagon, react at 37°C for 2 hours, add 120 μL of acetic acid (100) to stop the reaction, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 > \). Compare the chromatograms obtained from these solutions: both chromatograms show the similar peaks at the same retention time.

**Operating conditions**—
Column: A stainless steel column 4 mm in inside diameter and 50 mm in length, packed with octadecylsilylated silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 22°C.
Mobile phase A: To 0.5 mL of trifluoroacetic acid add 1000 mL of water.
Mobile phase B: To 0.5 mL of trifluoroacetic acid add 600 mL of ethanol (99.5) and 400 mL of water.
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 35</td>
<td>100 → 53</td>
<td>0 → 47</td>
</tr>
<tr>
<td>35 - 45</td>
<td>53 → 0</td>
<td>47 → 100</td>
</tr>
</tbody>
</table>

Flow rate: 1.0 mL per minute.

**System suitability**—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the peaks 1, 2, 3, 4 and 5 are eluted in this order, and the resolution between the peak 2 and the peak 3 is not less than 1.5.

(2) Perform the test with 15 μL each of the sample solution and standard solution obtained in the Assay as directed under Liquid Chromatography \( <2.01 > \) according to the conditions described in the Assay: the retention times of the principal peaks obtained from the sample solution and the standard solution are the same.

**Purity** Related substances and desamido substances—
Conduct this procedure at a temperature between 2°C and 8°C. Dissolve 50 mg of Glucagon (Genetical Recombination) in 100 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Perform the test with 15 μL of the sample solution as directed under Liquid Chromatography \( <2.01 > \) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of them by the area percentage method: the total amount of desamido substance 1 having the relative retention time of about 1.1 to glucagon, desamido substance 2 having the relative retention time of about 1.2, desamido substance 3 having the relative retention time of about 1.3 and desamido substance 4 having the relative retention time of about 1.4 is not more than 0.8%, and the total amount of peaks other than glucagon is not more than 2.0%.

**Operating conditions**—
Detector, column, column temperature, mobile phases A and B, flowing of mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: For 37 minutes after injection, beginning after the solvent peak.

**System suitability**—
System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: When the procedure is run with 15 μL of the standard solution obtained in the Assay under the above operating conditions, the peak corresponding to the desamido substance 2 is detected.

**Water \( <2.48 > \)** Not more than 10% (50 mg, coulometric titration).

**Assay** Conduct this procedure at a temperature between 2°C and 8°C. Weigh accurately about 50 mg of Glucagon (Genetical Recombination), dissolve in 100 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Separately dissolve Glucagon RS in 0.01 mol/L hydrochloric acid TS so that each mL contains about 0.5 mg of glucagon, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 > \) according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_2 \), of glucagon in each solution.

Amount (%) of glucagon = \( A_2 / A_5 \times C_5 / C_1 \times 100 \)

Containers and storage

Containers—Tight containers.
**C**

Concentration (mg/mL) of the standard solution

Concentration (mg/mL) of the sample solution

The calculated amount (%) of glucagon is corrected by the water content to obtain the amount (%) of glucagon on the anhydrous basis.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 3 mm in inside diameter and 150 mm in length, packed with octadeccylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase A: Dissolve 16.3 g of potassium dihydrogen phosphate in 750 mL of water, adjust to pH 2.7 with phosphoric acid, add water to make 800 mL, and add 200 mL of acetonitrile for liquid chromatography.

Mobile phase B: A mixture of water and acetonitrile (3:2).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>

* Adjust the time for the isocratic condition so that the gradient starts after the desamido substance 4 is eluted.

Flow rate: 0.5 mL per minute.

**System suitability**

System performance: Dissolve Glucagon RS in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains 0.5 mg of glucagon. Warm this solution at 50°C for 48 hours, and use this solution as the solution for system suitability test. When the procedure is run with 15 μL of the solution for system suitability test under the above operating conditions, four peaks corresponding to the desamido substances 1, 2, 3 and 4 eluted after the principal peak are clearly detected, the total amount of these peaks is not less than 7%, and the resolution between glucagon and the desamido substance 1 is not less than 1.5. Furthermore, when the procedure is run with 15 μL of the standard solution under the above operating conditions, the symmetry factor of the principal peak is not more than 1.8.

System repeatability: When the test is repeated 5 times with the standard solution under the above operating conditions, the relative standard deviation of the peak area of glucagon is not more than 2.0%.

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant, and not exceeding – 15°C.

---

Glucose

**ブドウ糖**

\[
\begin{align*}
\alpha-D-\text{glucopyranose} & : \text{R}^1=H, \text{R}^2=\text{OH} \\
\beta-D-\text{glucopyranose} & : \text{R}^1=\text{OH}, \text{R}^2=H
\end{align*}
\]

C_{6}H_{12}O_{6}: 180.16

β-D-glucopyranose

[50-99-7]

Glucose is α-D-glucopyranose, β-D-glucopyranose, or a mixture of them.

It, when dried, contains not less than 99.5% of glucose [β-D-glucopyranose (C_{6}H_{12}O_{6})].

**Description**

Glucose occurs as white, crystals or crystalline powder. It is odorless, and has a sweet taste.

It is freely soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification**

Add 2 to 3 drops of a solution of Glucose (1 in 20 to 5 mL of boiling Fehling's TS: a red precipitate is produced.

**Purity**

1. Clarity and color of solution—Add 25 g of Glucose to 30 mL of water in a Nessler tube, warm at 60°C in a water bath until solution is effected, cool, and add water to make 50 mL: the solution is clear and has no more color than the following control solution.

   Control solution: To a mixture of 1.0 mL of Cobalt (II) Chloride CS, 3.0 mL of Iron (III) Chloride CS, and 2.0 mL of Copper (II) Sulfate CS, add water to make 10.0 mL. To 3.0 mL of this solution add water to make 50 mL.

2. Acidity—Dissolve 5.0 g of Glucose in 50 mL of freshly boiled and cooled water, and add 3 drops of phenolphthalein TS and 0.60 mL of 0.01 mol/L sodium hydroxide VS: a red color develops.

3. Chloride <1.05>—Perform the test with 2.0 g of Glucose. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

4. Sulfate <1.14>—Perform the test with 2.0 g of Glucose. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

5. Heavy metals <1.07>—Proceed with 5.0 g of Glucose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).

6. Arsenic <1.11>—Dissolve 1.5 g of Glucose in 5 mL of water, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, heat on a water bath for 5 minutes, and concentrate to 5 mL. After cooling, perform the test with this solution as the test solution (not more than 1.3 ppm).

7. Dextrin—To 1.0 g of Glucose add 20 mL of ethanol (95), and boil under a reflux condenser: the solution is clear.

8. Soluble starch and sulfite—Dissolve 1.0 g of Glucose in 10 mL of water, and add 1 drop of iodine TS: a yellow color develops.

**Loss on drying <2.41>** Not more than 1.0% (1 g, 105°C, 6 hours).

**Residue on ignition <2.44>** Not more than 0.1% (2 g).
Assay Weigh accurately about 10 g of Glucose, previously dried, dissolve in 0.2 mL of ammonia TS and water to make exactly 100 mL, allow to stand for 30 minutes, and determine the optical rotation, $\alpha_D$, of this solution at 20 ± 1°C in a 100-mm cell as directed under Optical Rotation Determination <2.49>.

Amount (mg) of glucose ($C_6H_{12}O_6$) = $\alpha_D \times 1895.4$

Containers and storage Containers—Tight containers.

Glucose Hydrate

α-D-glucopyranose monohydrate: $R^1 = H, R^2 = OH$
β-D-glucopyranose monohydrate: $R^1 = OH, R^2 = H$

$C_6H_{12}O_6H_2O$: 198.17

β-Glucopyranose monohydrate [77928-63-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (◆), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◇). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Glucose Hydrate is the monohydrate of d-glucopyranose derived from starch. It contains not less than 97.5% and not more than 102.0% of glucose [β-glucopyranose ($C_6H_{12}O_6$: 180.16)], calculated on the anhydrous basis.

Description Glucose Hydrate occurs as white, crystals or crystalline powder, and has a sweet taste. It is freely soluble in water, sparingly soluble in methanol, and slightly soluble in ethanol (95%).

Identification (1) Add 2 to 3 drops of a solution of Glucose Hydrate (1 in 20) to 5 mL of boiling Fehling’s TS: a red precipitate is produced.

(2) Perform the test with 20 µL each of the sample solution and standard solution obtained in the Assay as directed under Liquid Chromatography <2.07> according to the following conditions: the peak other than glucose and the peaks mentioned above from the sample solution is similar in retention time and size to the principal peak in the chromatogram from the standard solution.

Operating conditions—
Proceed as directed in the operating conditions in the Assay.

System suitability—
Proceed as directed in the system suitability in the Assay.

Purity (1) Clarity and color of solution—Dissolve 10.0 g of Glucose Hydrate in 15 mL of water, and use this solution as the test solution. Perform the test with the test solution as directed under Turbidity Measurement <2.67>: the solution is clear. Perform the test with the test solution according to Method 2 under Methods for Color Matching <2.65>: the solution is not more colored than Matching Fluid BY7.

(2) Heavy metals—Proceed with 5.0 g of Glucose Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).-

(3) Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 25 mL of the standard solution (1), add water to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with exactly 20 µL. of each of the sample solution, the standard solution (1) and the standard solution (2) as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area by the automatic integration method: the total area of the peaks of maltose and isomaltose, having the relative retention time of about 0.8 to glucose, obtained from the sample solution, is not larger than the peak area of glucose from the standard solution (1) (not more than 0.4%), and the peak area of maltotriose, having the relative retention time of about 0.7 from the sample solution, is not larger than 1/2 times the peak area of glucose from the standard solution (1) (not more than 0.2%), and the peak area of fructose, having the relative retention time of about 1.3 from the sample solution, is not larger than 3 times the peak area of glucose from the standard solution (2) (not more than 0.15%), and the area of the peak other than glucose and the peaks mentioned above from the sample solution is not larger than 2 times the peak area of glucose from the standard solution (2) (not more than 0.10%). Furthermore, the total area of the peaks other than glucose from the sample solution is not larger than 1.25 times the peak area of glucose from the standard solution (1) (not more than 0.5%). For these calculations the peak areas not larger than the peak area of glucose from the standard solution (2) are excluded (disregard limit: 0.05%).

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 1.5 times as long as the retention time of glucose.

System suitability—
Proceed as directed in the system suitability in the Assay.

Test for required detectability: Confirm that the peak area of glucose obtained with 20 µL of the standard solution (2) is equivalent to 8.8 to 16.3% of that with 20 µL of the standard solution (1).

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of glucose is not more than 1.0%.-

Dextrin—To 1.0 g of powdered Glucose Hydrate add 20 mL of ethanol (95%), and boil under a reflux condenser: the solution is clear.

Soluble starch and sulfite—To 7.4 g of Glucose Hydrate add 15 mL of water, dissolve by heating on a water bath, cool, and add 25 µL of 0.05 mol/L iodine VS: a yellow color develops (not more than 15 ppm as SO₂).
Conductivity <2.5> Dissolve 20.0 g of Glucose Hydrate in a freshly boiled and cooled distilled water to make 100 mL, and use this solution as the sample solution. Measure the conductivity of the sample solution at 25 ± 0.1°C while gently stirring with a magnetic stirrer: not more than 20 μS-cm⁻¹.

Water <2.48> 7.5 – 9.5% (0.25 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.33 g of Glucose Hydrate and 0.3 g of Glucose RS (separately determine the water according to the following conditions, and determine the peak areas, A₁ and A₅, of glucose in each solution.

\[
\text{Amount (g) of glucose } (C_{12}H_{22}O_{11}) = M_s \times A_1/A_5
\]

M_s: Amount (g) of Glucose RS taken, calculated on the anhydrous basis.

Operating conditions—
Detector: A differential refractometer maintained at a constant temperature (40°C for example).
Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (Ca type) composed with a sulfonated polystyrene cross-linked with divinylbenzene (degree of cross-linkage: 8%) (9 μm in particle diameter).
Column temperature: A constant temperature of about 85°C.
Mobile phase: Water.
Flow rate: 0.3 mL per minute (the retention time of glucose is about 21 minutes).

System suitability—
System performance: Dissolve 5 mg of maltose, 5 mg of maltotriose and 5 mg of fructose in 50 mL of water, and use this solution as the solution for system suitability test. When the procedure is run with 20 μL each of the solution for system suitability test and the standard solution (2) in Purity (3) under the above operating conditions, maltotriose, maltose, glucose and fructose are eluted in this order, the relative retention times of maltotriose, maltose, isomaltose and fructose to glucose are about 0.7, about 0.8, about 0.8 and about 1.3, respectively, and the resolution between the peaks of maltotriose and maltose is not less than 1.3.

◇ System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glucose is not more than 1.0%.

Containers and storage Containers—Tight containers.

Purified Glucose

精製ブドウ糖

\[
\alpha-D-\text{glucopyranose; } R^1 = H, R^2 = OH \\
\beta-D-\text{glucopyranose; } R^1 = OH, R^2 = H
\]

C₆H₁₂O₆: 180.16
D-Glucopyranose

[50-99-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (◇ •), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◇ ◆). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Purified Glucose is D-glucopyranose derived from starch.

It contains not less than 97.5% and not more than 102.0% of glucose [D-glucopyranose (C₆H₁₂O₆)], calculated on the anhydrous basis.

Description Purified Glucose occurs as white, crystals or crystalline powder, and has a sweet taste.

It is freely soluble in water, and slightly soluble in methanol and in ethanol (95%).

Identification (1) Add 2 to 3 drops of a solution of Purified Glucose (1 in 20) to 5 mL of boiling Fehling’s TS: a red precipitate is produced.

(2) Perform the test with 20 μL each of the sample solution and standard solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions: the principal peak in the chromatogram obtained from the sample solution is similar in retention time and size to the principal peak in the chromatogram from the standard solution.

Operating conditions—
Proceed as directed in the operating conditions in the Assay.

System suitability—
Proceed as directed in the system suitability in the Assay.

Purity (1) Clarity and color of solution—Dissolve 10.0 g of Purified Glucose in 15 mL of water by heating on a water bath, and allow to cool to room temperature, and use this solution as the test solution. Perform the test with the test solution as directed under Turbidity Measurement <2.65>: the solution is clear. Perform the test with the test solution according to Method 2 under Methods for Color Matching <2.65>: the solution is not more colored than Matching Fluid BY7.

◇ (2) Heavy metals <1.07>—Proceed with 5.0 g of Purified Glucose in 15 mL of water by heating on a water bath, and allow to cool to room temperature, and use this solution as the test solution. Perform the test with the test solution as directed under Turbidity Measurement <2.65>: the solution is clear. Perform the test with the test solution according to Method 2 under Methods for Color Matching <2.65>: the solution is not more colored than Matching Fluid BY7.

◆ (2) Heavy metals <1.07>—Proceed with 5.0 g of Purified Glucose in 15 mL of water by heating on a water bath, and allow to cool to room temperature, and use this solution as the test solution. Perform the test with the test solution as directed under Turbidity Measurement <2.65>: the solution is clear. Perform the test with the test solution according to Method 2 under Methods for Color Matching <2.65>: the solution is not more colored than Matching Fluid BY7.
fied Glucose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).

(3) Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 25 mL of the standard solution (1), add water to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with exactly 20 μL each of the sample solution, the standard solution (1) and the standard solution (2) as directed under Liquid Chromatography <2,017> according to the following conditions. Determine each peak area by the automatic integration method: the total area of the peaks of maltose and isomaltose, having the relative retention time of about 0.8 to glucose, obtained from the sample solution, is not larger than the peak area of glucose from the standard solution (1) (not more than 0.4%), and the peak area of maltotriose, having the relative retention time of about 0.7 from the sample solution, is not larger than 1/2 times the peak area of glucose from the standard solution (1) (not more than 0.2%), and the peak area of fructose, having the relative retention time of about 1.3 from the sample solution, is not larger than 3 times the peak area of glucose from the standard solution (2) (not more than 0.15%), and the area of the peak other than glucose and the peaks mentioned above from the sample solution is not larger than 2 times the peak area of glucose from the standard solution (2) (not more than 0.10%). Furthermore, the total area of the peaks other than glucose from the sample solution is not larger than 1.25 times the peak area of glucose from the standard solution (1) (not more than 0.5%). For these calculations the peak areas not larger than the peak area of glucose from the standard solution (2) are excluded (disregard limit: 0.05%).

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 1.5 times as long as the retention time of glucose.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Confirm that the peak area of glucose obtained with 20 μL of the standard solution (2) is equivalent to 8.8 to 16.3% of that with 20 μL of the standard solution (1).

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of glucose is not more than 1.0%.

(4) Dextrin—To 1.0 g of powdered Purified Glucose add 20 mL of ethanol (95%), and boil under a reflux condenser: the solution is clear.

(5) Soluble starch and sulfite—To 6.7 g of Purified Glucose add 15 mL of water, dissolve by heating on a water bath, cool, and add 25 μL of 0.05 mol/L iodine VS: a yellow color develops (not more than 15 ppm as SO₃).

Conductivity <2.51>—Dissolve 20.0 g of Purified Glucose in a fleshly boiled and cooled distilled water to make 100 mL, and use this solution as the sample solution. Measure the conductivity of the sample solution at 25 ± 0.1°C while gently stirring with a magnetic stirrer: not more than 20 μS cm⁻¹.

Water <2.48>—Not more than 1.0% (0.5 g, volumetric titration, direct titration).

**Assay**

Weigh accurately about 0.3 g each of Purified Glucose and Glucose RS, (separately determine the water <2.48> in the same manner as Purified Glucose), dissolve separately in water to make exactly 10 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2,017> according to the following conditions, and determine the peak areas, A₁ and A₆, of glucose in each solution.

Amount (g) of glucose (C₆H₁₂O₆) = M₅ × A₁/A₆

M₅: Amount (g) of Glucose RS taken, calculated on the anhydrous basis

**Operating conditions**—

Detector: A differential refractometer maintained at a constant temperature (40°C for example).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (Ca type) composed with a sulfonated polystyrene cross-linked with divinylbenzene (degree of cross-linkage: 8%) (9 μm in particle diameter).

Column temperature: A constant temperature of about 85°C.

Mobile phase: Water.

Flow rate: 0.3 mL per minute (the retention time of glucose is about 21 minutes).

**System suitability**—

System performance: Dissolve 5 mg of maltose, 5 mg of maltotriose and 5 mg of fructose in 50 mL of water, and use this solution as the solution for system suitability test. When the procedure is run with 20 μL each of the solution for system suitability test and the standard solution (2) in Purity (3) under the above operating conditions, maltotriose, maltose, glucose and fructose are eluted in this order, the relative retention times of maltotriose, maltose, isomaltose and fructose to glucose are about 0.7, about 0.8, about 0.8 and about 1.3, respectively, and the resolution between the peaks of maltotriose and maltose is not less than 1.3.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glucose is not more than 1.0%.

**Containers and storage**—Tight containers.

**Glucose Injection**

ブドウ糖注射液

Glucose Injection is an aqueous injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of glucose (C₆H₁₂O₆: 180.16).

**Method of preparation**—Prepare as directed under Injections, with Purified Glucose or Glucose Hydrate.

No preservative is added.

**Description**—Glucose Injection is a clear, colorless liquid. It has a sweet taste. It occurs as a colorless to pale yellow, clear liquid when its labeled concentration exceeds 40%.

**Identification**—Measure a volume of Glucose Injection, equivalent to 0.1 g of glucose (C₆H₁₂O₆), and, if necessary, add water or evaporate on a water bath to make 2 mL. Add
2 to 3 drops of the solution to 5 mL of boiling Fehling’s TS: a red precipitate is produced.

\[ \text{pH} < 2.54 \]

3.5 – 6.5 In the case where the labeled concentration of the injection exceeds 5%, dilute to 5% with water before the test.

Purity 5-Hydroxymethylfurfural and related substances—Pipet a volume of Glucose Injection, equivalent to 2.5 g of glucose (C_{6}H_{12}O_{6}), and add water to make exactly 100 mL. Determine the absorbance of this solution at 284 nm as directed under Ultraviolet-visible Spectrophotometry \( <2.24 \): it is not more than 0.80.

Bacterial endotoxins \( <0.01 \) Less than 0.50 EU/mL.

Extractable volume \( <0.05 \) It meets the requirement.

Foreign insoluble matter \( <0.05 \) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \( <0.05 \) It meets the requirement.

Sterility \( <0.05 \) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure accurately a volume of Glucose Injection, equivalent to about 4 g of glucose (C_{6}H_{12}O_{6}), and add 0.2 mL of ammonia TS and water to make exactly 100 mL. Shake the solution well, allow to stand for 30 minutes, and determine the optical rotation, \( \alpha_{D} \), at 20 ± 1 °C in a 100-mm cell as directed under Optical Rotation Determination \( <2.49 \).

Amount (mg) of glucose (C_{6}H_{12}O_{6}) = \( \alpha_{D} \times 1895.4 \)

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

**L-Glutamic Acid**

\[ \text{Lグルタミン酸} \]

\[ \text{C}_{4}\text{H}_{7}\text{NO}_{4} \cdot \text{HCl} : 147.13 \]

(2S)-2-Aminopentanedioic acid [56-86-0]

L-Glutamic Acid contains not less than 99.0% and not more than 101.0% of L-glutamic acid (C_{4}H_{7}NO_{4}), calculated on the dried basis.

Description L-Glutamic acid occurs as white, crystals or crystalline powder. It has a slight characteristic and acid taste. It is slightly soluble in water, and practically insoluble in ethanol (99.5).

It dissolves in 2 mol/L hydrochloric acid TS. It shows crystal polymorphism.

Identification Determine the infrared absorption spectrum of L-Glutamic Acid as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25 \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve L-Glutamic Acid in a small amount of water, evaporate water at 60°C under reduced pressure, and perform the test in the same manner with the dried residue.

**Optical rotation** \( <2.49 \) \( \alpha_{D}^{20} + 31.5 – +32.5^\circ \) (2.5 g calculated on the dried basis, 2 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** \( <2.54 \) The pH of a solution prepared by dissolving 0.7 g of L-Glutamic Acid in 100 mL of water by warming and then cooling is 2.9 to 3.9.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of L-Glutamic Acid in 10 mL of 2 mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Chloride \( <1.05 \) Dissolve 0.5 g of L-Glutamic Acid in 6 mL of dilute nitric acid and 20 mL of water, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate \( <1.14 \) Dissolve 0.6 g of L-Glutamic Acid in 5 mL of dilute hydrochloric acid and 30 mL of water, and add water to make 45 mL. Perform the test using this solution as the test solution. Prepare the control solution from 0.35 mL of 0.005 mol/L sulfuric acid VS and 5 mL of dilute hydrochloric acid, and dilute with water to 45 mL. Prepare the test solution and the control solution with 5 mL of bromide chloride TS, respectively (not more than 0.02%).

(4) Ammonium \( <2.02 \) Perform the test with 0.25 g of L-Glutamic Acid. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals \( <0.07 \) Dissolve 1.0 g of L-Glutamic Acid in 20 mL of water and 7 mL of a solution of sodium hydroxide (1 in 25) by warming, cool, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution from 1.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to 50 mL (not more than 10 ppm).

(6) Iron \( <1.10 \) Prepare the test solution with 1.0 g of L-Glutamic Acid according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Weigh accurately about 0.5 g of L-Glutamic Acid, and dissolve in 0.5 mL of hydrochloric acid and water to make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount, equivalent to 2.5 mmol, of L-aspartic acid, L-threonine, L-serine, L-glutamic acid, glycine, L-alanine, L-cystine, L-valine, L-methionine, L-isoleucine, L-leucine, L-tyrosine, L-phenylalanine, L-lysine hydrochloride, ammonium chloride, L-histidine and L-arginine, dissolve them in 0.1 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the standard stock solution. Pipet 5 mL of the standard stock solution, and add 0.02 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 6 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.07 \) according to the following conditions, and calculate the mass percentage of each amino acid, using the mass of amino acid other than glutamic acid in 1 mL of the sample solution obtained from the height of the peaks obtained from the sample solution and standard solution: the amount of each amino acid other than glutamic acid is not more than 0.2%, and the total amount of these amino acids is not more than 0.6%.

Detector: A visible absorption photometer (wavelength:...
570 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (Na type) composed with a sulphonated polystyrene (3 μm in particle diameter).

Column temperature: A constant temperature of about 57°C.

Chemical reaction bath temperature: A constant temperature of about 130°C.

Reaction time: About 1 minute.

Mobile phase: Prepare the mobile phases A, B, C, D and E according to the following table, and add 0.1 mL each of caprylic acid.

Changing of mobile phase: Switch the mobile phases A, B, C, D and E sequentially so that when proceed with 20 μL of the standard solution under the above conditions, aspartic acid, threonine, serine, glutamic acid, glycine, alanine, cystine, valine, methionine, isoleucine, leucine, tyrosine, phenylalanine, lysine, ammonia, histidine and arginine are eluted in this order with the resolution between the peaks of isoleucine and leucine being not less than 1.2.

Reaction reagent: Dissolve 204 g of lithium acetate dihydrate in an appropriate amount of water, add 123 mL of acetic acid (100), 401 mL of 1-methoxy-2-propanol and water to make 1000 mL, introduce nitrogen for 10 minutes, and use this solution as Solution (I). Separately, to 979 mL of water to make 1000 mL, introduce nitrogen for 10 minutes, add 81 mg of sodium borohydride, introduce nitrogen for 30 minutes, and use this solution as Solution (II). Prepare a mixture with an equal volume of the Solution (I) and Solution (II) (Prepare before use).

Flow rate of mobile phase: 0.20 mL per minute.

Flow rate of reaction regent: 0.24 mL per minute.

System suitability—

System performance: When the test is run with 20 μL of the standard solution under the above operating conditions, the resolution between the peaks of glycine and L-alanine is not less than 1.2.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak height of each amino acid in the standard solution is not more than 5.0%, and the relative standard deviation of the retention time of them is not more than 1.0%.

Loss on drying <2.41> Not more than 0.3% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.12 g of L-Glutamic Acid, dissolve in 40 mL of water by warming, cool, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 14.71 mg of C₃H₇NO₄

Containers and storage Containers—Tight containers.

L-Glutamine

L-グルタミン

C₅H₁₀N₂O₅: 146.14

(25)3-2,5-Diamoeno-5-oxepentanoic acid [56-85-9]

L-Glutamine, when dried, contains not less than 99.0% and not more than 101.0% of L-glutamine (C₅H₁₀N₂O₅).

Description L-Glutamine occurs as white, crystals or a crystalline powder. It has a slight characteristic taste.

It is freely soluble in formic acid, soluble in water, and practically insoluble in ethanol (99.5).

Identification Determine the infrared absorption spectrum of L-Glutamine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar indices of absorption at the same wave numbers.

Optical rotation <2.49> [α]D: +6.3~+7.3° Weigh accurately about 2 g of L-Glutamine, previously dried, add 45 mL of water, warm to 40°C to dissolve, and after cooling, add water to make exactly 50 mL. Determine the optical rotation of this solution in a 100-mm cell, within 60 minutes.

pH <2.54> The pH of a solution prepared by dissolving 1.0 g of L-Glutamine in 50 mL of water is between 4.5 and 6.0.

Purity (1) Clarity and color of solution—A solution obtained by dissolving 0.5 g of L-Glutamine in 20 mL of water is clear and colorless.

(2) Chloride <1.03>—Perform the test with 0.5 g of L-Glutamine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Perform the test with 0.6 g of L-Glutamine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium <1.02>—Perform the test with 0.10 g of L-Glutamine, using the distillation under reduced pressure. Prepare the control solution with 10.0 mL of Standard Ammonium Solution. The temperature of the water bath is 45°C (not more than 0.1%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of L-Glutamine according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron <1.10>—Prepare the test solution with 1.0 g of
l-Glutamine according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.10 g of l-Glutamine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Then develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100) on the plate, and heat the plate at 80°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.3% (1 g, 105°C, 3 hours).

Residue on Ignition <2.49> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of l-Glutamine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 14.61 mg of C₇H₇NO₃

Containers and storage Containers—Tight containers.

Glutathione

グルタチオン

C₉H₁₇N₅O₅S: 307.32
(2S)-2-Amino-4-[1-(carboxymethyl)carbamoyl-(2R)-2-sulfanylethylcarbamoyl]butanoic acid [70-18-8]

Glutathione, when dried, contains not less than 98.0% and not more than 101.0% of glutathione (C₁₀H₁₇N₅O₅S).

Description Glutathione occurs as a white crystalline powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

Melting point: about 185°C (with decomposition).

Identification Determine the infrared absorption spectrum of Glutathione, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D² = −15.5 to −17.5° (after drying, 2 g, water, 50 mL, 100 mm).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Glutathione in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Glutathione according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.16>—Prepare the test solution with 1.0 g of Glutathione according to Method 1, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Glutathione in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak having the relative retention time of about 4 to glutathione obtained from the sample solution is not larger than 3/4 times the peak area of glutathione from the standard solution, and the total area of the peaks other than glutathione is not larger than the peak area of glutathione from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate and 2.02 g of sodium 1-heptane sulfonate in 1000 mL of water, and adjust the pH to 3.0 with phosphoric acid. To 970 mL of this solution add 30 mL of methanol.

Flow rate: Adjust so that the retention time of glutathione is about 5 minutes.

Time span of measurement: About 6 times as long as the retention time of glutathione, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 10 mL of the standard solution, and add the mobile phase to make exactly 100 mL. Confirm that the peak area of glutathione obtained with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the standard solution.

System performance: Dissolve 50 mg of glutathione, 10 mg of D-phenylglycine and 50 mg of ascorbic acid in 100 mL of water. When the procedure is run with 10 μL of this solution under the above operating conditions, ascorbic acid, glutathione and D-phenylglycine are eluted in this order, and the resolutions between the peaks of ascorbic acid and glutathione and between the peaks of glutathione and D-phenylglycine are not less than 5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glutathione is not more than 1.5%.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.49> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Glutathione, previously dried, dissolve in 50 mL of a solution of metathos-
Glycerin

Glycerol

\[ \text{C}_3\text{H}_6\text{O}_3: 92.09 \]

Glycerin contains not less than 84.0% and not more than 87.0% of glycerin (\(\text{C}_3\text{H}_6\text{O}_3\)).

**Description**  Glycerin is a clear, colorless, viscous liquid. It has a sweet taste. It is miscible with water and with ethanol (99.5). It is hygroscopic.

**Identification**  Determine the infrared absorption spectrum of Glycerin as directed in the liquid film method under Infrared Spectrophotometry \(<2.25\) \(\times\) \(\lambda\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index**  \(\angle 2.45\) \(n_0^\prime\): 1.449 – 1.454

**Specific gravity**  \(\angle 2.50\) \(d_2^\prime\): 1.221 – 1.230

**Purity**  
1. Color—Place 50 mL of Glycerin in a Nessler tube, and observe downward: the solution has no more color than the following control solution.

   a. Control solution: Place 0.40 mL of Iron (III) Chloride CS in a Nessler tube, and add water to make 50 mL.

2. Acidity or alkalinity—To 2 mL of Glycerin add 8 mL of water and mix: the solution is neutral.

3. Chloride \(\angle 2.07\)—Take 10.0 g of Glycerin, and perform the test: Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

4. Sulfate \(\angle 1.14\)—Take 10.0 g of Glycerin, and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.002%).

5. Ammonium—To 5 mL of Glycerin add 5 mL of a solution of sodium hydroxide (1 in 10), and boil: the gas evolved does not change made moistened red litmus paper to blue.

6. Heavy metals \(\angle 1.07\)—Proceed with 5.0 g of Glycerin according to Method 1, and perform the test: Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 5 ppm).

7. Calcium—To 5 mL of the solution obtained in (2) add 3 drops of ammonium oxalate TS: the solution remains unchanged.

8. Arsenic \(\angle 1.11\)—Prepare the test solution with 1.0 g of Glycerin according to Method 1, and perform the test (not more than 2 ppm).

9. Acrolein, glucose, and other reducing substances—To 1.0 g of Glycerin add 1 mL of ammonia TS, mix, and warm in a water bath at 60°C for 5 minutes: no yellow color is produced. Take the solution out of the water bath, add 3 drops of silver nitrate TS immediately, and allow to stand in a dark place for 5 minutes: the color of the solution does not change, and no turbidity is produced.

10. Fatty acids and esters—Mix 50 g of Glycerin with 50 mL of freshly boiled and cooled water, add exactly 10 mL of 0.1 mol/L sodium hydroxide VS, boil the mixture for 15 minutes, cool, and titrate \(\angle 2.50\) the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS: 0.1 mol/L sodium hydroxide VS consumed is not more than 3.0 mL (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner.

11. Ethylene glycol, diethylene glycol and related substances—Weigh accurately about 5.88 g of Glycerin, mix with methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g each of ethylene glycol and diethylene glycol, mix with methanol to make exactly 100 mL. Pipet 5 mL of this solution and transfer into a 100-mL volumetric flask. Separately, weigh 5.0 g of glycerin for gas chromatography, mix with a suitable amount of methanol and put in the volumetric flask, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 1 µL each of the sample solution and standard solution as directed under Gas Chromatography \(\angle 2.02\) according to the following conditions, and determine the peak areas, \(A_{S1}\) and \(A_{S3}\), of ethylene glycol and, \(A_{T2}\) and \(A_{T3}\), of diethylene glycol by the automatic integration method. The amounts of ethylene glycol and diethylene glycol, calculated by the following equations, are not more than 0.1%, respectively. The amount of the peak other than glycerin, ethylene glycol and diethylene glycol obtained from the sample solution, calculated by the area percentage method, is not more than 0.1%, and the total amount of the peaks other than glycerin is not more than 1.0%.

   \[
   \text{Amount (g) of ethylene glycol} = \frac{M_{S1}}{M_{T1}} \times \frac{A_{T1}}{A_{S1}} \times 5
   \]

   \[
   \text{Amount (g) of diethylene glycol} = \frac{M_{S2}}{M_{T2}} \times \frac{A_{T2}}{A_{S2}} \times 5
   \]

   \(M_{S1}\): Amount (g) of ethylene glycol taken

   \(M_{S2}\): Amount (g) of diethylene glycol taken

   \(M_{T1}\): Amount (g) of Glycerin taken

**Operating conditions—**

Detector: A hydrogen flame-ionization detector.

Column: A fused-silica column 0.32 mm in inside diameter and 30 m in length, coated the inner surface with 14% cyanopropylphenyl-86% dimethyl silicone polymer for gas chromatography 1 µm in thickness.

Column temperature: Inject at a constant temperature of about 100°C, raise the temperature at the rate of 7.5°C per minute to 220°C, and maintain at a constant temperature of about 220°C.

Injection port temperature: A constant temperature of about 220°C.

Detector temperature: A constant temperature of about 250°C.

Carrier gas: Helium.

Flow rate: about 38 cm per second.

Time span of measurement: About 3 times as long as the retention time of glycerin, beginning after the solvent peak.

**System suitability—**

System performance: Mix 50 µg each of ethylene glycol, diethylene glycol and glycerin for gas chromatography with 100 mL of methanol. When the procedure is run with 1 µL of this solution under the above operating conditions, ethylene glycol, diethylene glycol and glycerin are eluted in this order, and the resolution between the peaks of ethylene glycol and diethylene glycol is not less than 40, and between
the peaks of diethylene glycol and glycerin is not less than 10.

System repeatability: When the test is repeated 6 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of ethylene glycol and diethylene glycol are not more than 10%, respectively.

(12) Readily carbonizable substances—To 5 mL of Glycerin add carefully 5 mL of sulfuric acid for readily carbonizable substances, mix gently at a temperature between 18°C and 20°C, and allow to stand for 1 hour between 15°C and 25°C: the solution has not more color than Matching Fluid H.

Water <2.46> 13 - 17% (0.1 g, volumetric titration, direct titration).

Residue on ignition <2.46> Weigh accurately about 10 g of Glycerin in a tared crucible, heat to boiling, and fire to burn immediately. After cooling, moisten the residue with 1 to 2 drops of sulfuric acid, and ignite cautiously to constant mass: the mass of the residue is not more than 0.01%.

Assay Weigh accurately about 0.2 g of Glycerin, transfer into a glass-stoppered flask, add 50 mL of water, mix, add exactly 50 mL of sodium periodate TS, shake, and allow to stand in a dark place at room temperature for about 30 minutes. Add 10 mL of a mixture of water and ethylene glycol (1:1), allow to stand for about 20 minutes, add 100 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make the necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 9.209 mg of C₃H₈O₃

Containers and storage Containers—Tight containers.

Concentrated Glycerin

Concentrated Glycerin

濃グリセリン

C₃H₈O₃: 92.09
Propane-1,2,3-triol

[56-81-5]

Concentrated Glycerin contains not less than 98.0% and not more than 101.0% of glycerin (C₃H₈O₃), calculated of the anhydrous basis.

Description Concentrated Glycerin is a clear, colorless and viscous liquid. It has a sweet taste.

It is miscible with water and with ethanol (99.5).

It is hygroscopic.

Identification Determine the infrared absorption spectrum of Concentrated Glycerin as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Refractive index <2.46> nD²₀: Not less than 1.470.

Specific gravity <2.56> d₂₀¹₀: Not less than 1.258.

Purity (1) Color—Place 50 mL of Concentrated Glycerin in a Nessler tube, and observe downward: the solution has no more color than the following control solution.

Control solution: Pipet 0.40 mL of Iron (III) Chloride CS into a Nessler tube, and add water to make 50 mL.

(2) Acidity or alkalinity—To 2 mL of Concentrated Glycerin add 8 mL of water and mix: the solution is neutral.

(3) Chloride <1.07>—Take 10.0 g of Concentrated Glycerin, and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

(4) Sulfate <1.14>—Take 10.0 g of Concentrated Glycerin, and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.002%).

(5) Ammonium—To 5 mL of Concentrated Glycerin add 5 mL of a solution of sodium hydroxide (1 in 10), and boil: the gas evolved does not change moistened red litmus paper to blue.

(6) Heavy metals <1.07>—Proceed with 5.0 g of Concentrated Glycerin according to Method 1, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 5 ppm).

(7) Calcium—To 5 mL of the solution obtained in (2) add 3 drops of ammonium oxalate TS: the solution remains unchanged.

(8) Arsenic <1.11>—Prepare the test solution with 1.0 g of Concentrated Glycerin according to Method 1, and perform the test (not more than 2 ppm).

(9) Acrolein, glucose, or other reducing substances—To 1.0 g of Concentrated Glycerin add 1 mL of ammonia TS, mix, and warm in a water bath at 60°C for 5 minutes: no yellow color is produced. Take the solution out of the water bath, add 3 drops of silver nitrate TS immediately, and allow to stand in a dark place for 5 minutes: the color of the solution does not change, and no turbidity is produced.

(10) Fatty acids and esters—Mix 50 g of Concentrated Glycerin with 50 mL of freshly boiled and cooled water, add 10 mL of 0.1 mol/L sodium hydroxide VS, accurately measured, boil the mixture for 15 minutes, cool, and titrate <2.50> with the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS: not more than 3.0 mL of 0.1 mol/L sodium hydroxide VS is consumed (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner.

(11) Ethylene glycol, diethylene glycol and related substances—Weigh accurately about 5 g of Concentrated Glycerin, mix with methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g each of ethylene glycol and diethylene glycol, mix with methanol to make exactly 100 mL. Pipet 5 mL of this solution and transfer into a 100-mL volumetric flask. Separately, weigh 5.0 g of glycerin for gas chromatography, mix with a suitable amount of methanol and put in the volumetric flask, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 1 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak areas, A₇, and A₈₁, of ethylene glycol and, A₁₇ and A₃₂, of diethylene glycol by the automatic integration method. The amounts of ethylene glycol and diethylene glycol, calculated by the following equations, are not more than 0.1%, respectively. The amount of the peak other than glycerin, ethylene glycol and diethylene glycol obtained from the sample solution, calculated by the area percentage method, is not more than 0.1%, and the total amount of the peaks other than glycerin is not more than 1.0%.
Amount (%) of ethylene glycol
\[ M_{S2}/M_T \times A_{T1}/A_{S1} \times 5 \]
Amount (%) of diethylene glycol
\[ M_{S2}/M_T \times A_{T2}/A_{S2} \times 5 \]

\( M_{S1} \): Amount (g) of ethylene glycol taken
\( M_{S2} \): Amount (g) of diethylene glycol taken
\( M_T \): Amount (g) of Concentrated Glycerin taken

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A fused-silica column 0.32 mm in inside diameter and 30 m in length, coated the inner surface with 14% cyanopropylphenyl-86% dimethyl silicone polymer for gas chromatography 1 \( \mu m \) in thickness.
Column temperature: Inject at a constant temperature of about 100\( ^\circ \)C, raise the temperature at the rate of 7.5\( ^\circ \)C per minute to 220\( ^\circ \)C, and maintain at a constant temperature of about 220\( ^\circ \)C.
Injection port temperature: A constant temperature of about 220\( ^\circ \)C.
Detector temperature: A constant temperature of about 250\( ^\circ \)C.
Carrier gas: Helium.
Flow rate: about 38 cm per second.
Time span of measurement: About 3 times as long as the retention time of glycerin, beginning after the solvent peak.
System suitability—
System performance: Mix 50 mg each of ethylene glycol, diethylene glycol and glycerin for gas chromatography with 100 mL of methanol. When the procedure is run with 1 \( \mu L \) of this solution under the above operating conditions, ethylene glycol, diethylene glycol and glycerin are eluted in this order, and the resolution between the peaks of ethylene glycol and diethylene glycol is not less than 40, and between the peaks of diethylene glycol and glycerin is not less than 10.
System repeatability: When the test is repeated 6 times with 1 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviations of the peak area of ethylene glycol and diethylene glycol are not more than 10\%, respectively.

(12) Readily carbonizable substances—To 5 \( mL \) of Concentrated Glycerin add carefully 5 \( mL \) of sulfuric acid for readily carbonizable substances, mix gently at a temperature between 18\( ^\circ \)C and 20\( ^\circ \)C, and allow to stand for 1 hour between 15\( ^\circ \)C and 25\( ^\circ \)C: the solution has no more color than Matching Fluid H.
Water <2.45> Not more than 2.0\% (6 g, volumetric titration, direct titration).
Residue on ignition <2.44> Weigh accurately about 10 g of Concentrated Glycerin in a tared crucible, heat to boiling, and fire to burn immediately. Cool, moisten the residue with 1 to 2 drops of sulfuric acid, and ignite cautiously to constant mass: the mass of the residue is not more than 0.01%.
Assay Weigh accurately about 0.2 g of Concentrated Glycerin, transfer into a glass-stoppered flask, add 50 \( mL \) of water, mix, add exactly 50 \( mL \) of sodium periodate TS, shake, and allow to stand in a dark place at a room temperature for about 30 minutes. Add 10 \( mL \) of a mixture of water and ethylene glycol (1:1), allow to stand for about 20 minutes, add 100 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make the necessary correction.
Each mL of 0.1 mol/L sodium hydroxide VS = 9.209 mg of \( C_7H_{14}O_3 \)

Containers and storage Containers—Tight containers.

Glycerin and Potash Solution

グリセリンカリ液

Method of preparation
Potassium Hydroxide 3 g
Glycerin 200 mL
Ethanol 250 mL
Aromatic substance a suitable quantity
Water, Purified Water or Purified Water in Containers a sufficient quantity

To make 1000 mL
Dissolve Potassium Hydroxide in a portion of Water, Purified Water or Purified Water in Containers, add Glycerin, Ethanol, a suitable quantity of aromatic substance and another portion of Water, Purified Water or Purified Water in Containers to volume, and filter. Concentrated Glycerin may be used in place of Glycerin.

Description Glycerin and Potash Solution is a clear, colorless liquid, having an aromatic odor. The pH of a solution of Glycerin and Potash Solution (1 in 5) is about 12.
Specific gravity \( d_{20}^{40} \) about 1.02

Identification (1) A solution of Glycerin and Potash Solution (1 in 2) is alkaline (potassium hydroxide).
(2) Place 10 \( mL \) of a solution of Glycerin and Potash Solution (1 in 10) in a glass-stoppered test tube, add 2 \( mL \) of sodium hydroxide TS and 1 \( mL \) of copper (II) sulfate TS, and shake: a blue color is produced (glycerin).
(3) Glycerin and Potash Solution responds to Qualitative Tests <1.09> for potassium salt.

Containers and storage Containers—Tight containers.

Glyceryl Monostearate

モノステアリン酸グリセリン

Glyceryl Monostearate is a mixture of \( \alpha \)- and \( \beta \)-glyceryl monostearate and other fatty acid esters of glycerin.

Description Glyceryl Monostearate occurs as white to light yellow, waxy masses, thin flakes, or granules. It has a characteristic odor and taste. It is very soluble in hot ethanol (95), soluble in chloroform, sparingly soluble in diethyl ether, and practically insoluble in water and in ethanol (95).
It is slowly affected by light.

Identification (1) Heat 0.2 g of Glyceryl Monostearate with 0.5 g of potassium hydrogen sulfate until thoroughly charred: the irritative odor of acrolein is perceptible.
(2) Dissolve 0.1 g of Glyceryl Monostearate in 2 \( mL \) of ethanol (95) by warming, heat with 5 \( mL \) of dilute sulfuric acid in a water bath for 30 minutes, and cool: a white to yellow solid is produced. This separated solid dissolves when shaken with 3 \( mL \) of diethyl ether.
Melting point <1.13> Not below 55°C.
Acid value <1.13> Not more than 15.
Saponification value <1.13> 157 – 170
Iodine value <1.13> Not more than 3.0. Use chloroform instead of cyclohexane.
Purity <1.13> Acidity or alkalinity—To 1.0 g of Glycine Monostearate add 20 mL of boiling water, and cool with swirling: the solution is neutral.
Residue on ignition <2.44> Not more than 0.1% (1 g).
Containers and storage Containers—Tight containers. Storage—Light-resistant.

Glycine

グリシン

\[ \text{C}_2\text{H}_5\text{NO}_3\]\ H\text{N} \text{C}O\text{H}

75.07 Aminoacetic acid [56-40-6]

Glycine, when dried, contains not less than 98.5% of glycine (\(\text{C}_2\text{H}_5\text{NO}_3\)).

Description Glycine occurs as white, crystals or crystalline powder. It has a sweet taste.

It is freely soluble in water and in formic acid, and practically insoluble in ethanol (95).

It shows crystal polymorphism.

Identification Determine the infrared absorption spectrum of Glycine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Glycine in water, evaporate the water to dryness, and repeat the test with the residue.

pH <2.54> Dissolve 1.0 g of Glycine in 20 mL of water: the pH of the solution is between 5.6 and 6.6.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Glycine in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.07> Perform the test with 0.5 g of Glycine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14> Perform the test with 0.6 g of Glycine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium<1.02> Perform the test using 0.25 g of Glycine. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07> Proceed with 1.0 g of Glycine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Arsenic <1.13> Prepare the test solution with 1.0 g of Glycine according to Method 1, and perform the test (not more than 2 ppm).

(7) Related substances—Dissolve 0.10 g of Glycine in 25 mL of water and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1.1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50), and heat at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 80 mg of Glycine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate \(2.50^7\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 7.507 mg of \(\text{C}_2\text{H}_5\text{NO}_3\).

Containers and storage Containers—Well-closed containers.

Gonadorelin Acetate

ゴナドレリン酢酸塩

\[ \text{C}_8\text{H}_{16}\text{N}_4\text{O}_{14}{\cdot}\text{2C}_2\text{H}_5\text{O}_2; 1302.39 \]

[34973-08-5]

Gonadorelin Acetate contains not less than 96.0% and not more than 102.0% of gonadorelin acetate (\(\text{C}_{25}\text{H}_{32}\text{N}_{17}\text{O}_{32}\)), calculated on the anhydrous basis.

Description Gonadorelin Acetate occurs as a white to pale yellow powder. It is odorless or has a slight, acetic odor.

It is freely soluble in water, in methanol and in acetic acid (100), and sparingly soluble in ethanol (95).

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Gonadorelin Acetate in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Gonadorelin Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Gonadorelin Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 20 mg of Gonadorelin Acetate in 0.5 mL of
ethanol (99.5), add 1 mL of sulfuric acid, and heat: the odor of ethyl acetate is perceptible.

**Optical rotation** $<2.49^\circ$ [d]$_{589nm}^{20}$ $-53.0^\circ - 57.0^\circ$ (0.1 g calculated on the anhydrous basis, diluted acetic acid (100) (1 in 100), 10 mL, 100 nm).

**pH** $<2.54$ Dissolve 0.10 g of Gonadorelin Acetate in 10 mL of water: the pH of this solution is between 4.8 and 5.8.

**Constituent amino acids** Put 10 mg of Gonadorelin Acetate in a test tube for hydrolysis, add 0.5 mL of hydrochloric acid and 0.5 mL of a solution of mercaptoacetic acid (2 in 25), seal the tube under reduced pressure, and heat at 110°C for 5 hours. After cooling, open the tube, transfer the hydrolyzate into a beaker, and evaporate to dryness on a water bath. Add exactly 100 mL of 0.02 mol/L hydrochloric acid TS to dissolve the residue, and use this solution as the sample solution. Separately, weigh exactly 0.105 g of L-serine, 0.147 g of L-glutamic acid, 0.115 g of L-proline, 75 mg of glycine, 0.131 g of L-leucine, 0.181 g of L-tyrosine, 0.210 g of L-histidine hydrochloride monohydrate, 0.204 g of L-tryptophan and 0.211 g of L-arginine hydrochloride, which are all previously dried at 105°C for 3 hours, add 50 mL of 1 mol/L hydrochloric acid TS to dissolve them, and add water to make exactly 1000 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography $<2.07>$ according to the following conditions: the peaks of the nine constituent amino acids are observed on the chromatogram obtained from the sample solution, and their respective molar ratios to arginine are 0.7 – 1.0 for serine and tryptophan, 0.8 – 1.2 for proline, 0.9 – 1.1 for glutamic acid, leucine, tyrosine and histidine, respectively, and 1.8 – 2.2 for glycine.

**Operating conditions**

Detector: A visible spectrophotometer (wavelength: 440 nm for proline and 570 nm for others).

Column: A stainless steel column 4 mm in inside diameter and 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography composed with a sulfonated polystyrene copolymer (5 μm in particle diameter).

Column temperature: A constant temperature of about 57°C.

Chemical reaction bath temperature: A constant temperature of about 130°C.

Mobile phase: Prepare the mobile phases A, B, C and D according to the following table.

Reaction reagent: Dissolve 204 g of lithium acetate dihydrate in 336 mL of water, add 123 mL of acetic acid (100) and 401 mL of 1-methoxy-2-propanol, and use as Solution A. Separately, dissolve 39 g of ninhydrin and 81 mg of sodium borohydride in 979 mL of 1-methoxy-2-propanol, and use as Solution B. Mix the same volume of Solution A and Solution B before use.

Flow rate of mobile phase: 0.25 mL per minute.

Flow rate of reaction reagent: 0.3 mL per minute.

**System suitability**

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, serine, glutamic acid, proline, glycine, leucine, tyrosine, histidine, tryptophan and arginine are eluted in this order with enough separation between these peaks.

**Purity (1)**

Clarity and color of solution—A solution obtained by dissolving 0.10 g of Gonadorelin Acetate in 10 mL of water is clear, and the absorbance of this solution at 350 nm determined as directed under Ultraviolet-visible Spectrophotometry $<2.34>$ is not more than 0.10.

(2) Related substances—Dissolve 50 mg of Gonadorelin Acetate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography $<2.07>$ according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than gonadorelin from the sample solution is not larger than 1/5 times the peak area of gonadorelin from the standard solution, and the total area of the peaks other than gonadorelin from the sample solution is not larger than 3/5 times the peak area of gonadorelin from the standard solution.

**Operating conditions**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of gonadorelin, beginning after the solvent peak.

**System suitability**

Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of gonadorelin obtained with 10 μL of this solution is equivalent to 1 to 3% of that with 10 μL of the standard solution.

System performance: Dissolve 4 mg of Gonadorelin Acetate in a suitable amount of the mobile phase, add 5 mL of a solution of phenacetin in acetone-trile (1 in 1000) and the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, gonadorelin and phenacetin are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operat-
ing conditions, the relative standard deviation of the peak area of gonadorelin is not more than 5%.

Water Not more than 8.0% (0.15 g, volumetric titration, direct titration).

Residue on ignition Not more than 0.2% (0.1 g).

Assay Weigh accurately about 20 mg of Gonadorelin Acetate and Gonadorelin Acetate RS (separately determine the water in the same manner as Gonadorelin Acetate) and dissolve in diluted acetic acid (100) (1 in 1000) to make exactly 25 mL each. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and add water to make 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of gonadorelin to that of the internal standard.

\[
M_S = \frac{M_X \times Q_1}{Q_2}
\]

Where:
- \(M_X\) is the amount (mg) of gonadorelin acetate
- \(M_S\) is the amount (mg) of Gonadorelin Acetate RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of phenacetin in a mixture of water and acetonitrile (3:2) (1 in 1000).

Operating conditions—
- Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 µm in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS (pH 3.0) and acetonitrile (90:17).
- Flow rate: Adjust so that the retention time of gonadorelin is about 13 minutes.

System suitability—
- System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, gonadorelin and the internal standard are eluted in the following order, the relative standard deviation of the ratio of the peak area of gonadorelin to that of the internal standard is not more than 1.5%.

Containers and storage  Containers—Tight containers.
Storage—Light-resistant.

Human Chorionic Gonadotrophin

ヒト絨毛性腺刺激ホルモン

Human Chorionic Gonadotrophin is a dried preparation of gonad-stimulating hormone obtained from the urine of healthy pregnant women after the manufacturing process to remove or inactivate the virus.

It contains not less than 2500 human chorionic gonadotrophin Units per mg, and contains not less than 3000 chorionic gonadotrophin Units per mg protein.

It contains not less than 80% and not more than 125% of the labeled human chorionic gonadotrophin Units.

Description Human Chorionic Gonadotrophin occurs as a white to light yellow-brown powder. It is freely soluble in water.

Identification Calculate \(b\) by the following equation, using \(Y_1\) and \(Y_2\) obtained in the Assay: \(b\) is not more than 120.

\[
b = \frac{E}{I}
\]

Where:
- \(E = \frac{(Y_1 - Y_2)}{f}\)
- \(f\): Number of test animals per group
- \(I = \log \left(\frac{T_N}{T_L}\right)\)

Purity (1) Clarity and color of solution—Dissolve 0.05 g of Human Chorionic Gonadotrophin in 5 mL of isotonic sodium chloride solution: the solution is clear and colorless or light yellow.

(2) Estrogen—Inject subcutaneously into each of three female albino rats or albino mice ovariecetomized at least two weeks before the test, single dose of 100 units according to the labeled Units dissolved in 0.5 mL of isotonic sodium chloride solution. Take vaginal smear twice daily, on the third, fourth and fifth day. Place the smear thinly on a slide glass, dry, stain with Giemsa’s TS, wash with water, and again dry: no estrus figure is shown microscopically.

Loss on drying Not more than 5.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

Bacterial endotoxins Less than 0.03 EU/unit.

Abnormal toxicity Dilute Human Chorionic Gonadotrophin with isotonic sodium chloride solution so that each mL of the solution contains 120 Units, and use this solution as the sample solution. Inject 5.0 mL of the sample solution into the peritoneal cavity of each of 2 or more of well-nourished, healthy guinea pigs weighing about 350 g, and observe the conditions of the animals for more than 7 days: all the animals exhibit no abnormalities.

Specific activity When calculate from the results obtained by the Assay and the following test, the specific activity is not less than 3000 human chorionic gonadotrophin Units per mg protein.

(i) Sample solution—To an exactly amount of Human Chorionic Gonadotrophin add water to make a solution so that each mL contains about 500 Units of human chorionic gonadotrophin.

(ii) Standard solution—Weigh accurately about 10 mg of bovine serum albumin, and dissolve in water to make exactly 20 mL. To a suitable volume of this solution add water to make four solutions containing exactly 300, 200, 100 and 50 µg of the albumin per mL, respectively.

(iii) Procedure—Pipet 0.5 mL each of the sample solution and standard solutions, put them in glass test tubes about 18 mm in inside diameter and about 130 mm in length, add exactly 5 mL of alkaline copper TS, mix, and allow the tubes to stand in a water bath at 30°C for 10 minutes. Then add exactly 0.5 mL of diluted Folin’s TS (1 in 2), mix, and warm in a water bath at 30°C for 20 minutes. Determine the absorbances of these solutions at 750 nm as directed under Ultraviolet-visible Spectrophotometry using a solution obtained in the same manner with 0.5 mL of water as the
Plot the absorbances of the standard solutions on the vertical axis and their protein concentrations on the horizontal axis to prepare a calibration curve, and determine the protein content of the sample solution from its absorbance by using this curve. Then calculate the amount of the protein in the sample.

**Assay**

(i) **Test animals**—Select healthy female albino rats weighing about 45 to 65 g.  
(ii) **Standard solution**—Dissolve a quantity of Human Chorionic Gonadotrophin RS in bovine serum albumin-isotonic sodium chloride solution to prepare four kinds of solutions, having 7.5, 15, 30 and 60 Units per 2.5 mL, respectively. Inject these solutions into four groups consisting of five test animals each, and weigh their ovaries, as directed in procedure of (iv). Inject bovine serum albumin-isotonic sodium chloride solution to another group, and use this group as the control group. According to the result of this test, designate the concentration of the reference standard which will increase the masses of the ovaries about 2.5 times the mass of the ovaries of the control group as a low-dose concentration of the standard solution, and the concentration 1.5 to 2.0 times the low-dose concentration as a high-dose concentration. Dissolve a quantity of Human Chorionic Gonadotrophin RS, in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose standard solution S_H and a low-dose standard solution S_L whose concentrations are equal to those determined by the above test.  
(iii) **Sample solution**—According to the labeled units, weigh accurately a suitable quantity of Human Chorionic Gonadotrophin, dissolve in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose sample solution T_H and a low-dose sample solution T_L having Units equal to the standard solutions in equal volumes.  
(iv) **Procedure**—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously 0.5 mL of S_H and a low-dose concentration of the standard solution T_L into each group for 5 days. On the sixth day, excise the ovaries, remove the fat and other unwonted tissues attached to the ovaries, and remove the adhering water by lightly pressing between filter paper, and immediately weigh the ovaries.  
(v) **Calculation**—Designate the mass of ovaries by S_A, S_B, T_A and T_B as y_1, y_2, y_3 and y_4, respectively. Sum up y_1, y_2, y_3 and y_4 on each set to obtain y_1, y_2, y_3 and y_4.

Units per mg of Human Chorionic Gonadotrophin  
= antilog M × units per mL of S_L × b/a  

\[ M = \log (S_U/S_L) - \log (T_U/T_L) \]  
\[ I = -y_1 - y_2 + y_3 + y_4 \]  
\[ Y_a = y_1 - y_2 + y_3 - y_4 \]  
\[ Y_b = y_1 - y_2 + y_3 - y_4 \]  
\[ a: \text{Mass (mg) of Human Chorionic Gonadotrophin taken} \]  
\[ b: \text{Total volume (mL) of the high dose of the test solution prepared by diluting with bovine serum albumin-isotonic sodium chloride solution} \]

\[ F' = (Y_1 - Y_2 - Y_3 + Y_4)/(4b^2) \]

*F*': Number of test animals per group

\[ s^2 = (\Sigma y^2 - (Y/f))/n \]

\[ \Sigma y^2: \text{The sum of the squares of each } y_1, y_2, y_3 \text{ and } y_4 \]

\[ Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2 \]

\[ n = 4(f - 1) \]

\[ L = 2(C - 1)(CM^2 + f^2) \]

\[ C = Y_2^2/(Y_2^2 - 4f^2/4) \]

\[ t^2: \text{Value shown in the following table against } n \text{ used to calculate } s^2 \]

Containers and storage  
Containers—Tight containers.  
Storage—Light-resistant, and in a cold place.

**Human Chorionic Gonadotrophin for Injection**

**Chorionic Gonadotrophin for Injection**

**注射用ヒト絨毛性性腺刺激ホルモン**

Human Chorionic Gonadotrophin for Injection is a preparation for injection which is dissolved before use.  
It contains not less than 80% and not more than 125% of the labeled human chorionic gonadotrophin Units.  

**Method of preparation**  
Prepare as directed under Injections with Human Chorionic Gonadotrophin.  

**Description**  
Human Chorionic Gonadotrophin for Injection occurs as a white to light yellow-brown powder or masses.

**Identification**  
Proceed as directed in the Identification under Human Chorionic Gonadotrophin.

**pH**  
Prepare a solution so that each mL of isotonic sodium chloride solution contains 2 mg of Human Chorionic Gonadotrophin for Injection: the pH of this solution is between 5.0 and 7.0.

**Loss on drying**  
Not more than 5.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Bacterial endotoxins**  
Less than 0.03 EU/unit.

**Uniformity of dosage units**  
It meets the requirement of the Mass variation test, when calculate the acceptance
value using the mean of estimated contents of the units tested as \( M \).

**Foreign insoluble matter <6.06>** Perform the test according to the Method 2: it meets the requirement.

**Insoluble particulate matter <6.07>** It meets the requirement.

**Sterility <4.06>** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Proceed as directed in the Assay under Human Chorionic Gonadotrophin. The ratio of the assayed Units to the labeled Units should be calculated by the following equation.

\[ \text{Ratio of assayed Units to labeled Units} = \text{antilog} M \]

**Containers and storage** Containers—Hermetic containers. Storage—Light-resistant, and in a cold place.

**Human Menopausal Gonadotrophin**

ヒト下垂体性腺刺激ホルモン

Human Menopausal Gonadotrophin is a dried preparation of gonad-stimulating hormone obtained from the urine of postmenopausal healthy women, after processing for virus removal or inactivation. It has follicle-stimulating hormonal action and luteinizing hormonal action.

It contains not less than 40 follicle-stimulating hormone Units per mg.

**Description** Human Menopausal Gonadotrophin occurs as a white to pale yellow powder.

It is soluble in water.

**Ratio of interstitial cell-stimulating hormone to follicle-stimulating hormone** Perform the test according to the following method: the ratio of the unit of interstitial cell-stimulating hormone (luteinizing hormone) to that of follicle-stimulating hormone is not more than 1.

(i) Test animals—Select healthy male albino rats weighing about 45 to 65 g.

(ii) Standard solutions—Dissolve Menopausal Gonadotrophin RS in bovine serum albumin-sodium chloride-phosphate buffer solution (pH 7.2) to prepare three kinds of solutions, containing 10, 20 and 40 interstitial cell-stimulating hormone units per 1.0 mL, respectively. Inject these solutions into three groups consisting of five test animals each, and weigh their seminal vesicles as directed in (iv). According to the result of the test, designate the concentration of the reference standard, which will make the mass of the seminal vesicle 20 to 35 mg, as the high-dose standard solution, \( S_h \). Dilute the \( S_h \) to 1.5 to 2.0 times the initial volume with the bovine serum albumin-sodium chloride-phosphate buffer solution (pH 7.2) and designate this solution as the low-dose standard solution, \( S_l \).

(iii) Sample solutions—Weigh accurately a suitable amount of Human Menopausal Gonadotrophin, and dissolve in the bovine serum albumin-sodium chloride-phosphate buffer solution (pH 7.2) to prepare the sample solutions.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously once every day 0.2 mL of each of \( S_h \), \( S_l \), \( T_h \) and \( T_l \) to each animal in the respective groups for five days. On the sixth day, excise the seminal vesicles, remove extraneous tissue, remove fluid adhering to the vesicles and the contents of the vesicles by lightly pressing between filter papers, and weigh the vesicles.

(v) Calculation—Proceed as directed in (v) in the Assay by changing the mass of ovaries to the mass of seminal vesicles and the unit of follicle-stimulating hormone to the unit of interstitial cell-stimulating hormone to read.

**Water <2.48>** Not more than 5.0% (0.2 g, volumetric titration, direct titration).

**Bacterial endotoxins <4.01>** Dissolve Human Menopausal Gonadotrophin in water for bacterial endotoxins test to prepare a solution containing 75 follicle-stimulating hormone Units per mL, and perform the test: less than 0.66 EU/follicle-stimulating hormone Unit.

**Specific activity** Perform the test with Human Menopausal Gonadotrophin according to the following method, and calculate the specific activity using the amount (Unit) obtained in the Assay: it is not less than 50 follicle-stimulating hormone Units per 1 mg of protein.

(i) Sample solution—Weigh accurately about 10 mg of Human Menopausal Gonadotrophin, dissolve in water so that each mL contains exactly 200 \( \mu \)g, and use this solution as the sample solution.

(ii) Standard solutions—Weigh accurately about 10 mg of bovine serum albumin, and dissolve in water to make exactly 20 mL. To this solution add water to make four solutions containing exactly 300 \( \mu \)g, 200 \( \mu \)g, 100 \( \mu \)g and 50 \( \mu \)g of the albumin per mL, respectively, and use these solutions as the standard solutions.

(iii) Procedure—To glass test tubes, about 18 mm in inside diameter and about 130 mm in height, add separately exactly 0.5 mL of alkaline copper TS, warm in a water bath at 30°C for 10 minutes, then add exactly 0.5 mL of diluted Folin’s TS (1 in 2), and warm in a water bath at 30°C for 20 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrometry <2.24>, and determine the absorbances at 750 nm, using a liquid obtained with 0.5 mL of water in the same manner as above as a blank.

Prepare a calibration curve from the absorbances of the standard solutions, with absorbance on the vertical axis and concentration on the horizontal axis. Calculate the amount of protein in the sample solution from the absorbance of the sample solution using the curve, and calculate the protein content of the sample.

**Assay**

(i) Test animals—Select healthy female albino rats weighing about 45 to 65 g.

(ii) Standard solutions—Dissolve Human Menopausal Gonadotrophin RS in human chorionic gonadotrophin TS to prepare three solutions which contain 0.75, 1.5 and 3.0 follicle-stimulating hormone Units per 1.0 mL, respectively. Inject these solutions into three groups consisting of five test animals each, and weigh their ovaries, as directed in (iv). According to the result of the test, designate the concentration of the reference standard, which will make the mass of the ovary about 120 to 160 mg, as the high-dose standard solution, \( S_h \). Dilute the \( S_h \) to 1.5 to 2.0 times the initial volume...
with the human chorionic gonadotrophin TS, and designate the solution as the low-dose standard solution, \( S_1 \).

(iii) Sample solutions—Weigh accurately a suitable amount of Human Menopausal Gonadotrophin, dissolve in human chorionic gonadotrophin TS, and prepare the high-dose sample solution, \( T_{1H} \), and the low-dose sample solution, \( T_L \), which have similar numbers of units to those of corresponding standard solutions in equal volume, respectively.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously 0.2 mL each of \( S_{1H} \), \( S_L \), \( T_{1H} \) and \( T_L \) into the animals in each group, once in the afternoon on the first day, three times in the morning, noon and afternoon on the second day, and two times in the morning and afternoon on the third day. On the fifth day, excise the ovaries, remove the fat and extraneous tissue, remove fluid adhering to the ovaries by lightly pressing between filter papers, and immediately weigh the ovaries.

Containers and storage

Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

Guaifenesin

### Guaifenesin

![Guaifenesin](Image)

\( \text{C}_{10}\text{H}_{14}\text{O}_{4}: 198.22 \)

(2R)-3-(2-Methoxyphenoxy)propane-1,2-diol [93-14-1]

Guaifenesin, when dried, contains not less than 98.0% and not more than 102.0% of guaifenesin (\( \text{C}_{10}\text{H}_{14}\text{O}_{4} \)).

**Description**

Guaifenesin occurs as white, crystals or crystalline powder.

It is freely soluble in ethanol (95%), and sparingly soluble in water.

A solution of ethanol (95) (1 in 20) shows no optical rotation.

**Identification**

(1) Determine the absorption spectrum of a solution of Guaifenesin (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Guaifenesin RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Guaifenesin, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Guaifenesin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** <2.54>

Dissolve 1.0 g of Guaifenesin in 100 mL of water: the pH of the solution is between 5.0 and 7.0.

**Melting point** <2.60>

80 – 83°C

**Purity**

(1) Clarity and color of solution—Dissolve 0.20 g of Guaifenesin in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.7 g of Guaifenesin in 25 mL of water by warming. Cool, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using...
this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.020%).

(3) Heavy metals <1.07>—Dissolve 2.0 g of Guaifenesin in 25 mL of water by warming. Cool, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Guaifenesin according to Method 3, and perform the test (not more than 2 ppm).

(5) Free guaiacol—To 1.0 g of Guaifenesin add exactly 25 mL of water, dissolve by warming, cool, and use this solution as the sample solution. Separately, dissolve 0.100 g of guaiacol in water to make exactly 1000 mL. Pipet 3 mL of this solution, add exactly 22 mL of water, and use this solution as the standard solution. To each of the sample solution and standard solution add 1.0 mL of potassium hexacyanoferrate (III) TS and 5.0 mL of a solution of 4-aminooantipyrine (1 in 200), and immediately after shaking for exactly 5 seconds add a solution of sodium hydrogen carbonate (1 in 1200) to make exactly 100 mL. Determine the absorbances of these solutions at 500 nm exactly 15 minutes after the addition of the 4-aminooantipyrine solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared in the same manner with 25 mL of water, as the blank: the absorbance of the solution obtained from the sample solution is not more than that from the standard solution.

(6) Related substances—Dissolve 1.0 g of Guaifenesin in 100 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator. Develop the plate with a mixture of diethyl ether, ethanol (95), and ammonia solution (28) (40:10:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying on the plate, and heat the plate at 110°C for 10 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, 60°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 60 mg of Guaifenesin and Guaifenesin RS, previously dried, and dissolve each then in water to make exactly 100 mL. Pipet 5 mL of these solutions, and add water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Determine the absorbances, A<sub>S</sub> and A<sub>T</sub>, of the sample solution and standard solution at 273 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of guaifenesin (C<sub>41</sub>H<sub>36</sub>O<sub>4</sub>) = M<sub>S</sub> × A<sub>T</sub>/A<sub>S</sub>

M<sub>S</sub>: Amount (mg) of Guaifenesin RS taken

Containers and storage Containers—Tight containers.

**Guanabenz Acetate**

ゲアナベンズ酢酸塩

\[
\text{C}_6\text{H}_8\text{Cl}_3\text{N}_2\cdot\text{C}_2\text{H}_4\text{O}_2; 291.13} (\text{E})-1-(2,6-
\text{Dichlorobenzylideneamino})\text{guanidine monoacetate [23256-50-0]}
\]

Guanabenz Acetate, when dried, contains not less than 98.5% of guanabenz acetate (C<sub>6</sub>H<sub>8</sub>Cl<sub>3</sub>N<sub>2</sub>· C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>).

**Description** Guanabenz Acetate occurs as white, crystals or crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol and in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

It is gradually affected by light.

Melting point: about 190°C (with decomposition).

**Identification** (1) To 5 mL of a solution of Guanabenz Acetate (1 in 1000) add 0.5 mL of a diluted ethanol (95) (5 in 6) which contains 16 g of urea and 0.2 g of 1-naphthol in 100 mL, and add 1 mL of N-bromosuccinimide TS: a purple color develops.

(2) Determine the absorption spectrum of a solution of Guanabenz Acetate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Guanabenz Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) To 0.1 g of Guanabenz Acetate add 5 mL of water and 1 mL of ammonia TS, shake, filter, and neutralize the filtrate with dilute hydrochloric acid: the solution responds to Qualitative Tests <1.09> (3) for acetate.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Guanabenz Acetate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 0.05 g of Guanabenz Acetate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 10 mL, then pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (80:20:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution. Place the plate in a...
Guanethidine Sulfate

Guanethidine Sulfate, when dried, contains not less than 98.5% of guanethidine sulfate (C$_9$H$_{12}$N$_2$S$_2$O$_4$).

**Description** Guanethidine Sulfate occurs as white, crystals or crystalline powder. It is odorless or has a slight, characteristic odor and a bitter taste.

It is very soluble in formic acid, freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

Melting point: 251 – 256°C (an evacuated sealed capillary tube, with decomposition).

**Identification** (1) To 4 mL of a solution of Guanethidine Sulfate (1 in 4000) add 2 mL of 1-naphthol TS, 1 mL of diazotized sulfanilic acid, and 0.7 mL of 1% sodium carbonate in 1% sodium hydroxide TS. A red color develops.

(2) Determine the infrared absorption spectrum of Guanethidine Sulfate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2,25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Guanethidine Sulfate (1 in 10) responds to Qualitative Tests <1,09> for sulfate.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Guanethidine Sulfate in 50 mL of water: the solution is clear and colorless.

(2) Methylisothiourea sulfate—Dissolve 2.0 g of Guanethidine Sulfate in 80 mL of sodium hydroxide TS, and allow to stand for 10 minutes. Add 60 mL of hydrochloric acid, 2 g of sodium bromide and water to make 200 mL. Then, to this solution add 0.70 mL of 1/60 mol/L potassium bromate VS and 2 mL of zinc iodide-starch TS: a blue color develops.

Haloperidol

Haloperidol, when dried, contains not less than 99.0% and not more than 101.0% of haloperidol (C$_{22}$H$_{26}$ClFNO$_5$).

**Description** Haloperidol occurs as white to pale yellow, crystals or powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in 2-propanol and in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Dissolve 30 mg of Haloperidol in 100 mL of 2-propanol. To 5 mL of the solution add 10 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 100 mL.

(3) Heavy metals <1.07>—Proceed with 2.0 g of Guanethidine Sulfate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying** <2,44> Not more than 0.5% (1 g, 105°C, 4 hours).
mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry C2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

2) Determine the infrared absorption spectrum of Haloperidol as directed in the potassium bromide disk method under Infrared Spectrophotometry C2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point C2.60> 150 – 154°C

Purity (1) Sulfate C1.14>-To 1.0 g of Haloperidol add 50 mL of water, shake, and filter. To 25 mL of the filtrate add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(2) Heavy metals C1.07>-Produce with 1.0 g of Haloperidol according to method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 25 mg of Haloperidol in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography C2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than haloperidol obtained from the sample solution is not larger than the peak area of haroperidol from the standard solution, and the total area of these peaks is not larger than 2 times the peak area of haloperidol from the standard solution. For the areas of the peaks, having the relative retention time of about 0.5, about 1.2 and about 2.6 to haloperidol, multiply their correction factors, 0.75, 1.47 and 0.76, respectively.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilsilizanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 2.95 g of trisodium citrate dihydrate in 900 mL of water, adjust to pH 3.5 with dilute hydrochloric acid, and add water to make 1000 mL. To 300 mL of this solution add 700 mL of methanol and 1.0 g of sodium lauryl sulfate.

Flow rate: Adjust so that the retention time of haloperidol is about 9 minutes.

Time span of measurement: About 3 times as long as the retention time of haloperidol, beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of haloperidol obtained with 10 μL of this solution is equivalent to 15 to 25% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of haloperidol are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloperidol is not more than 2.0%.

Loss on drying C2.41> Not more than 0.5% (1 g, in vacuum, 60°C, phosphorus (V) oxide, 3 hours).

Residue on ignition C2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.6 g of haloperidol, previously dried, and dissolve in 40 mL of acetic acid (100), and titrate C2.50> with 0.1 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L perchloric acid VS = 37.59 mg of C21H23ClFNO2

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Haloperidol Fine Granules

Haloperidol Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of haloperidol (C21H23ClFNO2): 375.86).

Method of preparation Prepare as directed under Granules, with Haloperidol.

Identification Powder Haloperidol Fine Granules. To a portion of the powder, equivalent to 6 mg of Haloperidol, add 70 mL of 2-propanol, and heat to boiling on a water bath while shaking. After cooling, add 2-propanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add 2 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry C2.24>: it exhibits maxima between 219 nm and 223 nm and between 243 nm and 247 nm.

Dissolution C6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 60 minutes of Haloperidol Fine Granules is not less than 70%.

Start the test with an accurately weighed amount of Haloperidol Fine Granules, equivalent to about 3 mg of haloperidol (C21H23ClFNO2), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 17 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours using phosphorus (V) oxide as a desiccant, and dissolve in methanol to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography C2.01>, and determine the peak areas, A1 and A2, of haloperidol in each solution.
Dissolution rate (%) with respect to the labeled amount of haloperidol (C\(_21\)H\(_{23}\)ClFNO\(_2\))

\[ \frac{M_S}{M_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 18 \]

- \(M_S\): Amount (mg) of haloperidol for assay taken
- \(M_T\): Labeled amount (mg) of haloperidol (C\(_21\)H\(_{23}\)ClFNO\(_2\)) in 1 g

Operating conditions—
Column, column temperature, mobile phase, and flow rate: Proceed as detected in the operating conditions in the Assay.
Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

System suitability—
System performance: When the procedure is run with 100 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of haloperidol are not less than 4000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 100 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloperidol is not more than 2.0%.

Assay
Powder Haloperidol Fine Granules. Weigh accurately a portion of the powder, equivalent to about 10 mg of haloperidol (C\(_21\)H\(_{23}\)ClFNO\(_2\)), add 10 mL of water, disperse the particle by sonicating, and add exactly 20 mL of the internal standard solution to make 30 minutes, shaking, and add the mobile phase to make 100 mL. Centrifuge after shaking for more 30 minutes, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours on phosphorus (V) oxide, and dissolve in methanol to make exactly 25 mL. Pipet 10 mL of this solution, add exactly 20 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of haloperidol to that of the internal standard.

\[
\text{Amount (mg) of haloperidol (C}_{21}\text{H}_{23}\text{ClFNO}_2) = M_S \times \frac{Q_T}{Q_S} \times \frac{2}{5} \]

\[
M_S: \text{Amount (mg) of haloperidol for assay taken} \]

Internal standard solution—A solution of diphenyl in methanol (1 in 2000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 2.95 g of trisodium citrate dihydrate in 900 mL of water, adjust to pH 3.5 with dilute hydrochloric acid, and add water to make 1000 mL. To 250 mL of this solution add 750 mL of methanol and 1.0 g of sodium lauryl sulfate, and mix to dissolve.
Flow rate: Adjust so that the retention time of haloperidol is about 9 minutes.

System suitability—
System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, haloperidol and diphenyl are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of haloperidol to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.
Storage—Light-resistant.

**Haloperidol Injection**

HALOPERIDOL INJECTION

Haloperidol Injection is an aqueous injection.
It contains not less than 95.0% and not more than 105.0% of the labeled amount of haloperidol (C\(_21\)H\(_{23}\)ClFNO\(_2\): 375.86).

Method of preparation
Prepare as directed under Injections, with Haloperidol.

Description
Haloperidol Injection occurs as a colorless to pale yellow, clear liquid.

Identification
To a volume of Haloperidol Injection, equivalent to 5 mg of Haloperidol, add 2-propanol to make 100 mL. To 5 mL of this solution add 2 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits its maxima between 219 nm and 223 nm and between 243 nm and 247 nm.

Osmotic pressure ratio
Being specified separately when the drug is granted approval based on the Law.

pH
Being specified separately when the drug is granted approval based on the Law.

Bacterial endotoxins <4.01>
Less than 60 EU/mg.

Extractable volume <6.05>
It meets the requirement.

Foreign insoluble matter <6.06>
Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07>
It meets the requirement.

Sterility <4.06>
Perform the test according to the Membrane filtration method: it meets the requirement.

Assay
Pipet a volume of Haloperidol Injection, equivalent to about 10 mg of haloperidol (C\(_21\)H\(_{23}\)ClFNO\(_2\)), add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 25 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours on phosphorus (V) oxide, and dissolve in methanol to make exactly 25 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \(A_T\) and \(A_S\), of haloperidol in each solution.

\[
\text{Amount (mg) of haloperidol (C}_{21}\text{H}_{23}\text{ClFNO}_2) = M_S \times \frac{A_T}{A_S} \times \frac{2}{5} \]

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Haloperidol Tablets

Haloperidol Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of haloperidol (C_{23}H_{32}ClFNO_2: 375.86).

Method of preparation Prepare as directed under Tablets, with Haloperidol.

Identification To powdered Haloperidol Tablets, equivalent to 6 mg of Haloperidol, add 70 mL of 2-propanol, and heat on a water bath until to boiling while shaking. After cooling, add 2-propanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add 2 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (<2.24>): it exhibits maxima between 219 nm and 223 nm and between 243 nm and 247 nm.

Uniformity of dosage units (<6.02>) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Haloperidol Tablets add 5 mL of the mobile phase, disperse the particle by sonicating, add 30 mL of the mobile phase, sonicate, and extract for 30 minutes with occasional shaking. Shake for more 30 minutes, and add the mobile phase to make exactly 50 mL. Centrifuge the solution, pipet 1 mL of the supernatant liquid, equivalent to about 0.3 mg of haloperidol (C_{23}H_{32}ClFNO_2), add exactly 2 mL of the internal standard solution and the mobile phase to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours on phosphorus (V) oxide, and dissolve in the mobile phase to make exactly 100 mL. Pipet 15 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 2 mL of the internal standard solution and the mobile phase to make 25 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (<2.07> according the following conditions, and calculate the ratios, Q_T and Q_S, of the peak area of haloperidol to that of the internal standard.

Amount (mg) of haloperidol (C_{23}H_{32}ClFNO_2) = M_S \times Q_T/Q_S \times 1/V \times 3/4

M_S: Amount (mg) of haloperidol for assay taken

Internal standard solution—A solution of diphenyl in the mobile phase (1 in 6700).

Operating conditions—

Proceed as detected in the operating condition in the Assay.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of haloperidol are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloperidol is not more than 1.0%.

Containers and storage Containers—Hermetic containers. Colored containers may be used.

Storage—Light-resistant.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Mobile phase: Dissolve 2.95 g of trisodium citrate dihydrate in 900 mL of water, adjust to pH 3.5 with dilute hydrochloric acid, and add water to make 1000 mL. To 250 mL of this solution add 750 mL of methanol and 1.0 g of sodium lauryl sulfate, and mix to dissolve.

Flow rate: Adjust so that the retention time of haloperidol is about 9 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, haloperidol and diphenyl are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of haloperidol to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.

Storage—Light-resistant for the tablets without coating.

Halothane

Halothane contains not less than 0.008% and not more than 0.012% of Thymol as a stabilizer.

Description
Halothane is a clear, colorless, and mobile liquid.
It is miscible with ethanol (95), with diethyl ether and with isooctane.
It is slightly soluble in water.
It is a volatile, nonflammable liquid, and setting fire to its heated vapor does not support combustion.
It is affected by light.
Refractive index $n_D^2$: 1.369 – 1.371

Identification
Transfer about 3 μL of Halothane to a glass cell having light path 10 cm in length, and determine the infrared absorption spectrum as directed in the gas sampling method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Specific gravity $<2.56>$ $d^2_{4³}$: 1.872 – 1.877

Purity
(1) Acidity or alkalinity—Shake 60 mL of Halothane with 60 mL of freshly boiled and cooled water vigorously for 3 minutes. Separate the water layer, and use this as the sample solution. To 20 mL of the sample solution add 1 drop of bromcresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide VS: a red-purple color develops. To 20 mL of the sample solution add 1 drop of bromcresol purple TS and 0.6 mL of 0.01 mol/L hydrochloric acid VS: a yellow color is produced.

(2) Halide and halogen—To 5 mL of the sample solution obtained in (1) add 1 drop of nitric acid and 0.20 mL of silver nitrate TS: no turbidity is produced. To 10 mL of the sample solution obtained in (1) add 1 mL of potassium iodide TS and 2 drops of starch TS, and allow to stand for 5 minutes: no blue color develops.

(3) Phosgene—Transfer 50 mL of Halothane to a dried 300-mL conical flask, suspend a strip of phosgene test paper vertically inside the flask with the lower end about 10 mm above the surface of the liquid, insert the stopper, and allow to stand at a dark place for 20 to 24 hours: the test paper shows no yellow color.

(4) Residue on evaporation—Pipe 50 mL of Halothane, evaporate on a water bath, and dry the residue at 105°C for 2 hours: the mass of the residue is not more than 1.0 mg.

(5) Volatile related substances—To 100 mL of Halothane add exactly 5.0 μL of the internal standard, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Gas Chromatography $<2.02>$, and determine each peak area by the automatic integration method: the total area of the peaks other than halothane and the internal standard is not larger than the peak area of the internal standard.

Internal standard—1,1,2-Trichloro-1,2,2-trifluoroethane

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A column about 3 mm in inside diameter and 3 m in length, at the first 2 m from the injection port, having macrogol 400 coated in the ratio of 30% on siliceous earth for gas chromatography (180 to 250 μm in particle diameter), and at the remaining 1 m, having dinonyl phthalate coated in the ratio of 30% on siliceous earth for gas chromatography (180 to 250 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.
Carrier gas: Nitrogen.
Flow rate: Adjust so that the retention time of the internal standard is 2 to 3 minutes.
Selection of column: Mix 3 mL of Halothane and 1 mL of the internal standard. Proceed with 1 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of the internal standard and halothane in this order with the resolution between these peaks being not less than 10.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of the internal standard obtained with 5 μL of the sample solution composes 30 to 70% of the full scale.
Time span of measurement: About 3 times as long as the retention time of halothane.

Distilling range $<2.57>$ Not less than 95 vol% distills within a 1°C range between 49°C and 51°C.

Thymol
To 0.50 mL of Halothane add 5.0 mL of isooctane and 5.0 mL of titanium (IV) oxide TS, shake vigorously for 30 seconds, and allow to stand: the separated upper layer has more color than the following control solution A, and has no more color than the following control solution B.

Control solution: Dissolve 0.225 g of thymol for assay in isooctane to make exactly 100 mL. To 10 mL of each of these solutions, accurately measured, add isooctane to make exactly 150 mL and 100 mL, respectively. Proceed with 0.50 mL each of these solutions in the same manner as Halothane, and use the separated upper layers so obtained as the control solution A and B, respectively.

Containers and storage
Containers—Tight containers.

Storage—Light-resistant, and not exceeding 30°C.
Haloxazolam

ハロキサゾラム

\[
\text{C}_{17}\text{H}_{14}\text{BrF}_{2}\text{N}_{2}\text{O}_{2} \quad \text{Mr} \quad 377.21
\]

(1b\RS)-10-Bromo-11b-(2-fluorophenyl)-2,3,7,11b-tetrahydro[1,3]oxazolo[3,2-\de]\[1,4]benzodiazepin-6(H)-one

[59128-97-1]

Haloxazolam, when dried, contains not less than 99.0% of haloxazolam (C\textsubscript{17}H\textsubscript{14}BrF\textsubscript{2}N\textsubscript{2}O\textsubscript{2}).

**Description**  Haloxazolam occurs as white, crystals or crystalline powder. It is odorless and tasteless.

It is freely soluble in acetic acid (100), sparingly soluble in methanol, and in ethanol (99.5), slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: about 183°C (with decomposition).

**Identification**  (1)  Dissolve 10 mg of Haloxazolam in 10 mL of methanol, and add 1 drop of hydrochloric acid: the solution shows a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm). To this solution add 1 mL of sodium hydroxide TS: the fluorescence disappears immediately.

(2)  Prepare the test solution with 50 mg of Haloxazolam as directed under Oxygen Flask Combustion Method <1.02>, using a mixture of 20 mL of dilute sodium hydroxide TS and 1 mL of hydrogen peroxide (30%) as an absorbing liquid; the test solution responds to Qualitative Tests <1.09> for bromide and for fluoride.

(3)  Determine the absorption spectrum of a solution of Haloxazolam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4)  Determine the infrared absorption spectrum of Haloxazolam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Absorbance <2.24>  \(E_{1\text{cm}}^{1\text{dm}}\) (247 nm): 390 – 410 (10 mg, methanol, 1000 mL).

**Purity**  (1)  Clarity and color of solution—Dissolve 0.10 g of Haloxazolam in 20 mL of ethanol (99.5): the solution is clear and colorless.

(2)  Soluble halides—To 1.0 g of Haloxazolam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as directed under Chloride Limit Test <1.03>, Prepare the control solution with 0.10 mL of 0.01 mol/L hydrochloric acid VS.

(3)  Heavy metals <1.07>—Proceed with 1.0 g of Haloxazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4)  Arsenic <1.11>—To 1.0 g of Haloxazolam in a decomposition flask add 5 mL of nitric acid and 2 mL of sulfuric acid, place a small funnel on the mouth of the flask, and heat carefully until white fumes are evolved. After cooling, add 2 mL of nitric acid, heat, repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat until the solution is colorless to pale yellow. After cooling, add 2 mL of a saturated solution of ammonium oxalate monohydrate, and heat until white fumes are evolved. After cooling, add water to make 5 mL, and perform the test with this solution: the solution has no more color than the following control solution (not more than 2 ppm).

Control solution: Proceed in the same manner as above without using Haloxazolam, add 2.0 mL of Standard Arsenic Solution and water to make 5 mL, and proceed in the same manner as the test solution.

(5)  Related substances—Dissolve 0.10 g of Haloxazolam in 100 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than haloxazolam from the sample solution is not larger than the peak area of the haloxazolam from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.2 g of boric acid and 7.5 g of potassium chloride in 900 mL of water, adjust the pH with triethylamine to 8.5, and add water to make 1000 mL. To 300 mL of this solution add 200 mL of acetonitrile.

Flow rate: Adjust so that the retention time of haloxazolam is about 10 minutes.

Time span of measurement: About 3 times as long as the retention time of haloxazolam, beginning after the solvent peak.

**System suitability**

Test for required detectability: To exactly 5 mL of the standard solution add acetonitrile to make exactly 50 mL. Confirm that the peak area of haloxazolam obtained with 10 µL of this solution is equivalent to 8 to 12% of that with 10 µL of the standard solution.

System performance: Dissolve 10 mg each of Haloxazolam and cloxazolam in 200 mL of acetonitrile. When the procedure is run with 10 µL of this solution under the above operating conditions, haloxazolam and cloxazolam are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloxazolam is not more than 1.0%.

**Loss on drying <2.41>**  Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition <2.44>**  Not more than 0.1% (1 g, platinum crucible).
Heparin Calcium / Official Monographs

Assay
Weigh accurately about 0.5 g of Haloxazolam, previously dried, dissolve in 50 mL of acetic acid (100), and titrate to 2.50 ml with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 37.72 mg of C₇H₆BrFN₂O₃

Containers and storage
Containers—Tight containers.
Storage—Light-resistant.

Heparin Calcium
ヘパリンカルシウム

Heparin Calcium is the calcium salt of sulfated glycosaminoglycans composed of disaccharide units of D-glucosamine and uronic acid (L-iduronic acid or D-glucuronic acid) obtained from the intestinal mucosa of healthy edible swine.

It contains not less than 180 Heparin Units (antifactor IIa activity) per mg and not less than 8.0% and not more than 12.0% of calcium (Ca: 40.08), calculated on the dried basis.

Description
Heparin Calcium occurs as a white to grayish brown, powder or grains.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

It is hygroscopic.

Identification
(1) Dissolve 10 mg of Heparin Calcium in 5 mL of water, and add 0.1 mL of 1 mol/L hydrochloric acid TS and 5 mL of toluidine blue O solution (1 in 20,000): a purple to red-purple color develops.

(2) Dissolve 1 mg each of Heparin Calcium and Heparin Sodium for Identification RS in 1 mL of water, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions: the retention time for the major peak from the sample solution and standard solution is identical.

Operating conditions—
Detector, column, column temperature, mobile phases A and B, flowing of mobile phase and flow rate: Proceed as directed under the operating conditions in Purity (9).

System suitability—
System performance: Dissolve 1.0 mg of Heparin Calcium for Identification RS in 0.60 mL of water. Dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 0.20 mL of water. Dissolve 1.0 mg of dermatan sulfate in 2.0 mL of water. To 90 μL of the solution of Heparin Sodium for Identification RS add 30 μL each of the solutions of Over-sulfated Chondroitin Sulfate for System Suitability RS and dermatan sulfate, and mix. When the procedure is run with 20 μL of the mixture under the above operating conditions, dermatan sulfate, heparin and over-sulfated chondroitin sulfate are eluted in this order with the resolution between the peaks of dermatan sulfate and heparin being not less than 1.0 and that between the peaks of heparin and over-sulfated chondroitin sulfate being not less than 1.5.

(3) A solution of 50 mg of Heparin Calcium in 5 mL of water responds to Qualitative Tests <1.09> for calcium salt.

pH
Dissolve 1.0 g of Heparin Calcium in 100 mL of water: the pH of the solution is between 6.0 and 8.0.

Purity
Clarity and color of solution—Dissolve 0.5 g of Heparin Calcium in 20 mL of water: the solution is clear. Determine the absorbance of this solution at 400 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>:
the absorbance is not more than 0.05.

Chloride—Perform the test with 0.5 g of Heparin Calcium according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

Barium—Dissolve 30 mg of Heparin Calcium in 3.0 mL of water, and use this solution as the sample solution. To 1.0 mL of the sample solution add 3 drops of dilute sulfuric acid, and allow to stand for 10 minutes: no turbidity is produced.

Total nitrogen—Weigh accurately about 0.1 g of Heparin Calcium, previously dried, and perform the test as directed under Nitrogen Determination <1.09>:
the amount of nitrogen (N: 14.01) is not more than 3.0%.

Protein—(i) Sodium carbonate solution: To 4 volumes of a mixture of sodium hydroxide solution (1 in 100) and anhydrous sodium carbonate solution (1 in 20) (1:1) add 1 volume of water.

(ii) Copper sulfate solution: To 4 volumes of a mixture of copper (II) sulfate pentahydrate solution (1 in 80) and sodium tartrate dihydrate solution (149 in 5000) (1:1) add 1 volume of water.

(iii) Alkaline copper solution for heparin: Mix 50 volumes of the sodium carbonate solution and 1 volume of the copper sulfate solution. Prepare before using.

(iv) Procedure: Use a solution of Heparin Calcium (1 in 200) as the sample solution. Use a solution of bovine serum albumin (1 in 40,000) as the standard solution. To exactly 1 mL each of the sample solution and standard solution add exactly 5 mL of the alkaline copper solution for heparin, mix, and allow them to stand at room temperature for 10 minutes. To each of these solutions add exactly 0.5 mL of diluted Folin’s TS (1 in 2), shake, allow them to stand at room temperature for 10 minutes, and centrifuge at room temperature. Determine the absorbances at 750 nm of the supernatant liquids as directed under Ultraviolet-visible Spectrophotometry <2.24> using water as the blank: the absorbance of the solution obtained from the sample solution is not more than that of the solution from the standard solution.

Nucleic acid—Dissolve 40 mg of Heparin Calcium in 10 mL of a solution of disodium dihydrogen ethylene-diamine tetraacetate dihydrate (95 in 50,000), and determine...
the absorbance of this solution at 260 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>; the absorbance is not more than 0.15.

(8) Over-sulfated chondroitin sulfate—Dissolve 20 mg of Heparin Calcium in 0.60 mL of a solution of sodium 3-trimethylsilylpropionate-\(d_4\) for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). Determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.27> (\(1\)H) in accordance with the following conditions, using sodium 3-trimethylsilylpropionate-\(d_4\) for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits no signal corresponding to N-acetyl proton of over-sulfated chondroitin sulfate at \(2.18 \pm 0.05\) ppm, or the signal disappears when determining the spectrum of the sample solutions as directed under \(1\)H with \(^{13}\)C-decoupling.

Operating conditions—
Spectrometer: 1.1. FT-NMR, Not less than 400 MHz.
Temperature: 25°C.
Spinning: off.
Number of data points: 32,768.
Spectral range: Signal of DHO \(\pm 6.0\) ppm.
Flip angle: 90°.
Delay time: 20 seconds.
Dummy scans: 4.
Number of scans: SN ratio of the signal of N-acetyl proton of heparin is not less than 1000.
Window function: Exponential function (Line broadening factor = 0.2 Hz).
System suitability—
System performance: Dissolve 20 mg of Heparin Calcium in 0.40 mL of a solution of sodium 3-trimethylsilylpropionate-\(d_4\) for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). Dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 1.0 mL of a solution of sodium 3-trimethylsilylpropionate-\(d_4\) for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). To the solution of heparin calcium add 0.20 mL of the solution of Over-sulfated Chondroitin Sulfate for System Suitability RS. When determining the spectrum of this solution under the above operating conditions, it exhibits the signal of N-acetyl proton of heparin and the signal of N-acetyl proton of over-sulfated chondroitin sulfate at \(\delta 2.04 \pm 0.02\) ppm and \(\delta 2.18 \pm 0.05\) ppm, respectively.

(9) Related substances—Dissolve 2.0 mg of Heparin Calcium in 0.1 mL of water, and perform the test with exactly 20 \(\mu\)L of this solution as directed under Liquid Chromatography <2.01> according to the following conditions: it exhibits no peaks after the heparin peak.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 202 nm).
Column: A stainless steel column 2.0 mm in inside diameter and 7.5 cm in length, packed with synthetic polymer for liquid chromatography to which diethylaminoethyl group binds (10 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase A: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust to \(\mathrm{pH} 3.0\) with dilute phosphoric acid (1 in 10).
Mobile phase B: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate and 106.4 g of lithium perchlorate in 1000 mL of water, and adjust to \(\mathrm{pH} 3.0\) with dilute phosphoric acid (1 in 10).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>

<td>10 (\rightarrow) 100</td>
</tr>
</tbody>
</table>

Flow rate: 0.2 mL per minute.
Time span of measurement: About 2 times as long as the retention time of heparin, beginning after the solvent peak.

System suitability—
Test for required detectability: Dissolve 10 mg of Heparin Sodium for Identification RS in 0.40 mL of water, and use this solution as the heparin sodium standard stock solution. Separately, dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 0.20 mL of water, and use this solution as the over-sulfated chondroitin sulfate standard solution. To 60 \(\mu\)L of the heparin sodium standard stock solution add 3 \(\mu\)L of the over-sulfated chondroitin sulfate standard solution and 12 \(\mu\)L of water, and mix. When the procedure is run with 20 \(\mu\)L of the mixture under the above operating conditions, it exhibits an over-sulfated chondroitin sulfate peak.

System performance: To 120 \(\mu\)L of the heparin sodium standard stock solution add 30 \(\mu\)L of the over-sulfated chondroitin sulfate standard solution, mix and use this solution as the solution for system suitability test. When the procedure is run with 20 \(\mu\)L of the solution for system suitability test under the above operating conditions, heparin and over-sulfated chondroitin sulfate are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of over-sulfated chondroitin sulfate is not more than 2.0%.

Loss on drying <2.41> Not more than 8% (50 mg, in vacuum, 60°C, 3 hours).

Bacterial endotoxins <4.01x> Less than 0.0030 EU/heparin Unit.

Anti-factor Xa activity to anti-factor IIa activity ratio The ratio of the anti-factor Xa activity determined by the following method to the anti-factor IIa activity obtained in the Assay, calculated by dividing the former with the later, is 0.9 – 1.1.

Anti-factor Xa activity determination
(i) Substrate solution: Dissolve 25 mg of N-benzoyl-L-isoleucyl-L-glutamyl-(\(\gamma\)-OR)-glycyl-L-arginyl-p-nitroanilide hydrochloride in 33.3 mL of water.
(ii) Anti-thrombin solution: Dissolve human anti-thrombin in water so that each mL contains 1 IU. To 150 \(\mu\)L of this solution add 2250 \(\mu\)L of buffer solution.
(iii) Factor Xa solution: To 1200 \(\mu\)L of factor Xa TS add 1200 \(\mu\)L of buffer solution.
(iv) Buffer solution: Proceed as directed in the Assay (1).
(v) Stopping solution: Proceed as directed in the Assay (1).
(vi) Heparin standard solutions: Proceed as directed in the Assay (1). However, the standard solutions are prepared based on anti-factor Xa activity Unit instead of Heparin Unit.
(vii) Heparin sample solutions: Proceed as directed in
the Assay (I). However, the sample solutions are prepared based on anti-factor Xa activity Unit instead of Heparin Unit.

(viii) Procedure: Transfer separately two 50-µL portions of each different dilution of the heparin standard solutions and the heparin sample solutions and five 50-µL portions of buffer solution as the blank to 1.5-µL tubes. Warm these 21 tubes, anti-thrombin solution, factor Xa solution and substrate solution at 37°C all together. Start the following procedure at 2 minutes after warming in the order: buffer solution, S1, S2, S3, S4, buffer solution, T1, T2, T3, T4, buffer solution, S1, S2, S3, S4, and buffer solution. To each tube add 50 µL of anti-thrombin solution, mix, and warm at 37°C for exactly 4 minutes, add 100 µL of factor Xa solution, mix, and incubate for exactly 12 minutes. Then, add 100 µL of substrate solution, mix, incubate for exactly 4 minutes, add 50 µL of stopping solution to each tube, and mix immediately. Separately, to 50 µL of stopping solution add 100 µL of substrate solution, 100 µL of factor Xa solution, 50 µL of anti-thrombin solution and 50 µL of buffer solution, mix, and use this solution as a control. Determine the absorbance of each solution at 405 nm against the control. Confirm that the relative standard deviation of the reading of the blank is not more than 10%.

(ix) Calculations: When the regression expression, \( y = I_0 + A x_1 + B x_4 \), is obtained using \( y \) as log of the absorbance values, \( x_1 \) as the concentration of the heparin standard solutions and \( x_4 \) as the concentration of the heparin sample solutions, the potency ratio \( R = B/A \).

- \( I_0 \): Common intercept
- \( A \): Slope of regression expression of the heparin standard solution
- \( B \): Slope of regression expression of the heparin sample solution

Calculate anti-factor Xa activity per mg of Heparin Calcium by the following formula.

\[
\text{Anti-factor Xa activity per mg of Heparin Calcium} = 100 \times \frac{R \times V}{M}
\]

- \( V \): Total volume (mL) of the solution (the sample stock solution) prepared as containing about 100 anti-factor Xa activity Units per mL
- \( M \): Amount (mg) of Heparin Calcium taken for the sample stock solution

However, when a 90% confidence interval of \( D \) of the regression expression \( y = I_0 + A x_1 + B x_4 + D \), where \( D \) is a constant term showing the difference between the blank and the intercept assumed from the two lines, is not in the range of between –0.2 and 0.2, analyze by excluding the measurements of the blank.

The criteria for the test suitability are performed as directed in the Assay (I). When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

Assay (I) Heparin
(i) Substrate solution: Dissolve 25 mg of \( H\)-d-phenylalanyl-L-pipocetyl-L-arginyl-p-nitroanilide dihydrochloride in 32.0 mL of water.

(ii) Anti-thrombin solution (for heparin assay): Dissolve human anti-thrombin in water so that each mL contains 1 IU. Dilute this solution to an appropriate dilution factor of approximately more than 16 times with the buffer solution, and designate this solution as the anti-thrombin solution (for heparin assay). The dilution factor with the buffer solution is adjusted so that the absorbance of reaction solution with the blank solution (average of five tubes) is not more than 2.0, and that of reaction solution with \( S_t \) (0.020 Unit/mL heparin standard solution) (average of two tubes) is not less than 0.2 and not more than 1.0 when the test is performed according to the Assay. The absorbance is measured with 1 cm light path in length.

(iii) Factor IIa solution: Add an equivalent volume of water to the buffer solution, and use this solution as the factor IIa diluent. Dissolve factor IIa in the factor IIa diluent to make a solution so that each mL contains 20 IU. Dilute this solution to an appropriate dilution factor of approximately less than 4 times with the factor IIa diluent, and designate this solution as the factor IIa solution. Adjust the dilution factor with the factor IIa diluent so that the absorbance of reaction solution with the blank solution (average of five tubes) is not more than 2.0, and that of reaction solution with \( S_t \) (0.020 Unit/mL heparin standard solution) (average of two tubes) is not less than 0.2 and not more than 1.0 when the test is performed according to the Assay. The absorbance is measured with 1 cm light path in length.

(iv) Buffer solution: Dissolve 6.1 g of 2-amino-2-hydroxy-methyl-1,3-propanediol, 10.2 g of sodium chloride, 2.8 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate and 1.0 g of polyethylene glycol 6000 in 800 mL of water, adjust to pH 8.4 with 1 mol/L hydrochloric acid TS, and add water to make 1000 mL.

(v) Stopping solution: To 2 mL of acetic acid (100) add water to make 10 mL.

(vi) Heparin standard solutions: Dissolve Heparin Sodium RS in water so that each mL contains 100 Heparin Units, and use this solution as the standard stock solution. Dilute the standard stock solution with buffer solution so that each mL contains exactly 0.1 Heparin Units, and use this solution as the standard solution. Make heparin standard solutions \( S_1, S_2, S_3 \) and \( S_4 \) respectively by adding the standard solution to buffer solution as directed in the following table.

(vii) Heparin sample solutions: Weigh accurately an appropriate amount of Heparin Calcium, dissolve in water so that each mL contains about 100 Heparin Units, and use this solution as the sample stock solution. Dilute exactly the sample stock solution with buffer solution so that each mL contains 0.1 Heparin Units, and use this solution as the sample solution. Make heparin sample solutions \( T_1, T_2, T_3 \) and \( T_4 \) respectively by adding the sample solution to buffer solution as directed in the following table.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)

(viii) Procedure: Transfer separately two 50-µL portions of each dilution of the heparin standard solutions and the heparin sample solutions and five 50-µL portions of buffer solution as the blank to 1.5-mL tubes. Warm these 21 tubes, anti-thrombin solution (for heparin assay), factor Ila solution and substrate solution at 37°C all together. Start the following procedure at 2 minutes after warming in the order: buffer solution, S₁, S₂, S₃, buffer solution, T₁, T₂, T₃, T₄, buffer solution, S₁, S₂, S₃, and buffer solution. To each tube add 100 µL of anti-thrombin solution (for heparin assay), mix, and warm at 37°C for exactly 4 minutes, add 25 µL of factor Ila solution, mix, and incubate for exactly 4 minutes. Then, add 50 µL of substrate solution, mix, incubate for exactly 4 minutes, add 50 µL of stopping solution to each tube, and mix. Separately, to 50 µL of stopping solution add 50 µL of substrate solution, 25 µL of factor Ila solution, 100 µL of anti-thrombin solution (for heparin assay) and 50 µL of buffer solution, mix, and use this solution as a control. Determine the absorbance of each solution at 405 nm against the control. Confirm that the criteria for the test suitability are the following 3 items, (1), (2) and (3).

(1) Judgment on consistency of the intercept assumed from the two lines

When the regression expression, 

\[ y = I_x + A_{xS} + B_{xS} + D \]

is obtained from the data of the heparin standard solutions and the heparin sample solutions, a 90% confidence interval of the constant term, \( I_x \), is between \(-0.2\) and 0.2.

\( I_x \): Intercept of the regression expression of the heparin standard solution

\( I_{xe} \): Difference of the intercepts assumed from the two lines

(2) Judgment on linearity

When the regression expression, 

\[ y = I_x + A_{xS} + B_{xS} + \sum Q_{xS} + Q_{xS}' \]

is obtained from the data of the heparin standard solutions and the heparin sample solutions, a 90% confidence interval of the secondary coefficients, \( Q \) and \( Q' \), is between \(-1000\) and \(1000\).

\( Q \): Secondary coefficient of the regression expression of the heparin standard solution

\( Q' \): Secondary coefficient of the regression expression of the heparin sample solution

(3) Judgment by checking if the relative potency obtained is within the range previously validated on this test method

The potency ratio obtained is not less than 0.8 and not more than 1.2.

When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

(2) Calcium: Weigh accurately about 50 mg of Heparin Calcium, dissolve in 20 mL of water, add 2 mL of 8 mol/L potassium hydroxide TS, allow to stand for 3 to 5 minutes with occasional shaking, add 0.1 g of NN indicator, and immediately titrate \(<2.50\) with 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 0.4008 mg of Ca

Containers and storage  Containers—Tight containers.
Heparin Sodium

ヘパリンナトリウム

Heparin Sodium is a sodium salt of sulfated glycosaminoglycans composed of disaccharide units of D-glucosamine and uronic acid (L-iduronic acid or D-glucuronic acid) obtained from the intestinal mucosa of healthy edible swine.

It contains not less than 180 Heparin Units (antifactor IIa activity) per mg, calculated on the dried basis.

Description Heparin Sodium occurs as a white to grayish brown, powder or grains. It is odorless.

It is soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

Identification Dissolve 1 mg each of Heparin Sodium and Heparin Sodium for Identification RS in 1 mL of water, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions: the retention time for the major peak from the sample solution and standard solution is identical.

Operating conditions—
Detector, column, column temperature, mobile phases A and B, flowing of mobile phase and flow rate: Proceed as directed under the operating conditions in Purity (7).

System suitability—
System performance: Dissolve 1.0 mg of Heparin Sodium for Identification RS in 0.60 mL of water. Dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 0.20 mL of water. Dissolve 1.0 mg of dermatan sulfate in 2.0 mL of water. To 90 µL of the solution of Heparin Sodium for Identification RS add 30 µL each of the solutions of Over-sulfated Chondroitin Sulfate for System Suitability RS and dermatan sulfate, and mix. When the procedure is run with 20 µL of the mixture under the above operating conditions, dermatan sulfate, heparin and over-sulfated chondroitin sulfate are eluted in this order with the resolution between the peaks of dermatan sulfate and heparin being not less than 1.0 and that between the peaks of heparin and over-sulfated chondroitin sulfate being not less than 1.5.

pH <2.5> The pH of a solution of 1.0 g of Heparin Sodium in 100 mL of water is between 6.0 and 8.0.

Purity (1) Clarity and color of solution—Dissolve 0.5 g of Heparin Sodium in 20 mL of water: the solution is clear and colorless to light yellow.

(2) Barium—Dissolve 30 mg of Heparin Sodium in 3.0 mL of water, and use this solution as the sample solution. To 1.0 mL of the sample solution add 3 drops of dilute sulfuric acid, and allow to stand for 10 minutes: no turbidity is produced.

(3) Total nitrogen—Weigh accurately about 0.1 g of Heparin Sodium, previously dried at 60°C for 3 hours under reduced pressure, and perform the test as directed under Nitrogen Determination <1.08>: the amount of nitrogen (N: 14.01) is not more than 3.0%.

(4) Protein—(i) Sodium carbonate solution: To 4 mL of water, add 30 mg of Heparin Sodium, previously dried at 60°C for Identification RS, and mix. When the procedure is performed under the operating conditions in Purity (7), dermatan sulfate, heparin and over-sulfated chondroitin sulfate are eluted in this order with the resolution between the peaks of dermatan sulfate and heparin being not less than 1.0 and that between the peaks of heparin and over-sulfated chondroitin sulfate being not less than 1.5.

(ii) Copper sulfate solution: To 4 volumes of a mixture of sodium hydroxide solution (1 in 100) and anhydrous sodium carbonate solution (1 in 20) (1:1) add 1 volume of water.

(iii) Alkaline copper solution for heparin: Mix 50 volumes of the sodium carbonate solution and 1 volume of the copper sulfate solution. Prepare before using.

(iv) Procedure: Use a solution of Heparin Sodium (1 in 200) as the sample solution. Use a solution of bovine serum albumin (1 in 40,000) as the standard solution. To exactly 1 mL each of the sample solution and standard solution add exactly 5 mL of the alkaline copper solution for heparin, mix, and allow them to stand at room temperature for 10 minutes. To each of these solutions add exactly 0.5 mL of diluted Folin’s TS (1 in 2), shake, and allow to stand at room temperature for 30 minutes. Determine the absorbances at 750 nm of these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24> using water as the blank: the absorbance of the solution obtained from the sample solution is not more than that of the solution from the standard solution.

(5) Nucleic acid—Dissolve 40 mg of Heparin Sodium in 10 mL of water, and determine the absorbance of this solution at 260 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance is not more than 0.15.

(6) Over-sulfated chondroitin sulfate—Dissolve 20 mg of Heparin Sodium in 0.60 mL of a solution of sodium 3-trimethylsilylpropionate-d₄ for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). Determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (H) in accordance with the following conditions, using sodium 3-trimethylsilylpropionate-d₄ for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits no signal corresponding to N-acetyl proton of over-sulfated chondroitin sulfate at δ 2.15 ± 0.02 ppm, or the signal disappears when determining the spectrum of the sample solutions as directed under 'H with ¹³C-decoupling.

Operating conditions—
System performance—Dissolve 20 mg of Heparin Sodium for Identification RS in 0.40 mL of a solution of sodium 3-trimethylsilylpropionate-d₄ for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). Dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 1.0 mL of a solution of sodium 3-trimethylsilylpropionate-d₄ for nuclear magnetic resonance spectroscopy in heavy water for nuclear magnetic resonance spectroscopy (1 in 10,000). To the solution of Heparin Sodium for Identification RS add 0.20 mL of the solution of Over-sulfated Chondroitin Sulfate for System Suitability RS. When determining the spectrum of this solution under the above operating conditions, it exhibits the signal of N-acetyl proton of heparin and the signal of N-acetyl proton of over-sulfated chondroitin sulfate at δ 2.04 ± 0.02 ppm and δ 2.15 ± 0.02 ppm, respectively.

(7) Related substances—Dissolve 2.0 mg of Heparin Sodium in 0.1 mL of water and perform the test with exactly 20 μL of this solution as directed under Liquid Chromatography C.3.07 according to the following conditions: it exhibits no peaks after the heparin peak.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 202 nm).
Column: A stainless steel column 2.0 mm in inside diameter and 7.5 cm in length, packed with synthetic polymer for liquid chromatography to which diethylaminomethyl group binds (10 μm in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase A: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust to pH 3.0 with diluted phosphoric acid (1 in 10).
Mobile phase B: Dissolve 0.4 g of sodium dihydrogen phosphate dihydrate and 106.4 g of lithium perchlorate in 1000 mL of water, and adjust to pH 3.0 with diluted phosphoric acid (1 in 10).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 3</td>
<td>90</td>
<td>10</td>
</tr>
<tr>
<td>3 - 15</td>
<td>90 → 0</td>
<td>10 → 100</td>
</tr>
</tbody>
</table>

Flow rate: 0.2 mL per minute.
Time span of measurement: About 2 times as long as the retention time of heparin, beginning after the solvent peak.

System suitability—
Test for required detectability: Dissolve 10 mg of Heparin Sodium for Identification RS in 0.40 mL of water, and use this solution as the heparin sodium standard stock solution. Separately, dissolve 0.10 mg of Over-sulfated Chondroitin Sulfate for System Suitability RS in 0.20 mL of water, and use this solution as the over-sulfated chondroitin sulfate standard solution. To 60 μL of the heparin sodium standard stock solution add 3 μL of the over-sulfated chondroitin sulfate standard solution and 12 μL of water, and mix. When the procedure is run with 20 μL of the mixture under the above operating conditions, it exhibits a peak for over-sulfated chondroitin sulfate.

System performance: To 120 μL of the heparin sodium standard stock solution add 30 μL of the over-sulfated chondroitin sulfate standard solution, mix and use this solution as the solution for system suitability test. When the procedure is run with 20 μL of the solution for system suitability test under the above operating conditions, heparin and over-sulfated chondroitin sulfate are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of over-sulfated chondroitin sulfate is not more than 2.0%.

(8) Galactosamine—Dissolve 2.4 mg of Heparin Sodium in 1.0 mL of a mixture of water and hydrochloric acid (7:5), and use this solution as the heparin sodium stock solution. Dissolve 8.0 mg of D-glucosamine hydrochloride in a mixture of water and hydrochloric acid (7:5) to make exactly 10 mL. Dissolve 8.0 mg of D-galactosamine hydrochloride in a mixture of water and hydrochloric acid (7:5) to make exactly 10 mL. To 99 volumes of the solution of D-glucosamine add 1 volume of the solution of D-galactosamine, and use this solution as the standard stock solution. Transfer 500 μL each of the heparin sodium stock solution and the standard stock solution to a glass-stoppered test tube, stopper tightly, and heat at 100°C for 6 hours. After cooling to room temperature, evaporate 100 μL each of the reaction solutions to dryness. Add 50 μL of methanol to each of the residues and evaporate to dryness at room temperature. Dissolve each of the residues in 10 μL of water, add 40 μL of aminobenzoate derivatization TS, and heat at 80°C for 1 hour. After cooling to room temperature, evaporate the reaction solutions to dryness. Add 200 μL each of water and ethyl acetate to each of the residues, shake vigorously, and then centrifuge. After remove the upper layers, add 200 μL of ethyl acetate to each of the lower layers, shake vigorously, and then centrifuge. The lower layers are used as the sample solution and the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography C.2.07 with the following conditions: the peak area ratio of galactosamine to glucosamine of the sample solution is not larger than that of the standard solution.

Operating conditions—
Detector: A fluorescence photometer (excitation wavelength: 305 nm; emission wavelength: 360 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 45°C.
Mobile phase: To 100 mL of a mixture of water and trifluoroacetic acid (1000:1) add 100 mL of acetonitrile. Add 140 mL of the solution to 860 mL of a mixture of water and trifluoroacetic acid (1000:1).
Flow rate: 1.0 mL per minute.
Time span of measurement: About 50 minutes after injection.

System suitability—
Test for required detectability: Dissolve 8.0 mg of D-mannosamine hydrochloride in 10 mL of a mixture of water and hydrochloric acid (7:5), and use this solution as the mannosamine standard solution. Transfer 500 μL of a mixture of the standard stock solution and the mannosamine standard solution (100:1) to a glass-stoppered test tube, stopper tightly, and heat at 100°C for 6 hours. After cooling this solution to room temperature, evaporate 100 μL of the reaction solu-
tion to dryness. Add 50 µL of methanol to the residue and evaporate to dryness at room temperature. Dissolve the residue in 10 µL of water, add 40 µL of aminobenzoate derivatization TS, and heat at 80°C for 1 hour. After cooling to room temperature, evaporate the reaction solution to dryness. Add 200 µL each of water and ethyl acetate to the residue, shake vigorously, and then centrifuge. After removing the upper layer, add 200 µL of ethyl acetate to the lower layer, shake vigorously, and then centrifuge. The lower layer is used as the solution for system suitability test. When the procedure is run with 5 µL of the solution for system suitability test under the above operating conditions, the ratio of the peak area of galactosamine to that of glucosamine is 0.7 - 2.0%.

System performance: When the procedure is run with 5 µL of the solution for system suitability test under the above operating conditions, glucosamine, mannosamine and galactosamine are eluted in this order with the resolutions between the peaks of glucosamine and mannosamine and between the peaks of mannosamine and galactosamine being not less than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 µL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratio of the peak area of galactosamine to that of glucosamine is not more than 4.0%.

Loss on drying <2.4% Not more than 10% (20 mg, in vacuum, 60°C, 3 hours).

Residue on ignition <2.4% Not more than 40% (after drying, 20 mg).

Bacterial endotoxins <4.0% Less than 0.0030 EU/Heparin Unit.

**Anti-factor Xa activity to anti-factor IIa activity ratio**

The ratio of the anti-factor Xa activity determined by the following method to the anti-factor IIa activity obtained in the assay, calculated by dividing the former with the later, is 0.9 - 1.1.

Anti-factor Xa activity determination

(i) Substrate solution: Dissolve 25 mg of N-benzoyl-L-isoleucyl-L-glutamyl(γ-OR)-glycyl-L-arginyl-p-nitroanilide hydrochloride in 33.3 mL of water.

(ii) Anti-thrombin solution: Dissolve human anti-thrombin in water so that each mL contains 1 IU. To 150 µL of this solution add 2250 µL of buffer solution.

(iii) Factor Xa solution: To 1200 µL of factor Xa stock solution add 1200 µL of buffer solution.

(iv) Buffer solution: Proceed as directed in the assay.

(v) Stopping solution: Proceed as directed in the assay.

(vi) Heparin standard solutions: Proceed as directed in the assay. However, the standard solutions are prepared based on anti-factor Xa activity Unit instead of Heparin Unit.

(vii) Heparin sample solutions: Proceed as directed in the assay. However, the sample solutions are prepared based on anti-factor Xa activity Unit instead of Heparin Unit.

(viii) Procedure: Transfer separately two 50-µL portions of each dilution of the heparin standard solutions and the heparin sample solutions and five 50-µL portions of buffer solution as the blank to 1.5 mL-tubes. Warm these 21 tubes, anti-thrombin solution, factor Xa solution and substrate solution at 37°C all together. Start the following procedure at 2 minutes after warming in the order: buffer solution, S₁, S₂, S₃, S₄, buffer solution, T₁, T₂, T₃, T₄, buffer solution, T₅, T₆, buffer solution, S₁, S₂, S₃, S₄, and buffer solution. To each tube add 50 µL of anti-thrombin solution, mix, and warm at 37°C for exactly 4 minutes, add 100 µL of factor Xa solution, mix, and incubate for exactly 12 minutes. Then, add 100 µL of substrate solution, mix, incubate for exactly 4 minutes, add 50 µL of stopping solution to each tube, and mix immediately. Separately, to 50 µL of stopping solution add 100 µL of substrate solution, 100 µL of factor Xa solution, 50 µL of anti-thrombin solution and 50 µL of buffer solution, mix, and use this solution as a control. Determine the absorbance of each solution at 405 nm against the control. Confirm that the relative standard deviation of the reading of the blank is not more than 10%.

(ix) Calculations: When the regression expression, \( y = I_t + A_{X_s} + B_{X_s} \), is obtained using \( y \) as log of the absorbance values, \( x_t \), as the concentration of the heparin standard solutions and \( x_s \), as the concentration of the heparin sample solutions, the potency ratio \( R \) is \( B/A \).

\( I_t \): Common intercept

A: Slope of regression expression of the heparin standard solution

B: Slope of regression expression of the heparin sample solution

Calculate anti-factor Xa activity per mg of Heparin Sodium by the following formula.

\[ \text{Anti-factor Xa activity per mg of Heparin Sodium} = 100 \times \frac{R \times V}{M} \]

\( V \): Total volume (mL) of the solution (the sample stock solution) prepared as containing about 100 anti-factor Xa activity Units per mL

\( M \): Amount (mg) of Heparin Sodium taken for the sample stock solution

However, when a 90% confidence interval of \( D \) of the regression expression \( y = I_t' + A_{X_s} + B_{X_s} + D \), where \( D \) is a constant term showing the difference between the blank and the intercept assumed from the two lines, is not in a range of between -0.2 and 0.2, analyze by excluding the measurements of the blank.

The criteria for the test suitability are performed as directed in the assay. When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

**Assay**

(i) Substrate solution: Dissolve 25 mg of \( H-D\)-phenylalanil-L-piperetyl-L-arginyl-p-nitroanilide dihydrochloride in 32.0 mL of water.

(ii) Anti-thrombin solution (for heparin assay): Dissolve human anti-thrombin in water so that each mL contains 1 IU. Dilute this solution to an appropriate dilution factor of approximately more than 16 times with the buffer solution, and designate this solution as the anti-thrombin solution (for heparin assay). The dilution factor with the buffer solution is adjusted so that the absorbance of reaction solution with the blank solution (average of five tubes) is not more than 2.0, and that of reaction solution with \( S_4 \) (0.020 Unit/mL heparin standard solution) (average of two tubes) is not less than 0.2 and not more than 1.0 when the test is performed according to the assay. The absorbance is measured with 1 cm light path in length.

(iii) Factor IIa solution: Add an equivalent volume of water to the buffer solution, and use this solution as the factor IIa diluent. Dissolve factor IIa in the factor IIa diluent to make a solution so that each mL contains 20 IU. Dilute this solution to an appropriate dilution factor of approximately
less than 4 times with the factor Ila diluent, and designate this solution as the factor Ila solution. Adjust the dilution factor with the factor Ila diluent so that the absorbance of reaction solution with the blank solution (average of five tubes) is not more than 2.0, and that of reaction solution with $S_2$ (0.020 Unit/mL heparin standard solution) (average of two tubes) is not less than 0.2 and not more than 1.0 when the test is performed according to the Assay. The absorbance is measured with 1 cm light path in length.

(iv) Buffer solution: Dissolve 6.1 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 10.2 g of sodium chloride, 2.8 g of disodium dihydrogen ethylenediamine tetracacetate dihydrate and 1.0 g of polyethylene glycol 6000 in 800 mL of water, adjust to pH 8.4 with 1 mol/L hydrochloric acid TS, and add water to make 1000 mL.

(v) Stopping solution: To 2 mL of acetic acid (100) add water to make 10 mL.

(vi) Heparin standard solutions: Dissolve Heparin Sodium RS in water so that each mL contains 100 Heparin Units, and use this solution as the standard stock solution. Dilute the standard stock solution with buffer solution so that each mL contains exactly 0.1 Heparin Units, and use this solution as the standard solution. Make heparin standard solutions $S_1$, $S_2$, $S_3$ and $S_4$ respectively by adding the standard solution to buffer solution as directed in the following table.

<table>

(vii) Heparin sample solutions: Weigh accurately an appropriate amount of Heparin Sodium, dissolve in water so that each mL contains about 100 Heparin Units, and use this solution as the sample stock solution. Dilute exactly the sample stock solution with buffer solution so that each mL contains 0.1 Heparin Units, and use this solution as the sample solution. Make heparin sample solutions $T_1$, $T_2$, $T_3$ and $T_4$ respectively by adding the sample solution to buffer solution as directed in the following table.

(viii) Procedure: Transfer separately two 50-µL portions of each dilution of the heparin standard solution and the heparin sample solutions and five 50-µL portions of buffer solution as the blank to 1.5 mL-tubes. Warm these 21 tubes, anti-thrombin solution (for heparin assay), factor Ila solution and substrate solution at 37°C all together. Start the following procedure at 2 minutes after warming in the order: buffer solution, $S_1$, $S_2$, $S_3$, $S_4$, buffer solution, $T_1$, $T_2$, $T_3$, $T_4$, buffer solution, $S_1$, $S_2$, $S_3$, $S_4$, and buffer solution. To each tube add 100 µL of anti-thrombin solution (for heparin assay), mix, and warm at 37°C for exactly 4 minutes, add 25 µL of factor Ila solution, mix, and incubate for exactly 4 minutes. Then, add 50 µL of substrate solution, mix, incubate for exactly 4 minutes, add 50 µL of stopping solution to each tube, and mix. Separately, to 50 µL of stopping solution add 50 µL of substrate solution, 25 µL of factor Ila solution, 100 µL of anti-thrombin solution (for heparin assay) and 50 µL of buffer solution, mix, and use this solution as a control. Determine the absorbance of each solution at 405 nm against the control. Confirm that the relative standard deviation of the reading of the blank is not more than 10%.

(ix) Calculations: When the regression expression, $y = I_c + A_{X_5} + B_{X_5} + D$, is obtained using $y$ as log of the absorbance values, $x_5$ as the concentration of the heparin standard solutions and $X_5$ as the concentration of the heparin sample solutions, the potency ratio $R = B/A$.

$I_c$: Common intercept
$A$: Slope of regression expression of the heparin standard solution
$B$: Slope of regression expression of the heparin sample solution

Calculate Heparin Unit (anti-factor Ila activity) per mg of Heparin Sodium by the following formula.

Heparin Unit (anti-factor Ila activity) per mg of Heparin Sodium

\[ \text{Heparin Unit} = \frac{100 \times R \times V/M}{M} \]

$V$: Total volume (mL) of the solution (the sample stock solution) prepared as containing about 100 Heparin Units (anti-factor Ila activity) per mL

$M$: Amount (mg) of Heparin Sodium taken for the sample stock solution

However, when a 90% confidence interval of $D$ of the regression expression $y = I_c + A_{X_5} + B_{X_5} + D$, where $D$ is a constant term showing the difference between the blank and the intercept assumed from the two lines, is not in the range of between $-0.2$ and $0.2$, analyze by excluding the measurements of the blank.

The criteria for the test suitability are the following 3 items, (1), (2) and (3).

(1) Judgment on consistency of the intercept assumed from the two lines

When the regression expression, $y = I_c + A_{X_5} + B_{X_5} + L_{s,s}$, is obtained from the data of the heparin standard solution and the heparin sample solution except of the blank solution, a 90% confidence interval of the constant term, $L_{s,s}$, is between $-0.2$ and $0.2$.

$I_{c}$: Intercept of the regression expression of the heparin standard solution
$L_{s,s}$: Difference of the intercepts assumed from the two lines

(2) Judgment on linearity

When the regression expression, $y = I_c + A_{X_5} + B_{X_5} + Q_{\alpha_5}^2 + Q_{\beta_5}^2$, is obtained from the data of the heparin standard solution and the heparin sample solution, a 90% confidence interval of the secondary coefficients, $Q_{\alpha_5}$ and $Q_{\beta_5}$, is between $-1000$ and $1000$. 
Q1: Secondary coefficient of the regression expression of the heparin standard solution
Q2: Secondary coefficient of the regression expression of the heparin sample solution

(3) Judgment by checking if the relative potency obtained is within the range previously validated on this test method.

The potency ratio obtained is not less than 0.8 and not more than 1.2.

When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

Containers and storage
Containers—Tight containers.

### Heparin Sodium Injection

ヘパリンナトリウム注射液

Heparin Sodium Injection is an aqueous injection.

It contains not less than 90% and not more than 110% of the labeled heparin Units.

**Method of preparation** Dissolve Heparin Sodium in Isotonic Sodium Chloride Solution and prepare as directed under Injections.

**Description** Heparin Sodium Injection is a clear, colorless to light yellow liquid.

pH: 5.5 – 8.0

**Purity** Barium—Measure exactly a volume of Heparin Sodium Injection, equivalent to 3000 Units of Heparin Sodium, add water to make 3.0 mL and use this solution as the sample solution. To 1.0 mL of the sample solution add 3 drops of dilute sulfuric acid, and allow to stand for 10 minutes: no turbidity is produced.

**Bacterial endotoxins** Less than 0.0030 EU/unit.

**Extractable volume** It meets the requirement.

**Foreign insoluble matter** Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** It meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Proceed as directed in the Assay under Heparin Sodium, replacing (vii) Heparin sample solutions and (ix) Calculations with the following.

(vii) Heparin sample solutions: Take exactly an appropriate amount of Heparin Sodium Injection, dilute exactly with buffer solution so that each mL contains 0.1 Heparin Units, and use this solution as the sample solution. Make heparin sample solutions T1, T2, T3, and T4 respectively by adding the sample solution to buffer solution as directed in the following table.

<table>
<thead>
<tr>
<th>Heparin sample solution</th>
<th>Buffer solution (µL)</th>
<th>Sample solution (µL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>T1</td>
<td>0.005</td>
<td>950</td>
</tr>
<tr>
<td>T2</td>
<td>0.010</td>
<td>900</td>

<tr>
<td>T4</td>
<td>0.020</td>
<td>800</td>
</tr>
</tbody>
</table>

(ix) Calculations: When the regression expression, $y = I_c + A x_1 + B x_2$, is obtained using $y$ as log of the absorbance values, $x_1$ as the concentration of the heparin standard solutions and $x_2$ as the concentration of the heparin sample solutions, the potency ratio $R$ is $B/A$.

$I_c$: Common intercept
$A$: Slope of regression expression of the heparin standard solution
$B$: Slope of regression expression of the heparin sample solution

Calculate Heparin Units (anti-factor IIa activity) in 1 mL of Heparin Sodium Injection by the following formula.

Heparin Units (anti-factor IIa activity) in 1 mL of Heparin Sodium Injection

$$V = 0.1 \times R \times V/a$$

$V$: Total volume (mL) of the sample solution prepared as containing 0.1 Heparin Units (anti-factor IIa activity) per mL
$a$: Amount (mL) of Heparin Sodium Injection taken for the sample solution

However, when a 90% confidence interval of $D$ of the regression expression $y = I_c + A x_1 + B x_2 + D$, where $D$ is a constant term showing the difference between the intercepts assumed from the measurement of the blank and the two lines, is not in the range of between $-0.2$ and $0.2$, analyze by excluding the measurements of the blank.

The criteria for the test suitability are followed as directed in the Assay under Heparin Sodium. When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

Containers and storage
Containers—Hermetic containers.

Storage—Light-resistant.

### Heparin Sodium Lock Solution

ロック用ヘパリンナトリウム液

Heparin Sodium Lock Solution is a preparation used to prevent blood coagulation in intravenous indwelling routes.

It contains not less than 90% and not more than 110% of the labeled Heparin Units.

**Method of preparation** Prepare as directed under Injections, with Heparin Sodium.

**Description** Heparin Sodium Lock Solution is a clear, colorless to light yellow liquid.

Osmotic pressure ratio: 0.9 – 1.1
**Heparin Sodium Solution for Dialysis**

透析用ヘパリンナトリウム液

Heparin Sodium Solution for Dialysis is a preparation used to prevent coagulation of perfused blood during hemodialysis. It contains not less than 90% and not more than 110% of the labeled Heparin Unit.

**Method of preparation** Prepare as directed under Injections, with Heparin Sodium.

**Description** Heparin Sodium Solution for Dialysis is a clear, colorless to light yellow liquid. The osmotic pressure: 0.9 – 1.1

**pH** <2.5 → 5.5 – 8.0

**Bacterial endotoxins** <4.01> Less than 0.0030 EU/unit.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Proceed as directed in the Assay under Heparin Sodium, replacing (vii) Heparin sample solutions and (ix) Calculations with the following.

(vii) Heparin sample solutions: Pipet a suitable volume of Heparin Sodium Lock Solution, dilute exactly with the buffer solution so that each mL contains 0.1 Heparin Units, and use this solution as the sample solution. Prepare heparin sample solutions T₁, T₂, T₃, and T₄ respectively by adding the sample solution to the buffer solution as directed in the following table.

<table>
<thead>
<tr>
<th>Heparin sample solution</th>
<th>Buffer solution (µL)</th>
<th>Sample solution (µL)</th>

</tbody>
</table>

(ix) Calculations: When the regression expression, \( y = I_c + A x_c + B x_e \), is obtained using \( y \) as log of the absorbance values, \( x_c \) as the concentration of the heparin standard solutions and \( x_e \) as the concentration of the heparin sample solutions, the potency ratio \( R = B / A \).

\( I_c \): Common intercept
\( A \): Slope of regression expression of the heparin standard solution

Calculate Heparin Units (anti-factor IIa activity) in 1 mL of Heparin Sodium Lock Solution by the following formula.

Heparin Units (anti-factor IIa activity) in 1 mL of Heparin Sodium Lock Solution

\[ 0.1 \times V / a \]

**V:** Total volume (mL) of the sample solution prepared as containing 0.1 Heparin Units (anti-factor IIa activity) per mL

**a:** Amount (mL) of Heparin Sodium Lock Solution taken

However, when a 90% confidence interval of \( D \) of the regression expression \( y = I_c + A x_c + B x_e + D \), where \( D \) is a constant term showing the difference between the intercepts assumed from the measurement of the blank and the two lines, is not in the range of between -0.2 and 0.2, analyze by excluding the measurements of the blank.

The criteria for the test suitability are followed as directed in the Assay under Heparin Sodium. When these criteria are not satisfied, repeat the test after changing the dilution rate so that the potency ratio becomes about 1 using the obtained potency as reference.

**Containers and storage** Containers—Hermetic containers. Plastic containers for aqueous injections may be used.
Adsorbed Hepatitis B Vaccine

Adsorbed Hepatitis B Vaccine is a liquid for injection prepared by adding an aluminum salt to a liquid containing a surface antigen of hepatitis B virus to make the HBs antigen insoluble. It conforms to the requirements of Adsorbed Hepatitis B Vaccine in the Minimum Requirements for Biological Products. Description Adsorbed Hepatitis B Vaccine becomes a homogeneous, whitish turbid liquid on shaking.

L-Histidine

L-ヒステチジン

\[
\begin{align*}
\text{C}_6\text{H}_{12}\text{N}_3\text{O}_2 & : 155.15 \\
(2S)-2\text{-Amino-3-(1H-imidazol-4-yl)propanoic acid} [71-00-1]
\end{align*}
\]

L-Histidine contains not less than 99.0% and not more than 101.0% of L-histidine (C₆H₁₂N₃O₂), calculated on the dried basis. Description L-Histidine occurs as white, crystals or crystalline powder, having a slight bitter taste. It is freely soluble in formic acid, and soluble in water, and practically insoluble in ethanol (99.5). It dissolves in 6 mol/L hydrochloric acid TS. It shows crystal polymorphism.

Identification Determine the infrared absorption spectrum of L-Histidine as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve the sample with a little amount of water, evaporate the water at 60°C under reduced pressure, dry the residue, and perform the test.

Optical rotation 2.45 [\alpha]_D^25: +118.8~\sim~+12.8° (5.5 g calculated on the dried basis, 6 mol/L hydrochloric acid TS, 50 mL, 100 mm).

pH 2.45 The pH of a solution of 1.0 g of L-Histidine in 50 mL of water is between 7.0 and 8.5.

Purity (1) Clarity and color of solution—A solution of 0.40 g of L-Histidine in 20 mL of water is clear and colorless.

(2) Chloride 1.05—Perform the test with 0.5 g of L-Histidine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate 1.14—Perform the test with 0.6 g of L-Histidine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium 1.02—Perform the test with 0.25 g of L-Histidine. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals 1.07—Dissolve 1.0 g of L-Histidine in 30 mL of water by warming. To this solution add 2.4 mL of dilute hydrochloric acid, 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 1.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

(6) Iron 1.10—Prepare the test solution with 1.0 g of L-Histidine according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.10 g of L-Histidine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.07. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with a mixture of l-propanol and ammonia solution (28) (67:33) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100) to the plate, and heat at 80°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying 2.44 Not more than 0.3% (1 g, 105°C, 3 hours).

Residue on ignition 2.44 Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of L-Histidine, dissolve in 2 mL of formic acid, add 50 mL of acetic acid (100), and titrate 2.50 with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 15.52 mg of C₆H₁₂N₃O₂

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.
**L-Histidine Hydrochloride Hydrate**

C₆H₁₂N₃O₂·HCl·H₂O: 209.63  
(2S)-2-Amino-3-(1H-imidazol-4-yl)propanoic acid monohydrochloride monohydrate  
\[C₆H₁₂N₃O₂·HCl·H₂O\]  

L-Histidine Hydrochloride Hydrate contains not less than 99.0% and not more than 101.0% of L-histidine hydrochloride (C₆H₁₂N₃O₂·HCl: 191.62), calculated on the anhydrous basis.

**Description**  
L-Histidine Hydrochloride Hydrate occurs as white crystals or a white crystalline powder. It has an acid taste at first, and a slight bitter taste later.  
It is freely soluble in water and in formic acid, and practically insoluble in ethanol (99.5).  
It dissolves in 6 mol/L hydrochloric acid TS.

**Identification** (1) Determine the infrared absorption spectrum of L-Histidine Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of L-Histidine Hydrochloride Hydrate (1 in 10) responds to Qualitative Tests \(<1.09>\) for chloride.

**Optical rotation** \(<2.49>\) \([\alpha]D^20\) +9.2 – +10.6° (5.5 g calculated on the anhydrous basis, 6 mol/L hydrochloric acid TS, 50 mL, 100 mm).

**pH** \(<2.54>\)  
The pH of a solution of 1.0 g of L-Histidine Hydrochloride Hydrate in 10 mL of water is between 3.5 and 4.5.

**Purity** (1) Clarity and color of solution—A solution of 1.0 g of L-Histidine Hydrochloride Hydrate in 10 mL of water is clear and colorless.

(2) Sulfate \(<1.14>\)—Perform the test with 0.6 g of L-Histidine Hydrochloride Hydrate. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(3) Ammonium \(<1.02>\)—Perform the test with 0.25 g of L-Histidine Hydrochloride Hydrate. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4) Heavy metals \(<1.07>\)–Proceed with 1.0 g of L-Histidine Hydrochloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Iron \(<1.10>\)–Prepare the test solution with 1.0 g of L-Histidine Hydrochloride Hydrate according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.10 g of L-Histidine Hydrochloride Hydrate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography.

**Assay**  
Weigh accurately about 0.1 g of L-Histidine Hydrochloride Hydrate, dissolve in 3 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 30 minutes. After cooling, add 45 mL of acetic acid (100), and titrate \(<2.50>\) the excess of perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L perchloric acid VS = 9.581 mg of C₆H₁₂N₃O₂·HCl

**Containers and storage**  
Containers—Tight containers.

**Homatropine Hydrobromide**

C₁₆H₁₇NO₃·HBr: 356.25  
(1R,3r,5S)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl [[2RS]-2-hydroxy-2-phenyl]acetate monohydrobromide  
[51-56-9]

Homatropine Hydrobromide contains not less than 99.0% of homatropine hydrobromide (C₁₆H₁₇NO₃·HBr), calculated on the dried basis.

**Description**  
Homatropine Hydrobromide occurs as white, crystals or crystalline powder. It is odorless.

It is freely soluble in water, sparingly soluble in ethanol (95), slightly soluble in acetic acid (100), very slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.  
It is affected by light.

Melting point: about 214°C (with decomposition).

**Identification** (1) To 5 mL of a solution of Homatropine Hydrobromide (1 in 20) add 2 to 3 drops of iodine TS: a brown precipitate is produced.

(2) Dissolve 0.05 g of Homatropine Hydrobromide in 5 mL of water, and add 3 mL of 2,4,6-trinitrophenol TS: a yellow precipitate is produced. Filter the precipitate, wash with five 10-mL portions of water, and dry at 105°C for 2 hours: it melts \(<2.60>\) between 184°C and 187°C.

(3) A solution of Homatropine Hydrobromide (1 in 20) responds to Qualitative Tests \(<1.09>\) for bromide.

**Purity** (1) Acidity—Dissolve 1.0 g of Homatropine...
Hydrobromide in 20 mL of water, and add 0.40 mL of 0.01 mol/L sodium hydroxide VS and 1 drop of methyl red-methylene blue TS: a green color develops.

(2) Atropine, hyoscyamine and scopolamine—To 10 mg of Homatropine Hydrobromide add 5 drops of nitric acid, evaporate on a water bath to dryness, and cool. Dissolve the residue in 1 mL of N,N-dimethylformamide, and add 5 to 6 drops of tetraethylammonium hydroxide TS: no red-purple color is produced.

(3) Related substances—Dissolve 0.15 g of Homatropine Hydrobromide in 3 mL of water, and use this solution as the sample solution.

(i) To 1 mL of the sample solution add 2 to 3 drops of tannic acid TS: no precipitate is produced.

(ii) To 1 mL of the sample solution add 2 to 3 drops each of dilute hydrochloric acid and platinic chloride TS: no precipitate is produced.

Loss on drying <2.41> Not more than 1.5% (0.5 g, 105°C, 2 hours).

Residue on ignition <2.4> Not more than 0.2% (0.2 g).

Assay Dissolve by warming about 0.4 g of Homatropine Hydrobromide in 60 mL of a mixture of acetic anhydride and acetic acid (100:7:3). Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.63 mg of C₁₉H₂₁NO₃HBr

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Homochlorcyclizine Hydrochloride

ホモクロルシクリジン塩酸塩

C₁₉H₂₅ClN₂·2HCl: 387.77
1-[(R,S)-(4-Chlorophenyl)(phenyl)methyl]-4-methylhexahydro-1H-1,4-diazepine dihydrochloride [1982-36-1]

Homochlorcyclizine Hydrochloride, when dried, contains not less than 98.0% of homochlorcyclizine hydrochloride (C₁₉H₂₅ClN₂·2HCl).

Description Homochlorcyclizine Hydrochloride occurs as white to pale brown, crystals or powder.

It is very soluble in water, freely soluble in acetic acid (100), slightly soluble in ethanol (99.5), and very slightly soluble in acetonic and in acetic anhydride.

It dissolves in 0.1 mol/L hydrochloric acid TS.

It is hygroscopic.

It is colored slightly by light.

A solution of Homochlorcyclizine Hydrochloride (1 in 10) shows no optical rotation.

Melting point: about 227°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Homochlorcyclizine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Homochlorcyclizine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Homochlorcyclizine Hydrochloride (1 in 100) responds to Qualitative Tests <1.09> for chloride.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Homochlorcyclizine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.10 g of Homochlorcyclizine Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Measure exactly 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas by the automatic integration method: the areas of the peaks other than homochlorcyclizine obtained from the sample solution are not larger than 1/2 times the peak area of homochlorcyclizine from the standard solution, and the total area of the peaks other than homochlorcyclizine from the sample solution is not larger than the peak area of homochlorcyclizine from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 223 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water, acetonitrile and perchloric acid (134:66:1).

Flow rate: Adjust so that the retention time of homochlorcyclizine is about 10 minutes.

Time span of measurement: About 2 times as long as the retention time of homochlorcyclizine.

System suitability—

Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 50 mL. Confirm that the peak area of homochlorcyclizine obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: Dissolve 5 mg each of Homochlorcyclizine Hydrochloride and methyl parahydroxybenzoic acid in 100 mL of the mobile phase. When the procedure is run with 10 μL of this solution under the above operating conditions, methyl parahydroxybenzoic acid and homochlorcyclizine are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of homochlorcyclizine is not more than 1.0%.

Loss on drying <2.41> Not more than 2.0% (1 g, 110°C, 4 hours).

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Homochlorcyclizine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate \(<2.30\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.39 mg of C\(_{10}\)H\(_{8}\)CIN\(_2\)2HCl

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Human Normal Immunoglobulin

人免疫グロブリン

Human Normal Immunoglobulin is a liquid for injection containing immunoglobulin G in serum globulins of humans.

It conforms to the requirements of Human Normal Immunoglobulin in the Minimum Requirements for Biological Products.

Description Human Normal Immunoglobulin is a clear, colorless or yellow-brown liquid.

Hydralazine Hydrochloride

ヒドララジン塩酸塩

C\(_8\)H\(_{12}\)N\(_4\).HCl: 196.64
Phthalazin-1-ylhydrazine monohydrochloride [304-20-1]

Hydralazine Hydrochloride, when dried, contains not less than 98.0% of hydralazine hydrochloride (C\(_8\)H\(_{12}\)N\(_4\)HCl).

Description Hydralazine Hydrochloride occurs as a white crystalline powder. It is odorless, and has a bitter taste.

It is soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 275°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Hydralazine Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Hydralazine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Hydralazine Hydrochloride (1 in 50) responds to Qualitative Tests \(<1.09>\) for chloride.

\(\text{pH} <2.54>\) Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water: the pH of the solution is between 3.5 and 4.5.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water: the solution is clear, and colorless or pale yellow.

(2) Heavy metals \(<1.07>\)—Proceed with 1.0 g of Hydralazine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Loss on drying \(<2.41>\) Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 8 hours).

Residue on ignition \(<2.44>\) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Hydralazine Hydrochloride, previously dried, transfer it to a glass-stoppered flask, dissolve in 25 mL of water, add 25 mL of hydrochloric acid, cool to room temperature, add 5 mL of chloroform, and titrate \(<2.30>\) with 0.05 mol/L potassium iodate VS while shaking until the purple color of the chloroform layer disappears. The end point is reached when the red-purple color no more reappears in the chloroform layer within 5 minutes after the layer has been decolorized.

Each mL of 0.05 mol/L potassium iodate VS = 9.832 mg of C\(_8\)H\(_{12}\)N\(_4\)HCl

Containers and storage Containers—Tight containers.

Hydralazine Hydrochloride for Injection

注射用ヒドララジン塩酸塩

Hydralazine Hydrochloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 99.0% and not more than 113.0% of the labeled amount of hydralazine hydrochloride (C\(_8\)H\(_{12}\)N\(_4\)HCl: 196.64).

Method of preparation Prepare as directed under Injections, with Hydralazine Hydrochloride.

Description Hydralazine Hydrochloride for Injection occurs as a white to pale yellow powder or mass. It is odorless, and has a bitter taste.

Identification Determine the absorption spectrum of a solution of Hydralazine Hydrochloride for Injection (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\): it exhibits maxima between 238 nm and 242 nm, between 258 nm and 262 nm, between 301 nm and 305 nm, and between 313 nm and 317 nm.

\(\text{pH} <2.54>\) Dissolve 1.0 g of Hydralazine Hydrochloride for Injection in 50 mL of water: the pH of this solution is between 3.5 and 4.5.

Bacterial endotoxins \(<4.01>\) Less than 5.0 EU/mg.

Uniformity of dosage units \(<6.02>\) It meets the requirement of the Mass variation test. (T: 106.0%)

Foreign insoluble matter \(<6.06>\) Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter \(<6.07>\) It meets the requirement.

Sterility \(<4.06>\) Perform the test according to the Mem-
Hydralazine Hydrochloride Powder

**Method of preparation** Prepare as directed under Granules or Powders, with Hydralazine Hydrochloride.

**Identification** Weigh a portion of Hydralazine Hydrochloride Powder, equivalent to 25 mg of Hydralazine Hydrochloride, add 100 mL of water, shake well, and filter, if necessary. Add water to 2 mL of this solution to make 50 mL and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 238 nm and 242 nm, between 258 nm and 262 nm, between 301 nm and 305 nm, and between 313 nm and 317 nm.

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Hydralazine Hydrochloride Powder is not less than 85%.

Start the test with an accurately weighed amount of Hydralazine Hydrochloride Powder, equivalent to about 50 mg of hydralazine hydrochloride (C₈H₈N₄.HCl), withdraw not less than 10 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard not less than 5 mL of the first filtrate, pipet 4 mL of the subsequent filtrate, add water to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of hydralazine hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 50 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances at 260 nm, A₁ and A₃, at 280 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry:

\[
\text{Dissolution rate (\% with respect to the labeled amount of hydralazine hydrochloride (C}_8\text{H}_8\text{N}_4\text{HCl})} = \frac{M_5}{M_7} \times \frac{A_1}{A_3} \times \frac{1}{C} \times 180
\]

\[M_5: \text{Amount (mg) of hydralazine hydrochloride for assay taken}\]
\[M_7: \text{Amount (g) of hydralazine Hydrochloride Powder taken}\]
\[C: \text{Labeled amount (mg) of hydralazine hydrochloride (C}_8\text{H}_8\text{N}_4\text{HCl)} in 1 g}\]

**Assay** Weigh accurately a portion of Hydralazine Hydrochloride Powder, equivalent to about 0.15 g of hydralazine hydrochloride (C₈H₈N₄.HCl), transfer it to a glass-stoppered flask, add 25 mL of water, shake well, add 25 mL of hydrochloric acid, cool to room temperature, and proceed as directed in the Assay under Hydralazine Hydrochloride.

Each mL of 0.05 mol/L potassium iodate VS = 9.832 mg of C₈H₈N₄.HCl

**Containers and storage** Containers—Tight containers.

Hydralazine Hydrochloride Tablets

Hydralazine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of hydralazine hydrochloride (C₈H₈N₄.HCl: 196.64).

**Method of preparation** Prepare as directed under Tablets, with Hydralazine Hydrochloride.

**Identification** Weigh a quantity of powdered Hydralazine Hydrochloride Tablets, equivalent to 25 mg of Hydralazine Hydrochloride, add 100 mL of water, mix well, and filter if necessary. To 2 mL of this solution add water to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 238 nm and 242 nm, between 258 nm and 262 nm, between 301 nm and 305 nm and between 313 nm and 317 nm.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Hydralazine Hydrochloride Tablets add 25 mL of 0.1 mol/L hydrochloric acid TS, disperse the tablet into a small particles by sonicating, then shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and centrifuge. Pipet V mL of the supernatant liquid, add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 10 μg of hydralazine hydrochloride (C₈H₈N₄.HCl), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of hydralazine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances at 260 nm, A₁₁ and A₃₁, and at 350 nm, A₁₂ and A₃₂, of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry:

\[
\text{Amount (mg) of hydralazine hydrochloride (C}_8\text{H}_8\text{N}_4\text{HCl)} = M_5 \times \frac{(A_{11} - A_{12})}{(A_{31} - A_{32})} \times V/V \times 1/50
\]

\[M_5: \text{Amount (mg) of hydralazine hydrochloride for assay taken}\]

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Hydralazine Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Hydralazine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm.
Discard not less than 10 mL of the first filtrate, pipet $V$ mL of the subsequent filtrate, add water to make exactly $V'$ mL so that each mL contains about 11 μg of hydralazine hydrochloride ($C_9H_9N_2.HCl$), and use this solution as the sample solution. Separately, weigh accurately not less than 20 mg of hydralazine hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 50 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, $A_1$ and $A_2$, of the sample solution and standard solution at 260 nm as directed under Ultraviolet-visible Spectrophotometry 2.2.4.

Dissolution rate (%) with respect to the labeled amount of hydralazine hydrochloride ($C_9H_9N_2.HCl$) = $M_5 \times A_1 / A_2 \times V' / V \times 1 / C \times 18$

$M_5$: Amount (mg) of hydralazine hydrochloride for assay taken

$C$: Labeled amount (mg) of hydralazine hydrochloride ($C_9H_9N_2.HCl$) in 1 tablet

Assay Weigh accurately not less than 20 Hydralazine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.15 g of hydralazine hydrochloride ($C_9H_9N_2.HCl$), transfer it to a glass-stoppered flask, and proceed as directed in the Assay under Hydralazine Hydrochloride.

Each mL of 0.05 mol/L potassium iodate VS = 9.832 mg of $C_9H_9N_2.HCl$

Containers and storage Containers—Tight containers.

**Hydrochloric Acid**

塩酸

Hydrochloric Acid contains not less than 35.0% and not more than 38.0% of hydrogen chloride (HCl: 36.46).

Description Hydrochloric Acid is a colorless liquid having a pungent odor.

It is fuming but ceases to fume when it is diluted with 2 volumes of water.

Specific gravity $d_{20}$: about 1.18.

Identification (1) Allow a glass stick wet with ammonia TS to come near the surface of Hydrochloric Acid: a remarkable white smoke evolves.

(2) A solution of Hydrochloric Acid (1 in 100) changes blue litmus paper to red, and responds to Qualitative Tests $<1.09>$ for chloride.

Purity (1) Sulfate $<1.14>$—To 15 mL of Hydrochloric Acid add water to make 50 mL, and use this solution as the sample solution. To 3.0 mL of the sample solution add 5 mL of water and 5 drops of barium chloride TS, and allow to stand for 1 hour: no turbidity is produced.

(2) Sulphate—To 3.0 mL of the sample solution obtained in (1) add 5 mL of water and 1 drop of iodine TS: the color of iodine TS does not disappear.

(3) Bromide or iodide—Place 10 mL of the sample solution obtained in (1) in a glass-stoppered test tube, add 1 mL of chloroform and 1 drop of 0.002 mol/L potassium permanganate VS, and shake well: the chloroform layer remains colorless.

(4) Bromine or chlorine—Place 10 mL of the sample solution obtained in (1) in a glass-stoppered test tube, add 5 drops of potassium iodate TS and 1 mL of chloroform, and shake for 1 minute: the chloroform layer remains free from a purple color.

(5) Heavy metals $<1.07>$—Evaporate 5 mL of Hydrochloric Acid on a water bath to dryness, and add 2 mL of dilute acetic acid and water to the residue to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 3.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and water to make 50 mL (not more than 5 ppm).

(6) Arsenic $<1.11>$—Prepare the test solution with 1.7 mL of Hydrochloric Acid according to Method 1, and perform the test (not more than 1 ppm).

(7) Mercury—Dilute 20 mL of Hydrochloric Acid with water to make exactly 100 mL, and use the solution as the sample solution. Perform the test with the sample solution as directed under Atomic Absorption Spectrophotometry $<2.2.3>$ (cold vapor type). Place the sample solution in a sample bottle of the atomic absorption spectrophotometer, add 10 mL of tin (II) chloride-sulfuric acid TS, connect the bottle immediately to the spectrophotometer, circulate air, and determine the absorbance $A_1$ of the sample solution after the recorder reading has risen rapidly, and becomes constant at a wavelength of 253.7 nm. On the other hand, to 8 mL of Standard Mercury Solution add water to make exactly 100 mL, and determine the absorbance $A_2$ of the solution obtained by the same procedure as used for the sample solution: $A_1$ is smaller than $A_2$ (not more than 0.04 ppm).

Residue on ignition $<2.44>$ Pipet 10 mL of Hydrochloric Acid, add 2 drops of sulfuric acid, evaporate to dryness, and ignite: not more than 1.0 mg of residue remains.

Assay Weigh accurately a glass-stoppered flask containing 20 mL of water, add about 3 mL of Hydrochloric Acid, and weigh accurately again. Dilute with 25 mL of water, and titrate $<2.50>$ with 1 mol/L sodium hydroxide VS (indicator: 2 to 3 drops of methyl red TS).

Each mL of 1 mol/L sodium hydroxide VS = 36.46 mg of HCl

Containers and storage Containers—Tight containers.

**Dilute Hydrochloric Acid**

希塩酸

Dilute Hydrochloric Acid contains not less than 9.5 w/v% and not more than 10.5 w/v% of hydrogen chloride (HCl: 36.46).

Description Dilute Hydrochloric Acid is a colorless liquid. It is odorless and has a strong acid taste.

Specific gravity $d_{20}$: about 1.05.

Identification A solution of Dilute Hydrochloric Acid (1 in 30) changes blue litmus paper to red and responds to Qualitative Tests $<1.09>$ for chloride.

Purity (1) Sulfate—To 3.0 mL of Dilute Hydrochloric Acid add 5 mL of water and 5 drops of barium chloride TS, and allow to stand for 1 hour: no turbidity is produced.

(2) Sulphate—To 3.0 mL of Dilute Hydrochloric Acid add 5 mL of water and 1 drop of iodine TS: the color of iodine TS does not disappear.

(3) Bromide or iodide—Place 10 mL of Dilute Hydrochloric Acid in a glass-stoppered test tube, add 1 mL of chloro-
roform and 1 drop of 0.002 mol/L potassium permanganate VS, and shake well: the chloroform layer remains colorless.

(4) Bromine or chlorine—Place 10 mL of Dilute Hydrochloric Acid in a glass-stoppered test tube, add 5 drops of potassium iodide TS and 1 mL of chloroform, and shake for 1 minute: the chloroform layer remains free from a purple color.

(5) Heavy metals <1.07>—Evaporate 9.5 mL of Dilute Hydrochloric Acid on a water bath to dryness, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 3.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and water to make 50 mL (not more than 3 ppm).

(6) Arsenic <1.11>—Prepare the test solution with 4.0 mL of Dilute Hydrochloric Acid according to Method 1, and perform the test (not more than 0.5 ppm).

(7) Mercury—Dilute 80 mL of Dilute Hydrochloric Acid with water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution as directed under Atomic Absorption Spectrophotometry <2.23> (cold vapor type). Place the sample solution in a sample bottle of the atomic absorption spectrophotometer, add 10 mL of tin (II) chloride-sulfuric acid TS, connect the bottle immediately to the spectrophotometer, circulate air, and determine the absorbance \( A_1 \) of the sample solution after the recorder reading has risen rapidly and become constant at a wavelength of 253.7 nm. On the other hand, to 8 mL of Standard Mercury Solution add water to make exactly 100 mL, and determine the absorbance \( A_S \) of the solution obtained by the same procedure as used for the sample solution: \( A_1 \) is smaller than \( A_S \) (not more than 0.01 ppm).

Residue on ignition <2.44> Pipet 10 mL of Dilute Hydrochloric Acid, add 2 drops of sulfuric acid, evaporate to dryness, and ignite: the mass of the residue is not more than 1.0 mg.

Assay Measure exactly 10 mL of Dilute Hydrochloric Acid, and dilute with 20 mL of water. Titrate <2.50> with 1 mol/L sodium hydroxide VS (indicator: 2 to 3 drops of methyl red TS).

Each mL of 1 mol/L sodium hydroxide VS = 36.46 mg of HCl

Containers and storage Containers—Tight containers.

### Hydrochlorothiazide

#### 塩酸リモナーデ

### Hydrochlorothiazide

**Structure**

![Hydrochlorothiazide Structure](image)

**Formula**

\( \text{C}_6\text{H}_2\text{ClIN}_2\text{O}_3\text{S}_2 \)

**Molecular Weight**

297.74

**Chemical Name**

6-Chloro-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide

**CAS Number**

58-93-5

**Description**

Hydrochlorothiazide, when dried, contains not less than 99.0% of hydrochlorothiazide (\( \text{C}_6\text{H}_2\text{ClIN}_2\text{O}_3\text{S}_2 \)).

**Identification**

1. To 5 mg of Hydrochlorothiazide add 5 mL of chromotropic acid TS, and allow to stand for 5 minutes: a purple color develops.

2. Fuse a mixture of 0.1 g of Hydrochlorothiazide and 0.5 g of sodium carbonate dehydrate cautiously: the gas evolved changes moistened red litmus paper to blue. After cooling, crush with a glass rod, add 10 mL of water, stir, and filter. To 4 mL of the filtrate add 2 drops of hydrogen peroxide (30), 5 mL of diluted hydrochloric acid (1 in 5) and 2 to 3 drops of barium chloride TS: a white precipitate is produced.

3. To 4 mL of the filtrate obtained in (2) add 5 mL of dilute nitric acid and 3 drops of silver nitrate TS: a white precipitate is produced.

4. Dissolve 12 mg of Hydrochlorothiazide in 100 mL of sodium hydroxide TS. Dilute 10 mL of the solution with water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Hydrochlorothiazide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity**

1. Chloride <1.03>—Dissolve 1.0 g of Hydrochlorothiazide in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 1.0 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.036%).

2. Sulfate <1.14>—Dissolve 1.0 g of Hydrochlorothiazide in 30 mL of acetone, add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 1.0 mL of 0.005 mol/L sulfuric acid VS add 30 mL of acetone, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.04%).

3. Heavy metals <1.07>—Proceed with 1.0 g of Hydrochlorothiazide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

---

*The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)*
(4) Primary aromatic amines—Dissolve 80 mg of Hydrochlorothiazide in acetone to make exactly 100 mL. Measure exactly 1 mL of the solution, add 3.0 mL of dilute hydrochloric acid, 3.0 mL of water and 0.15 mL of sodium nitrite TS, shake, and allow to stand for 1 minute. Shake this solution with 1.0 mL of ammonium metabisulfite TS, allow to stand for 3 minutes, then add 1.0 mL of N,N-diethyl-N'1-naphthylendiamine oxalate TS, shake, and allow to stand for 5 minutes. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared with 1.0 mL of acetone in the same manner as the blank: the absorbance at 525 nm is not more than 0.10.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 30 mg each of Hydrochlorothiazide and Hydrochlorothiazide RS, previously dried, and dissolve in 150 mL of the mobile phase, add exactly 10 mL each of the internal standard solution, then add the mobile phase to make 200 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01G> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of hydrochlorothiazide to that of the internal standard.

\[
M = M_0 \times \frac{Q_1}{Q_2}
\]

**Internal standard solution**—A solution of 4-aminoacetophenone in acetonitrile (9 in 2000).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 0.1 mol/L sodium dihydrogen phosphate TS (pH 3.0) and acetonitrile (9:1).
Flow rate: Adjust so that the retention time of hydrochlorothiazide is about 10 minutes.

**System suitability**—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, hydrochlorothiazide and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of hydrochlorothiazide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

---

**Hydrocortisone**

ヒドロコルチゾン

C₂₁H₃₀O₅: 362.46
11β,17,21-Trihydroxypregn-4-ene-3,20-dione [50-23-7]

Hydrocortisone, when dried, contains not less than 97.0% and not more than 102.0% of hydrocortisone (C₂₁H₃₀O₅).

**Description** Hydrocortisone occurs as a white crystalline powder.
It is sparingly soluble in methanol and in ethanol (99.5), and very slightly soluble in water.
Melting point: 212 – 220°C (with decomposition).
It shows crystal polymorphism.

**Identification** (1) Add 2 mL of sulfuric acid to 2 mg of Hydrocortisone: the solution shows a yellow-green fluorescence immediately, and the color of the solution changes gradually from orange to dark red. Dilute carefully the solution with 10 mL of water: the color changes through yellow to orange-yellow with green fluorescence, and a small amount of a flocculent precipitate is formed.
(2) Dissolve 0.1 g of Hydrocortisone in 1 mL of methanol, add 1 mL of Fehling’s TS, and heat: a red precipitate is formed.
(3) Determine the infrared absorption spectrum of Hydrocortisone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Hydrocortisone RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Hydrocortisone and Hydrocortisone RS in ethanol (95), respectively, then evaporate the ethanol to dryness, and repeat the test on the residues.

**Optical rotation** <2.49> [α]₀^25°: +160° to +170° (after drying, 0.1 g, ethanol (99.5), 10 mL, 100 mm).

**Purity** Related substances—Dissolve 20 mg of Hydrocortisone in 10 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.02>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (95) (17:3) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).
**Hydrocortisone Acetate**

**Assay** Dissolve about 20 mg each of Hydrocortisone and Hydrocortisone RS, previously dried and accurately weighed, in 20 mL each of a mixture of chloroform and methanol (9:1), add 10 mL each of the internal standard solution, then add a mixture of chloroform and methanol (9:1) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 µL each of these solutions as directed under Liquid Chromatography \( <2.01 > \) according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of hydrocortisone to that of the internal standard, respectively.

Amount (mg) of hydrocortisone \( (C_{21}H_{26}O_5) = M_5 \times \frac{Q_T}{Q_S} \)

\( M_5 \): Amount (mg) of Hydrocortisone RS taken

**Internal standard solution**—A solution of prednisone in a mixture of chloroform and methanol (9:1) (9 in 10,000).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 245 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 20°C.
Mobile phase: A mixture of chloroform, methanol and acetic acid (100) (1000:20:1).
Flow rate: Adjust so that the retention time of hydrocortisone is about 15 minutes.

**System suitability**—
System performance: When the procedure is run with 5 µL of the standard solution under the above operating conditions, the internal standard and hydrocortisone are eluted in this order with the resolution between these peaks being not less than 7.
System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of hydrocortisone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

**Hydrocortisone Acetate**

ヒドロコルチゾン酢酸エステル

\[
\text{C}_2\text{H}_3\text{O}_4: \text{404.50} \\
11\beta,17,21-\text{Trihydroxypregn-4-ene-3,20-dione 21-acetate} \ [50-03-3]
\]

Hydrocortisone Acetate, when dried, contains not less than 97.0% and not more than 102.0% of hydrocortisone acetate \( (C_{21}H_{23}O_5) \).

**Description** Hydrocortisone Acetate occurs as white, crystalline or crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

Melting point: about 220°C (with decomposition). It shows crystal polymorphism.

**Identification** (1) Add 2 mL of sulfuric acid to 2 mg of Hydrocortisone Acetate: the solution shows a yellowish green fluorescence immediately, and the color of the solution gradually changes through orange-yellow to dark red. This solution shows a strong light green fluorescence under ultraviolet light. Add carefully 10 mL of water to this solution: the color changes from yellow to orange-yellow with a light green fluorescence, and a yellow-brown, flocculent precipitate is formed.

(2) Dissolve 0.01 g of Hydrocortisone Acetate in 1 mL of methanol by warming, add 1 mL of Fehling’s TS, and heat: an orange to red precipitate is formed.

(3) To 0.05 g of Hydrocortisone Acetate add 2 mL of potassium hydroxide-ethanol TS, and heat on a water bath for 5 minutes. Cool, add 2 mL of diluted sulfuric acid (2 in 7), and boil gently for 1 minute: the odor of ethyl acetate is perceptible.

(4) Determine the infrared absorption spectra of Hydrocortisone Acetate and Hydrocortisone Acetate RS, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25 > \): both the sample and the RS exhibit similar intensities of absorption at the same wave numbers. If any difference appears, dissolve the sample and the Reference Standard in ethanol (95), respectively, evaporate to dryness, and repeat the test on the residues.

**Optical rotation** \( <2.49 > \) \([\alpha]_D^2:\ +154^\circ - +164^\circ \) (after drying, 50 mg, dimethylsulfoxide, 10 mL, 100 mm).

**Purity** Related substances—Dissolve 40 mg of Hydrocortisone Acetate in 25 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 2 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.06 > \). Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, diethyl ether, methanol and water (160:30:8:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \( <2.41 > \) Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** \( <2.44 > \) Not more than 0.1% (0.5 g).

**Assay** Dissolve about 20 mg each of Hydrocortisone Acetate and Hydrocortisone Acetate RS, previously dried and accurately weighed, in methanol, add exactly 10 mL each of the internal standard solution, then add methanol to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 > \) according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of hydrocortisone acetate to that of the internal standard, respectively.

Amount (mg) of hydrocortisone acetate \( (C_{21}H_{25}O_5) = M_5 \times \frac{Q_T}{Q_S} \)

\( M_5 \): Amount (mg) of Hydrocortisone Acetate RS taken.
Internal standard solution—A solution of benzyl parahydroxybenzoate in methanol (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water and acetonitrile (13:7).
Flow rate: Adjust so that the retention time of hydrocortisone acetate is about 8 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, hydrocortisone acetate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of hydrocortisone acetate to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

Hydrocortisone Butyrate

Hydrocortisone Butyrate occurs as a white powder. It is odorless.
It is freely soluble in chloroform, soluble in methanol, sparingly soluble in ethanol (99.5) and practically insoluble in water.

Melting point: about 200°C (with decomposition).

Identification (1) Add 2 mL of sulfuric acid to 2 mg of Hydrocortisone Butyrate: the solution shows a yellowish green fluorescence immediately, and the color of the solution gradually changes through orange-yellow to dark red. This solution shows a strong light green fluorescence under ultraviolet light (main wavelength: 254 nm). Add carefully 10 mL of water to this solution: the color changes from yellow to orange-yellow with a light green fluorescence, and a yellow-brown, flocculent precipitate is formed.

(2) Dissolve 0.01 g of Hydrocortisone Butyrate in 1 mL of methanol by warming, add 1 mL of Fehling’s TS, and heat: an orange to red precipitate is formed.

(3) To 50 mg of Hydrocortisone Butyrate add 2 mL of potassium hydroxide-ethanol TS, and heat on a water bath for 5 minutes. Cool, add 2 mL of diluted sulfuric acid (2 in 7), and boil gently for 1 minute: the odor of ethyl butyrate is perceptible.

(4) Determine the infrared absorption spectrum of Hydrocortisone Butyrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D25 +48°–+52° (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

Purity (1) Heavy metals <1.0%—Proceed with 1.0 g of

Hydrocortisone Butyrate and Diphenhydramine Ointment

Method of preparation

<tr>
<td></td>
<td>To make 1000 g</td>
</tr>
</tbody>
</table>

Prepare as directed under Ointments, with the above ingredients.

Description Hydrocortisone and Diphenhydramine Ointment is white to pale yellow in color.

Identification (1) To 1 g of Hydrocortisone and Diphenhydramine Ointment add 10 mL of ethanol (95%), heat on a water bath for 5 minutes with occasional shaking, cool, and filter. Take 5 mL of the filtrate, distill off the ethanol, and to the residue add 2 mL of sulfuric acid: the solution shows a yellow-green fluorescence immediately and the color of the solution gradually changes through yellow to yellow-brown. Add carefully 10 mL of water to this solution: the color changes to yellow with green fluorescence, and a light yellow, flocculent precipitate is formed (hydrocortisone acetate).

(2) To 1 mL of the filtrate obtained in (1) add 5 mL of potassium hydrogen phthalate buffer solution (pH 4.6) and 2 mL of bromophenol blue TS, and add further 5 mL of chloroform. Shake well, and allow to stand: a yellow color develops in the chloroform layer (diphenhydramine).

(3) To 0.2 g of Hydrocortisone and Diphenhydramine Ointment add 0.5 mL of methanol, warm, and shake. After cooling, separate the methanol layer, and use this layer as the sample solution. Dissolve 10 mg each of hydrocortisone acetate and diphenhydramine in 10 mL each of methanol, and use these solutions as standard solutions (1) and (2).

Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and diethyl ether (4:1) to a distance of about 5 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): two spots obtained from the sample solution show the same Rf value as the corresponding spots from standard solutions (1) and (2).

Containers and storage—Containers—Tight containers.

Storage—Light-resistant.

Hydrocortisone Butyrate

ビドロコレゾン酢酸エステル

C₂₁H₃₅O₄: 432.55
11β,17,21-Trihydroxy pregn-4-ene-3,20-dione 17-butanoate [13609-67-1]
Hydrocortisone Butyrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Hydrocortisone Butyrate in 50 mL of a mixture of acetonitrile and the mobile phase A (4:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile and the mobile phase A (4:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than hydrocortisone butyrate obtained from the sample solution is not larger than the peak area of hydrocortisone butyrate from the standard solution, and the total area of the peaks other than hydrocortisone butyrate from the sample solution is not larger than 2 times the peak area of hydrocortisone butyrate from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: Dissolve 1 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 5.5 with potassium hydroxide TS.
Mobile phase B: Acetonitrile.
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 12.5</td>
<td>100 → 35</td>
<td>20 → 65</td>
</tr>
<tr>
<td>12.5 – 15.5</td>
<td>35</td>
<td>65</td>
</tr>
</tbody>
</table>

Flow rate: 2.0 mL per minute.
Time span of measurement: For 15.5 minutes after injection, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of acetonitrile and the mobile phase A (4:1) to make exactly 20 mL. Confirm that the peak area of hydrocortisone butyrate obtained with 5 μL of this solution is equivalent to 3.5 to 6.5% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of hydrocortisone butyrate are not less than 10,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of hydrocortisone butyrate is not more than 2.0%.

**Loss on drying** <2.44> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg of Hydrocortisone Butyrate, previously dried, and dissolve in ethanol (99.5) to make exactly 100 mL. Pipet 2 mL of this solution, and add ethanol (99.5) to make exactly 50 mL. Determine the absorbance A of this solution at the wavelength of maximum absorption at about 241 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of hydrocortisone butyrate ($C_{25}H_{30}O_8P$) = $A/375 \times 25,000$

**Containers and storage** Containers—Tight containers.

**Hydrocortisone Sodium Phosphate**

ヒドロコルチゾンリン酸エステルナトリウム

$C_{25}H_{30}Na_8O_8P$: 486.40
11β,17,21-Trihydroxyprog-4-e-ne-3,20-dione
21-(disodium phosphate)
[6000-74-4]

Hydrocortisone Sodium Phosphate contains not less than 96.0% and not more than 102.0% of hydrocortisone sodium phosphate ($C_{25}H_{30}Na_8O_8P$), calculated on the anhydrous basis.

**Description** Hydrocortisone Sodium Phosphate occurs as a white to light yellow powder. It is freely soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol (95).

It is hygroscopic. It shows crystal polymorphism.

**Identification** (1) To 2 mg of Hydrocortisone Sodium Phosphate add 2 mL of sulfuric acid: a yellowish green fluorescence is exhibited initially, then gradually changes through orange-yellow to dark red. Examine the solution under ultraviolet light (main wavelength: 254 nm): an intense, light green fluorescence is exhibited. To this solution add carefully 10 mL of water: the color changes from yellow to orange-yellow with a light green fluorescence and a yellow-brown, flocculent floating substance is formed.

(2) Determine the infrared absorption spectrum of Hydrocortisone Sodium Phosphate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Hydrocortisone Sodium Phosphate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Hydrocortisone Sodium Phosphate and Hydrocortisone Sodium Phosphate RS in methanol, respectively, then evaporate the methanol to dryness, and repeat the test on the residues.

(3) Moisten 1.0 g of Hydrocortisone Sodium Phosphate with a small quantity of sulfuric acid, and incinerate by gradual heating. After cooling, dissolve the residue in 10 mL of dilute nitric acid, and heat in a water bath for 30 minutes. After cooling, filter if necessary. This solution responds to Qualitative Tests <1.99> for sodium salt and for phosphate.

**Optical rotation** <2.49> $[\alpha]_D^{\text{20}} + 123 \pm 131\,\text{°}$ (1 g calculated on the anhydrous basis, phosphate buffer solution (pH 7.0), 100 mL, 100 mm).
pH <2.5> Dissolve 1.0 g of Hydrocortisone Sodium Phosphate in 100 mL of water: the pH of this solution is between 7.5 and 9.5.

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Hydrocortisone Sodium Phosphate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Chloride <1.0%>—Dissolve 0.30 g of Hydrocortisone Sodium Phosphate in 20 mL of water, and add 6 mL of dilute nitric acid and water to make 100 mL. To 5 mL of this solution add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.600%).

(3) Heavy metals <1.0%>—Proceed with 0.5 g of Hydrocortisone Sodium Phosphate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 40 ppm).

(4) Arsenic <1.1%>—Prepare the test solution with 1.0 g of Hydrocortisone Sodium Phosphate according to Method 3, and perform the test (not more than 2 ppm).

(5) Free phosphoric acid—Weigh accurately about 0.25 g of Hydrocortisone Sodium Phosphate, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Pipet 5 mL each of the sample solution and Standard Phosphoric Acid Solution into separate 25-mL volumetric flasks, add 2.5 mL of hexammonium heptamolybdate-sulfuric acid TS and 1 mL of l-aminoo-2-naphthyl-4-sulfonic acid TS, shake, add water to make exactly 25 mL, and allow to stand at 20 ± 1°C for 30 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared with 5 mL of water in the same manner as the blank. Determine the absorbances, A₁ and A₅, at 740 nm of the sample solution and Standard Phosphoric Acid Solution: the amount of free phosphoric acid is not more than 1.0%.

**Content (%) of free phosphoric acid (H₃PO₄)**

\[
\text{Content} = \frac{1}{M} \times \frac{A_1}{A_5} \times 258.0
\]

M: Amount (mg) of Hydrocortisone Sodium Phosphate taken, calculated on the anhydrous basis

(6) Free hydrocortisone—Dissolve 25 mg of Hydrocortisone Sodium Phosphate in the mobile phase to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh 25 mg of Hydrocortisone RS, previously dried at 105°C for 3 hours, and dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas, A₁ and A₅, of hydrocortisone in each solution: A₁ is not larger than A₅.

**Operating conditions**

Proced as directed in the operating conditions in the Assay.

**System suitability**

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of hydrocortisone is not more than 1.0%.

**Water <2.4%>** Not more than 5.0% (30 mg, coulometric titration).

**Assay**

Weigh accurately about 20 mg each of Hydrocortisone Sodium Phosphate and Hydrocortisone Sodium Phosphate RS (previously determine the water <2.4%> in the same manner as Hydrocortisone Sodium Phosphate), dissolve each in 50 mL of the mobile phase, add exactly 10 mL of the internal standard solution, then add the mobile phase to make 200 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₅, of the peak area of hydrocortisone phosphate to that of the internal standard, respectively.

Amount (mg) of hydrocortisone sodium phosphate

\[
(C_{21}H_{29}NaO_{8}P) = M_S \times \frac{Q_1}{Q_5}
\]

Mₛ: Amount (mg) of Hydrocortisone Sodium Phosphate RS taken, calculated on the anhydrous basis

**Internal standard solution**—A solution of isopropyl parahydroxybenzoate in the mobile phase (3 in 5000).

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L sodium dihydrogen phosphate TS (pH 2.6) and methanol (1:1).

Flow rate: Adjust so that the retention time of hydrocortisone phosphate is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, hydrocortisone phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of hydrocortisone phosphate to that of the internal standard is not more than 1.0%.

**Containers and storage**

Containers—Tight containers.

### Hydrocortisone Sodium Succinate

ヒドロコルチゾンコハク酸エステルナトリウム

C₂₂H₃₃NaO₄: 484.51

Monosodium 11β,17,21-trihydroxypregn-4-ene-3,20-dione 21-succinate

[125-04-2]

Hydrocortisone Sodium Succinate, calculated on the dried basis, contains not less than 97.0% and not more than 103.0% of hydrocortisone sodium succinate (C₂₂H₃₃NaO₄).
**Description** Hydrocortisone Sodium Succinate occurs as a white, powder or masses.

It is freely soluble in water, in methanol and in ethanol (95).

It is hygroscopic.

It is gradually colored by light.

It shows crystal polymorphism.

**Identification (1)** Dissolve 0.2 g of Hydrocortisone Sodium Succinate in 20 mL of water, and add 0.5 mL of dilute hydrochloric acid with stirring: a white precipitate is formed. Collect the precipitate, wash it with two 10-mL portions of water, and dry at 105°C for 3 hours. To 3 mg of this dried matter add 2 mL of sulfuric acid: the solution shows a yellowish green fluorescence immediately, and the color of the solution gradually changes through orange-yellow to dark red. This solution shows a strong light green fluorescence under ultraviolet light. Add carefully 10 mL of water to this solution: the color changes from yellow to orange-yellow with a light green fluorescence, and a yellow-brown flocculent precipitate is formed.

(2) Dissolve 10 mg of the dried matter obtained in (1) in 1 mL of methanol, add 1 mL of Fehling’s TS, and heat: an orange to red precipitate is formed.

(3) To 0.1 g of the dried matter obtained in (1) add 2 mL of sodium hydroxide TS, and allow to stand for 10 minutes. Filter the solution to remove the precipitate formed, mix the filtrate with 1 mL of dilute hydrochloric acid, filter if necessary, then adjust the solution to a pH of about 6 with diluted ammonia TS (1 in 10), and add 2 to 3 drops of iron (III) chloride TS: a brown precipitate is formed.

(4) Determine the infrared absorption spectrum of the dried matter obtained in (1) as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Hydrocortisone Succinate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Hydrocortisone Sodium Succinate and Hydrocortisone Succinate RS in methanol, respectively, then evaporate the methanol to dryness, and repeat the test on the residues.

(5) Hydrocortisone Sodium Succinate responds to Qualitative Tests <1.09 (1) for sodium salt.

**Optical rotation** <2.49> [α]D<sup>20</sup> = +135 – +145° (0.1 g calculated on the dried basis, ethanol (95), 10 mL, 100 mm).

**Purity (1)** Clarity of color of solution—Dissolve 0.5 g of Hydrocortisone Sodium Succinate in 5 mL of water: the solution is clear and colorless.

(2) Related substances—Dissolve 25 mg of Hydrocortisone Sodium Succinate in methanol to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 25 mg of hydrocortisone in methanol to make exactly 10 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 6 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 3 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethanol (99.5) and formic acid (150:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot obtained from the sample solution corresponding to the spot from the standard solution (1) is not more intense than the spot from the standard solution (1). Any spot other than the principal spot and the above spot from the sample solution is not more than one, and is not more intense than the spot from the standard solution (2).

**Loss on drying <2.41>** Not more than 2.0% (0.5 g, 105°C, 3 hours).

**Assay** Weigh accurately about 10 mg of Hydrocortisone Sodium Succinate, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Hydrocortisone Succinate RS, previously dried at 105°C for 3 hours, proceed in the same manner as directed for the sample solution, and use this solution as the standard solution. Determine the absorbances, A<sub>T</sub> and A<sub>S</sub>, of the sample solution and standard solution at 240 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of hydrocortisone sodium succinate} = \frac{M_S}{M_R} \times A_T / A_S \times 1.048
\]

M<sub>S</sub>: Amount (mg) of Hydrocortisone Succinate RS taken

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Hydrocortisone Succinate**

ヒドロコルチゾンコハク酸エステル

C<sub>22</sub>H<sub>34</sub>O<sub>5</sub>; 462.53

11β,17,21-Trihydroxyprog-4-ene-3,20-dione

21-(hydrogen succinate) [2203-97-6]

Hydrocortisone Succinate, when dried, contains not less than 97.0% and not more than 103.0% of hydrocortisone succinate (C<sub>22</sub>H<sub>34</sub>O<sub>5</sub>).

**Description** Hydrocortisone Succinate occurs as a white crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (95), and practically insoluble in water.

It shows crystal polymorphism.

**Identification (1)** To 3 mg of Hydrocortisone Succinate add 2 mL of sulfuric acid: the solution shows a yellowish green fluorescence immediately, and the color of the solution gradually changes through orange-yellow to dark red. This solution shows a strong light green fluorescence under ultraviolet light. Add carefully 10 mL of water to this solution: the color changes from yellow to orange-yellow with a light green fluorescence, and a yellow-brown flocculent precipitate is formed.

(2) Determine the infrared absorption spectrum of Hydrocortisone Succinate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Refer-
enone Spectrum or the spectrum of previously dried Hydrocortisone Succinate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Hydrocortisone Succinate and Hydrocortisone Succinate RS in methanol, respectively, then evaporate the methanol to dryness, and repeat the test on the residues.

**Optical rotation** \[\langle 2,49 \rangle \; [\alpha]_D^2 = \pm 147 - \pm 153^\circ \) (after drying, 0.1 g, ethanol (99.5), 10 mL, 100 nm).

**Purity** Related substances—Dissolve 25 mg of Hydrocortisone Succinate in exactly 10 mL of methanol, and use this solution as the sample solution. Separately, dissolve 25 mg of hydrocortisone in exactly 10 mL of methanol. Pipet 1 mL of this solution, dilute with methanol to exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( < 2.05 \rangle \). Spot 3 mL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethanol (99.5) and formic acid (150:10:1) to a distance of about 10 cm, and air-dry the plate. **Assay** Weigh accurately about 50 mg each of Hydrocortisone Succinate and Hydrocortisone Succinate RS, previously dried, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography \( < 2.01 \rangle \) according to the following operating conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of hydrocortisone succinate to that of the internal standard, respectively.

\[
\text{Amount (mg) of hydrocortisone succinate} \quad (\text{C}_21\text{H}_{34}\text{O}_3) = M_s \times \frac{Q_1}{Q_2}
\]

\( M_s \): Amount (mg) of Hydrocortisone Succinate RS taken

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (1 in 2500).

**Operating conditions**—
- Detector: An ultraviolet absorbance photometer (wavelength: 254 nm).
- Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecysilsilanized silica gel (10 µm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of acetic acid-sodium acetate buffer solution (pH 4.0) and acetonitrile (3:2).
- Flow rate: Adjust so that the retention time of hydrocortisone succinate is about 5 minutes.

**System suitability**—
- System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, hydrocortisone succinate and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

**System repeatability:** When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of hydrocortisone succinate to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.

**Storage**—Light-resistant.

---

**Hydrocotarnine Hydrochloride Hydrate**

【ヒドロコタルニン塩酸塩水和物】

\( \text{C}_{16}\text{H}_{15}\text{NO}_3\cdot\text{HCl}\cdot\text{H}_2\text{O} : 275.73 \)

4-Methoxy-6-methyl-5,6,7,8-tetrahydro[1,3]dioxolo[4,5-g]isoquinoline monohydrochloride monohydrate [5985-55-7, anhydride]

**Appearance**—White to pale yellow, crystals or crystalline powder.

**Description**—Sparingly soluble in water, slightly soluble in ethanol (95) and in acetic acid (100), and slightly soluble in acetic anhydride.

**Identification** (1) Determine the absorption spectrum of a solution of Hydrocotarnine Hydrochloride Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \( > 2.24 \rangle \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Hydrocotarnine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \( > 2.25 \rangle \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Hydrocotarnine Hydrochloride Hydrate (1 in 50) responds to Qualitative Tests \( > 1.09 \rangle \) (2) for chloride.

**pH** \( < 2.54 \rangle \) Dissolve 1.0 g of Hydrocotarnine Hydrochloride Hydrate in 20 mL of water: the pH of the solution is between 4.0 and 6.0.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Hydrocotarnine Hydrochloride Hydrate in 10 mL of water: the solution is clear, and when the test is performed with this solution as directed under Ultraviolet-visible Spectrophotometry \( > 2.34 \rangle \), using water as the blank, the absorbance at 400 nm is not more than 0.17.

(2) Heavy metals \( < 0.07 \rangle \)—Proceeds with 1.0 g of Hydrocotarnine Hydrochloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Hydrocotarnine Hydrochloride Hydrate in 10 mL of diluted ethanol
Weigh accurately about 0.5 g of Hydroxocobalamin Acetate occurs as dark. Hydrogenated Oil occurs as a white mass or occa-

Official Monographs

Not more than 0.2 of hydroxocobalam-

Containers—Well-closed contain-

(1 g).

< Not more than 7.0

Chloride—To 1.5 g of Hydrogenated Oil add 30 mL of dilute hydrochloric acid and 10 mL of water on a water bath for 5 minutes with occasional shaking. After cooling, filter, and make 5 mL of the filtrate weakly alkaline with ammonia TS, then add 3 drops of sodium sulfide TS: the solution remains unchanged.

(5) Nickel—Place 5.0 g of Hydrogenated Oil in a quartz or porcelain crucible, heat slightly with caution at the beginning, and, after carbonization, incinerate by strong heating (500 ± 20°C). Cool, add 1 mL of hydrochloric acid, evaporate on a water bath to dryness, dissolve the residue in 3 mL of dilute hydrochloric acid, and add 7 mL of water. Then add 1 mL of bromine TS and 1 mL of a solution of citric acid monohydrate (1 in 5), make alkaline with 5 mL of ammonia TS, and cool in running water. To this solution add 1 mL of dimethylglyoxime TS, add water to make 20 mL, and use this solution as the test solution. Allow to stand for 5 minutes: the solution has no more color than the following control solution.

Control solution: Evaporate 1 mL of hydrochloric acid on a water bath to dryness, add 1 mL of Standard Nickel Solution and 3 mL of dilute hydrochloric acid, and add 6 mL of water. Then proceed as directed in the test solution, add water to make 20 mL, and allow to stand for 5 minutes.

Residue on ignition  Not more than 0.1% (5 g).

Containers and storage Containers—Well-closed containers.

Hydroxocobalamin Acetate

ヒドロキソコバラミン酢酸塩

\[
\begin{align*}
\text{C}_{62}\text{H}_{89}\text{CoN}_{7}\text{O}_{13}\text{P}_{2}\text{C}_{2}\text{H}_{12} \text{O}_{2} & : 1406.41 \\

\text{hydroxocobamide monacetate [13422-51-0, Hydroxocobalamin}}
\end{align*}
\]

Hydroxocobalamin Acetate contains not less than 96.0% and not more than 101.0% of hydroxocobalamin acetate \( \text{C}_{62}\text{H}_{89}\text{CoN}_{7}\text{O}_{13}\text{P}_{2}\text{C}_{2}\text{H}_{12} \text{O}_{2} \), calculated on the anhydrous and residual solvent-free basis.

Description Hydroxocobalamin Acetate occurs as dark red, crystals or powder. It is odorless.

It is freely soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is hygroscopic.

Weigh accurately about 0.5 g of Hydrocotarnine

\text{hydroxocobamide monacetate [13422-51-0, Hydroxocobalamin}}
\end{align*}
\]

Hydroxocobalamin Acetate contains not less than 96.0% and not more than 101.0% of hydroxocobalamin acetate \( \text{C}_{62}\text{H}_{89}\text{CoN}_{7}\text{O}_{13}\text{P}_{2}\text{C}_{2}\text{H}_{12} \text{O}_{2} \), calculated on the anhydrous and residual solvent-free basis.

Description Hydroxocobalamin Acetate occurs as dark red, crystals or powder. It is odorless.

It is freely soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is hygroscopic.
Hydroxyethylcellulose

Identification (1) Determine the absorption spectrum of a solution of Hydroxocobalamin Acetate in acetic acid-sodium acetate buffer solution (pH 4.5) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2,4>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Mix 1 mg of Hydroxocobalamin Acetate with 50 mg of potassium hydrogen sulfate, and fuse by igniting. Cool, break up the mass with a glass rod, add 3 mL of water, and dissolve by boiling. Add 1 drop of phenolphthalein TS, and add dropwise sodium hydroxide TS until the solution develops a light red. Then add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of a solution of disodium 1-nitroso-2-naphthol-3,6-disulfonate (1 in 500): a red to orange-red color develops immediately. Then add 0.5 mL of hydrochloric acid, and boil for 1 minute: the red color does not disappear.

(3) Add 0.5 mL of ethanol (99.5) and 1 mL of sulfuric acid to 20 mg of Hydroxocobalamin Acetate, and heat the mixture: the odor of ethyl acetate is perceptible.

Purity Conduct this procedure using light-resistant vessels. Dissolve 75 mg of Hydroxocobalamin Acetate in 100 mL of the dissolving solution, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the dissolving solution to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2,0> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than hydroxocobalamin obtained from the sample solution is not larger than the peak area of hydroxocobalamin from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 351 nm).
Column: Connect two columns which are 4.6 mm in inside diameter and 10 cm in length, composed of octadecylsilylized monolithic silica for liquid chromatography, having a bimodal pore structure with 2 μm macropore and 13 nm mesopore, coated with polyether ether ketone.
Column temperature: A constant temperature of about 30°C.
Mobile phase A: Water.
Mobile phase B: Methanol.
Mobile phase C: Dissolve 15.6 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust to pH 3 with diluted phosphoric acid (1 in 100).
Flowing of mobile phase: Control the gradient by mixing the mobile phase A, B and C as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
<th>Mobile phase C (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 20</td>
<td>82</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>20 – 40</td>
<td>82 → 50</td>
<td>8 → 40</td>
<td>10</td>
</tr>
</tbody>
</table>

Flow rate: 2 mL per minute.
Time span of measurement: For 40 minutes after injection of the sample solution.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, add the dissolving solution to make exactly 50 mL. Confirm that the peak area of hydroxocobalamin obtained with 20 μL of this solution is equivalent to 1.4 to 2.6% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of hydroxocobalamin are not less than 4000 and not more than 2,4, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of hydroxocobalamin is not more than 2.0%.

Water <2,4> 8.0 – 12.0% (50 mg, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Hydroxocobalamin Acetate, and dissolve in water to make exactly 500 mL. Pipet 5 mL of this solution, and add acetic acid-sodium acetate buffer solution (pH 4.5) to make exactly 25 mL. Determine the absorbance, A, of this solution at 351 nm as directed under Ultraviolet-visible Spectrophotometry <2,4>.

Amount (mg) of hydroxocobalamin acetate
\[
(C_{2}H_{9}CoN_{3}O_{12}P\cdot C_{2}H_{4}O_{2}) = A/187 \times 25,000

Containers and storage Containers—Tight containers.
Storage—Light-resistant, and in a cold place.

Hydroxyethylcellulose

ヒドロキシエチルセルロース

[9004-62-0]

This monograph is harmonized with the European Pharmacopoeia and the U. S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (◆ ◆), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◇ ◇).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Hydroxyethylcellulose is partly O-(2-hydroxyethylated) cellulose.

It contains not less than 30.0% and not more than 70.0% of hydroxyethoxy group (-OC_{2}H_{4}OH: 61.06), calculated on the dried basis.

It may contain suitable pH-adjusting agents such as phosphates.

◆ The viscosity is shown in millipascal second (mPa·s) on the label.

◆ Description Hydroxyethylcellulose occurs as a white to yellowish white, powder or grains.

It is practically insoluble in ethanol (95).

It forms a viscous liquid upon addition of water.

It is hygroscopic ◆

Identification (1) Determine the infrared absorption spec-
trum of Hydroxyethylcellulose as directed in the ATR method under Infrared Spectrophotometry <2.25> and compare the spectrum with the spectrum of Hydroxyethylcellulose for Identification RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Disperse 1.0 g of Hydroxyethylcellulose, calculated on the dried basis, in 50 mL of freshly boiled and cooled water. After 10 minutes, add freshly boiled and cooled water to make 100 mL, stir to dissolve completely, and use this solution as the sample solution. Boil 10 mL of the sample solution: the solution is clear.

**Viscosity**<2.53> Weigh exactly a quantity of Hydroxyethylcellulose, equivalent to 10.00 g calculated on the dried basis, add 400 mL of water, stir to dissolve, and add water to make exactly 500.0 g. Remove air bubbles, and use this solution as the sample solution. Perform the test with the sample solution at 20 ± 0.1°C as directed in Method II under Viscosity Determination, using a beaker with an inside diameter of not less than 70 mm and a single cylinder-type rotational viscometer, according to the following operating conditions: not less than 75% and not more than 140% of the labeled viscosity.

**Operating conditions**
- Apparatus: Brookfield type viscometer LV or RV model.
- Rotor No., rotation frequency and calculation multiplier: According to the following table, depending on the labeled viscosity.

<table>
<thead>
<tr>
<th>Labeled viscosity (mPa·s)</th>

Procedure of apparatus: Read a value after 2 minutes of rotation, and stop the rotation for at least 2 minutes. Repeat this procedure more two times, and average the three observed values.

**pH**<2.54> The pH of the sample solution obtained in the Identification (2) is between 5.5 and 8.5.

**Purity**
1. Chloride—To 1 mL of the sample solution obtained in the Identification (2) add water to make 30 mL, and use this solution as the sample solution. Separately, to 10 mL of Standard Chloride Solution add 5 mL of water, and use this solution as the control solution. To 15 mL of the sample solution and control solution add 1 mL of diluted nitric acid (1 in 5), transfer to test tubes containing 1 mL of a solution of silver nitrate (17 in 1000), allow to stand for 5 minutes protecting from light, and compare the opalescence developed in the both solutions against a black background by viewing transversely: the opalescence developed in the sample solution is not more intense than that of the control solution (not more than 1.0%).

2. Nitrate—Prepare the solutions before use. Dissolve 0.50 g of Hydroxyethylcellulose in the diluting solution to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve 0.8154 g of potassium nitrate in the diluting solution to make 1000 mL, and use this solution as the standard nitrate stock solution. If the viscosity of Hydroxyethylcellulose is not more than 1000 mPa·s, pipet 10 mL, 20 mL and 40 mL of the standard nitrate stock solution, add the diluting solution to each to make exactly 100 mL, and use these solutions as the standard solutions. If the viscosity of Hydroxyethylcellulose is more than 1000 mPa·s, pipet 1 mL, 2 mL and 4 mL of the standard nitrate stock solution, add the diluting solution to each to make exactly 100 mL, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions using a nitrate-selective electrode as an indicator electrode, a silver-silver chloride electrode as a reference electrode and diluted ammonium sulfate TS (1 in 30) as reference electrolyte. Calculate the concentration of nitrates in the sample solution using a calibration curve obtained from the potential differences of the standard solutions: not more than 3.0%, calculated on the dried basis, if Hydroxyethylcellulose has a viscosity of not more than 1000 mPa·s, and not more than 0.2%, calculated on the dried basis, if Hydroxyethylcellulose has a viscosity of more than 1000 mPa·s.

Diluting solution: To a mixture of 50 mL of 1 mol/L sulfuric acid TS and 800 mL of water add 135 g of potassium dihydrogen phosphate, and add water to make 1000 mL. To this solution add water to make exactly 25 times the initial volume.

In order to determine the applicable limit, determine the viscosity using the following procedure:
- Introduce a quantity of Hydroxyethylcellulose, equivalent to 2.00 g calculated on the dried basis, into 50 g of water, stir, add water to make 100 g, and stir to dissolve completely. Determine the viscosity using a rotating viscometer at 25°C and at a shear rate of 100 s⁻¹ for substances with an expected viscosity less than 100 mPa·s, at a shear rate of 1 s⁻¹ for substances with an expected viscosity not less than 100 mPa·s and not more than 20,000 mPa·s, and at a shear rate of 1 s⁻¹ for substances with an expected viscosity more than 20,000 mPa·s. If it is impossible to obtain a shear rate of exactly 10 s⁻¹ or 100 s⁻¹ respectively, use a rate slightly higher and a rate slightly lower and interpolate.

3. Heavy metal <1.07>—Proceed with 1.0 g of Hydroxyethylcellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

4. Aldehydes—Introduce 1.0 g of Hydroxyethylcellulose into a glass-stoppered test tube, add 10 mL of ethanol (99.5), stopper the tube tightly, and stir for 30 minutes. Centrifuge, and use the supernatant liquid as the sample solution. Use Standard Glyoxal Solution as the control solution. Pipet 2 mL each of the sample solution and control solution, to each add 5 mL of a solution prepared by dissolving 4 g of 3-methyl-2-benzothiazolonehydrazone hydrochloride monohydrate in diluted acetic acid (100) (4 in 5) to make 1000 mL, shake to homogenize, and allow to stand for 2 hours. Compare the color of these solutions: the sample solution is not more intensely colored than the control solution (not more than 20 ppm).

**Loss on drying**<2.41> Not more than 10.0% (1 g, 105°C, 3 hours).

**Residue on Ignition**<2.44> Not more than 4.0% if the viscosity of Hydroxyethylcellulose is not more than 1000 mPa·s, and not more than 1.0% if the viscosity of Hydroxyethylcellulose is more than 1000 mPa·s (1 g). In order to determine the applicable limit, determine the viscosity according to the method in the Purity (2).

**Assay** Weigh accurately about 30 mg of Hydroxyethylcellulose, transfer to a 5-mL pressure-tight serum vial, add exactly 60 mg of adipic acid, 2 mL of the internal standard solution and 1 mL of hydroiodic acid, seal the vial immediately with a septum coated with fluororesin and an aluminum cap..

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Dissolve 1 g of Hydroxypropylcellulose and not more than 0.2% of hydroxypropoxy group (-OC₂H₄O)₃SiO₂Silicon dioxide—Apply to Hydroxypropylcellulose, if < (g)). Moisten the residue with water, and add 5 mL of Hydroxypropylcellulose occurs as a white to 39.15 ter phase separation, pierce through the septum of the vial with a cooled syringe, and withdraw a sufficient volume of the upper phase as the sample solution. Separately, place exactly 60 mg of adipic acid, 2 mL of the internal standard solution and 1 mL of hydroiodic acid in another serum vial, and seal immediately. Weigh accurately the vial, inject 55 μL of iodoethane for assay through the septum in the vial, and weigh again accurately. Shake thoroughly, after phase separation, pierce through the septum of the vial with a cooled syringe, and withdraw a sufficient volume of the upper phase as the standard solution. Perform the test with 1 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of iodoethane to that of the internal standard.

\[
\text{Amount (\% of hydroxyethoxy group (C₂H₅O₂)₃)) = } \frac{M_5}{M_7} \times \frac{Q_1}{Q_2} \times 39.15
\]

\[
M_5: \text{Amount (mg) of iodoethane for assay taken}
\]
\[
M_7: \text{Amount (mg) of Hydroxyethylcellulose taken, calculated on the dried basis}
\]

**Internal standard solution**—A solution of n-octane in o-xylene (1 in 200).

**Operating conditions**—

- **Detector**: A hydrogen flame-ionization detector.
- **Column**: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated with dimethylpolysiloxane for gas chromatography in 3 μm thickness.
- **Column temperature**: Maintain the temperature at 50°C for 3 minutes, raise to 100°C at a rate of 10°C per minute, then raise to 250°C at a rate of 35°C per minute, and maintain at 250°C for 8 minutes.
- **Injection port temperature**: A constant temperature of about 250°C.
- **Detector temperature**: A constant temperature of about 280°C.
- **Carrier gas**: Helium.
- **Flow rate**: 4.2 mL per minutes (the retention time of the internal standard is about 10 minutes).
- **Split ratio**: 1:40.

**System suitability**—

- **System performance**: When the procedure is run with 1 μL of the standard solution under the above operating conditions, iodoethane and the internal standard are eluted in this order with the relative retention time of iodoethane to the internal standard being about 0.6 and the resolution between these peaks being not less than 5.0.
- **System repeatability**: When the test is repeated 6 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of iodoethane to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

### Hydroxypropylcellulose

**ヒドロキシプロピルセルロース**

[9004-64-2]

This monograph is harmonized with the European Pharmacopoeia and the U. S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (◆, ■), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◇, ○).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Hydroxypropylcellulose is partially O-(2-hydroxypropylated) cellulose.

It contains not less than 53.4% and not more than 80.5% of hydroxypropoxy group (-OC₂H₄OH: 75.09), calculated on the dried basis.

It may contain silicon dioxide as anti-caking agent.

◆ The label states the addition in the case where silicon dioxide is added as anti-caking agent.

- **Description** Hydroxypropylcellulose occurs as a white to yellowish white powder.
- It forms a viscous liquid upon addition of water or ethanol.

**Identification** (1) Dissolve 1 g of Hydroxypropylcellulose in 100 mL of water, transfer 1 mL of the solution to a glass plate, and allow the water to evaporate: a thin film is formed.

(2) Determine the infrared absorption spectrum of Hydroxypropylcellulose as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If there are an absorption at about 1719 cm⁻¹, disregard the absorption.

**pH** <2.54> Disperse evenly 1.0 g of Hydroxypropylcellulose in 100 mL of freshly boiled water, and allow to cool the mixture while stirring with a magnetic stirrer: the pH of the solution is between 5.0 and 8.0.

**Purity**

(1) Heavy metals<1.07>—Proceed with 1.0 g of Hydroxypropylcellulose according to Method 2 and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).◆

(2) Silicon dioxide—Apply to Hydroxypropylcellulose, if the addition of silicon dioxide is stated on the label and if more than 0.2% residue is found in the Residue on ignition test. Weigh accurately the crucible containing the residue tested in the Residue on ignition of Hydroxypropylcellulose (a g). Moisten the residue with water, and add 5 mL of hydrofluoric acid, in small portions. Evaporate it on a steam bath to dryness and cool. Add 5 mL of hydrochloric acid and 0.5 mL of sulfuric acid, and evaporate to dryness. Slowly increase the temperature until all the acids have been volatilized, and ignite at 1000 ± 25°C. Cool the crucible in a desiccator, and weigh (b g). Calculate the amount of silicon dioxide by the following equation: not more than 0.6%.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Amount (%) of silicon dioxide (SiO₂) = \( (a - b)/M \times 100 \)

\( M \): Amount (g) of Hydroxypropylcellulose used for residue on ignition test

**Loss on drying** Not more than 5.0% (1 g, 105°C, 4 hours).

**Residue on ignition** Not more than 0.8% (1 g, platinum crucible).

**Assay** Weigh accurately about 30 mg of Hydroxypropylcellulose, transfer to a reaction vial, add exactly 60 mg of adipic acid, 2 mL of the internal standard solution and 1 mL of hydriodic acid, stopper the vial tightly, and weigh accurately. Place the vial in an oven or beaker by a suitable container with continuous stirring, maintaining the internal temperature of 115 ± 2°C for 70 minutes. Allow the vial to cool and weigh accurately. If the difference of the mass between before heating and after heating is more than 10 mg, prepare a new test solution. If the difference of the mass between before heating and after heating is not more than 10 mg, after phase separation by allowing the vial to stand, pierce through the septum of the vial with a cooled syringe, and withdraw a sufficient volume of the upper phase as the sample solution. Separately, place exactly 60 mg of adipic acid, 2 mL of internal standard solution and 1 mL of hydriodic acid in another reaction vial, stopper tightly, and weigh accurately. Inject 25 μL of isopropyl iodide for assay through the septum, and again weigh accurately. Shake the vial thoroughly, and after phase separation by allowing the vial to stand, pierce through the septum of the vial with a cooled syringe, and withdraw a sufficient volume of the upper phase as the standard solution. Perform the test with 2 μL each of the sample solution and standard solution as directed under Gas Chromatography according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of isopropyl iodide to that of the internal standard.

Amount (%) of hydroxypropoxy group (C₃H₇O₂) = \( M_1/M_2 \times Q_1/Q_2 \times 1.15 \times 44.17 \)

\( M_3 \): Amount (mg) of isopropyl iodide for assay taken

\( M_1 \): Amount (mg) of Hydroxypropylcellulose taken, calculated on the dried basis

1.15: Correction factor

**Internal standard solution**—A solution of methylcyclohexan in o-xylene (1 in 50).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A fused silica tube 0.53 mm in diameter and 30 m in length, coated with methylsilicone polymer for gas chromatography in 3 μm thickness.

Column Temperature: Maintain the temperature at 40°C for 3 minutes, raise to 100°C at a rate of 10°C per minute, then raise to 250°C at a rate of 50°C per minute, and maintain at 250°C for 3 minutes.

Injection port temperature: A constant temperature of about 180°C.

Detector temperature: A constant temperature of about 280°C.

Carrier gas: Helium.

Flow rate: 52 cm per second (the retention time of the internal standard is about 8 minutes).

Split ratio: 1:50.

**System suitability**—

System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, isopropyl iodide and the internal standard are eluted in this order with the relative retention time of isopropyl iodide to the internal standard being about 0.8, and with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of isopropyl iodide to that of the internal standard is not more than 2.0%.

**Containers and storage**—Containers—Well-closed containers.

**Low Substituted Hydroxypropylcellulose**

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization are marked with symbols (●), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (◊). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Low Substituted Hydroxypropylcellulose is a low substituted hydroxyparyl ether of cellulose. It contains not less than 5.0% and not more than 15.0% of hydroxypropoxy group (−OC₃H₇OH: 75.09), calculated on the dried basis.

**Description**—Low Substituted Hydroxypropylcellulose occurs as a white to yellowish white, powder or granules. It is practically insoluble in ethanol (99.5). It dissolves in a solution of sodium hydroxide (1 in 10), and produces a viscous solution. It swells in water, in sodium carbonate TS and in 2 mol/L hydrochloric acid TS.

**Identification**

1. Shake thoroughly 0.1 g of Low Substituted Hydroxypropylcellulose with 10 mL of water; it does not dissolve.
2. To the dispersed solution obtained in (1) add 1 g of sodium hydroxide, and shake until the solution becomes uniform. Transfer 5 mL of this solution to a suitable vessel, add 10 mL of a mixture of acetone and methanol (4:1), and shake: a white, flocculent precipitate is formed.
3. Determine the infrared absorption spectrum of Low Substituted Hydroxypropylcellulose as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** Not less than 2.54 and not more than 7.5.

**Purity**—Heavy metals <1.0%—Proceed with 2.0 g of Low Substituted Hydroxypropylcellulose according to Method 2,
and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

Loss on drying 2.4.7 Not more than 5.0% (1 g, 105°C, 1 hour).

Residue on ignition 2.4.7 Not more than 0.8% (1 g).

Assay (i) Apparatus—Reaction vial: A 5-mL pressure-tight serum vial, 20 mm in outside diameter and 50 mm in height, 20 mm in outside diameter and 13 mm in inside diameter at the neck, equipped with a septum made of butyl-rubber whose surface is processed with fluoroplastics, which can be fixed to the vial and stoppered tightly with an aluminum cap or another system providing an equivalent air-tightness.

Heater: A square-shaped aluminum block, having holes 20 mm in diameter and 32 mm in depth, adopted to the reaction vial. Capable of stirring the content of the reaction vial by means of a magnetic stirrer or of a reciprocal shaker about 100 times per minute.

(ii) Procedure—Weigh accurately about 65 mg of Low Substituted Hydroxypropylcellulose, transfer to a reaction vial, add 0.06 to 0.10 g of adipic acid, 2.0 mL of the internal standard solution and 2.0 mL of hydroiodic acid, immediately stopper the vial tightly, and weigh accurately. Using a magnetic stirrer equipped in the heating module, or using a shaker, mix for 60 minutes while heating so that the temperature of the vial content is 130 ± 2°C. In the case when a magnetic stirrer or shaker is not available, heat for 30 minutes with repeated shaking at 5-6 minutes intervals by hand, and continue heating for an additional 30 minutes. Allow the vial to cool, and again weigh accurately. If the mass loss is less than 26 mg and there is no evidence of a leak of the content, use the upper layer of the mixture as the sample solution. Separately, put 0.06 to 0.10 g of adipic acid, 2.0 mL of the internal standard solution and 2.0 mL of hydroiodic acid in a reaction vial, immediately stopper the vial tightly, and weigh accurately. Add 15 to 22 mL of isopropyl iodide for assay through the septum using a micro-syringe, and weigh accurately. Shake the reaction vial thoroughly, and use the upper layer of the content as the standard solution. Perform the test with 1 to 2 μL each of the sample solution and standard solution as directed under Gas Chromatography 2.02 according to the following conditions, and calculate the ratios, Q\text{S} and Q\text{T}, of the peak area of isopropyl iodide to that of the internal standard.

\[
\text{Amount} \text{(%)} \text{ of hydroxypropoxy group (C}_3\text{H}_7\text{O}_2) = \frac{M\text{S}}{M\text{T}} \times \frac{Q\text{S}}{Q\text{T}} \times 44.17
\]

M\text{S}: Amount (mg) of isopropyl iodide for assay taken
M\text{T}: Amount (mg) of Low Substituted Hydroxypropylcellulose taken, calculated on the dried basis

Internal standard solution—A solution of n-octane in o-xylene (3 in 100).

Operating conditions—Detector: A thermal conductivity detector or hydrogen flame-ionization detector.
Column: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated with dimethylpolysiloxane for gas chromatography in 3 μm thickness. Use a guard column if necessary.

Column temperature: Maintain the temperature at 50°C for 3 minutes after injection, raise to 100°C at a rate of 10°C per minute, then to 250°C at a rate of 35°C per minute and maintain at 250°C for 8 minutes.
Injection port temperature: 250°C.
Detector temperature: 280°C.

Carrier gas: Helium.
Flow rate: 4.3 mL per minute (the retention time of the internal standard is about 10 minutes).
Split ratio: 1:40.

System suitability—
System performance: When the procedure is run with 1 to 2 μL of the standard solution under the above operating conditions, isopropyl iodide and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 1 to 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of isopropyl iodide to that of the internal standard is not more than 2.0%.

Containers and storage—Containers—Tight containers.

## Hydroxyzine Hydrochloride

### ヒドロキシジン塩酸塩

C\text{2}\text{H}_\text{3}\text{H}_\text{2}\text{ClN}_\text{2}\text{O}_\text{2}\cdot\text{2HCl}: 447.83
2-(2-[(R,S)-(4-Chlorophenyl)[phenyl)methyl]piperazin-1-yl)ethoxyethanol dihydrochloride

[2192-20-3]

Hydroxyzine Hydrochloride, when dried, contains not less than 98.5% of hydroxyzine hydrochloride (C\text{2}\text{H}_\text{7}\text{ClN}_\text{2}\text{O}_\text{2}\cdot\text{2HCl}).

Description Hydroxyzine Hydrochloride occurs as a white crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in water, freely soluble in methanol, in ethanol (95) and in acetic acid (100), very slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

Melting point: about 200°C (with decomposition).

Identification (1) To 5 mL of a solution of Hydroxyzine Hydrochloride (1 in 100) add 2 to 3 drops of ammonium thiocyanate-cobalt (II) nitrate TS: a blue precipitate is formed.

(2) Determine the absorption spectrum of a solution of Hydroxyzine Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.4, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Hydroxyzine Hydrochloride (1 in 10) responds to Qualitative Tests 1.09 for chloride.

\[ \text{pH} < 2.54 \] Dissolve 1.0 g of Hydroxyzine Hydrochloride in 20 mL of water: the pH of this solution is between 1.3 and 2.5.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Hydroxyzine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals 1.07—Proceed with 1.0 g of Hydroxyzine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
(3) Related substances—Dissolve 0.20 g of Hydroxyzine hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (95) and ammonia solution (28) (150:95:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spots other than the principal spot obtained from the sample solution are not more intense than the spot obtained from the standard solution.

**Loss on drying** <2.41> Not more than 3.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.1 g of Hydroxyzine hydrochloride, previously dried, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 22.39 mg of \( \text{C}_{21}\text{H}_{27}\text{ClN}_2\text{O}_2\cdot2\text{HCl} \)

**Containers and storage** Containers—Tight containers.

---

**Hydroxyzine Pamoate**

ヒドロキシジンパモ酸塩

![Chemical Structure](image)

\( \text{C}_2\text{H}_7\text{ClN}_2\text{O}_4 \cdot \text{C}_2\text{H}_6\text{O}_4: 763.27 \)

2-[2-(4-[4-((RS)-4-Chlorophenyl)(phenyl)methyl]piperazin-1-yl)ethoxy]ethanol mono[4,4'-methylenebis(3-hydroxy-2-naphthoate)]

[10246-75-0]

Hydroxyzine Pamoate contains not less than 98.0% of hydroxyzine pamoate \( \text{C}_{21}\text{H}_{27}\text{ClN}_2\text{O}_2\cdot\text{C}_2\text{H}_6\text{O}_4 \), calculated on the anhydrous basis.

**Description** Hydroxyzine Pamoate occurs as a light yellow crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in \( \text{N},\text{N}-\text{dimethylformamide} \), slightly soluble in acetone, and practically insoluble in water, in methanol, in ethanol (95) and in diethyl ether.

**Identification** (1) To 0.1 g of Hydroxyzine Pamoate add 25 mL of sodium hydroxide TS, and shake well. Extract with 20 mL of chloroform, and use the chloroform layer as the sample solution. Use the water layer for test (4). To 5 mL of the sample solution add 2 mL of ammonium thiocyanate-cobalt (II) nitrate TS, shake well, and allow to stand: a blue color is produced in the chloroform layer.

(2) Evaporate 2 mL of the sample solution obtained in (1) on a water bath to dryness, and dissolve the residue in 0.1 mol/L hydrochloric acid TS to make 500 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Hydroxyzine Pamoate as directed under Flame Coloration Test <1.04> (2): a green color appears.

(4) To 1 mL of the water layer obtained in (1), add 2 mL of 1 mol/L hydrochloric acid TS: a yellow precipitate is produced. Collect the precipitate, dissolve the precipitate in 5 mL of methanol, and add 1 drop of iron (III) chloride TS: a green color is produced.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Hydroxyzine Pamoate in 10 mL of \( \text{N},\text{N}-\text{dimethylformamide} \): the solution is clear, and shows a slightly greenish, light yellow-brown color.

(2) Chloride <1.03>—To 0.3 g of Hydroxyzine Pamoate add 6 mL of dilute nitric acid and 10 mL of water, shake for 5 minutes, and filter. Wash the residue with two 10-mL portions of water, combine the washings with the filtrate, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.80 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.095%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Hydroxyzine Pamoate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.17>—Prepare the test solution with 2.0 g of Hydroxyzine Pamoate according to Method 3, and perform the test (not more than 1 ppm).

(5) Related substances—Dissolve 0.40 g of Hydroxyzine Pamoate in 10 mL of a mixture of sodium hydroxide TS and acetic acid (1:1), and use the solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of sodium hydroxide TS and acetone (1:1) to make exactly 20 mL. Pipet 5 mL of this solution, add a mixture of sodium hydroxide TS and acetone (1:1) to make exactly 50 mL, and use the solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (95) and ammonia TS (150:95:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly hydrogen hexachloroplatinate (IV)-potassium iodide TS on the plate: the spots other than hydroxyzine and pamoic acid obtained from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 3.0% (1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.5% (1 g).

**Assay** Weigh accurately about 0.6 g of Hydroxyzine Pamoate, add 25 mL of sodium hydroxide TS, shake well, and extract with six 25-mL portions of chloroform. Filter each extract through 5 g of anhydrous sodium sulfate on a pledget of absorbent cotton. Combine the chloroform extracts, and evaporate the combined chloroform extracts on a water bath to about 30 mL. Add 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mL/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 2 drops of crystal violet TS). Perform a blank de-
Dissolve 25 mg of Hymecromone in 5 mL of diluted acid.

Determine the infrared absorption spectrum of Hymecromone, when dried, containing not less than 98.0% of hymecromone (C_{16}H_{16}O_{3}).

**Description**  
Hymecromone occurs as white, crystals or crystalline powder. It is odorless and tasteless.

It is freely soluble in N,N-dimethylformamide, sparingly soluble in ethanol (95), in ethanol (99.5) and in acetone, slightly soluble in diethyl ether, and practically insoluble in water.

**Identification (1)**  
Dissolve 2 mg of Hymecromone in 5 mL of ammonia-ammonium chloride buffer solution (pH 11.0); the solution shows an intense blue-purple fluorescence.

(2)  
Dissolve 25 mg of Hymecromone in 5 mL of diluted ethanol (95) (I in 2), and add 1 drop of iron (III) chloride TS; initially a blackish brown color develops, and when allowed to stand the color changes to yellow-brown.

(3)  
Determine the absorption spectrum of a solution of Himecromone in ethanol (99.5) (1 in 250,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4)  
Determine the infrared absorption spectrum of Himecromone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point**  
<2.60>  187 - 191°C

**Purity**  
(1)  
Chloride <1.05>—Dissolve 0.8 g of Hymecromone in 40 mL of a mixture of acetone and water (2:1), and add 6 mL of dilute nitric acid and a mixture of acetone and water (2:1) to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and a mixture of acetone and water (2:1) to make 50 mL (not more than 0.024%).

(2)  
Sulfate <1.14>—Dissolve 0.8 g of Hymecromone in 40 mL of a mixture of acetone and water (2:1), and add 1 mL of dilute hydrochloric acid and a mixture of acetone and water (2:1) to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and a mixture of acetone and water (2:1) to make 50 mL (not more than 0.024%).

**Assay**  
Each mL of 0.1 mol/L perchloric acid VS = 17.62 mg of C_{16}H_{16}O_{3}.

**Loss on drying** <2.41>  Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44>  Not more than 0.1% (1 g).

**Assay**  
Weigh accurately about 0.25 g of Hymecromone, previously dried, dissolve in 90 mL of N,N-dimethylformamide, and titrate <2.5b> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Separately, perform a blank determination in the same manner with a solution prepared by adding 14 mL of water to 90 mL of N,N-dimethylformamide, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 17.62 mg of C_{16}H_{16}O_{3}.

**Containers and storage**  
Containers—Tight containers.

**Hypromellose**

ヒプロメロース

Hypromellose is a methyl and hydroxypropyl mixed ether of cellulose.

There are four substitution types of Hypromellose, 1828, 2208, 2906 and 2910. They contain methoxy (-OCH_{3}: 31.03) and hydroxypropoxy (-OC_{3}H_{7}OH: 38.16 mg of C_{3}H_{7}O_{3}) in respective amounts.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
75.09) groups conforming to the limits for the types of Hypromellose shown in the table below, calculated on the dried basis.

The viscosity is shown in millipascal second (mPa·s) on the label, together with the substitution type.

**Difference** Hypromellose occurs as a white to yellowish white, powder or grains.

It is practically insoluble in ethanol (99.5).

It swells with water and becomes a clear or slightly turbid, viscous solution.

**Identification** (1) Disperse evenly 1.0 g of Hypromellose over the surface of 100 mL of water in a beaker, while gently tapping the top of the beaker, if necessary, and allow the beaker to stand: it aggregates on the surface of water.

(2) Add 1.0 g of Hypromellose to 100 mL of hot water, and stir: it becomes a suspension. Cool the suspension to 10°C, and stir: the resulting liquid is a clear or a slightly cloudy, viscous fluid.

(3) To 0.1 mL of the viscous fluid obtained in (2) add 9 mL of diluted sulfuric acid (9 in 10), shake, heat in a water bath for exactly 3 minutes, and immediately cool in ice water. Add carefully 0.6 mL of ninhydrin TS, shake, and heat gently. The solution shows a red color first, then changes to purple color within 100 minutes.

(4) Pour and spread out 2 to 3 mL of the viscous fluid obtained in (2) onto a glass plate, and allow the water to evaporate: a transparent film results.

(5) Pipet 50 mL of water, add exactly 50 mL of the viscous fluid obtained in (2), and warm to raise the temperature at a rate of 2 to 5°C per minute while stirring: the temperature, when a white turbidity of the solution starts to increase, is not less than 50°C.

**Viscosity** <2.53> (i) Method I: Apply to Hypromellose having a labeled viscosity of less than 600 mPa·s. Put an exact amount of Hypromellose, equivalent to 4.000 g calculated on the dried basis, in a tared, wide-mouth bottle, add water (between 90°C and 99°C) to make 200 g, stopper the bottle, stir by mechanical means at 350 to 450 revolutions per minute for 10 to 20 minutes to get a homogeneous dispersion. If necessary, take off the sample attached on the walls of the bottle, put them in the dispersed solution, and dissolve by continuing the stirring in a water bath at not exceeding 10°C for 20 to 40 minutes. Add cold water, if necessary, to make 200 g, and use this solution as the sample solution. Centrifuge the solution if necessary to expel any entrapped air bubbles. Perform the test with the sample solution at 20 ± 0.1°C as directed in Method I under Viscosity Determination: not less than 80% and not more than 120% of the labeled viscosity.

(ii) Method II: Apply to Hypromellose having a labeled viscosity of not less than 600 mPa·s. Put an exact amount of Hypromellose, equivalent to 10.00 g calculated on the dried basis, in a tared, wide-mouth bottle, add water (between 90°C and 99°C) to make 500 g, and prepare the sample solution in the same manner as directed in Method I. Perform the test with the sample solution at 20 ± 0.1°C as directed in Method II under Viscosity Determination, using a single cylinder-type rotational viscometer, according to the following operating conditions: not less than 75% and not more than 140% of the labeled viscosity.

**Operating conditions**—

Apparatus: Brookfield type viscometer LV model or an equivalent apparatus.

Rotor No., rotation frequency, and calculation multiplier: According to the following table, depending on the labeled viscosity.

<table>
<thead>

Procedure of apparatus: Read the value after 2 minutes of rotation, and stop the rotation for at least 2 minutes. Repeat this procedure more two times, and average the three observed values.

pH <2.54> The pH of the sample solution obtained in the Viscosity, measured after 5 minutes immersing the electrode in the sample solution, is between 5.0 and 8.0.

**Purity** Heavy metals—Put 1.0 g of Hypromellose in a 100-mL Kjeldahl flask, add a sufficient amount of a mixture of nitric acid and sulfuric acid (5:4) to wet the sample, and heat gently. Repeat this procedure until to use totally 40 mL of the mixture of nitric acid and sulfuric acid (5:4). Then boil gently until the solution changes to black. After cooling, add 2 mL of nitric acid, and heat until the solution changes to black. Repeat this procedure until the solution no longer changes to black, and heat strongly until dense white fumes are evolved. After cooling, add 5 mL of water, boil gently until dense white fumes are evolved, then heat until the volume of the solution becomes to 2 to 3 mL. After cooling, if the solution reveals yellow color by addition of 5 mL of water, add 1 mL of hydrogen peroxide (30), and heat until the volume of the solution becomes to 2 to 3 mL. After cooling, dilute the solution with 2 to 3 mL of water, transfer to a Nessler tube, add water to make 25 mL, and use this solution as the sample solution. Separately, put 2.0 mL of Standard Lead Solution in a 100-mL Kjeldahl flask, add 18 mL of the mixture of nitric acid and sulfuric acid (5:4) and an amount of nitric acid equal to that used for preparation of the sample solution, and heat until white fumes are evolved. After cooling, add 10 mL of water. In the case where hydrogen peroxide (30) is added for the preparation of the sample solution, add the same amount of hydrogen peroxide (30), then proceed in the same manner for preparation of the sample solution, and use so obtained solution as the control solution. Adjust the sample solution and the control solution to pH 3.0 to 4.0 with ammonia solution (28), and add water to make 40 mL, respectively. To these solutions add 1.2 mL of thiocacetic-aldehyd-glycerin TS, 2 mL of acetate buffer solution (pH 3.5) and water to make 50 mL, separately. After allowing to stand for 5 minutes, observe vertically both tubes on a white background: the color obtained with the sample solution is not more intense than that with the control solution (not more than 20 ppm). ☞

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C,
Residue on ignition $\lt 2.4\%$ Not more than 1.5% (1 g).

Assay (i) Apparatus—Reaction vial: A 5-mL pressure-tight serum vial, having 20 mm in outside diameter and 50 mm in height, the neck 20 mm in outside diameter and 13 mm in inside diameter, equipped with a septum of butyl-rubber processed the surface with fluoroplastics, which can be fixed tightly to vial with aluminum cap, or equivalent.

Heater: A square-shaped aluminum block, having holes 20 mm in diameter and 32 mm in depth, adopted to the reaction vial. Capable of stirring the content of the reaction vial by means of magnetic stirrer or of reciprocal shaker about 100 times per minute.

(ii) Procedure—Weigh accurately about 65 mg of Hypromellose, transfer to a reaction vial, add 60 to 100 mg of adipic acid, 2.0 mL of the internal standard solution and 2.0 mL of hydroiodic acid, immediately stopper the vial tightly, and weigh accurately. Using a magnetic stirrer equipped in the heating module, or using a shaker, stir for 60 minutes while heating so that the temperature of the vial content is $130 \pm 2^\circ$C. In the case when a magnetic stirrer or shaker is not available, heat for 30 minutes with repeated shaking at 5-minute intervals by hand, and continue heating for an additional 30 minutes. Allow the vial to cool, and again weigh accurately. If the mass loss is less than 26 mg and there is no evidence of a leak of the content, use the upper layer of the mixture as the sample solution. Separately, put 60 to 100 mg of adipic acid, 2.0 mL of the internal standard solution and 2.0 mL of hydroiodic acid in a reaction vial, immediately stopper the vial tightly, and weigh accurately. Add 45 $\mu$L of iodomethane for assay and 15 to 22 $\mu$L of isopropyl iodide for assay through the septum using a micro-syringe with weighing accurately every time, shake thoroughly, and use the upper layer of the content as the standard solution. Perform the test with 1 to 2 $\mu$L each of the sample solution and standard solution as directed under Gas Chromatography $\lt 2.02$ according to the following conditions, and calculate the ratios, $Q_{Ta}$ and $Q_{Tb}$, of the peak area of iodomethane and isopropyl iodide to that of the internal standard obtained from the sample solution, and $Q_{Sa}$ and $Q_{Sb}$ of the peak area of iodomethane and isopropyl iodide to that of the internal standard from the standard solution.

Content (% of methoxy group (CH$_2$O))

\[
M_{Sa}/M \times Q_{Ta}/Q_{Sb} \times 21.86
\]

Content (% of hydroxypropoxy group (C$_3$H$_7$O$_2$))

\[
M_{Sb}/M \times Q_{Tb}/Q_{Sb} \times 44.17
\]

$M_{Sa}$: Amount (mg) of iodomethane for assay taken

$M_{Sb}$: Amount (mg) of isopropyl iodide for assay taken

$M$: Amount (mg) of Hypromellose taken, calculated on the dried basis

Internal standard solution—A solution of n-octane in o-xylene (3 in 100).

Operating conditions—

Detector: A thermal conductivity detector or hydrogen flame-ionization detector.

Column: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated with dimethylpolysiloxane for gas chromatography in 3 $\mu$m thickness. Use a guard column, if necessary.

Column temperature: Maintain the temperature at 50$^\circ$C for 3 minutes, raise to 100$^\circ$C at a rate of 10$^\circ$C per minute, then raise to 250$^\circ$C at a rate of 35$^\circ$C per minute, and maintain at 250$^\circ$C for 8 minutes.

Injection port temperature: A constant temperature of about 250$^\circ$C.

Detector temperature: A constant temperature of about 280$^\circ$C.

Carrier gas: Helium.

Flow rate: 4.3 mL per minute (the retention time of the internal standard is about 10 minutes).

Split ratio: 1:40.

System suitability—

System performance: When the procedure is run with 1 – 2 $\mu$L of the standard solution under the above operating conditions, iodomethane, isopropyl iodide and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 1 – 2 $\mu$L of the standard solution under the above operating conditions, the relative standard deviations of the ratio of the peak area of iodomethane and isopropyl iodide to that of the internal standard are not more than 2.0%, respectively.

Containers and storage Containers—Well-closed containers.

Hypromellose Acetate Succinate

ヒプロメロース酢酸エステルコハク酸エステル

[71138-97-1]

Hypromellose Acetate Succinate is an acetic acid and monosuccinic acid mixed ester of hypromellose.

It contains not less than 12.0% and not more than 28.0% of methoxy group (-OCH$_3$: 31.03), not less than 4.0 and not more than 23.0% of hydroxypropoxy group (-OC$_3$H$_7$OH: 75.09), not less than 2.0% and not more than 16.0% of acetyl group (-COCH$_3$: 43.04), and not less than 4.0% and not more than 28.0% of succinyl group (-CO$_2$H; COOH: 101.08), calculated on the dried basis.

Its viscosity is expressed in millipascal second (mPa·s).

Description Hypromellose Acetate Succinate occurs as a white to yellowish white, powder or granules.

It is practically insoluble in water and in ethanol (99.5).

It dissolves in sodium hydroxide TS.

It is hygroscopic.

Identification Determine the infrared absorption spectrum of Hypromellose Acetate Succinate as directed in the ATR method under Infrared Spectrophotometry $\lt 2.25$: it exhibits absorption at the wave numbers of about 2840 cm$^{-1}$, 1737 cm$^{-1}$, 1371 cm$^{-1}$, 1231 cm$^{-1}$ and 1049 cm$^{-1}$.

Viscosity $\lt 2.53$: To 2.00 g of Hypromellose Acetate Succinate, previously dried, add dilute sodium hydroxide TS to make 100 g, stopper tightly, and dissolve by shaking for 30 minutes. Perform the test with this solution at 20$^\circ$C according to Method 1: 80 – 120% of the labeled viscosity.

Purity (1) Heavy metals $\lt 0.07$—Proceed with 2.0 g of Hypromellose Acetate Succinate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Free acetic acid and free succinic acid—Weigh accurately about 0.1 g of Hypromellose Acetate Succinate, add exactly 4 mL of 0.02 mol/L phosphate buffer solution (pH
Ammonium, KCl, and dioxane can be used as the mobile phase for quantification of the peak areas of acetic acid and succinic acid. The resolution between these peaks should be not less than 5.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
and again weigh accurately. If the mass loss is less than 0.50% or there is no evidence of a leak, use the upper layer of the mixture as the sample solution. Separately, put 0.06 to 0.10 g of adipic acid, 2.0 mL of the internal standard solution and 2.0 mL of hydriodic acid in a reaction bottle, stopper the bottle immediately, and weigh accurately. Add 45 μL of iodomethane for assay and 15 to 22 μL of isopropyl iodide for assay through the septum using a micro-syringe with weighing accurately every time, stir thoroughly, and use the upper layer of the mixture as the standard solution. Perform the test with 1 to 2 μL each of the sample solution and standard solution as directed under Gas Chromatography 1.10 according to the following conditions, and calculate the ratios of the peak areas of iodomethane and isopropyl iodide to the peak area of the internal standard, Q\textsubscript{Ta}, Q\textsubscript{ Tb}, and Q\textsubscript{Sa}, Q\textsubscript{Sb}.

\[
\text{Amount (\% of methoxy group (CH}_3\text{O)) } = \frac{M\text{Sa}}{M\text{T}} \times \frac{Q\text{Ta}}{Q\text{Sa}} \times 21.86
\]

\[
\text{Amount (\% of hydroxypropoxy group (C}_3\text{H}_7\text{O})} = \frac{M\text{Sa}}{M\text{T}} \times \frac{Q\text{Tb}}{Q\text{Sa}} \times 44.17
\]

M\text{Sa}: Amount (mg) of iodomethane for assay taken
M\text{Ta}: Amount (mg) of iodomethane for assay taken
M\text{Tb}: Amount (mg) of Hypromellose Acetate Succinate taken, calculated on the dried basis

Internal standard solution—A solution of n-octane in o-xylene (3:100).

**Operating conditions**—

Detector: A thermal conductivity detector or hydrogen flame-ionization detector.

Column: A glass tube 3 – 4 mm in inside diameter and 1.8 – 3 m in length, packed with silicous earth for gas chromatography, 120 to 150 μm in diameter coated with methyl silicon polymer for gas chromatography in 10 – 20%.

Column temperature: A constant temperature of about 100°C.

Carrier gas: Helium for the thermal conductivity detector, or Helium or Nitrogen for the hydrogen flame-ionization detector.

Flow rate: Adjust so that the retention time of the internal standard is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 1 – 2 μL of the standard solution under the above operating conditions, iodomethane, isopropyl iodide and the internal standard are eluted in this order with the resolution between each peak being not less than 5.

System repeatability: When the test is repeated 6 times with 1 – 2 μL of the standard solution under the above operating conditions, the relative standard deviations of the ratio of the peak area of iodomethane and isopropyl iodide to that of the internal standard are not more than 2.0%, respectively.

**Containers and storage** —Containers—Tight containers.
ing each time, combine the supernatant liquid and the washings, add water to make 200 mL, and filter. Perform the test with 50 mL of the filtrate. Control solution: To 0.50 mL of 0.01 mol/L hydrochloric acid VS add 10 mL of 0.2 mol/L sodium hydroxide VS and 7 mL of dilute nitric acid, and add water to make 50 mL (not more than 0.07%).

(2) Heavy metals
Proceed with 2.0 g of Hypromellose Phthalate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Phthalic acid—Weigh accurately about 0.2 g of Hypromellose Phthalate, add about 50 mL of acetonitrile to dissolve partially with the aid of ultrasonic waves, add 10 mL of water, and dissolve further with the ultrasonic waves. After cooling, add acetonitrile to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 12.5 mg of phthalic acid, dissolve in about 125 mL of acetonitrile by mixing, add 25 mL of water, then add acetonitrile to make exactly 250 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine the peak areas, A₁ and A₂, of phthalic acid in each solution: amount of phthalic acid (C₆H₄O₄: 166.13) is not more than 1.0%.

Amount (%) of phthalic acid = Mₛ/Mₖ × A₁/A₂ × 40

Mₛ: Amount (mg) of phthalic acid taken
Mₖ: Amount (mg) of Hypromellose Phthalate taken, calculated on the anhydrous basis

Operating conditions—
Column: A stainless steel column about 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 to 10 μm in particle diameter).
Column temperature: A constant temperature of about 20°C.
Mobile phase: A mixture of 0.1% trifluoroacetic acid and acetonitrile (9:1).
Flow rate: About 2.0 mL per minute.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of phthalic acid are not less than 2500 and not more than 1.5, respectively.
System repeatability: When repeat the test 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of phthalic acid is not more than 1.0%.

Water Not more than 5.0% (1 g, volumetric titration, direct titration, using a mixture of ethanol (99.5) and dichloromethane (3:2) instead of methanol for water determination).

Residue on ignition Not more than 0.2% (1 g).

Assay
Weigh accurately about 1 g of Hypromellose Phthalate, dissolve in 50 mL of a mixture of ethanol (95), acetone and water (2:2:1), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Amount (%) of carboxybenzoyl group (C₆H₄O₃)
= [(0.01 × 149.1 × V)/M] − [(2 × 149.1 × P)/166.1]

P: Amount (%) of phthalic acid obtained in the Purity (3)
V: Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed
M: Amount (g) of Hypromellose Phthalate taken, calculated on the anhydrous basis

Containers and storage—Containers—Tight containers.

Ibudilast
イブジラスト

C₁₈H₁₈N₂O₃: 230.31
1-[2-(1-Methylpyridin-3-yl)]pyrazolo[1,5-e]pyrazin-2-yl]propan-1-one
[50847-11-5]

Ibudilast, when dried, contains not less than 98.5% and not more than 101.0% of ibudilast (C₁₈H₁₈N₂O₃).

Description
Ibudilast occurs as a white crystalline powder. It is very soluble in methanol, freely soluble in ethanol (99.5) and in acetic anhydride, and very slightly soluble in water.

Identification (1)
Determine the absorption spectrum of a solution of Ibudilast in methanol (1 in 250,000) as directed under Ultraviolet-visible Spectrophotometry according to the following conditions, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ibudilast as directed in the potassium bromide disk method under Infrared Spectrophotometry according to the following conditions, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point
54 – 58°C

Purity
Heavy metals—Proceed with 1.0 g of Ibudilast according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Ibudilast in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than ibudilast obtained from the sample solution is not larger than the peak area of ibudilast from the standard solution, and the total area of the peaks other than ibudilast is not larger than 3 times the peak area of ibudilast from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wave-
length: 292 nm).

Column: A stainless steel column 2.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of hexane and ethyl acetate (5:1).

Flow rate: Adjust so that the retention time of ibudilast is about 9 minutes.

Time span of measurement: About 4 times as long as the retention time of ibudilast, beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of ibudilast obtained with 10 μL of this solution is equivalent to 40 to 60% of that with 10 μL of the standard solution.

System performance: To 5 mL of the sample solution add the mobile phase to make 50 mL. To 2 mL of this solution add the mobile phase to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ibudilast are not less than 3500 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ibudilast is not more than 3.0%.

Loss on drying <2.4> Not more than 0.3% (1 g, in vacuum, 4 hours).

Residue on ignition <2.4> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Ibudilast, previously dried, dissolve in 50 mL of acetic anhydride, and titrate <2.5> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 23.03 mg of C13H17N2O

Containers and storage Containers—Tight containers.

Ibuprofen

イブプロフェン

C13H18O2: 206.28
(2RS)-2-[4-(2-Methylpropyl)phenyl]propanoic acid [15687-27-1]

Ibuprofen, when dried, contains not less than 98.5% of ibuprofen (C13H18O2).

Description Ibuprofen occurs as a white crystalline powder.

It is freely soluble in ethanol (95) and in acetone, and practically insoluble in water.

It dissolves in dilute sodium hydroxide TS.

Identification (1) Determine the absorption spectrum of a solution of Ibuprofen in dilute sodium hydroxide TS (3 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ibuprofen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.6> 75 – 77°C

Purity (1) Heavy metals <1.0>—Proceed with 3.0 g of Ibuprofen according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.1>—Prepare the test solution with 1.0 g of Ibuprofen according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.50 g of Ibuprofen in 5 mL of acetic acid, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate and acetic acid (100:15:5:1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.4> Not more than 0.5% (1 g, reduced pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 4 hours).

Residue on ignition <2.4> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Ibuprofen, previously dried, dissolve in 50 mL of ethanol (95%), and titrate <2.5> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 20.63 mg of C13H18O2

Containers and storage Containers—Well-closed containers.

Ibuprofen Piconol

イブプロフェンピコノール

C18H23NO3: 297.39
Pyridin-2-ylmethyl (2RS)-2-[4-(2-methylpropyl)phenyl]propanoate [64622-45-3]

Ibuprofen Piconol contains not less than 98.5% and not more than 101.0% of ibuprofen piconol (C18H23NO3), calculated on the anhydrous basis.
Description  Ibuprofen Piconol occurs as a clear, colorless to pale yellow liquid. It is odorless or has a slight characteristic odor.

It is miscible with methanol, with ethanol (95), with acetone and with acetic acid (100).

It is practically insoluble in water.

It decomposes on exposure to light.

It shows no optical rotation.

Identification  (1)  Dissolve 10 mg of Ibuprofen Piconol in 250 mL of ethanol (95). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2)  Determine the infrared absorption spectrum of Ibuprofen Piconol as directed in the liquid film method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Refractive index  \(<2.45\)  \(n_{{D: 20}}^0\)  1.529 – 1.532

Specific gravity  \(<2.50\)  \(d_{{20: 4}}^2\)  1.046 – 1.050

Purity  (1)  Chloride  \(<1.0\)  —Dissolve 0.5 g of Ibuprofen Piconol in 20 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.30 mL of 0.01 mol/L hydrochloric acid VS add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.021%).

(2)  Sulfate  \(<2.0\)  —Dissolve 0.5 g of Ibuprofen Piconol in 20 mL of acetone, add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 20 mL of acetone, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.038%).

(3)  Heavy metals  \(<1.0\)  —Proceed with 4.0 g of Ibuprofen Piconol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 5 ppm).

(4)  Related substances — Dissolve 0.10 g of Ibuprofen Piconol in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Develop the plate with a mixture of hexane, ethyl acetate, and acetic acid (100) and methanol (30:10:2:1) to a distance of about 10 cm, and air-dry the plate. Place a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.74 mg of \(C_{13}H_{23}NO_2\)

Containers and storage  Containers—Tight containers. Storage—Light-resistant.

Ibuprofen Piconol Cream

イブプロフェンピコノールクリーム

Ibuprofen Piconol Cream contains not less than 95.0% and not more than 105.0% of the labeled amount of ibuprofen piconol (\(C_{13}H_{23}NO_2\): 297.39).

Method of preparation  Prepare as directed under Creams, with Ibuprofen Piconol.

Identification  To an amount of Ibuprofen Piconol Cream, equivalent to 50 mg of Ibuprofen Piconol, add 10 mL of methanol, warm in a water bath, mix well, filter after cooling, and use the filtrate as the sample solution. Separately, dissolve 1.00 g of ibuprofen piconol in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Infrared Spectrophotometry. Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate and acetic acid (100:15:5:1) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same \(R_f\) value.

pH  Being specified separately when the drug is granted approval based on the Law.

Assay  Weigh accurately about 0.6 g of Ibuprofen Piconol Cream, equivalent to about 15 mg of Ibuprofen Piconol (\(C_{13}H_{23}NO_2\)), add 10 mL of tetrahydrofuran for liquid chromatography, shake vigorously, and add exactly 10 mL of the internal standard solution. Then, add methanol to make 30 mL, shake vigorously, filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m, and use the filtrate as the sample solution. Separately, weigh accurately about 0.15 g of ibuprofen piconol for assay (separately determine the water \(<2.0\) in the same manner as Ibuprofen Piconol), and dissolve in tetrahydrofuran for liquid chromatography to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 30 mL, and use this solution as the standard solution. Perform the test with 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_5\), of the peak area of ibuprofen piconol to that of the internal standard.

\[\text{Amount (mg) of ibuprofen piconol (} C_{13}H_{23}NO_2 \text{)} = M_5 \times Q_5 / Q_1 \times 1/10\]

\(M_5\): Amount (mg) of ibuprofen piconol for assay taken, calculated on the anhydrous basis

Internal standard solution — A solution of triphenylmethane in methanol (1 in 200).

Operating conditions —

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter.
Ichthammol is a red-brown to black-brown.

Weigh accurately an amount of Ibuprofen Piconol of ammonia (NH$_2$) in the same manner as Ibuprofen Piconol), and according to the following conditions, and Prepare as directed under Ointment—Tight containers.

Containers—Tight containers.

Storage—Light-resistant.

Ibuprofen Piconol Ointment

イブプロフェンピコノール軟膏

Ibuprofen Piconol Ointment contains not less than 95.0% and not more than 105.0% of the labeled amount of ibuprofen piconol (C$_{19}$H$_{23}$NO$_2$; 297.39).

Method of preparation Prepare as directed under Ointments, with Ibuprofen Piconol.

Identification To an amount of Ibuprofen Piconol Ointment, equivalent to 50 mg of Ibuprofen Piconol, add 10 mL of methanol, warm at 60°C in a water bath, mix well, and filter after cooling. Use the filtrate as the sample solution. Separately, dissolve 50 mg of ibuprofen piconol in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate and acetic acid (100) (15:5:1) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same Rf value.

Assay Weigh accurately an amount of Ibuprofen Piconol Ointment, equivalent to about 15 mg of ibuprofen piconol (C$_{19}$H$_{23}$NO$_2$), add 10 mL of tetrahydrofuran for liquid chromatography, shake vigorously, and add exactly 10 mL of the internal standard solution. Then, add methanol to make 30 mL, shake vigorously, filter through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 0.15 g of ibuprofen piconol for assay (separately determine the water <2.05> in the same manner as Ibuprofen Piconol), and dissolve in tetrahydrofuran for liquid chromatography to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make exactly 30 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.05> according to the following conditions, and calculate the ratios, Q$_T$ and Q$_S$, of the peak area of ibuprofen piconol to that of the internal standard.

Amount (mg) of ibuprofen piconol (C$_{19}$H$_{23}$NO$_2$) = M$_S$ × Q$_T$/Q$_S$ × 1/10

M$_S$: Amount (mg) of ibuprofen piconol for assay taken, calculated on the anhydrous basis

Internal standard solution—A solution of triphenylmethane in methanol (1 in 200).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanol and acetic acid-sodium acetate buffer solution (pH 4.0) (3:1).

Flow rate: Adjust so that the retention time of ibuprofen piconol is about 6.5 minutes.

System suitability—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, ibuprofen piconol and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ibuprofen piconol to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Ichthammol

イクタモール

Ichthammol, calculated on the dried basis, contains not less than 2.5% of ammonia (NH$_2$; 17.03), not more than 8.0% of ammonium sulfate [(NH$_4$)$_2$SO$_4$; 132.14], and not less than 10.0% of total sulfur (as S; 32.07).

Description Ichthammol is a red-brown to black-brown, viscous fluid. It has a characteristic odor. It is miscible with water. It is partially soluble in ethanol (95) and in diethyl ether.

Identification (1) To 4 mL of a solution of Ichthammol (in 10) add 8 mL of hydrochloric acid: a yellow-brown to blackish brown, oily or resinous mass is produced. Cool the mass with ice to solidify, and discard the water layer. Wash the residue with diethyl ether: a part of the mass dissolves but it does not dissolve completely even when it is washed until almost no color develops in the washing. Perform the following tests with this residue.

(i) To 0.1 g of the residue add 1 mL of a mixture of ethanol (95) and diethyl ether (1:1): it dissolves.

(ii) To 0.1 g of the residue add 2 mL of water: it dissolves. To 1 mL of this solution add 0.4 mL of hydrochloric acid: a yellow-brown to blackish brown oily or resinous substance is produced.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Idarubicin Hydrochloride

イダルビシン塩酸塩

C_{26}H_{27}NO_{9}.HCl: 533.95
(25,45)-2-Acetyl-4-(3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranosyloxy)-2,5,12-trihydroxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride

[57852-57-0]

Idarubicin Hydrochloride contains not less than 960 μg (potency) and not more than 1030 μg (potency) per mg, calculated on the anhydrous basis. The potency of Idarubicin Hydrochloride is expressed as mass (potency) of idarubicin hydrochloride (C_{26}H_{27}NO_{9}.HCl).

Description
Idarubicin Hydrochloride occurs as a yellow-red powder.

It is sparingly soluble in methanol, slightly soluble in water and in ethanol (95), and practically insoluble in acetone-nitrite and in diethyl ether.

Identification
(1) Determine the absorption spectra of a solution of Idarubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Idarubicin Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectra of Idarubicin Hydrochloride and Idarubicin Hydrochloride RS as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 2 mg of Idarubicin Hydrochloride in 3 mL of water, and add 1 mL of dilute nitric acid and 3 drops of silver nitrate TS: a white turbidity is produced.

Optical rotation

<2.49> [α]_{D}^{20} +188 – +201° (20 mg calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

pH

<2.54> Dissolve 10 mg of Idarubicin Hydrochloride in 10 mL of water: the pH of the solution is between 5.0 and 6.5.

Purity

(1) Clarity and color of solution—Dissolve 10 mg of Idarubicin Hydrochloride in 10 mL of water: the solution is clear and yellow-red in color.

(2) Silver—Dissolve exactly 0.10 g of Idarubicin Hydrochloride in diluted nitric acid (1 in 200) to make exactly 20 mL, and use this solution as the sample solution. Separately, to exactly 5 mL of Standard Silver Solution for Atomic Absorption Spectrophotometry add diluted nitric acid (1 in 200) to make exactly 50 mL. Pipet a suitable amount of this solution, dilute exactly it with diluted nitric acid (1 in 200) so that each mL contains 0.05 μg, 0.075 μg, 0.1 μg and 0.2 μg of sil-
The pH of a solution prepared by dissolving an

×

×

not more than 20 ppm.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Silver hollow-cathode lamp.

Wavelength: 328.1 nm.

(3) Related substances—Conduct this procedure using light-resistant vessels. Perform the test with 20 μL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, determine each peak area by the automatic integration method, and calculate their amounts by the area percentage method: the amount of the peak other than idarubicin is not more than 1.0%, and the total amount of the peaks other than idarubicin is not more than 2.0%.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3.3 times as long as the retention time of idarubicin, beginning after the solvent peak.

System suitability—

Test for required detectability: To 1 mL of the sample solution add the mobile phase without sodium lauryl sulfate to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add the mobile phase without sodium lauryl sulfate to make exactly 20 mL. Confirm that the peak area of idarubicin obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the solution for system suitability test.

System performance: When the procedure is run with 20 μL of the solution for system suitability test under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of idarubicin are not less than 3000 and 0.8 to 1.2, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of idarubicin is not more than 2.0%.

Water <2.48> Not more than 5.0% (0.1 g, coulometric titration).

Residue on ignition <2.44> Not more than 0.5% (2 g).

Assay Weigh accurately an amount of Idarubicin Hydrochloride and Idarubicin Hydrochloride RS, equivalent to about 10 mg (potency), dissolve each in the mobile phase prepared without addition of sodium lauryl sulfate to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A5, of idarubicin in each solution.

Amount [μg (potency)] of idarubicin hydrochloride

\[
(C_{26}H_{27}NO_{7} \cdot HCl): M_h \times A1 / A5 \times 1000
\]

Mh: Amount [mg (potency)] of Idarubicin Hydrochloride RS taken

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 10.2 g of potassium dihydrogen-phosphate in a suitable amount of water, add 1 mL of phosphoric acid and water to make 750 mL, and add 250 mL of tetrahydrofuran. To 500 mL of this solution add 0.72 g of sodium lauryl sulfate and 0.5 mL of N,N-dimethyl-n-octylamine, and adjust to pH 4 with 2 mol/L sodium hydroxide TS.

Flow rate: Adjust so that the retention time of idarubicin is about 15 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates of the peak of idarubicin is not less than 3000.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of idarubicin is not more than 2.0%.

Containers and storage Containers—Tight containers.

Idarubicin Hydrochloride for Injection

注射用イダルビシン塩酸塩

Idarubicin Hydrochloride for Injection is a preparation for injection, which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of idarubicin hydrochloride (C_{26}H_{27}NO_{7} \cdot HCl: 533.95).

Method of preparation Prepare as directed under Injections, with Idarubicin Hydrochloride.

Description Idarubicin Hydrochloride for Injection occurs as yellow-red masses.

Identification (1) Dissolve an amount of Idarubicin Hydrochloride for Injection, equivalent to 2 mg (potency) of Idarubicin Hydrochloride, in 5 mL of sodium hydroxide TS: the solution shows a blue-purple color.

(2) Dissolve an amount of Idarubicin Hydrochloride for Injection, equivalent to 1 mg (potency) of Idarubicin Hydrochloride, in 1 mL of water, and add methanol to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>:

\[
\text{it exhibits maxima between 250 nm and 254 nm, between 285 nm and 289 nm, between 480 nm and 484 nm, and between 510 nm and 520 nm.}
\]

pH <2.5> The pH of a solution prepared by dissolving an amount of Idarubicin Hydrochloride for Injection, equivalent to 5 mg (potency) of Idarubicin Hydrochloride, in 5 mL of water is between 5.0 and 7.0.

Purity Clarity and color of solution—Dissolve an amount of Idarubicin Hydrochloride for Injection, equivalent to 5 mg (potency) of Idarubicin Hydrochloride, in 5 mL of water: the solution is clear and yellow-red.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Idoxuridine

**Identification** (1) Dissolve 0.01 g of Idoxuridine in 5 mL of water by warming, add 5 mL of diphenylamine-acetic acid TS, and heat for 5 minutes: a blue color develops.

(2) Heat 0.1 g of Idoxuridine: a purple gas evolves.

(3) Dissolve 2 mg of Idoxuridine in 50 mL of 0.01 mol/L sodium hydroxide. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry 2.24→, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Idoxuridine RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Optical rotation** $<4.49>$ $\left[\alpha\right]_{D}^{20}: +28°$ to $+31°$ (after drying, 0.2 g, sodium hydroxide TS, 20 mL, 100 mm).

**Purity** (1) Clarity and color of solution—Dissolve 0.2 g of Idoxuridine in 5 mL of a solution of sodium hydroxide (1 in 200): the solution is clear and colorless.

(2) Heavy metals $<1.07>$—Proceed with 2.0 g of Idoxuridine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Idoxuridine in exactly 10 mL of a mixture of dilute ethanol and ammonia solution (28) (99:1), and use this solution as the sample solution. Perform the test with the sample solution as directed under Thin-layer Chromatography $<2.07>$. Spot 50 $\mu$L of the sample solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and diluted 2-propanol (2 in 3) (4:1) to a distance of about 10 cm, and air-dry the plate. Then develop two-dimensionally at right angles to the first, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): any spot other than the principal spot does not appear.

(4) Iodine and iodide—Dissolve 0.10 g of Idoxuridine in 20 mL of water and 5 mL of sodium hydroxide TS, and add immediately 5 mL of dilute sulfuric acid under ice-cooling. Allow to stand for 10 minutes with occasional shaking, and
filter. Transfer the filtrate into a Nessler tube, add 10 mL of chloroform and 3 drops of a solution of potassium iodate (1 in 100), shake for 30 seconds, and allow to stand: the chloroform layer has no more color than the following control solution.

Control solution: Weigh accurately 0.111 g of potassium iodide, and dissolve in water to make 1000 mL. To exactly 1 mL of this solution add 19 mL of water, 5 mL of sodium hydroxide TS and 5 mL of dilute sulfuric acid, mix, and filter. Transfer the filtrate to a Nessler tube, and proceed in the same manner.

Loss on drying <2.1% Not more than 0.5% (2 g, in vacuum, 60°C, 3 hours).

Residue on ignition <2.4% Not more than 0.3% (1 g).

Assay Weigh accurately about 0.7 g of Idoxuridine, previously dried, dissolve in 80 mL of N,N-dimethylformamide, and titrate <2.50d with 0.1 mol/L tetramethylammonium hydroxide VS until the color of the solution changes from yellow through yellow-green to blue (indicator: 5 drops of thymol blue-dimethylformamide TS). Perform a blank determination, and make any necessary correction in the same manner.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 35.41 mg of C$_{9}$H$_{11}$IN$_{2}$O$_{2}$

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Idoxuridine Ophthalmic Solution

イドクスウリジン点眼液

Idoxuridine Ophthalmic Solution contains not less than 90.0% and not more than 110.0% of the labeled amount of idoxuridine (C$_{9}$H$_{11}$IN$_{2}$O$_{2}$: 354.10).

Method of preparation Prepare as directed under Ophthalmic Liquids and Solutions, with Idoxuridine.

Description Idoxuridine Ophthalmic Solution is a clear, colorless liquid.

Identification (1) To a volume of Idoxuridine Ophthalmic Solution, equivalent to 5 mg of Idoxuridine, add 5 mL of diphenylamine-acetic acid TS, and heat for 20 minutes: a light blue color develops.

(2) Place a volume of Idoxuridine Ophthalmic Solution, equivalent to 5 mg of Idoxuridine, in a porcelain crucible, add 0.1 g of anhydrous sodium carbonate, heat slowly, evaporate to dryness and ignite until the residue is incinerated. Dissolve the residue in 5 mL of water, acidify with hydrochloric acid, and add 2 to 3 drops of sodium nitrite TS: a yellow-brown color develops. Then add 2 to 3 drops of starch TS: a deep blue color develops.

(3) To a volume of Idoxuridine Ophthalmic Solution, equivalent to 2 mg of Idoxuridine, add 0.01 mol/L sodium hydroxide TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 277 nm and 281 nm.

pH <2.54d 4.5 – 7.0

Purity 5-Iodouracil and 2'-deoxyuridine—To a volume of Idoxuridine Ophthalmic Solution, equivalent to 4.0 mg of Idoxuridine, add water to make exactly 5 mL, and use this solution as the sample solution. Separately, dissolve 12.0 mg of 5-iodouracil for liquid chromatography and 4.0 mg of 2'-deoxyuridine for liquid chromatography in water to make exactly 200 mL. Measure exactly 5 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas of 5-iodouracil and 2'-deoxyuridine: the peak areas of 5-iodouracil and 2'-deoxyuridine of the sample solution are not larger than the peak areas of 5-iodouracil and 2'-deoxyuridine of the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 µm in particle diameter).

Temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (24:1).

Flow rate: Adjust so that the retention time of 2'-deoxyuridine is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 2'-deoxyuridine is not more than 1.0%.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 2'-deoxyuridine is not more than 2.0.

Foreign insoluble matter <6.11> It meets the requirement.

Insoluble particulate matter <6.08> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Idoxuridine Ophthalmic Solution, equivalent to 3 mg of idoxuridine (C$_{9}$H$_{11}$IN$_{2}$O$_{2}$), add exactly 2 mL of the internal standard solution, then add water to make 10 mL, and use this solution as the sample solution. Separately weigh accurately about 10 mg of Idoxuridine RS, previously dried at 60°C for 3 hours, dissolve in water to make exactly 10 mL. Measure exactly 3 mL of this solution, add exactly 2 mL of the internal standard solution, then add water to make 10 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_1$ and $Q_2$, of the peak area of idoxuridine to that of the internal standard, respectively.

$$\text{Amount (mg) of idoxuridine (C}_{9}\text{H}_{11}\text{IN}_{2}\text{O}_{2}) = M_S \times \frac{Q_T}{Q_S} \times \frac{3}{10}$$

$M_S$: Amount (mg) of Idoxuridine RS taken

Internal standard solution—A solution of sulfathiazole in the mobile phase (1 in 4000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (87:13).

Flow rate: Adjust so that the retention time of idoxuridine is about 9 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, idoxuridine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of idoxuridine to that of the internal standard is not more than 1.0%.

Containers and storage—Tight containers.

Storage—Light-resistant, in a cold place, and avoid freezing.

Ifenprodil Tartrate

イフェンプロジル酒石酸塩

\[
\text{Ifenprodil Tartrate} \quad \text{[(C}_{27}\text{H}_{26}\text{NO}_{7})_2\text{C}_{6}\text{H}_{12}\text{O}_3] \quad 800.98
\]

Ifenprodil Tartrate contains not less than 98.5% of ifenprodil tartrate [(C\(_{27}\)H\(_{26}\)NO\(_{7}\))\(_2\)C\(_{6}\)H\(_{12}\)O\(_3\)], calculated on the anhydrous basis.

Description—Ifenprodil Tartrate occurs as a white crystalline powder. It is odorless.

It is freely soluble in acetic acid (100), soluble in ethanol (95), slightly soluble in water and in methanol, and practically insoluble in diethyl ether.

Optical rotation [\(\alpha\)]\(_D\) = +11 - +15° (1 g calculated on the anhydrous basis, ethanol (95), 20 mL, 100 mm).

Melting point: about 148°C (with decomposition).

Identification—(1) Determine the absorption spectrum of a solution of Ifenprodil Tartrate in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ifenprodil Tartrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.4 g of Ifenprodil Tartrate in 40 mL of water by warming. After cooling, add 0.5 mL of ammonia TS to this solution, extract with two 40-mL portions of chloroform, and collect the water layer. Evaporate 30 mL of the water layer on a water bath to dryness, and after cooling, dissolve the residue in 6 mL of water: the solution corresponds to Qualitative Tests \(<1.09\rangle\) for tartrate.

Purity—(1) Heavy metals \(<1.0\rangle\)—Proceed with 2.0 g of Ifenprodil Tartrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.30 g of Ifenprodil Tartrate in 10 mL of diluted ethanol (95) (3 in 4), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted ethanol (95) (3 in 4) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07\rangle\). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thinlayer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, 1-butanol and ammonia solution (28) (140:40:20:1) to a distance of about 10 cm, and air-dry the plate. Spray hydrogen hexachloroplatinate (IV)-potassium iodide TS evenly on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Water \(<2.48\rangle\) Not more than 4.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition \(<2.44\rangle\) Not more than 0.1% (1 g).

Assay—Weigh accurately about 0.5 g of Ifenprodil Tartrate, dissolve in 50 mL of acetic acid (100), and titrate \(<2.59\rangle\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS is equivalent to 40.05 mg of \((\text{C}_{27}\text{H}_{26}\text{NO}_{7})_2\text{C}_{6}\text{H}_{12}\text{O}_3\).

Containers and storage—Well-closed containers.

Storage—Light-resistant.

Ifenprodil Tartrate Fine Granules

イフェンプロジル酒石酸塩細粒

Ifenprodil Tartrate Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of ifenprodil tartrate [(C\(_{27}\)H\(_{26}\)NO\(_{7}\))\(_2\)C\(_{6}\)H\(_{12}\)O\(_3\)]: 800.98.

Method of preparation—Prepare as directed under Granules, with Ifenprodil Tartrate.

Identification—Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\); it exhibits a maximum between 274 nm and 278 nm.

Uniformity of dosage units \(<6.02\rangle\) Perform the test according to the following method: Ifenprodil Tartrate Fine Granules in single-dose packages meet the requirement of the Content uniformity test.

To the total amount of the content of 1 package of Ifenprodil Tartrate Fine Granules, add 10 mL of water and a suitable amount of a mixture of ethanol (99.5) and water (3:1), shake thoroughly, and add a mixture of ethanol (99.5) and water (3:1) to make exactly \(V\) mL so that each mL contains about 0.1 mg of ifenprodil tartrate.
Ifenprodil Tartrate Tablets

イフェンプロジル酒石酸塩錠

Ifenprodil Tartrate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ifenprodil tartrate \([C_2H_7NO_2_2\cdot C_4H_6O_6]\) 800.98.

Method of preparation  Prepare as directed under Tablets, with Ifenprodil Tartrate.

Identification  Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry \(\angle 2.24\): it exhibits a maximum between 274 nm and 278 nm.

Uniformity of dosage units  \(\S 6.02\)  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ifenprodil Tartrate Tablets, add \(V/20\) mL of water, and shake until the tablet is completely disintegrated. Then, add \(7V/10\) mL of a mixture of ethanol (99.5) and water (3:1), shake thoroughly, and add a mixture of ethanol (99.5) and water (3:1) to make exactly \(V\) mL so that each mL contains about 0.1 mg of ifenprodil tartrate \([C_2H_7NO_2_2\cdot C_4H_6O_6]\). Filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of ifenprodil tartrate \([C_2H_7NO_2_2\cdot C_4H_6O_6]\) = \(M_S \times \frac{A_T}{A_S} \times \frac{V}{200}\)

\(M_S\): Amount (mg) of ifenprodil tartrate for assay taken, calculated on the anhydrous basis.

Dissolution  Being specified separately when the drug is granted approval based on the Law.

Assay  Powder Ifenprodil Tartrate Fine Granules, and weigh accurately a portion of the powder, equivalent to about 10 mg of ifenprodil tartrate \([C_2H_7NO_2_2\cdot C_4H_6O_6]\), add 5 mL of water and a suitable amount of a mixture of ethanol (99.5) and water (3:1) to make exactly 100 mL. Filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of ifenprodil tartrate for assay (separately determine the water \(\angle 2.48\) in the same manner as Ifenprodil Tartrate), add 10 mL of water and a mixture of ethanol (99.5) and water (3:1) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(\S 2.07\) according to the following conditions, and determine the peak areas, \(A_T\) and \(A_S\), of ifenprodil in each solution.

Amount (mg) of ifenprodil tartrate \([C_2H_7NO_2_2\cdot C_4H_6O_6]\) = \(M_S \times \frac{A_T}{A_S} \times 1/2\)

\(M_S\): Amount (mg) of ifenprodil tartrate for assay taken, calculated on the anhydrous basis.

Operating conditions—  Detector: An ultraviolet absorption photometer (wavelength: 224 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 900 mL of water, adjust to pH 6.5 with potassium hydroxide TS, and add water to make 1000 mL. To 420 mL of this solution add 320 mL of methanol for liquid chromatography and 260 mL of acetonitrile for liquid chromatography.

Flow rate: Adjust so that the retention time of ifenprodil is about 10 minutes.

System suitability—  System performance: When the procedure is run with 20 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ifenprodil are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ifenprodil is not more than 1.0%.

Containers and storage  Containers—Tight containers.

Storage—Light-resistant.
Imidapril Hydrochloride / Official Monographs

Imidapril Hydrochloride

**Description**

Imidapril Hydrochloride occurs as white crystals. It is freely soluble in methanol, soluble in water, and sparingly soluble in ethanol (99.5%).

Dissolve 1.0 g of Imidapril Hydrochloride in 100 mL of water: the pH of the solution is about 2.

Melting point: About 203°C (with decomposition).

**Identification**

(1) To 3 mL of a solution of Imidapril Hydrochloride (1 in 50) add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(2) Determine the infrared absorption spectrum of Imidapril Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both samples show identity.

(3) A solution of Imidapril Hydrochloride (1 in 50) responds to Qualitative Tests (1.09) for chloride.

**Optical rotation**

\[ [\alpha]_D^20 = -65.0° \text{ to } -69.0° \] (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity**

(1) Heavy metals (2.07) — Proceed with 2.0 g of Imidapril Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances — Dissolve 25 mg of Imidapril Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 mL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak having the relative retention time of about 0.45 to imidapril, obtained from the sample solution, is not larger than 2/5 times the peak area of imidapril from the standard solution, and the area of each peak other than imidapril and the peak mentioned above from the sample solution is not larger than 1/5 times the peak area of imidapril from the standard solution. Furthermore, the total area of the peaks other than imidapril from the sample solution is not larger than 1/2 times the peak area of imidapril from the standard solution.

**Operating conditions**

- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
- Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 2.7 with phosphoric acid. To 600 mL of this solution add 400 mL of methanol.

Flow rate: Adjust so that the retention time of imidapril is about 8 minutes.

Time span of measurement: About 2 times as long as the retention time of imidapril, beginning after the solvent peak.

**System suitability**

- Test for required detectability: Pipet 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of imidapril obtained with 20 µL of this solution is equivalent to 7 to 13% of that with 20 µL of the standard solution.

- System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of imidapril are not less than 3000 and not more than 2.0, respectively.

- System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imidapril is not more than 1.0%.

- Containers and storage — Tight containers.
Each mL of 0.1 mol/L sodium hydroxide VS
= 44.19 mg of C$_{20}$H$_{27}$N$_3$O$_6$.HCl

Containers and storage  Containers—Well-closed containers.

Imidapril Hydrochloride Tablets

イミダプリル塩酸塩錠

Imidapril Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of Imidapril Hydrochloride (C$_{20}$H$_{27}$N$_3$O$_6$.HCl: 441.91).

Method of preparation  Prepare as directed under Tablets, with Imidapril Hydrochloride.

Identification  Weigh accurately an amount of powdered Imidapril Hydrochloride Tablets, equivalent to 25 mg of Imidapril Hydrochloride, add 5 mL of ethanol (99.5), shake well, filter, and use the filtrate as the sample solution. Separately, dissolve 25 mg of imidapril hydrochloride in 5 mL of ethanol (99.5), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.07. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, ethyl acetate, water, ethanol (99.5) and acetic acid (100) (16:16:7:2:2) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution has the same Rf value as the spot from the standard solution.

Purity  Related substances—To a quantity of powdered Imidapril Hydrochloride Tablets, equivalent to 25 mg of Imidapril Hydrochloride, add 40 mL of diluted methanol (2 in 5), shake vigorously for 10 minutes, add diluted ethanol (2 in 5) to make 50 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 1 mL of the sample solution, add diluted methanol (2 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak having the relative retention time of about 0.45 to imidapril, obtained from the sample solution, is not larger than the peak area of imidapril from the standard solution, the area of each peak other than imidapril and the peaks mentioned above from the sample solution is not larger than 7/10 times the peak area of imidapril from the standard solution, and the area of each peak other than imidapril and the peaks mentioned above from the sample solution is not larger than 3/10 times the peak area of imidapril from the standard solution. Furthermore, the total area of the peaks other than imidapril from the sample solution is not larger than 1.5 times the peak area of imidapril from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of imidapril, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 2 mL of the standard solution, and add diluted methanol (2 in 5) to make exactly 20 mL. Confirm that the peak area of imidapril obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of imidapril are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imidapril is not more than 2.0%.

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Imidapril Hydrochloride Tablets add 2V/5 mL of water, shake vigorously for 10 minutes, add diluted methanol (2 in 3) to make exactly V mL so that each mL contains about 0.1 mg of imidapril hydrochloride (C$_{20}$H$_{27}$N$_3$O$_6$.HCl), filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 10 mg of imidapril for assay, previously dried at 105°C for 3 hours, dissolve in diluted methanol (2 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and determine the peak areas, A_T and A_S, of imidapril in each solution.

Amount (mg) of imidapril hydrochloride (C$_{20}$H$_{27}$N$_3$O$_6$.HCl) = M_S × A_T/A_S × V/100

M_S: Amount (mg) of imidapril hydrochloride for assay taken

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of imidapril are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imidapril is not more than 1.0%.

Dissolution 6.10 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Imidapril Hydrochloride Tablets is not less than 85%.

Start the test with 1 tablet of Imidapril Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 2.8 μg of imidapril hydrochloride (C$_{20}$H$_{27}$N$_3$O$_6$.HCl), and use this solution as the sample
solution. Separately, weigh accurately about 28 mg of imidapril hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_3 \), of imidapril in each solution.

Dissolution rate (％) with respect to the labeled amount of imidapril hydrochloride (C\(_{20}\)H\(_{27}\)N\(_3\)O\(_6\)•HCl) = \( M_5 \times A_1 / A_3 \times V/V \times 1/C \times 9 \)

\( M_5 \): Amount (mg) of imidapril hydrochloride for assay taken

C: Labeled amount (mg) of imidapril hydrochloride (C\(_{20}\)H\(_{27}\)N\(_3\)O\(_6\)•HCl) in 1 tablet

**Operating conditions**

Proceed as directed in the operating conditions in the Assay.

**System suitability**

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of imidapril are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imidapril is not more than 2.0%.

**Assay**

Weigh accurately not less than 20 Imidapril Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of imidapril hydrochloride (C\(_{20}\)H\(_{27}\)N\(_3\)O\(_6\)•HCl), add 30 mL of diluted methanol (2 in 5) and exactly 5 mL of the internal standard solution, shake vigorously for 10 minutes, add diluted methanol (2 in 5) to make 50 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add diluted methanol (2 in 5) to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of imidapril hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in exactly 5 mL of the internal standard solution, add diluted methanol (2 in 5) to make 50 mL, and use this solution as the sample solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01D> according to the following conditions, and determine the peak areas, \( Q_1 \) and \( Q_3 \), of the peak area of imidapril to that of the internal standard.

Amount (mg) of imidapril hydrochloride (C\(_{20}\)H\(_{27}\)N\(_3\)O\(_6\)•HCl) = \( M_5 \times Q_1 / Q_3 \)

\( M_5 \): Amount (mg) of imidapril hydrochloride for assay taken

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in diluted methanol (2 in 5) (1 in 500).

**Operating conditions**

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octysilaneized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 2.7 with phosphoric acid. To 600 mL of this solution add 400 mL of methanol.

Flow rate: Adjust so that the retention time of imidapril is about 8 minutes.

**System suitability**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, imidapril and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of imidapril to that of the internal standard is not more than 1.0%.

**Containers and storage**

Containers—Tight containers.

**Imipenem Hydrate**

イミペネム水和物

\[
\text{C}_{31}\text{H}_{41}\text{N}_{17}\text{O}_{29}\text{S}_{3}\text{H}_{2}O: 317.36}
\]

(SR,6S)-3-[2-(Formimidoylamino)ethylsulfanyl]-6-[(1R)-1-hydroxyethyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid monohydrate [74431-23-5]

Imipenem Hydrate contains not less than 980 μg (potency) and not more than 1010 μg (potency) per mg, calculated on the anhydrous basis. The potency of Imipenem Hydrate is expressed as mass (potency) of imipenem (C\(_{31}\)H\(_{41}\)N\(_{17}\)O\(_{29}\)S\(_3\)) 299.35.

**Description**

Imipenem Hydrate occurs as a white to light yellow crystalline powder.

It is sparingly soluble in water, and practically insoluble in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Imipenem Hydrate in 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) (1 in 50,000) as directed under Ultraviolet-Visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Imipenem RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Imipenem Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Imipenem RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> \([\alpha]_D^20 = +89 – +94\degree\) (50 mg calculated on the anhydrous basis, 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0), 10 mL, 100 mm).
pH <2.54> The pH of a solution obtained by dissolving 1.0 g of Imipenem Hydrate in 200 mL of water is between 4.5 and 7.0.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Imipenem Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.17>—Put 2.0 g of Imipenem Hydrate in a crucible, add 5 mL of nitric acid and 1 mL of sulfuric acid, and heat carefully until white fumes evolve. After cooling, add 2 mL of nitric acid, heat, and repeat this procedure once more. Then add 2 mL of hydrogen peroxide (30%), heat, and repeat this procedure several times until the color of the solution changes to colorless to pale yellow. After cooling, heat again until white fumes evolve. After cooling, add water to make 5 mL, and perform the test with this solution as the test solution (not more than 1 ppm).

(3) Related substances—Dissolve 50 mg of Imipenem Hydrate in 50 mL of 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of thienamycin, having the relative retention time of about 0.8 to imipenem, obtained from the sample solution is not larger than 1.4 times the peak area of imipenem from the standard solution, the area of the peak other than imipenem and thienamycin from the sample solution is not larger than 1/3 times the peak area of imipenem from the standard solution, and the total area of the peaks other than imipenem and thienamycin from the sample solution is not larger than the peak area of imipenem from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 2 times as long as the retention time of imipenem.
System suitability—
System performance: Proceed as directed in the system suitability in the Assay.
Test for required detectability: Measure exactly 5 mL of the standard solution, add 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) to make exactly 50 mL. Confirm that the peak area of imipenem obtained with 10 μL of this solution is equivalent to 7 to 13% of that with the standard solution.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imipenem is not more than 2.0%.

Water <2.48> Not less than 5.0% and not more than 8.0% (20 mg, coulometric titration, water evaporation temperature: 140°C).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Perform the procedure within 30 minutes after preparation of the sample solution and standard solution. Weigh accurately an amount of Imipenem Hydrate and Imipenem RS, equivalent to about 50 mg (potency), dissolve each in 0.1 mol/L 3-(N-morpholino)-propanesulfonic acid buffer solution (pH 7.0) to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution, within 30 minutes after preparation of these solutions, as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₈, of imipenem in each solution.

\[
\text{Amount [mg (potency)] of imipenem (C₁₂H₁₅N₃O₅S) = } M₁ \times \frac{A₁}{A₈} \times 1000
\]

M₁: Amount [mg (potency)] of Imipenem RS taken

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecysilsanilized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) and acetonitrile (100:1).
Flow rate: Adjust so that the retention time of imipenem is about 6 minutes.

System suitability—
System performance: Dissolve 50 mg of Imipenem Hydrate and 75 mg of resorcinol in 50 mL of 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0). When the procedure is run with 10 μL of this solution under the above operating conditions, imipenem and resorcinol are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of imipenem is not more than 0.80%.

Containers and storage Container—Hermetic containers.

Imipenem and Cilastatin Sodium for Injection
注射用イミペネム・シラスタチンナトリウム

Imipenem and Cilastatin Sodium for Injection is a preparation for injection which is dissolved or suspended before use. It contains not less than 93.0% and not more than 115.0% of the labeled potency of imipenem (C₁₂H₁₅N₃O₅S: 299.35) and an amount of cilastatin sodium (C₂₄H₂₅N₃O₅S: 380.43), equivalent to not less than 93.0% and not more than 115.0% of the labeled amount of cilastatin (C₁₆H₂₆N₂O₅S: 358.45).

Method of preparation Prepare as directed under Injections, with Imipenem Hydrate and Cilastatin Sodium.

Description Imipenem and Cilastatin Sodium for Injection occurs as a white to light yellow-white powder.

Identification (1) To 1 mL of a solution of Imipenem and Cilastatin Sodium for Injection (1 in 100) add 1 mL of ninhydrin TS, heat in a water bath for 5 minutes: a purple color appears (cilastatin).

(2) To 2 mL of a solution of Imipenem and Cilastatin...
Perform the test according to the following method: it meets the requirement of the Content uniformity test (T: 104.0%).

Dissolve the total amount of the content of 1 Imipenem and Cilastatin Sodium for Injection in isotonic sodium chloride solution to make exactly 100 mL. Measure exactly $V$ mL of this solution, equivalent to about 25 mg (potency) of Imipenem Hydrate, add 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the sample solution. Proceed hereafter as described in the Assay.

Amount [mg (potency)] of imipenem (C$_{12}$H$_{17}$N$_{3}$O$_{6}$S) = $M_{SI} \times A_{TI}/A_{SI} \times 100/V$

Amount (mg) of cilastatin (C$_{16}$H$_{32}$N$_{6}$O$_{6}$S) = $M_{SC} \times A_{TC}/A_{SC} \times 100/V \times 0.955$

$M_{SI}$: Amount [mg (potency)] of Imipenem RS taken

$M_{SC}$: Amount (mg) of cilastatin ammonium for assay taken, calculated on anhydrous and ethanol-free basis

Foreign insoluble matter <6.06> Perform the test according to Method 2: It meets the requirement.

Insoluble particulate matter <6.07> Perform the test according to the Method 1: The Injection which is dissolved before use meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Weigh accurately the mass of the contents of not less than 10 Imipenem and Cilastatin Sodium for Injections. Weigh accurately an amount of the content, equivalent to 1 Imipenem and Cilastatin Sodium for Injection, dissolve in isotonic sodium chloride solution to make exactly 100 mL. Measure exactly an amount of this solution, equivalent to about 25 mg (potency) of imipenem, add 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) to make exactly 50 mL, and use this as the sample solution. Separately, weigh accurately an amount of Imipenem RS, equivalent to about 25 mg (potency), and weigh accurately about 25 mg of cilastatin ammonium for assay, dissolve in 10 mL of isotonic sodium chloride solution, add 0.1 mol/L 3-(N-morpholino)propanesulfonic acid buffer solution (pH 7.0) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_{TI}$ and $A_{SI}$ of imipenem, and those, $A_{TC}$ and $A_{SC}$ of cilastatin in each solution.

Amount [mg (potency)] of imipenem (C$_{12}$H$_{17}$N$_{3}$O$_{6}$S) = $M_{SI} \times A_{TI}/A_{SI}$

Amount (mg) of cilastatin (C$_{16}$H$_{32}$N$_{6}$O$_{6}$S) = $M_{SC} \times A_{TC}/A_{SC} \times 0.955$

$M_{SI}$: Amount [mg (potency)] of Imipenem RS taken

$M_{SC}$: Amount (mg) of cilastatin ammonium for assay taken, calculated on anhydrous and ethanol-free basis

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 $\mu$m in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 0.836 g of 3-(N-morpholino)propanesulfonic acid, 1.0 g of sodium 1-hexane sulfonate and 50 mg of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 800 mL of water, adjust to pH 7.0 with 0.1 mol/L sodium hydrate TS, and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of imipenem is about 3 minutes.

System suitability—

System performance: When the procedure is run with 10 $\mu$L of the standard solution under the above operating conditions, imipenem and cilastatin are eluted in this order with the resolution between these peaks being not less than 2.0, and the symmetry factors of the peak of imipenem and cilastatin are not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviations of the peak area of imipenem and cilastatin are not more than 2.0%, respectively.

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Imipramine Hydrochloride

イミプラミン塩酸塩

C$_{13}$H$_{21}$N$_{2}$HCl: 316.87
3-(10,11-Dihydro-5H-dibenzo[b,f]azepin-5-yl)-N,N-dimethylpropylamine monohydrochloride [113-52-0]

Imipramine Hydrochloride, when dried, contains not less than 98.5% of imipramine hydrochloride (C$_{13}$H$_{21}$N$_{2}$HCl).
Description Imipramine Hydrochloride occurs as a white to pale yellow-white crystalline powder. It is odorless.

It is freely soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of 0.1 g of Imipramine Hydrochloride in 10 mL of water is between 4.2 and 5.2.

It is gradually colored by light.

Identification (1) Dissolve 5 mg of Imipramine Hydrochloride in 2 mL of nitric acid: a deep blue color develops.

(2) Dissolve 5 mg of Imipramine Hydrochloride in 250 mL of 0.01 mol/L hydrochloric acid TS. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Imipramine Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Dissolve 0.05 g of Imipramine Hydrochloride in 10 mL of water, add 1 mL of ammonia TS, allow to stand for 5 minutes, filter, and acidify the filtrate with dilute nitric acid: it responds to Qualitative Tests (1.09) (2) for chloride.

Melting point <2.60> 172–176°C (with decomposition).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Imipramine Hydrochloride in 10 mL of water: the solution is clear, and has no more color than the following control solution.

Control solution: Take exactly 1.0 mL of Cobalt (II) Chloride CS, 2.4 mL of Iron (III) Chloride CS, 0.4 mL of Copper (II) Sulfate CS and 6.2 mL of diluted hydrochloric acid (1 in 40), and mix them. Pipet 0.5 mL of this solution, and add exactly 9.5 mL of water.

(2) Iminodibenzyl—Dissolve 50 mg of Imipramine Hydrochloride in 10 mL of a mixture of hydrochloric acid and ethanol (95) (1:1) in a 25-mL brown volumetric flask. Cool the flask in ice water, add 5 mL of an ethanol (95) solution of furfural (1 in 250) and 5 mL of hydrochloric acid, and allow to stand at 25°C for 3 hours. Add a mixture of hydrochloric acid and ethanol (95) (1:1) to make 25 mL, and determine the absorbance of this solution at 565 nm as directed under Ultraviolet-visible Spectrophotometry (2.24): it is not more than 0.16.

(3) Related substances—Dissolve 0.20 g of Imipramine Hydrochloride in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethanol (95) to make exactly 50 mL. Pipet 5 mL of this solution, add ethanol (95) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.63). Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetonic acid (100), hydrochloric acid and water (11:7:1:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Imipramine Hydrochloride, previously dried, and dissolve in 20 mL of water. Add 5 mL of sodium hydroxide TS, and extract with three 20-mL portions of chloroform. Filter each extract through a pledget of absorbent cotton on which a small quantity of anhydrous sodium sulfate is placed. Combine the chloroform extracts, and titrate <2.50> with 0.1 mol/L perchloric acid VS until the yellow solution changes to red-purple (indicator: 10 drops of metanil yellow TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.69 mg of C₆H₃N₂.HCl

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Imipramine Hydrochloride Tablets

イミプラミン塩酸塩錠

Imipramine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of imipramine hydrochloride (C₁₉H₂₃N₂.HCl: 316.87).

Method of preparation Prepare as directed under Tablets, with Imipramine Hydrochloride.

Identification (1) Weigh a quantity of powdered Imipramine Hydrochloride Tablets, equivalent to 0.25 g of Imipramine Hydrochloride, add 25 mL of chloroform, shake thoroughly, and filter. Evaporate the filtrate on a water bath, and proceed with the residue as directed in the Identification (1) under Imipramine Hydrochloride.

(2) Dissolve an amount of the residue obtained in (1), equivalent to 5 mg of Imipramine Hydrochloride, in 250 mL of 0.01 mol/L hydrochloric acid TS, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 249 nm and 253 nm, and a shoulder between 270 nm and 280 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Imipramine Hydrochloride Tablets add exactly 40 mL of 0.01 mol/L hydrochloric acid TS, disperse the tablet into a small particles by sonicating, then shake well. Centrifuge the solution, pipet 10 mL of the supernatant liquid, add water to make exactly V mL so that each mL contains about 20 μg of imipramine hydrochloride (C₁₉H₂₃N₂.HCl), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Imipramine Hydrochloride RS, previously dried at 105°C for 2 hours, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Determine the absorbances at 251 nm, A₁, and at 330 nm, A₂, and at 270 nm, A₃, of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry (2.24).

Amount (mg) of imipramine hydrochloride (C₁₉H₂₃N₂.HCl) = Mₛ × (A₁ – A₃)/(Aₛ₁ – Aₛ₃) × V/V × 4/125

Mₛ: Amount (mg) of Imipramine Hydrochloride RS taken

Dissolution <6.10> When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 60 minutes of Imipramine Hydrochloride Tablets is not less than 75%.
Start the test with 1 tablet of Imipramine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL of the filtrate contains about 10 μg of imipramine hydrochloride \((C_{19}H_{22}N_2\cdot HCl)\), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of imipramine hydrochloride RS, previously dried at 105°C for 2 hours, dissolve in the dissolution medium to make exactly 100 mL. Pipet 4 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_T\) and \(A_S\), of the sample solution and the standard solution at 250 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
Dissolution \ rate (\%) \ with \ respect \ to \ the \ labeled \ amount \ of \ imipramine \ hydrochloride \ (C_{19}H_{22}N_2\cdot HCl) = M_S \times A_T/A_S \times V/V \times 1/C \times 36
\]

\(M_S:\) Amount (mg) of Imipramine Hydrochloride RS taken
\(C:\) Labeled amount (mg) of imipramine hydrochloride \((C_{19}H_{22}N_2\cdot HCl)\) in 1 tablet

**Assay** Take 20 Imipramine Hydrochloride Tablets, add exactly 200 mL of 0.01 mol/L hydrochloric acid TS, and shake well until the tablets are completely disintegrated. After centrifuging the solution, pipet a volume of the supernatant liquid, equivalent to about 25 mg of imipramine hydrochloride \((C_{19}H_{22}N_2\cdot HCl)\), add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Imipramine Hydrochloride RS, previously dried at 105°C for 2 hours, dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Pipet 3 mL each of these solutions into separators which contain 15 mL of potassium hydrogen phthalate buffer solution (pH 5.6), 8 mL of bromocresol green-sodium hydroxide TS and 30 mL of chloroform, and shake. Filter the chloroform layer through a pledget of absorbent cotton into a 100-mL volumetric flask. Repeat the extraction with two 30-mL portions of chloroform, combine the chloroform layers in the 100-mL volumetric flask, and add chloroform to make exactly 100 mL. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution obtained by proceeding with 3 mL of 0.01 mol/L hydrochloric acid TS in the same manner as the blank. Determine the absorbances, \(A_T\) and \(A_S\), of these solutions at 416 nm.

\[
Amount (mg) \ of \ imipramine \ hydrochloride \ (C_{19}H_{22}N_2\cdot HCl) = M_S \times A_T/A_S
\]

\(M_S:\) Amount (mg) of Imipramine Hydrochloride RS taken

**Containers and storage** Containers—Tight containers.
the plate with a mixture of ethyl acetate, cyclohexane and acetic acid (100) (100:80:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution (1), and the total amount of these related substances, calculated by comparison with the spots from the standard solutions (1) and (2), is not more than 2.0%.

**Loss on drying** Not more than 3.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 110°C, 2 hours).

**Residue on ignition** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 20 mg each of Indapamide and Indapamide RS. Prepare as directed under Tablets, and perform the test accordingly. Containers—Tight containers. To an amount of powdered Indapamide according to the formula,

\[ M_s = \frac{Q_1}{Q_3} \]

Amount (mg) of indapamide (C_{16}H_{16}ClN_{2}O_{5}S) = \[ M_s \times \frac{Q_1}{Q_3} \]

\[ M_s: \text{Amount (mg) of Indapamide RS taken, calculated on the dried basis} \]

**Internal standard solution**—A solution of isopropyl parahydroxybenzoate in a mixture of water and ethanol (99.5) (1:1) to make exactly 100 mL.

**Operating conditions**— Detector: An ultraviolet absorption photometer (wavelength: 287 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of diluted phosphoric acid (1 in 1000), acetonitrile and methanol (6:3:1).

Flow rate: Adjust so that the retention time of indapamide is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, indapamide and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of indapamide is not more than 1.0%.

**Containers and storage**—Containers—Tight containers. Storage—Light-resistant.

---

**Indapamide Tablets**

Indapamide Tablets contain not less than 93.0% and not more than 103.0% of the labeled amount of indapamide (C_{16}H_{16}ClN_{2}O_{5}S: 365.83).

**Method of preparation** Prepare as directed under Tablets, with Indapamide.

**Identification** To an amount of powdered Indapamide Tablets, equivalent to 10 mg of Indapamide, add 5 mL of ethyl acetate, shake for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Indapamide RS in 5 mL of ethyl acetate, and use this solution as the standard solution. Perform the test with these solutions directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, cyclohexane and acetic acid (100) (100:80:1): the spot from the sample solution and the spot from the standard solution show a blue-purple color and the same Rf value.

**Uniformity of dosage units**<6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Indapamide Tablets add exactly V/10 mL of the internal standard solution, and add a mixture of water and ethanol (99.5) (1:1) to make 10 mL so that each mL contains about 0.1 mg of indapamide (C_{16}H_{16}ClN_{2}O_{5}S), shake to disintegrate, sonicate for 10 minutes, shake again for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Proceed as directed in the Assay.

Amount (mg) of indapamide (C_{16}H_{16}ClN_{2}O_{5}S) = \[ M_s \times \frac{Q_1}{Q_3} \times V/200 \]

\[ M_s: \text{Amount (mg) of Indapamide RS taken, calculated on the dried basis} \]

**Internal standard solution**—A solution of isopropyl parahydroxybenzoate in a mixture of water and ethanol (99.5) (1:1) (3 in 1000).

**Dissolution**<6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rates in 45 minutes of 1-mg tablet and in 90 minutes of 2-mg tablet are not less than 70%, respectively.

Start the test with 1 tablet of Indapamide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 1.1 μg of indapamide (C_{16}H_{16}ClN_{2}O_{5}S), and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Indapamide RS (separately, determine the loss on drying <2.41> under the same condition as Indapamide), and dissolve in ethanol (99.5) to make exactly 50 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the...
Indenolol Hydrochloride

インデノロール塩酸塩

Indenolol Hydrochloride is a mixture of (2RS)-1-(3H-Inden-4-ylxylo)-3-(1-methylethyl)aminopropan-2-ol monohydrochloride and (2RS)-1-(3H-Inden-7-ylxylo)-3-(1-methylethyl)aminopropan-2-ol monohydrochloride.

When dried, it contains not less than 98.5% of indenolol hydrochloride (C_{15}H_{15}NO_3.HCl).

Description

Indenolol Hydrochloride occurs as white to pale yellow, crystals or crystalline powder.

It is freely soluble in water and in acetic acid (100), soluble in ethanol (95) and in chloroform, slightly soluble in acetic anhydride, very slightly soluble in ethyl acetate, and practically insoluble in diethyl ether.

The pH of a solution of 1.0 g of Indenolol Hydrochloride in 10 mL of water is between 3.5 and 5.5.

It is colored by light.

Identification

(1) Dissolve 0.1 g of Indenolol Hydrochloride in 1 to 2 drops of dilute hydrochloric acid and 5 mL of water, and add 1 mL of Reinecke salt TS: a red-purple precipitate is formed.

(2) Determine the absorption spectrum of a solution of Indenolol Hydrochloride (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Indenolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Indenolol Hydrochloride (1 in 10) responds to Qualitative Tests <1.09> for chloride.

Absorbance <2.24> \( E_{1%}^{1cm} \) (250 nm): 330 - 340 (after drying, 10 mg, water, 1000 mL).

Melting point <2.60> 140 - 143°C

Purity

(1) Clarity and color of solution—Dissolve 1.0 g of Indenolol Hydrochloride in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of In-

sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of indapamide in each solution.

Dissolution rate (%) with respect to the labeled amount of indapamide (C_{16}H_{18}ClN_3O_2S): 

\[
M_S = \frac{M_S \times A_T}{A_S \times V/V \times 1/C \times 9/2}
\]

\( M_S \): Amount (mg) of Indapamide RS taken, calculated on the dried basis

\( C \): Labeled amount (mg) of indapamide (C_{16}H_{18}ClN_3O_2S) in 1 tablet

Operating conditions—

Proceed as directed in the operating conditions in the Assay under Indapamide.

System suitability—

System performance: When the procedure is run with 50 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of indapamide are not less than 3500 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of indapamide is not more than 1.5%.

Assay

To 20 Indapamide Tablets add 80 mL of a mixture of water and ethanol (99.5) (1:1), shake well to disintegrate, and sonicate for 10 minutes. Shake the solution for 10 minutes, and add a mixture of water and ethanol (99.5) (1:1) to make exactly 100 mL. Pipet a volume of indapamide (C_{16}H_{18}ClN_3O_2S), equivalent to about 2 mg, and add exactly 2 mL of the internal standard solution and a mixture of water and ethanol (99.5) (1:1) to make 20 mL. Centrifuge this solution, in 1 tablet.

Separately, weigh accurate about 20 mg of Indapamide RS (separately, determine the loss on drying <2.41> under the same condition as Indapamide), and dissolve in a mixture of water and ethanol (99.5) (1:1) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution and a mixture of water and ethanol (99.5) (1:1) to make 20 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Indapamide.

Amount (mg) of indapamide (C_{16}H_{18}ClN_3O_2S)

\[
M_S = M_S \times \frac{Q_T}{Q_S} \times 1/10
\]

\( M_S \): Amount [mg (potency)] of Indapamide RS taken, calculated on the dried basis

Internal standard solution—A solution of isopropyl parahydroxybenzoate in a mixture of water and ethanol (99.5) (1:1), 3-(1-methylethyl)aminopropan-2-ol monohydrochloride, and (2RS)-1-(3H-Inden-4-ylxylo)-3-(1-methylethyl)aminopropan-2-ol monohydrochloride [68906-88-7].

Containers and storage

Containers—Tight containers.
denolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.17>—Prepare the test solution with 1.0 g of Indenolol Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Indenolol Hydrochloride in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.02>. The plate is then further treated as described below.

Isomer ratio Dissolve 5 mg of Indenolol Hydrochloride in 1.0 mL of a mixture of ethyl acetate and trifluoroacetic anhydride for gas chromatography (9:1), and use this solution as the sample solution. Perform the test with 2 μL of the sample solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the areas of two adjacent peaks, A₁ and A₃, with the retention times of about 16 minutes, where A₂ is the peak area of shorter retention time and A₃ is the peak area of longer retention time: the ratio A₂/(A₁ + A₃) is between 0.6 and 0.7.

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A glass column about 2 mm in inside diameter and about 2 m in length, packed with siliceous earth for gas chromatography (150 to 180 μm in particle diameter) coated with 65% phenyl-methyl silicon polymer for gas chromatography at the ratio of 2%.
Column temperature: A constant temperature between 150℃ and 170℃.
Carrier gas: Helium.
Flow rate: Adjust so that the retention time of the peak showing earlier elution of the two peaks of indenolol hydrochloride is about 16 minutes.
Selection of column: Proceed with 2 μL of the sample solution under the above operating conditions, and calculate the resolution. Use a column with the resolution between the two peaks being not less than 1.1.

Assay Weigh accurately about 0.5 g of Indenolol Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (4:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to green (indicator: 3 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 28.38 mg of C₁₇H₁₇NO₃·HCl

Containers and storage Containers—Well-closed containers.
Storage—Light-resistant.

Indigocarmine

インジゴカルミン

C₆H₇N₃Na₂O₅S₂: 466.35
Disodium 3,3’-dioxo-[12-2.2-biindoline]-5,5’-disulfonate [860-22-0]

Indigocarmine, when dried, contains not less than 95.0% of indigocarmine (C₁₃H₁₄N₃Na₂O₅S₂).

Description Indigocarmine occurs as a blue to dark blue, powder or granules. It is odorless.
It is sparingly soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.
It is hygroscopic.
When compressed, it has a coppery luster.

Identification (1) A solution of Indigocarmine (1 in 100) is dark blue in color. Perform the following tests with this solution as the sample solution: the dark blue color of each solution disappears.
(i) Add 1 mL of nitric acid to 2 mL of the sample solution;
(ii) Add 1 mL of bromine TS to 2 mL of the sample solution;
(iii) Add 1 mL of chlorine TS to 2 mL of the sample solution;
(iv) Add 2 mL of sodium hydroxide TS and 0.2 g of zinc powder to 2 mL of the sample solution, and warm.

(2) Dissolve 0.1 g of Indigocarmine in 100 mL of a solution of ammonium acetate (1 in 650). To 1 mL of the solution add a solution of ammonium acetate (1 in 650) to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Ignite 1 g of Indigocarmine to carbonize. After cooling, add 20 mL of water to the residue, shake, and filter the mixture: the filtrate responds to Qualitative Tests <1.09> for sodium salt and for sulfate.

pH <2.54> Dissolve 0.10 g of Indigocarmine in 20 mL of water: the pH of the solution is between 5.0 and 6.0.

Purity (1) Water-insoluble substances—To 1.00 g of Indigocarmine add 200 mL of water, shake, and filter through a tared glass filter (G4). Wash the residue with water until the blue color of the filtrate becomes practically colorless, and dry the residue at 105℃ for 4 hours: the mass of the residue does not exceed 5.0 mg.

(2) Arsenic <1.17>—Place 0.8 g of Indigocarmine in a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and ignite gently. Repeat the addition of 2 to 3 mL of nitric acid occasionally, and continue to heat until a colorless to light yellow solution is obtained. After cooling, add 15 mL of a saturated ammonium oxalate solution, heat the solution until dense white fumes are evolved, and concentrate to 2 to 3 mL. After cooling, dilute with water to 10 mL, and perform the test with 5 mL of this solution as the test solution (not more than 5 ppm).
Indigocarmine Injection

Indigocarmine Injection is an aqueous injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of indigocarmine (C₁₆H₁₄N₂Na₂O₇S₂: 466.35).

Method of preparation Prepare as directed under Injection, with Indigocarmine.

Description Indigocarmine Injection is a clear, colorless liquid.

Identification (1) To a volume of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, add 1 mL of nitric acid: the dark blue color of the liquid disappears, and a yellow-brown color develops.

(2) To a volume of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, add 1 mL of bromine TS: the dark blue color disappears, and a yellow-brown color develops.

(3) To a volume of Indigocarmine Injection, equivalent to 20 mg of Indigocarmine, add 1 mL of chlorine TS: the dark blue color disappears, and a yellow-brown color develops.

(4) To a volume of Indigocarmine Injection, equivalent to 10 mg of Indigocarmine, add ammonium acetate solution (1 in 650) to make 1000 mL, and determine the absorbance of the solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 610 nm and 614 nm.

Bacterial endotoxins <4.01> Less than 7.5 EU/mg.

Extractable volume <6.05> It meets the requirement.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07> Perform the test according to Method 2: it meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Indigocarmine Injection, equivalent to about 0.2 g of indigocarmine (C₁₆H₁₄N₂Na₂O₇S₂), add 6 g of sodium hydrogen tartrate monohydrate, and dissolve in water to make 200 mL. Then boil under a carbon dioxide stream, and proceed as directed in the Assay under Indigocarmine.
JP XVIII

Official Monographs / Indometacin Capsules

1153

If any difference appears between the spectra, recrystallize the sample and the RS with diethyl ether, filter and dry the crystals, and perform the test with the crystals.

(3) Perform the test with Indometacin as directed under Flame Coloration Test <1.0G> (2): a green color appears.

Purity (1) Acidity—To 1.0 g of Indometacin add 50 mL of water, shake for 5 minutes, and filter. To the filtrate add 0.20 mL of 0.1 mol/L sodium hydroxide VS and 1 drop of phenolphthalein TS: a red color develops.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Indometacin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Indometacin according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Indometacin in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 25 \( \mu \)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dehydrated diethyl ether and acetic acid (100:100:3) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.4I> Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.4D> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Indometacin, previously dried, dissolve in 60 mL of methanol, add 30 mL of water, and titrate <2.5D> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 35.78 mg of \( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \)

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Indometacin Capsules

インドメタシンカプセル

Indometacin Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of indometacin (\( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \): 357.79).

Method of preparation Prepare as directed under Capsules, with Indometacin.

Identification Powder the contents of Indometacin Capsules. To a quantity of the powder, equivalent to 0.1 g of Indometacin, add 20 mL of chloroform, shake well, and centrifuge. Filter the supernatant liquid, and evaporate the filtrate to dryness. After cooling, dissolve the residue in 20 mL of methanol. To 10 mL of this solution add methanol to make 50 mL, then to 2 mL of this solution add methanol to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.2D>: it exhibits a maximum between 317 nm and 321 nm.

Purity Related substances—Powder the content of Indometacin Capsules. To a quantity of the powder, equivalent to 0.10 g of Indometacin, add exactly 10 mL of methanol, shake well, filter, and use the filtrate as the sample solution. Dissolve 25 mg of Indometacin RS in methanol to make exactly 50 mL. Pipet 1 mL of the solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Proceed as directed in the Purity (4) under Indometacin.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take out the content of 1 capsule of Indometacin Capsules, and dissolve in methanol to make exactly \( V \) mL so that each mL contains about 1 mg of indometacin (\( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \)). Filter the solution, discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 3 mL of the internal standard solution, then add the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Indometacin RS, previously dried at 105°C for 4 hours, dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, add exactly 3 mL of the internal standard solution, then add the mobile phase to make 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of indometacin (\( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \)) = \( M_5 \times Q/V \times V/25 \)

\( M_5 \): Amount (mg) of Indometacin RS taken

Internal standard solution—A solution of butyl parahydroxybenzoate in methanol (1 in 1000).

Dissolution <6.10> When the test is performed at 100 revolutions per minute according to the Basket method, using 900 mL of a mixture of water and phosphate buffer solution (pH 7.2) (4:1) as the dissolution medium, the dissolution rate in 20 minutes of Indometacin Capsules is not less than 75%.

Start the test with 1 capsule of Indometacin Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 \( \mu \)m. Discard not less than 10 mL of the first filtrate, pipet \( V \) mL of the subsequent filtrate, add the dissolution medium to make exactly \( V \) mL so that each mL contains about 28 \( \mu \)g of indometacin (\( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \)), and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Indometacin RS, previously dried at 105°C for 4 hours, dissolve in the dissolution medium to make exactly 1000 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and the standard solution at 320 nm as directed under Ultraviolet-visible Spectrophotometry <2.2D>.

Dissolution rate (%): \[ \frac{C - L}{C} \times 100 \]

\( C \): Labeled amount (mg) of indometacin (\( \text{C}_{19}\text{H}_{13}\text{ClNO}_4 \)) in 1 capsule
Assay Weigh accurately the contents of not less than 20 Indometacin Capsules. Powder the combined contents, and weigh accurately a portion of the powder, equivalent to about 50 mg of indometacin (C₁₉H₁₆ClNO₄). Dissolve in 40 mL of methanol, and add methanol to make exactly 50 mL. Filter this solution, discarding the first 10-mL portion of the filtrate. Pipet 5 mL of the subsequent filtrate, add exactly 3 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Indometacin RS, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of the solution, add exactly 3 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and calculate the ratios, Q₁ and Q₈, of the peak area of indometacin to that of the internal standard, respectively.

Amount (mg) of indometacin (C₁₉H₁₆ClNO₄) = Mₛ × Q₁/Q₈

Mₛ: Amount (mg) of Indometacin RS taken

Internal standard solution—A solution of butyl parahydroxybenzoate in methanol (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and diluted phosphoric acid (1 in 1000) (7:3).
Flow rate: Adjust so that the retention time of indometacin is about 8 minutes.

System suitability—
System performance: Dissolve 50 mg of 4-chlorobenzoic acid, 30 mg of butyl parahydroxybenzoate and 50 mg of indometacin in 50 mL of methanol. To 5 mL of this solution add the mobile phase to make 100 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, 4-chlorobenzoic acid, butyl parahydroxybenzoate and indometacin are eluted in this order, with the resolution between the peaks of 4-chlorobenzoic acid and butyl parahydroxybenzoate being not less than 2.0, and between the peaks of butyl parahydroxybenzoate and indometacin being not less than 5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of indometacin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Indometacin Suppositories

インドメタシン・セプティ・エス

Indometacin Suppositories contain not less than 90.0% and not more than 110.0% of the labeled amount of indometacin (C₁₉H₁₆ClNO₄: 357.79).

Method of preparation Prepare as directed under Suppositories, with Indometacin.

Identification Dissolve a quantity of Indometacin Suppositories, equivalent to 50 mg of Indometacin, in 20 mL of methanol by warming, add methanol to make 50 mL, and filter if necessary. To 2 mL of this solution add methanol to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry 2.2G; it exhibits a maximum between 317 nm and 321 nm.

Uniformity of dosage units 6.07 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 suppository of Indometacin Suppositories add 80 mL of a mixture of methanol and acetic acid (100:200:1), dissolve by warming, add a mixture of methanol and acetic acid (100:200:1) to make exactly 100 mL. Pipet V mL of this solution, equivalent to about 2 mg of indometacin (C₁₉H₁₆ClNO₄), add a mixture of methanol and acetic acid (100:200:1) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Indometacin RS, previously dried at 105°C for 4 hours, and dissolve in a mixture of methanol and acetic acid (100:200:1) to make exactly 100 mL. Pipet 4 mL of this solution, add a mixture of methanol and acetic acid (100:200:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.2G, and determine the absorbances, A₁ and A₅, at 320 nm.

Amount (mg) of indometacin (C₁₉H₁₆ClNO₄) = Mₛ × A₁/A₅ × 2/V

Mₛ: Amount (mg) of Indometacin RS taken

Assay Weigh accurately not less than 20 Indometacin Suppositories, cut into small pieces carefully, and mix well. Weigh accurately a portion of the mass, equivalent to about 50 mg of indometacin (C₁₉H₁₆ClNO₄), add 40 mL of tetrahydrofuran, warm at 40°C, dissolve by shaking, cool, and add tetrahydrofuran to make exactly 50 mL. Filter the solution, discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 3 mL of the internal standard solution, and add the mobile phase to make 100 mL. Allow the solution to stand for 30 minutes, filter through a membrane filter (0.5 μm pore size), discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of Indometacin RS, previously dried at 105°C for 4 hours, and dissolve in tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of the solution, proceed in the same manner as the sample solution, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions, and calculate the ratios, Q₁ and Q₈, of the peak area of indometacin to that of the internal standard, respectively.
Insulin Human (Genetical Recombination)

インスリン ヒト (遺伝子組換え)

Insulin Human (Genetical Recombination) is a recombinant human insulin. It is a peptide composed of A chain consisting of 21 amino acid residues and B chain consisting of 30 amino acid residues.

It contains not less than 27.5 Insulin Units per mg, calculated on the dried basis.

Description Insulin Human (Genetical Recombination) occurs as a white powder.

It is practically insoluble in water and in ethanol (95).

It dissolves in 0.01 mol/L hydrochloric acid TS and in sodium hydroxide TS with decomposition.

It is hygroscopic.

Identification Weigh accurately a suitable amount of Insulin Human (Genetical Recombination), and dissolve in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains 2.0 mg. Transfer 500 μL of this solution into a clean test tube, add 2.0 mL of HEPES buffer solution (pH 7.5) and 400 μL of V8-protease TS, incubate at 25°C for 6 hours, then add 2.9 mL of ammonium sulfate buffer solution to stop the reaction, and use this solution as the sample solution. Separately, proceed with Insulin Human RS in the same manner as above, and use this solution as the standard solution. Perform the test with 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07\) according to the following conditions, and compare the chromatograms obtained from these solutions: a similar peak is observed at the same retention time in the two chromatograms.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave- length: 214 nm).

Column: A stainless steel column 4.6 mm in inside diame- ter and 10 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: A mixture of water, ammonium sulfate buffer solution and acetonitrile (7:2:1).

Mobile phase B: A mixture of water, acetonitrile and am- monium sulfate buffer solution (2:2:1).

Flowing of mobile phase: Change the mixing ratio of the mobile phase A and B linearly from 9:1 to 3:7 in 60 minutes after sample injection, further change to 0:10 linearly in 5 minutes, and then flow the mobile phase B only for 5 minutes.

Flow rate: 1.0 mL per minute.

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating con-
Purity (1) Related substances—Perform this procedure rapidly. Dissolve 7.5 mg of Insulin Human (Genetical Recombination) in 2 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak area of human insulin, A₁, the peak area of the desamido substance having the relative retention time of about 1.3 to human insulin, A₂, and the total area of the peaks other than the solvent peak, A₃; the amounts of the desamido substance and related substances other than the desamido substance are not more than 2.0%, respectively. Previously, perform the test with 0.01 mol/L hydrochloric acid TS in the same manner to confirm the solvent peak.

Amount (%) of the desamido substance = A₂/A₃ × 100

Amount (%) of related substances other than the desamido substance

= [(A₁ – (A₂ + A₃))/A₃] × 100

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: A mixture of phosphoric acid-sodium sulfate buffer solution (pH 2.3) and acetonitrile for liquid chromatography (41:9).

Mobile phase B: A mixture of phosphoric acid-sodium sulfate buffer solution (pH 2.3) and acetonitrile for liquid chromatography (1:1).

Flowing of mobile phase: Flow a mixture of the mobile phases A and B (78:22) for 36 minutes before and after the sample injection, then change the mixing ratio to 33:67 linearly in 25 minutes, and maintain this ratio for 6 minutes. Then flow the first mixture (78:22) for the next 15 minutes. Adjust the mixing ratio of the first mixture so that the retention time of human insulin is about 25 minutes.

Flow rate: 1.0 mL per minute.

Time span of measurement: For about 75 minutes after the sample is injected.

System suitability—

Test for required detectability: Confirm that the peak height of the dimer obtained with 100 μL of human insulin dimer-containing TS is between 10% and 50% of the full scale.

System performance: When the procedure is run with 100 μL of human insulin dimer-containing TS under the above operating conditions, polymer, dimer and monomer are eluted in this order, and the ratio H₁/H₂ of the peak height of the dimer H₁ to the height of the bottom between the peaks of the dimer and the monomer H₂ is not less than 2.0.

(3) Product related impurities—Being specified separately when the drug is granted approval based on the Law.

(4) Process related impurities—Being specified separately when the drug is granted approval based on the Law.

Loss on drying (2.41) Not more than 10.0% (0.2 g, 105°C, 24 hours).

Bacterial endotoxins (4.01) Less than 10 EU/mg.

Zinc content Weigh accurately about 50 mg of Insulin Human (Genetical Recombination), and dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL. If necessary, dilute with 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains between 0.4 μg and 1.6 μg of zinc (Zn: 65.38), and use this solution as the sample solution. Separately, take exactly a suitable amount of Standard Zinc Solution for Atomic Absorption Spectrophotometry, dilute with 0.01 mol/L hydrochloric acid TS to make solutions containing 0.40 μg, 0.80 μg, 1.20 μg and 1.60 μg of zinc (Zn: 65.38) in each mL, respectively, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectrophotometry (2.22), and calculate the amount of zinc (Zn: 65.38) in the sample solution by using a calibration curve obtained from the absorbances of the standard solutions: not more than 1.0%, calculated on the dried basis.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Zinc hollow cathode lamp.

Wavelength: 213.9 nm.

Assay Perform this procedure quickly. Weigh accurately about 7.5 mg of Insulin Human (Genetical Recombination), dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 5 mL, and use this solution as the sample solution. Separately, weigh accurately a suitable amount of Insulin Human RS, dissolve exactly in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains about 40 Insulin Units, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution...
Insulin Human (Genetical Recombination) Injection

インスリンヒト(遺伝子組換え)注射液

Insulin Human (Genetical Recombination) Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled Insulin Unit of insulin human (genetical recombination) (C$_{25}$H$_{33}$N$_{5}$O$_{2}$S$_{6}$: 5807.57).

Method of preparation Prepare as directed under Injections, with Insulin Human (Genetical Recombination) suspended in Water for Injection then dissolved by addition of Hydrochloric Acid or Sodium Hydroxide.

Description Insulin Human (Genetical Recombination) Injection occurs as a clear, colorless liquid, and slightly a fine precipitate may be observable upon storage.

Identification Insulin Human (Genetical Recombination) Injection forms a precipitate when adjusted to pH 5.3 – 5.5 by addition of dilute hydrochloric acid, and the precipitate disappears when adjusted to pH 2.5 – 3.5 by further addition of the acid.

Osmotic pressure ratio Being specified separately when the drug is granted approval based on the Law.

pH Being specified separately when the drug is granted approval based on the Law.

Purity (1) Desamido substance—Perform the test with 20 μL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate their amounts by the area percentage method: the amount of the peak, having the relative retention time of about 1.3 to human insulin, is not more than 1.5%.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of phosphoric acid-sodium sulfate buffer solution (pH 2.3) and acetonitrile for liquid chromatography (3:1). Adjust the mixing ratio of the component of the mobile phase so that the retention time of human insulin is between 10 minutes and 17 minutes.

Flow rate: 1.0 mL per minute.

System suitability—

System performance: When the procedure is run with 20 μL of human insulin desamido substance-containing TS under the above operating conditions, human insulin and human insulin desamido substance are eluted in this order with the resolution between these peaks being not less than 2.0, and the symmetry factor of the peak of human insulin is not more than 1.8.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of human insulin is not more than 1.6%.

Containers and storage Containers—Tight containers.

Storage—Not exceeding –20°C.
Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension

イソフェンインスリン ヒト(遺伝子組換え)水性懸濁注射液

Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension is an aqueous suspension for injection. It contains not less than 95.0% and not more than 105.0% of the labeled Insulin Unit of insulin human (genetical recombination) (C$_{22}$H$_{33}$N$_{6}$O$_{7}$S$_{6}$: 5807.57). It contains not less than 10 µg and not more than 40 µg of zinc (Zn: 65.38) per the labeled 100 Insulin Units.

**Method of preparation** Prepare as directed under Injections, with Insulin Human (Genetical Recombination) and Protamine Sulfate.

**Description** Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension is a white aqueous suspension. When allowed to stand, it separates into a white precipitate and colorless supernatant liquid, and the precipitate returns to the suspension state on gentle shaking.

When it is examined microscopically, the precipitate mostly consists of fine, oblong crystals of 1 to 30 µm in major axis, and does not contain amorphous substances or large aggregates.

**Identification** Adjust Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension to pH between 2.5 and 3.0 with dilute hydrochloric acid: the precipitate dissolves, and the solution is clear and colorless.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity (1)** Desamido substance—Perform the test with 20 µL of the sample solution obtained in the Assay (1) as directed under Liquid Chromatography <2.23> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the amount of the peak, having the relative retention time of about 1.3 to insulin human, is not more than 1.5%.

**Operating conditions—** Proceed as directed in the operating conditions in the Assay (1).

**System suitability—**

- System performance: Proceed as directed in the system suitability in the Assay (1).

- Test for required detectability: Pipet 1 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of insulin human obtained with 20 µL of this solution is equivalent to 1.4 to 2.6% of that with 20 µL of the sample solution.

- System repeatability: Dissolve Insulin Human RS in 0.01 mol/L hydrochloric acid TS so that each mL contains about 4 Insulin Units. When the test is repeated 6 times with 20 µL of this solution under the above operating conditions, the relative standard deviation of the peak area of insulin human is not more than 2.0%.

**2** Dissolved insulin human—Centrifuge Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, and use the supernatant liquid as the sample solution. Separately, dissolve exactly Insulin Human RS in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains about 1.0 Insulin Units, and use this solution as the standard solution. Perform the test with exactly 20 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine the peak areas, $A_1$ and $A_3$, of insulin human by the automatic integration method, and calculate the amount of dissolved insulin human by the following equation: not more than 0.5 Insulin Units per mL.

$$M_S = \frac{(M_5 \times F)/D \times (A_1 + A_3)/(A_3 + A_3)}{1.004 \times 5/2}$$

Where $M_5$: Amount (mg) of Insulin Human RS taken

$F$: Labeled unit (Insulin Unit/mg) of Insulin Human RS

$D$: Volume (mL) of 0.01 mol/L hydrochloric acid TS used to dissolve Insulin Human RS

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant, at a temperature of 2 – 8°C avoiding freezing.
F: Labeled unit (Insulin Unit /mg) of Insulin Human RS
D: Volume (mL) of 0.01 mol/L hydrochloric acid TS used to dissolve Insulin Human RS

Operating conditions—
Proceed as directed in the operating conditions in the Assay (1).

System suitability—

System performance: When the procedure is run with 20 μL of insulin human desamido substance-containing TS under the above operating conditions, insulin human and insulin human desamido substance are eluted in this order with the resolution between these peaks being not less than 2.0, and the symmetry factor of the peak of insulin human is not more than 1.6.

System repeatability: When the test is repeated 4 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of insulin human is not more than 6.0%.

(3) High-molecular mass protein—Take a suitable volume of gently shaken Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, add 4 μL of 6 mol/L hydrochloric acid TS for each mL of the suspension, and mix until the solution becomes clear. Perform the test with 100 μL of this solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the total amount of the peaks other than insulin human is not more than 2.5%.

Operating conditions—

Detector, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Purity (2) under Insulin Human (Genetical Recombination).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with hydrophilic silica gel for liquid chromatography.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion column to the completion of the elution of insulin human.

System suitability—

System performance: Proceed as directed in the system suitability in the Purity (2) under Insulin Human (Genetical Recombination).

Test for required detectability: Pipet 1 mL of the sample solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of insulin human obtained with 100 μL of this solution is equivalent to 1.4 to 2.6% of that with 100 μL of the sample solution.

Extractable volume <6.05> It meets the requirement.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay (1) Insulin human—Pipet 10 mL of gently shaken Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, and add exactly 40 μL of 6 mol/L hydrochloric acid TS. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make exactly 5 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay under Insulin Human (Genetical Recombination).

Amount (Insulin Unit) of insulin human (C_{258}H_{383}N_{60}O_{77}S_{8}) in 1 mL = (M_{5} × F)/D × (A_{T1} + A_{T2})/(A_{SI} + A_{SD}) × 1.004 × 5/2

M_{5}: Amount (mg) of Insulin Human RS taken
F: Labeled unit (Insulin Unit /mg) of Insulin Human RS
D: Volume (mL) of 0.01 mol/L hydrochloric acid TS used to dissolve Insulin Human RS

(2) Zinc—Pipet a volume of gently shaken Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, equivalent to 300 Insulin Units, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. If necessary, further add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, pipet a suitable volume of Standard Zinc Solution for Atomic Absorption Spectroscopy, dilute with 0.01 mol/L hydrochloric acid TS to make three solutions containing 0.20 μg, 0.60 μg and 1.20 μg of zinc (Zn: 65.38) in each mL, respectively, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectroscopy <2.2D> according to the following conditions, using 0.01 mol/L hydrochloric acid TS as the blank, and calculate the content of zinc in the sample solution by using the calibration curve obtained from the absorbances of the standard solutions.

Gas: Combustible gas—Acetylene.
Supporting gas—Air.
Lamp: Zinc hollow cathode lamp.
Wavelength: 213.9 nm.

Containers and storage—Containers—Hermetic containers.
Storage—Light-resistant, at a temperature between 2°C and 8°C avoiding freezing.

Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension
二相性イソフェンインスリン ヒト(遺伝子組換え)水性懸濁注射液

Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension is an aqueous suspension for injection. It contains not less than 95.0% and not more than 105.0% of the labeled Insulin Unit of insulin human (genetical recombination) (C_{258}H_{383}N_{60}O_{77}S_{8}: 5807.57). It contains not less than 10 μg and not more than 40 μg of zinc (Zn: 65.38) per the labeled 100 Insulin Units.

Method of preparation Prepare as directed under Injections, with Insulin Human (Genetical Recombination) Injection and Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension.

Description Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension is a white aqueous suspension. When allowed to stand, it separates into a white precipitate and colorless supernatant liquid, and the precipitate returns to the suspension state on gentle shaking.

When it is examined microscopically, the precipitate mostly consists of fine, oblong crystals of 1 to 30 μm in major.
axis, and does not contain amorphous substances or large aggregates.

**Identification** Adjust Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension to pH between 2.5 and 3.0 with dilute hydrochloric acid: the precipitate dissolves, and the solution is clear and colorless.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity** (1) Desamido substance—Perform the test with 20 μL of the sample solution obtained in the Assay (1) as directed under Liquid Chromatography (<2.0%) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the amount of the peak, having the relative retention time of about 1.3 to insulin human, is not more than 1.5%.

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay (1).

**System suitability**—
System performance: Proceed as directed in the system suitability in the Assay (1).

Test for required detectability: Pipet 1 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of insulin human obtained with 20 μL of this solution is equivalent to 1.4 to 2.6% of that with 20 μL of the sample solution.

System repeatability: Dissolve Insulin Human RS in 0.01 mol/L hydrochloric acid TS so that each mL contains about 4 Insulin Units. When the test is repeated 6 times with 20 μL of this solution under the above operating conditions, the relative standard deviation of the peak area of insulin human is not more than 2.0%.

(2) High-molecular mass protein—Take a suitable volume of gently shaken Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, add 4 μL of 6 mol/L hydrochloric acid TS for each mL of the suspension, and mix until the solution becomes clear. Perform the test with 100 μL of this solution as directed under Liquid Chromatography (<2.0%) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the total amount of the peaks other than insulin human is not more than 2.0%.

**Operating conditions**—
Detector, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Purity (2) under Insulin Human (Genetical Recombination).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with hydrophilic silica gel for liquid chromatography.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion column to the completion of the elution of insulin human.

**System suitability**—
System performance: Proceed as directed in the system suitability in the Purity (2) under Insulin Human (Genetical Recombination).

Test for required detectability: Pipet 1 mL of the sample solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of insulin human obtained with 100 μL of this solution is equivalent to 1.4 to 2.6% of that with 100 μL of the sample solution.

**Extractable volume** (<6.0%) It meets the requirement.

**Foreign insoluble matter** (<6.0%) Perform the test according to Method 1: it meets the requirement.

**Sterility** (<4.0%) Perform the test according to the Membrane filtration method: it meets the requirement.

**Soluble Insulin Human** Being specified separately when the drug is granted approval based on the Law.

**Assay** (1) Insulin human—Pipet 10 mL of gently shaken Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, and add exactly 40 μL of 6 mol/L hydrochloric acid TS. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make exactly 5 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay under Insulin Human (Genetical Recombination).

Amount (Insulin Unit) of insulin human (C_{257}H_{333}N_{65}O_{77}S_{6}) in 1 mL

\[ M_S = \frac{(M_S \times F)/D \times (A_{T1} + A_{T2})}{A_{S1} + A_{S2}} \times 1.004 \times 5/2 \]

\[ M_S: \text{Amount (mg) of Insulin Human RS taken} \]

\[ F: \text{Labeled unit (Insulin Unit /mg) of Insulin Human RS} \]

\[ D: \text{Volume (mL) of 0.01 mol/L hydrochloric acid TS used to dissolve Insulin Human RS} \]

(2) Zinc—Pipet a volume of gently shaken Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension, equivalent to 300 Insulin Units, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. If necessary, further add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, pipet a suitable volume of Standard Zinc Solution for Atomic Absorption Spectroscopy, dilute with 0.01 mol/L hydrochloric acid TS to make three solutions containing 0.20 μg, 0.60 μg and 1.20 μg of zinc (Zn: 65.38) in each mL, respectively, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectroscopy (<2.2%) according to the following conditions, using 0.01 mol/L hydrochloric acid TS as the blank, and calculate the content of zinc in the sample solution by using the calibration curve obtained from the absorbances of the standard solutions.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Zinc hollow cathode lamp.

Wavelength: 213.9 nm.

**Containers and storage** Containers—Hermetic containers. Storage—Light-resistant, at a temperature between 2°C and 8°C avoiding freezing.

**Insulin Aspart (Genetical Recombination)**

インスリン アスパルト（遺伝子組換え）
Insulin Aspart (Genetical Recombination) is a recombinant human insulin analogue, in which proline residue at 28th of B chain is substituted with aspartic acid. It is a peptide composed of A chain consisting of 21 amino acid residues and B chain consisting of 30 amino acid residues.

It contains not less than 92.6% and not more than 109.5% of insulin aspart (genetical recombination) \((C_{28}H_{38}N_{2}O_{30}S_{6})\), calculated on the dried and residue on ignition-free basis.

0.0350 mg of Insulin Aspart (Genetical Recombination) is equivalent to 1 Insulin Unit.

**Description** Insulin Aspart (Genetical Recombination) occurs as a white powder.

It is practically insoluble in water and in ethanol (95).

It dissolves in 0.01 mol/L hydrochloric acid TS.

It is hygroscopic.

**Identification** Weigh a suitable amount of Insulin Aspart (Genetical Recombination), and dissolve in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains 2.0 mg. Separately, dissolve Insulin Aspart RS in 0.01 mol/L hydrochloric acid TS to make a solution so that each mL contains 2.0 mg. Transfer 25 μL each of these solutions into clean test tubes, add 100 μL of HEPES buffer solution (pH 7.5) and 20 μL of V8-protease TS, and allow to react at 25°C for 6 hours. Then add 145 μL of ammonium sulfate buffer solution to stop the reaction, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.0D>\) according to the following conditions, and compare the peak (peak 1) eluted just after the peak of the solvent and the succeeding three peaks (peaks 2, 3 and 4) with apparently higher peak height in the chromatograms obtained from these solutions: the similar peaks are observed at the same retention times.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (not exceeding 5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: A mixture of water, ammonium sulfate buffer solution and acetonitrile for liquid chromatography (7:2:1).

Mobile phase B: A mixture of water, acetonitrile for liquid chromatography and ammonium sulfate buffer solution (2:2:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 60</td>

<td>70 → 100</td>
</tr>
<tr>
<td>65 – 70</td>
<td>0</td>
<td>100</td>
</tr>
</tbody>
</table>

Flow rate: 1 mL per minute.

**System suitability**—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the symmetry factors of the peaks 2 and 3 are not more than 1.5, respectively, and the resolution between these peaks is not less than 8.

**Purity** (1) Related substances—Perform the test with 10 μL of the sample solution obtained in the Assay as directed under Liquid Chromatography \(<2.0D>\) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of them by the area percentage method: the amount of the peak of B28isoAsp insulin aspart, having the relative retention time of about 0.9 to insulin aspart, is not more than 0.3%, the total amount of the peak of A21Asp insulin aspart and B3asp insulin aspart, having the relative retention times of about 1.3, and the peak of B3isoAsp insulin aspart, having the relative retention time of about 1.5, is not more than 1.0%, and the total amount of the peaks other than the peaks mentioned above is not more than 0.5%.

**Operating conditions**—

Detector, column, column temperature, mobile phase A, mobile phase B, flowing of mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: From 4 minutes to 50 minutes after injection of the sample solution.

**System suitability**—

System performance and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 5 mL of the solution for system suitability test obtained in the Assay, add 0.01 mol/L hydrochloric acid TS to make exactly 10 mL. Confirm that the area percentage of the peak of B28isoAsp insulin aspart obtained with 10 μL of this solution is equivalent to 80 to 120% of that with 10 μL of the solution for system suitability test.

(2) High-molecular proteins—Store the sample solution at a temperature between 2°C and 8°C, and use within 48 hours after preparation. Dissolve 4 mg of Insulin Aspart (Genetical Recombination) in 1 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Perform the test with 100 μL of the sample solution as directed under Liquid Chromatography \(<2.0D>\) according to the following conditions, determine each peak area by the automatic integration method, and calculate the amounts of them by the area percentage method: the total amount of the peaks other than insulin aspart is not more than 0.3%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with hydrophilic silica gel for liquid chromatography (5 to 10 μm in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase: A mixture of a solution of L-arginine (1 in 1000), acetonitrile for liquid chromatography and acetic acid (100) (13:4:3).

Flow rate: 0.5 mL per minute.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion column to the completion of the elution of insulin aspart.

**System suitability**—

Test for required detectability: Allow Insulin Aspart (Genetic Recombination) to stand at ordinary temperature for about 10 days, which results in containing about 0.4% of high-molecular proteins, dissolve in 0.01 mol/L hydrochloric acid TS so that each mL contains about 4 mg of insulin aspart, and use this solution as the solution for system...
suitability test. Store the solution for system suitability test at a temperature between 2°C and 8°C, and use within 7 days. Pipet 5 mL of the solution for system suitability test, and add 0.01 mol/L hydrochloric acid TS to make exactly 10 mL. Confirm that the area percentage of the peak of insulin aspart dimer obtained with 100 μL of this solution is equivalent to 80 to 120% of that with 100 μL of the solution for system suitability test.

System performance: When the procedure is run with 100 μL of the solution for system suitability test under the above operating conditions, insulin aspart polymer (retention time: 13 to 17 minutes), insulin aspart dimer (retention time: about 17.5 minutes) and insulin aspart (retention time: 18 to 20 minutes) are eluted in this order, and determine the peak height of the dimer and the height of the bottom between the peaks of the dimer and the monomer: the peak-valley ratio is not less than 2.0.

System repeatability: When the test is repeated 6 times with 100 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of insulin aspart is not more than 2.0%.

(3) Host cell proteins—Being specified separately when the drug is granted approval based on the Law.

(4) Host cell DNA—Being specified separately when the drug is granted approval based on the Law.

Loss on drying <2.4> Not more than 10.0% (0.2 g, 105°C, 24 hours).

Residue on ignition <2.4> Not more than 6.0% (0.2 g).

Assay Store the sample solution and the standard solution at a temperature between 2°C and 8°C, use the sample solution within 24 hours after preparation, and use the standard solution within 48 hours after preparation. Weigh accurately a suitable amount of Insulin Aspart (Genetical Recombination), dissolve in 0.01 mol/L hydrochloric acid TS so that each mL contains 4.0 mg, and use this solution as the sample solution. Separately, dissolve Insulin Aspart RS in 0.01 mol/L hydrochloric acid TS so that each mL contains 4.0 mg, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the total areas, A1 and A5, of the peak of B28isoAsp insulin aspart (relative retention time to insulin aspart: about 0.9), the peak of insulin aspart (retention time: 20 to 24 minutes), the peak of A21Asp insulin aspart and B3Asp insulin aspart (usually eluted together having the relative retention time of about 1.3) and the peak of B3isoAsp insulin aspart (relative retention time: about 1.5) in each solution.

Amount (mg) of insulin aspart (C25H35N6O5S6)

= M5 × A1/A5

M5: Total amount (mg) of insulin aspart, B28isoAsp insulin aspart, A21Asp insulin aspart and B3Asp insulin aspart, and B3isoAsp insulin aspart in 1 mL of the standard solution

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadeckylsilaized silica gel for liquid chromatography (not exceeding 5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Dissolve 142.0 g of anhydrous sodium sulfate in water, add 13.5 mL of phosphoric acid, and add water to make 5 L. Adjust to pH 3.6 with sodium hydroxide TS. To 4500 mL of this solution add 500 mL of acetonitrile for liquid chromatography.

Mobile phase B: A mixture of water and acetonitrile for liquid chromatography (1:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Flow rate: 1 mL per minute.

System suitability—

System performance: Dissolve Insulin Aspart (Genetical Recombination) in 0.01 mol/L sodium dihydrogen phosphate TS (pH 7.5) so that each mL contains 8 mg, and allow to stand at ordinary temperature for 10 to 15 days. To 1 mL of this solution add 1 mL of 0.01 mol/L hydrochloric acid TS, allow to stand at ordinary temperature for 1 to 3 days, and use this solution as the solution for system suitability test. The solution for system suitability test contains 0.1 to 2.2% of B28isoAsp insulin aspart, and not less than 1% of B3Asp insulin aspart and A21Asp insulin aspart. Store the solution for system suitability test at a temperature between 2°C and 8°C, and use within 72 hours. When the procedure is run with 10 μL of the solution for system suitability test under the above operating conditions, B28isoAsp insulin aspart, insulin aspart, A21Asp insulin aspart and B3Asp insulin aspart. Store the solution for system suitability test contains 0.1 to 2.2% of B28isoAsp insulin aspart, and not less than 1% of B3Asp insulin aspart and A21Asp insulin aspart. Store the solution for system suitability test at a temperature between 2°C and 8°C, and use within 72 hours. When the procedure is run with 10 μL of the solution for system suitability test under the above operating conditions, B28isoAsp insulin aspart, insulin aspart, A21Asp insulin aspart and B3Asp insulin aspart. Store the solution for system suitability test contains 0.1 to 2.2% of B28isoAsp insulin aspart, and not less than 1% of B3Asp insulin aspart and A21Asp insulin aspart. Store the solution for system suitability test contains 0.1 to 2.2% of B28isoAsp insulin aspart, and not less than 1% of B3Asp insulin aspart and A21Asp insulin aspart. Store the solution for system suitability test contains 0.1 to 2.2% of B28isoAsp insulin aspart, and not less than 1% of B3Asp insulin aspart and A21Asp insulin aspart.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of A5 is not more than 1.5%.

Containers and storage Containers—Tight containers.

Storage—Not exceeding –18°C.
ed asparagine residue with glycine residue at 21st of A chain and added two arginine residues at C-terminal of B chain. It is a peptide composed with A chain consisting of 21 amino acid residues and B chain consisting of 32 amino acid residues.

It contains not less than 94.0% and not more than 105.0% of insulin glargine (genetical recombination) \( \text{C}_{20}\text{H}_{40}\text{N}_{2}\text{O}_{8}\text{S}_{2} \) calculated on the anhydrous basis. 0.0364 mg of Insulin Glargine (Genetical Recombination) is equivalent to 1 Insulin Unit.

**Description** Insulin Glargine (Genetical Recombination) occurs as a white powder. It is practically insoluble in water and in ethanol (99.5). It is sparingly soluble in 0.01 mol/L hydrochloric acid TS. It is hygroscopic. It is gradually decomposed by light.

**Identification** Keep the sample solution and standard solution at 2–8°C. Weigh a suitable amount of Insulin Glargine (Genetical Recombination) and Insulin Glargine RS, and dissolve separately in 0.01 mol/L hydrochloric acid TS so that each mL contains 10.0 mg. Transfer 5 mL of these solutions into clean test tubes, add 1 mL of 1 mol/L tris buffer solution (pH 7.5) and 100 µL of a solution of V8 protease for insulin glargine in 1 mol/L tris buffer solution (pH 7.5) (20 units/mL), allow to react at 35–37°C for 3 hours, then add 2 µL of phosphoric acid to stop the reaction, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 50 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and compare the chromatograms obtained from these solutions: The similar peaks appear at the same retention times.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 3 mm in inside diameter and 12.5 cm in length, packed with octadeetyl-silianaized silica gel for liquid chromatography (4 µm in particle diameter). Column temperature: A constant temperature of about 35°C.

Mobile phase A: To 930 mL of a solution, prepared by dissolving 11.6 g of phosphoric acid and 42.1 g of sodium perchloric acid in 1600 mL of water, adjusting to pH 2.3 with triethylamine and adding water to make 2000 mL, add 70 mL of acetonitrile for liquid chromatography.

Mobile phase B: To 430 mL of a solution, prepared by dissolving 11.6 g of phosphoric acid and 42.1 g of sodium perchloric acid in 1600 mL of water, adjusting to pH 2.3 with triethylamine and adding water to make 2000 mL, add 570 mL of acetonitrile for liquid chromatography.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as follows.

Flow rate: 0.55 mL per minute.

**System suitability—**

System performance: When the procedure is run with 50 µL of the standard solution under the above operating conditions, the symmetry factors of the two larger peaks, which appear next to the first peak just after the solvent peak, are not more than 1.5, respectively, and the resolution between these peaks is not less than 3.4.

**Purity (1) Related substances—**

Perform the test with 5 µL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of these peaks by the area percentage method: the amount of the peak other than insulin glargine is not more than 0.4%, and the total amount of the peaks other than insulin glargine is not more than 1.0%

**Operating conditions—**

Detector, column, column temperature, mobile phases A and B, flow rate, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: For 40 minutes after injection, beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 1 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, add 0.01 mol/L hydrochloric acid TS to make exactly 10 mL. Confirm that the peak area of insulin glargine obtained with 5 µL of this solution is equivalent to 5 to 15% of that with 5 µL of the solution for system suitability test.

System performance: When the procedure is run with 5 µL of the standard solution obtained in the Assay under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of insulin glargine are not less than 20,000 and not more than 1.8, respectively.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution obtained in the Assay under the above operating conditions, the relative standard deviation of the peak area of insulin glargine is not more than 2.0%.

(2) High-molecular mass proteins—Keep the sample solution at 2–8°C. Dissolve 15 mg of Insulin Glargine (Genetical Recombination) in 1.5 mL of 0.01 mol/L hydrochloric acid TS, add water to make 10 mL, and use this solution as the sample solution. Perform the test with 100 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the total amount of the peaks other than insulin glargine is not more than 0.3%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 276 nm).

Column: Two stainless steel columns connected in series of 8 mm in inside diameter and 30 cm in length, packed with hydrophilic silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 400 mL of water add 300 mL of acetonitrile for liquid chromatography and 200 mL of acetic acid (100), adjust to pH 3.0 with ammonia solution (28), and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of insulin glargine is about 35 minutes.

Time span of measurement: From the retention time corresponding to the exclusion volume of the size-exclusion
column to the completion of the elution of insulin glargine.  

**System suitability**—
Test for required detectability: To 1 mL of the sample solution add 0.01 mol/L hydrochloric acid TS to make 50 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, add 0.01 mol/L hydrochloric acid TS to make exactly 10 mL. Confirm that the peak area of insulin glargine obtained with 100 μL of this solution is equivalent to 5 to 15% of that with 100 μL of the solution for system suitability test.  

System performance: Heat 15 mg of Insulin Glargine (Genetical Recombination) at 100°C for 1.5–3 hours, then dissolve in 1.5 mL of 0.01 mol/L hydrochloric acid TS, and add water to make exactly 10 mL. When the procedure is run with 100 μL of this solution under the above operating conditions, the high-molecular mass protein and insulin glargine are eluted in this order with the resolution between these peaks not less than 1.5.  

System repeatability: When the test is repeated 6 times with 100 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of insulin glargine is not more than 2.0%.  

(3) Other product-related impurities—Being specified separately when the drug is granted approval based on the Law.  

(4) Host cell proteins—Being specified separately when the drug is granted approval based on the Law.  

(5) Host cell DNA—Being specified separately when the drug is granted approval based on the Law.  

**Water** <2.48> Not more than 8.0% (90 mg, coulometric titration).  

**Bacterial endotoxins** <4.01> Less than 10 EU/mg.  

**Zinc content** Weigh accurately about 45 mg of Insulin Glargine (Genetical Recombination), dissolve in 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, take exactly a suitable amount of Standard Zinc Solution for Atomic Absorption Spectrophotometry, dilute with 0.01 mol/L hydrochloric acid TS to make three solutions containing 0.20 μg, 0.40 μg and 0.60 μg of zinc (Zn: 65.38) in each mL, respectively, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions, and calculate the amount of zinc in the sample solution using a calibration curve obtained from the absorbances of the standard solutions: not more than 0.80% of zinc (Zn: 65.38), calculated on the anhydrous basis.  

Gas: Combustible gas—Acetylene.  
Supporting gas—Air.  
Lamp: Zinc hollow-cathode lamp.  
Wavelength: 213.9 nm.  

**Assay** Keep the sample solution and standard solution at 2–8°C. Weigh accurately about 15 mg of Insulin Glargine (Genetical Recombination), dissolve in 1.5 mL of 0.01 mol/L hydrochloric acid TS, add water to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve Insulin Glargine RS in 0.01 mol/L hydrochloric acid TS so that each mL contains about 10 mg of insulin glargine, then exactly dilute with water so that each mL contains about 1.5 mg of insulin glargine, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of insulin glargine in each solution.  

\[
\text{Amount (mg) of insulin glargine (C}_{26}H_{30}N_7O_5S_6) = M_S \times A_T / A_S
\]

\( M_S \): Amount (mg) of insulin glargine in 1 mL of the standard solution  

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 214 nm).  
Column: A stainless steel column 3 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).  
Column temperature: A constant temperature of about 35°C.  

Mobile phase A: Dissolve 20.7 g of anhydrous sodium dihydrogen phosphate in 900 mL of water, adjust to pH 2.5 with phosphoric acid, and add water to make 1000 mL. To 250 mL of this solution add 250 mL of acetonitrile for liquid chromatography, dissolve 18.4 g of sodium chloride in this solution, and add water to make 1000 mL.  

Mobile phase B: Dissolve 20.7 g of anhydrous sodium dihydrogen phosphate in 900 mL of water, adjust to pH 2.5 with phosphoric acid, and add water to make 1000 mL. To 250 mL of this solution add 650 mL of acetonitrile for liquid chromatography, dissolve 3.2 g of sodium chloride in this solution, and add water to make 1000 mL.  

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.  

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 20</td>

<td>83 → 63</td>
<td>17 → 37</td>
</tr>
<tr>
<td>30 – 40</td>
<td>63 → 96</td>
<td>37 → 4</td>
</tr>
</tbody>
</table>

Flow rate: 0.55 mL per minute (the retention time of insulin glargine is about 21 minutes).  

**System suitability**—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of insulin glargine are not less than 20,000 and not more than 1.8, respectively.  

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of insulin glargine is not more than 2.0%.  

**Containers and storage** Containers—Tight containers.  
Storage—Not exceeding −15°C.  

**Insulin Glargine (Genetical Recombination) Injection**  
インスリン グラルギン(遺伝子組換え)注射液  
Insulin Glargine (Genetical Recombination) Injection is an aqueous injection.  
It contains not less than 95.0% and not more than 105.0% of the labeled Insulin Unit of insulin glargine
Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Zinc content Being specified separately when the drug is granted approval based on the Law.

Assay To a suitable amount of Insulin Glargine (Genetical Recombination) Injection add exactly water so that each mL contains 40 Insulin Units, and use this solution as the sample solution. Then, proceed as directed in the Assay under Insulin Glargine (Genetical Recombination).

Amount (Insulin Unit) of insulin glargine (C_{26}H_{40}aN_{7}O_{7}S_{6}) in 1 mL

\[ M_1 = M_5 \times A_1/A_5 \times d \times 1/0.0364 \]

\[ M_2: \text{Amount (mg) of insulin glargine in 1 mL of the standard solution} \]

\[ d: \text{Dilution factor of the sample solution} \]

0.0364: Mass (mg) of insulin glargine equivalent to 1 Insulin Unit

Containers and storage Containers—Hermetic containers.

Storage—Light-resistant, at a temperature of 2 – 8°C avoiding freezing.

**Interferon Alfa (NAMALWA)**

インターフェロン アルファ (NAMALWA)

Interferon Alfa (NAMALWA) is essentially a human interferon alfa, which is a glycoprotein (molecular mass: 17,000 – 30,000) produced by the human lymphoblast NAMALWA cell induced by Sendai virus. It is an aqueous solution. It possesses the antiviral activity.

- It contains not less than 50 μg and not more than 500 μg of protein per mL, and not less than 1.0 × 10⁸ Units per mg of the protein.

**Description** Interferon Alfa (NAMALWA) occurs as a clear and colorless liquid.

**Identification (1)** To Interferon Alfa (NAMALWA) add Eagle’s minimum essential medium containing bovine serum so that each mL contains 5000 Units, and use this solution as the sample stock solution. To anti-interferon alfa antiserum add an amount of Eagle’s minimum essential medium containing bovine serum so that each mL contains an amount of anti-interferon alfa antiserum which neutralizes 10,000 Units of interferon alfa. To this solution add an equal volume of the sample stock solution, stir, and use this solution as the sample solution. Separately, to the sample stock solution add an equal volume of Eagle’s minimum essential medium containing bovine serum, stir, and use this solution as the control solution. Determine the remained potency of the sample solution and control solution after allowing to stand at 37 ± 1°C for 1 hour, according to the Assay. When the antiviral activity of Interferon Alfa (NAMALWA) is neutralized by anti-interferon alfa antiserum, it meets the requirement. Not detection of the remaining potency of the sample solution is a criterion of neutralization.

(2) Soak polyvinylidene fluoride membrane in methanol for 10 – 20 seconds, then soak additionally in phosphate-buffered sodium chloride TS for more than 30 minutes. To the well in the dot blot apparatus mounted the polyvinylid-
Interferon Alfa (NAMALWA) / Official Monographs

**Constituent amino acids** When perform the test by Method 2 of 2. Methodologies of Amino Acid Analysis after hydrolyzing by Method 1 (but not containing phenol) of 1. Hydrolysis of Protein and Peptide under Amino Acid Analysis of Proteins 2.04, the molar ratios of each constituent amino acid are 8 – 11 for aspartic acid, 4 – 7 for threonine, 7 – 10 for serine, 16 – 19 for glutamic acid, 2 – 4 for glycine and tyrosine, 5 – 7 for alanine, phenylalanine and lysine, 3 – 6 for valine, 2 – 5 for methionine, 4 – 6 for isoleucine, 12 – 15 for leucine, 1 – 3 for histidine and 6 – 9 for arginine.

(i) Hydrolysis—To Interferon Alfa (NAMALWA) add tris-glycine buffer solution (pH 6.8) so that each mL contains 6,000,000 Units. Pass 3 mL of the solution through a column 4 mm in internal diameter, packed with 0.145 g of ethylsulfonated silica gel for column chromatography and previously washed with 5 mL of a mixture of water, acetonitrile and dilute trifluoroacetic acid (1 in 50) (13:6:1). Then, after washing with not less than 10 mL of a mixture of water, acetonitrile and dilute trifluoroacetic acid (1 in 50) (13:6:1), elute interferon alfa with 0.5 mL of a mixture of acetonitrile and dilute trifluoroacetic acid (1 in 50) (19:1), and use the eluate as the sample stock solution. To 0.45 mL of the sample stock solution add 50 μL of the internal standard solution, and stir. Transfer 0.1 mL each of this solution into two glass vessels for hydrolysis, and evaporate to dryness under reduced pressure. Add 20 μL of a solution which is prepared by adding 10 μL of mercapto acetic acid to 1 mL of 6 mol/L hydrochloric acid TS for amino acid automatic analysis, and 0.18 mL of 6 mol/L hydrochloric acid TS for amino acid automatic analysis to the bottom of the glass vessels, replace the air in the vessels with nitrogen, close the vessels tightly under reduced pressure, and heat at 110 ± 2°C for 24 hours for one of the vessels and for 72 hours for another. After cooling, open the vessels, evaporate the hydrolyzate to dryness under reduced pressure, dissolve the residue in 20 μL of water, and evaporate to dryness under reduced pressure. Dissolve the residues with 0.1 mL each of diluted 6 mol/L hydrochloric acid TS for amino acid automatic analysis (31 in 10,000), and use these solutions as the sample solutions (1) and (2), respectively. Separately, weigh exactly a suitable amount each of L-lysine hydrochloride, L-histidine hydrochloride monohydrate, L-arginine, L-aspartic acid, L-threonine, L-serine, L-glutamic acid, glycine, L-alanine, L-valine, L-methionine, L-isoleucine, L-leucine, L-phenylalanine and L-norleucine, dissolve in diluted 6 mol/L hydrochloric acid TS for amino acid automatic analysis (31 in 10,000) so that each mL contains a certain concentration of about 20 nmol for each amino acid, and use this solution as the standard solution.

(ii) Amino acid analysis—When perform the test with 15 μL each of the sample solutions (1) and (2) and 10 μL of the standard solution as directed under Liquid Chromatography 2.04 according to the following conditions, either chromatogram obtained from the sample solutions shows the peaks corresponding to the peaks obtained from the standard solution. The molar ratios of each constituent amino acids are calculated. When calculate the molar ratios of each constituent amino acid, for threonine and serine the molar value is corrected by extrapolation to 0 hour-heating based on the values obtained from the sample solutions (1) and (2), for isoleucine and valine use the value from the sample solution (2), and for the other amino acids use the value from the sample solution (1). The molar ratios of cystine, proline and tryptophan are excluded from calculation.

**Internal standard solution**—To exactly 32.81 mg of L-norleucine add diluted 6 mol/L hydrochloric acid TS for amino acid automatic analysis (31 in 10,000) to make exactly 100 mL. Pipet 4 mL of this solution, add diluted 6 mol/L hydrochloric acid TS for amino acid automatic analysis (31 in 10,000) to make exactly 100 mL.

**Operating conditions**—

Column: A stainless steel column 5 mm in inside diameter and 8 cm in length, packed with strongly acidic ion-exchange resin (Na type) for liquid chromatography composed with a sulfonated styrene-divinylbenzene copolymer (3 μm in particle diameter).

Column temperature: Inject the sample at 50 ± 1°C, maintain the temperature for 11 minutes, change to 40 ± 1°C and maintain for 23 minutes, then change to 65 ± 1°C and maintain for 56 minutes, and change to 45 ± 1°C.

Reaction vessel temperature: A constant temperature of about 51°C.

**Mobile phase:** Prepare the mobile phases A, B, C and D according to the following table.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A, B, C and D as directed in the following table.
Interferon Alfa (NAMALWA)  

To a suitable amount of Interferon Alfa process-related impurities—
as suitable as possible

Sodium hypochlorite TS — 0.1 mL —

Prepare a calibration curve by

(100) and adding water to make 1000 mL, and destain by immersing the gel in a solution containing Coomassie brilliant blue R-250 in 450 mL of methanol and 100 mL of acetic acid (10%) followed by washing with water. Then, stain the gel by immersing for more than 2 hours in a solution containing a mixture of tris-glycine buffer solution (pH 6.8) and 1 mol/L tris buffer solution (pH 8.0) (40:1) so that each mL contains 128, 64, 32, 16, 8, and 4 pg of DNA, respectively, and use these solutions as DNA standard solutions.

(i) DNA standard solutions: To the DNA standard stock solution for interferon alfa (NAMALWA) add salmon sperm DNA solution (1 in 10,000,000) so that each mL contains exactly 20 ng DNA. Hereinafter, the concentration of DNA is the concentration of DNA for interferon alfa (NAMALWA). To this solution add tris-glycine buffer solution (pH 6.8) exactly so that each mL contains 10 ng DNA. Then, dilute serially by adding tris-glycine buffer solution (pH 6.8). Dilute exactly with a mixture of tris-glycine buffer solution (pH 6.8) and 1 mol/L tris buffer solution (pH 8.0) (40:1) so that each mL contains 128, 64, 32, 16, 8, and 4 pg of DNA, respectively, and use these solutions as DNA standard solutions.

(ii) Procedure: Use Interferon Alfa (NAMALWA) as the sample solution. Place 0.11 mL each of DNA standard solutions, a mixture of tris-glycine buffer solution (pH 6.8) and 1 mol/L tris buffer solution (pH 8.0) (43:1), and the sample solution into tubes separately. Heat these solutions in an aluminum block thermostat bath at 98°C for 10 minutes. After ice-cooling, centrifuge, and transfer 50 µL each of the supernatants to new tubes. In separate wells of a PCR microplate place 6 µL each of DNA standard solutions which have been treated by heating for DNA extraction, a mixture of tris-glycine buffer solution (pH 6.8) and 1 mol/L tris buffer solution (pH 8.0) (43:1), and the sample solution. Then, add 20 µL each of a mixture of 2-fold PCR reaction solution containing SYBR Green, nuclease free water, primer F TS and primer R TS (167:70:10:10) into each well. Seal with plate film, and centrifuge. After centrifugation, attach the plate to a real-time PCR system, repeat 40 cycles of 15 seconds at 95°C and 1 minute at 60°C, and measure the fluorescence intensity of each well in every PCR cycle. Plot the fluorescent amount on the vertical axis and the PCR cycle number on the horizontal axis, and determine the PCR cycle number at which the fluorescence of each well is greater than a certain value. Further, make a calibration curve by plotting the number of PCR cycles on the vertical axis and the logarithm of the concentration of DNA standard solution on the horizontal axis to calculate the concentration of DNA in the sample solution.

System suitability—

Test for required detectability: The PCR cycle number obtained with 4 pg/mL DNA standard solution is not greater than that obtained with a mixture of tris-glycine buffer solution (pH 6.8) and tris buffer solution (pH 8.0) (43:1).

System performance: When the procedure is run with each DNA standard solution under the above conditions, the correlation coefficient of the calibration curve obtained is 0.990 or more.

(iii) Infective virus test—Inject 0.2 mL each of Interferon Alfa (NAMALWA) into the allantoic cavity of not less than 6 embryonated eggs, allow them to stand at 36 ± 1°C for 3
days, and then allow to stand at 4°C for a night. Collect more than 1 mL of the allantoic fluid from each egg. To 50 μL of the allantoic fluid add 50 μL of 0.5% chicken erythrocyte suspension, mix, and allow to stand at room temperature for 1 hour. Examine the presence of the aggregate. When the aggregation is not found, inject 0.2 mL each of this allantoic fluid into the allantoic cavity of the embryonated eggs, and repeat the same procedure as above: the test is met when the aggregation is not found. As a positive control, inoculate the Sendai virus $1.6 \times 10^{-4}$ to $6.4 \times 10^{-4}$ HA value per embryonated chicken egg into the allantoic cavity, and perform the test at the same time.

**Assay (1) Protein content—**

(i) **Sample solution:** Dilute Interferon Alfa (NAMALWA) with isotonic sodium chloride solution so that each mL contains 3,000,000 to 4,000,000 Units, and use this solution as the sample solution.

(ii) **Standard solution:** Weigh accurately about 50 mg of bovine serum albumin, and dissolve in isotonic sodium chloride solution to make exactly 50 mL. Determine the absorbance of this solution at 280 nm as directed under Ultraviolet-visible Spectrophotometry $\leq 2.4\%$. Calculate the protein concentration based on $E_{280}^{1\%}(280 \text{ nm}) = 6.6$. To this solution add isotonic sodium chloride solution so that each mL contains exactly 50, 25, 12.5, 6.25, and 3.13 μg of the bovine serum albumin, and use these solutions as the standard solutions.

(iii) **Procedure:** To exactly 0.25 mL each of the sample solution and the standard solutions add exactly 0.25 mL of Coomassie brilliant blue TS for interferon alfa, and allow to stand at room temperature for exactly 30 seconds. Determine the absorbance of these solutions at 614 nm as directed under Ultraviolet-visible Spectrophotometry $< 2.4\%$. Plot the absorbance of the standard solutions on the vertical axis and their protein concentrations on the horizontal axis to prepare a calibration curve. Determine the protein content of the sample solution from its absorbance using the calibration curve, and calculate the amount of protein per mL of the sample solution. Perform a blank determination in the same manner with isotonic sodium chloride solution, and make any necessary correction.

(2) **Specific activity**—To each well of a flat-bottom microplate add 45,000 to 60,000 cells of FL cell, prepared with Eagle's minimum essential medium containing bovine serum, and incubate at 37 ± 1°C for 18 to 22 hours in an incubator filled with 5% carbon dioxide. Dilute Interferon Alfa (NAMALWA) and Interferon Alfa RS separately with Eagle's minimum essential medium containing bovine serum so that each mL contains about 30 Units, and use these solutions as the sample solution (1) and the standard solution (1), respectively. To 200 μL each of these solutions add 117 μL of Eagle's minimum essential medium containing bovine serum, and use these solutions as the sample solution (2) and the standard solution (2), respectively. Repeat this operation, and prepare the sample solutions and standard solutions with log dilutions of 8 serials (dilution ratio per stage is 0.2 log₁₀ fold). Repeat to prepare the sample solutions three or more times. Add each sample solution or standard solution into each well of the cell culture, and incubate at 37 ± 1°C for 6 hours. Discard the culture medium, add $1 \times 10^4$ to $1 \times 10^6$ PFU of Sindbis virus per well, and incubate at 37 ± 1°C for 38 to 42 hours. Discard the culture medium, add neutral red-Eagle's minimum essential medium containing bovine serum, and incubate at 37 ± 1°C for 45 to 75 minutes. Discard the culture medium, and add 0.01 mol/L phosphate buffer solution. Discard the liquid. Repeat this operation. Elute the neutral red that is taken up by the cells by adding sodium dihydrogen phosphate-ethanol TS. Determine the absorbance at 540 nm, prepare the dose-response curves by plotting the absorbances on the vertical axis and the logarithm of the dilution ratio on the horizontal axis with the absorbances obtained from the sample solution and standard solution. On the dose-response curves of the sample solution and standard solution, calculate the relative potency of the sample solution ($n = 3$ or more), obtained independently, to the standard solution by comparing the points where the intermediate of absorbances in cells infected with virus and cells not infected with virus, and calculate the average value of them as the potency of Interferon Alfa (NAMALWA) in 1 mL. Calculate the specific activity by dividing the obtained potency by the amount of protein content. When all of the following conditions are satisfied, the test is valid.

- Absorbance obtained from cells not infected with virus is 0.8 to 1.2.
- Absorbance obtained from the cells infected with virus is not more than 0.1.
- Standard deviation of the (log) potency of Interferon Alfa (NAMALWA) in 1 mL obtained from the sample solution prepared three or more times independently is not more than 0.06.

**Containers and storage**  Containers—Tight containers. Storage—Light-resistant, and at a temperature not exceeding 5°C, avoiding freezing.

---

**Interferon Alfa (NAMALWA) Injection**

インターフェロン アルファ(NAMALWA)注射液

Interferon Alfa (NAMALWA) Injection is an aqueous injection. It contains not less than 70% and not more than 150% of the labelled amount of interferon alfa (NAMALWA).

**Method of preparation** Prepare as directed under Injections, with Interferon Alfa (NAMALWA).

**Description** Interferon Alfa (NAMALWA) Injection is a clear and colorless liquid.

**Identification** To Interferon Alfa (NAMALWA) Injection add Eagle's minimum essential medium containing bovine serum so that each mL contains 5000 Units, and use this solution as the sample stock solution. To anti-interferon alfa antiserum add an amount of Eagle's minimum essential medium containing bovine serum so that each mL contains an amount of anti-interferon alfa antiserum which neutralizes 10,000 Units of interferon alfa. To this solution add an equal volume of the sample stock solution, stir, and use this solution as the sample solution. Separately, to the sample stock solution add an equal volume of Eagle's minimum essential medium containing bovine serum, stir, and use this solution as the control solution. Determine the remained potency of the sample solution and control solution after allowing to stand at 37 ± 1°C for 1 hour, according to the Assay. When neutralized the antiviral activity of Interferon Alfa (NAMALWA) by anti-interferon alfa antiserum, it meets the requirement. Not detection of the remaining potency of the sample solution is the criterion of neutralization.
Osmotic pressure ratio  Being specified separately when the drug is granted approval based on the Law.

pH  Being specified separately when the drug is granted approval based on the Law.

Purity  Multimers—To a suitable amount of Interferon Alfa (NAMALWA) Injection add tris-glycine buffer solution (pH 6.8) so that each mL contains 3,000,000 Units, and use this as the sample solution. Perform the test with 200 μL of the sample solution as directed under Liquid Chromatography (<2.0%)

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A glass column 10 mm in inside diameter and 30 cm in length, packed with dextran-highly cross-linked agarose gel filtration carrier for liquid chromatography.

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.15 g of anhydrous disodium hydrogen phosphate, 0.2 g of potassium dihydrogen phosphate, 8.0 g of sodium chloride and 0.2 g of potassium chloride in water to make 1000 mL. To 950 mL of this solution add 50 mL of a solution prepared by dissolving 10 g of sodium lauryl sulfate in 100 mL of water, and mix gently.

Flow rate: 1 mL per minute.

Time span of measurement: Until the elution of interferon alfa monomer is completed.

System suitability—

Test for required detectability: Pipet 50 μL of the sample solution, add tris-glycine buffer solution (pH 6.8) to make exactly 2 mL. Confirm that the peak area of the main peak obtained with 200 μL of this solution is equivalent to 2.0 to 3.0% of that with 200 μL of the sample solution.

System performance: Dissolve 15 mg of egg albumin for gel filtration molecular mass marker and 15 mg of ribonuclease A for gel filtration molecular mass marker in 100 mL of tris-glycine buffer solution (pH 6.8). When the procedure is run with 20 μL of this solution under the above conditions, egg albumin and ribonuclease A are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 200 μL of the sample solution under the above operating conditions, the relative standard deviation of the area of the main peak is not more than 2.0%.

Bacterial endotoxins <4.0%  Less than 0.25 EU per 600,000 Units.

Extractable volume <6.0%  It meets the requirement.

Foreign insoluble matter <6.0%  Perform the test according to Method1: it meets the requirement.

Insoluble particulate matter <6.0%  It meets the requirement.

Sterility <4.0%  Perform the test according to the Membrane filtration method: it meets the requirement.

Assay  To each well of a flat-bottom microplate add 45,000 to 60,000 cells of FL cell, prepared with Eagle’s minimum essential medium containing bovine serum, and incubate at 37 ± 1°C for 18 to 22 hours in an incubator filled with 5% carbon dioxide. Dilute Interferon Alfa (NAMALWA) Injection and Interferon Alfa RS separately with Eagle’s minimum essential medium containing bovine serum so that each mL contains about 30 Units, and use these solutions as the sample solution (1) and the standard solution (1), respectively. To 200 μL each of these solutions add 117 μL of Eagle’s minimum essential medium containing bovine serum, and use these solutions as the sample solution (2) and the standard solution (2), respectively. Repeat this operation, and prepare the sample solutions and standard solutions with logarithm dilutions of 8 serials (dilution ratio per stage is 0.2 log₂ fold). Repeat to prepare the sample solutions three or more times. Add each sample solution or each standard solution into each well of the cell culture, and incubate at 37 ± 1°C for 6 hours. Discard the culture medium, add 1 × 10⁶ to 1 × 10⁷ PFU of Sindbis virus per well, and incubate at 37 ± 1°C for 45 to 75 minutes. Discard the culture medium, and add 0.01 mol/L phosphate buffer solution. Discard the liquid. Repeat this operation. Elute the neutral red that is taken up by the cells by adding sodium dihydrogen phosphate-ethanol TS. Determine the absorbance at 540 nm, prepare the dose-response curves by plotting the absorbances on the vertical axis and the logarithm of the dilution ratio on the horizontal axis with the absorbances obtained from the sample solution and standard solution. Absorbance obtained from cells not infected with virus is 0.8 to 1.2.

Absorbance obtained from the cells infected with virus is not more than 0.1.

Standard deviation of the (log) potency of Interferon Alfa (NAMALWA) Injection in 1 mL obtained from the sample solution prepared three or more times independently is not more than 0.06.

Containers and storage  Containers—Hermetic containers.

Storage—Light-resistant, and at a temperature not exceeding 10°C, avoiding freezing.

Iodinated (¹³¹I) Human Serum Albumin Injection

ヨウ化人血清アルブミン（¹³¹I）注射液

Iodinated (¹³¹I) Human Serum Albumin Injection is an aqueous injection containing normal human serum albumin iodinated by iodine-131 (¹³¹I).

It conforms to the requirements of Iodinated (¹³¹I) Human Serum Albumin Injection in the Minimum Requirements for Radiopharmaceuticals.

Test for Extractable Volume of Parenteral Preparations and Insoluble Particulate Matter Test for Injections are not applied to this injection.

Description  Iodinated (¹³¹I) Human Serum Albumin Injec-
Iodine

ヨウ素

I: 126.90

Iodine contains not less than 99.5% of iodine (I).

**Description** Iodine occurs as grayish black, plates or granular, heavy crystals, having a metallic luster and a characteristic odor.

It is freely soluble in diethyl ether, soluble in ethanol (95), sparingly soluble in chloroform, and very slightly soluble in water.

It dissolves in potassium iodide TS. It sublimes at room temperature.

**Identification (1)** A solution of Iodine in ethanol (95) (1 in 5) shows a red-brown color.

(2) A solution of Iodine in chloroform (1 in 1000) shows a red-purple to purple color.

(3) Add 0.5 mL of starch TS to 10 mL of a saturated solution of Iodine: a dark blue color is produced. When the mixture is boiled, the color disappears, and it reappears on cooling.

**Purity (1)** Non-volatile residue—Sublime 2.0 g of Iodine on a water bath, and dry the residue at 105 °C for 1 hour: the mass of the residue is not more than 1.0 mg.

(2) Chloride or bromide—Mix 1.0 g of finely powdered Iodine with 20 mL of water, and filter the mixture. To 10 mL of the filtrate add dropwise 2% hydrochloric acid solution (1 in 5) until the yellow color disappears. Add 1 mL of ammonia TS, followed by 1 mL of silver nitrate TS in small portions, and add water to make 20 mL. Shake well, filter, and after discarding the first 2 mL of the filtrate, take 10 mL of the subsequent filtrate. To the filtrate add 2.0 mL of nitric acid and water to make 20 mL: the solution so obtained has no more turbidity than the following control solution.

Control solution: To 0.20 mL of 0.01 mol/L hydrochloric acid VS add 5 mL of water, 2.5 mL of ammonia TS, 1 mL of silver nitrate TS, 2.0 mL of nitric acid and water to make 20 mL.

**Assay** Place 1 g of potassium iodide and 1 mL of water in a glass-stoppered flask, weigh accurately, add about 0.3 g of Iodine to the flask, and weigh accurately again. Dissolve the iodine by gentle shaking, add 20 mL of water and 1 mL of dilute hydrochloric acid, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS).

Each mL of 0.1 mol/L sodium thiosulfate VS = 12.69 mg of I

**Containers and storage** Containers—Tight containers.

---

**Iodine Tincture**

ヨードチンキ

Iodine Tincture contains not less than 5.7 w/v% and not more than 6.3 w/v% of iodine (I: 126.90), and not less than 3.8 w/v% and not more than 4.2 w/v% of potassium iodide (KI: 166.00).

**Method of preparation**

<table>

<tbody>
<tr>
<td>Potassium Iodide</td>
<td>40 g</td>
</tr>
<tr>
<td>70 vol% Ethanol</td>
<td>a sufficient quantity</td>
</tr>
</tbody>
</table>

To make 1000 mL

Prepare as directed under Spirits, with the above ingredients. It may be prepared with an appropriate quantity of Ethanol or Ethanol for Disinfection and Purified Water or Purified Water in Containers in place of 70 vol% Ethanol.

**Description** Iodine Tincture is a dark red-brown liquid, and has a characteristic odor.

Specific gravity $d_20^0$: about 0.97

**Identification (1)** To a mixture of 1 mL of starch TS and 9 mL of water add 1 drop of Iodine Tincture: a dark blue-purple color develops.

(2) Evaporate 3 mL of Iodine Tincture to dryness on a water bath, and heat gently over a free flame: a white residue is formed which responds to Qualitative Tests 1.09 for potassium salt and iodide.

**Alcohol number <1.07>** Not less than 6.6 (Method 2). Perform the pretreatment (ii) in the Method 1.

**Assay (1)** Iodine—Pipet 5 mL of Iodine Tincture, add 0.5 g of potassium iodide, 20 mL of water and 1 mL of dilute hydrochloric acid, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

Each mL of 0.1 mol/L sodium thiosulfate VS = 12.69 mg of I

(2) Potassium iodide—Pipet 5 mL of Iodine Tincture into an iodine flask, add 20 mL of water, 50 mL of hydrochloric acid and 5 mL of chloroform. Cool to room temperature, and titrate with 0.05 mol/L potassium iodate VS until the red-purple color disappears from the chloroform layer, with agitation the mixture vigorously and continuously. After the chloroform layer has been decolorized, allow the mixture to stand for 5 minutes. If the color reappears, the mixture should be titrated further with 0.05 mol/L potassium iodate VS. Calculate the amount (mg) of potassium iodide from the number of mL ($a$) of 0.05 mol/L potassium iodate VS used as above and the number of mL ($b$) of 0.1 mol/L sodium thiosulfate VS used in the titration under the Assay (1).

Amount (mg) of potassium iodide (KI) $= 16.60 \times \left( a - \frac{b}{2} \right)$

**Containers and storage** Containers—Tight containers.
**Dilute Iodine Tincture**

Dilute Iodine Tincture contains not less than 2.8 w/v% and not more than 3.2 w/v% of iodine (I: 126.90), and not less than 1.9 w/v% and not more than 2.1 w/v% of potassium iodide (KI: 166.00).

To make 1000 mL

Prepare as directed under Spirits, with the above ingredients. It may be prepared with an appropriate quantity of ethanol or ethanol for disinfection and purified water or purified water in containers in place of 70 vol% ethanol. It may also be prepared by adding 70 vol% ethanol to 500 mL of iodine tincture to make 1000 mL.

### Description

Dilute Iodine Tincture is a dark red-brown liquid, and has a characteristic odor.

**Specific gravity** $d_\text{20}^\text{6}$: about 0.93

### Identification (1)

To a mixture of 1 mL of starch TS and 9 mL of water add 1 drop of dilute iodine tincture: a dark blue-purple color develops.

(2) Evaporate 3 mL of dilute iodine tincture to dryness on a water bath, and heat gently over a free flame: a white residue is formed which responds to the Qualitative Tests $<1.07$ for potassium salt and iodide.

**Alcohol number** $<1.07$: Not less than 6.7 (Method 2). Perform the pretreatment (ii) in the Method 1.

### Assay (1)

Iodine— Pipet exactly 10 mL of dilute iodine tincture, add 0.5 g of potassium iodide, 20 mL of water and 1 mL of dilute hydrochloric acid, and titrate $<2.50$ with 0.1 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

Each mL of 0.1 mol/L sodium thiosulfate VS = 12.69 mg of I

(2) Potassium iodide— Pipet 10 mL of dilute iodine tincture into an iodine flask, add 20 mL of water, 50 mL of hydrochloric acid and 5 mL of chloroform. Cool to room temperature, and titrate $<2.50$ with 0.05 mol/L potassium iodate VS until the red-purple color in the chloroform layer disappears while agitating vigorously and continuously. After the chloroform layer has been decolorized, allow the mixture to stand for 5 minutes. If the color reappears, the mixture should be titrated $<2.50$ further with 0.05 mol/L potassium iodate VS. Calculate the amount (mg) of potassium iodide from the volume (a mL) of 0.05 mol/L potassium iodate VS consumed as above and the volume (b mL) of 0.1 mol/L sodium thiosulfate VS consumed in the titration under Assay (1).

Amount (mg) of potassium iodide (KI) = 16.60 × $\lfloor a - (b/2) \rfloor$

### Containers and storage

Containers—Tight containers.

---

**Compound Iodine Glycerin**

Compound Iodine Glycerin contains not less than 1.1 w/v% and not more than 1.3 w/v% of iodine (I: 126.90), not less than 2.2 w/v% and not more than 2.6 w/v% of potassium iodide (KI: 166.00), not less than 2.7 w/v% and not more than 3.3 w/v% of total iodine (as I), and not less than 0.43 w/v% and not more than 0.53 w/v% of phenol (C₇H₈O: 94.11).

To make 1000 mL

Dissolve potassium iodide and iodine in about 25 mL of purified water or purified water in containers. After adding glycerin, add mentha water, liquefied phenol and sufficient purified water or purified water in containers to make 1000 mL, mixing thoroughly. It may be prepared with an appropriate quantity of concentrated glycerin and purified water or purified water in containers in place of glycerin, and with an appropriate quantity of phenol and purified water or purified water in containers in place of liquefied phenol.

### Description

Compound Iodine Glycerin is a red-brown, viscous liquid. It has a characteristic odor.

**Specific gravity** $d_\text{20}^\text{6}$: about 1.23

### Identification (1)

The colored solution obtained in the assay (1) acquires a red color. Determine the absorption spectrum of this solution as directed under ultraviolet-visible spectrophotometry $<2.24>$: it exhibits a maximum between 510 nm and 514 nm (iodine).

(2) The colored solution obtained in the assay (2) acquires a red color. Determine the absorption spectrum of this solution as directed under ultraviolet-visible spectrophotometry $<2.24>$: it exhibits a maximum between 510 nm and 514 nm (potassium iodide).

(3) The colored solution obtained in the assay (4) has a yellow color. Determine the absorption spectrum of this solution as directed under ultraviolet-visible spectrophotometry $<2.24>$: it exhibits a maximum between 401 nm and 405 nm (phenol).

(4) Take 1 mL of compound iodine glycerin in a glass-stopped test tube, add 10 mL of ethanol (95), and mix. Then add 2 mL of sodium hydroxide TS, add 1 mL of a solution of copper (II) chloride dihydrate in ethanol (95) (1 in 10), and shake: a blue color develops (glycerin).

### Assay (1)

Iodine—Measure the specific gravity of compound iodine glycerin according to method 2 under Determination of specific gravity and density $<2.50>$. Weigh exactly about 7 mL of it, add ethanol (95) to make exactly 200 mL, and use this solution as the sample solution. On the other hand, weight approximately about 80 mg of iodine for assay and about 0.17 g of potassium iodide for assay, previously dried at 105°C for 4 hours, dissolve in ethanol (95) to make exactly 200 mL, and use this solution as the standard solu-
tion. Pipet 3 mL each of the sample solution and the standard solution into 50-mL separators, to each add exactly 10 mL of a mixture of chloroform and hexane (2:1) and 15 mL of water successively, and shake immediately and vigorously. Separate the chloroform-hexane layers [use the water layers in (2)], and filter through a pledget of cotton. Determine the absorbances of the filtrates, \( A_T \) and \( A_S \), at 512 nm as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \), using a mixture of chloroform and hexane (2:1) as the blank.

\[
M_S: \text{Amount (mg) of iodine for assay taken}
\]

\[
M_S = M_S \times A_T / A_S
\]

(2) Potassium iodide—Separate the water layers of the sample solution and the standard solution obtained in (1), pipet 10 mL each of the water layers, and to each add 1 mL of a mixture of chloroform and hexane (2:1). Shake immediately and vigorously, separate the chloroform-hexane layers, and filter through a pledget of cotton. Determine the absorbances, \( A_T \) and \( A_S \), at both solutions at 512 nm as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \), using a mixture of chloroform and hexane (2:1) as the blank.

\[
M_S: \text{Amount (mg) of potassium iodide for assay taken}
\]

\[
M_S = M_S \times A_T / A_S \times 1/50
\]

Containers and storage Containers—Tight containers. Storage—Light-resistant.

**Dental Iodine Glycerin**

**歯科用ヨード・グリセリン**

Dental Iodine Glycerin contains not less than 9.0 w/\(^\circ\) and not more than 11.0 w/\(^\circ\) of iodine (I: 126.90), not less than 7.2 w/\(^\circ\) and not more than 8.8 w/\(^\circ\) of potassium iodide (KI: 166.00), and not less than 0.9 w/\(^\circ\) and not more than 1.1 w/\(^\circ\) of zinc sulfate hydrate (ZnSO\(_4\).7H\(_2\)O: 287.55).

**Method of preparation**

<table>

</tbody>
</table>

**To make** 100 mL

Dissolve and mix the above ingredients.

**Description** Dental Iodine Glycerin is a dark red-brown liquid, having the odor of iodine.

**Identification** (1) The colored solution obtained in the Assay (1) acquires a red color. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \): it exhibits a maximum between 510 nm and 514 nm (iodine).

(2) The colored solution obtained in the Assay (2) acquires a red color. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \): it exhibits a maximum between 510 nm and 514 nm (potassium iodide).

(3) Put 1 mL of Dental Iodine Glycerin in a glass-stoppered test tube, add 10 mL of ethanol (95), and mix. Then add 2 mL of sodium hydroxide TS, add 1 mL of a solution of copper (II) chloride dihydrate in ethanol (95) (1 in 10), and shake: a blue color develops (glycerin).

(4) The colored solution obtained in the Assay (3) acquires a red-purple to purple color. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \): it exhibits a maximum between 618 nm and 622 nm (zinc sulfate hydrate).

**Assay** (1) Iodine—Pipet 5 mL of Dental Iodine Glycerin,
and add diluted ethanol (3 in 10) to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 200 mL, and use this solution as the sample solution. On the other hand, weigh accurately about 0.5 g of iodine for assay and about 0.4 g of potassium iodide as assay, previously dried at 105°C for 4 hours, and dissolve in diluted ethanol (3 in 10) to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Pipet 10 mL of each of the sample solution and standard solution, to each add exactly 20 mL of a mixture of chloroform and hexane (2:1), shake immediately, and separate the chloroform-hexane layer. Use the water layer in (2). Filter through a pledget of cotton. Determine the absorbances, \( A_T \) and \( A_S \), of the filtrates obtained from the sample solution and standard solution, respectively, at 512 nm as directed under Ultraviolet-visible Spectrophotometry. 

\[ M_5: \text{Amount (mg) of potassium iodide} \times \frac{A_T}{A_S} \]

\[ M_5: \text{Amount (mg) of potassium iodide for assay taken} \]  

(2) Potassium iodide—Separate the water layers of the sample solution and standard solution obtained in (1), pipet 7 mL each of the water layers, and to each add exactly 1 mL of diluted hydrochloric acid (1 in 2), 1 mL of sodium nitrite TS and 10 mL of a mixture of chloroform and hexane (2:1), and shake immediately. Separate the chloroform-hexane layer, and filter through a pledget of cotton. Determine the absorbances, \( A_T \) and \( A_S \), of the filtrates obtained from the sample solution and standard solution, respectively, at 512 nm as directed under Ultraviolet-visible Spectrophotometry, using a mixture of chloroform and hexane (2:1) as the blank.

\[ M_5: \text{Amount (mg) of potassium iodide (KI)} \times \frac{A_T}{A_S} \]

(3) Zinc sulfate hydrate—Pipet 5 mL of Dental Iodine Glycerin, and add diluted ethanol (3 in 10) to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the sample solution. On the other hand, pipet 10 mL of Standard Zinc Stock Solution, add diluted ethanol (3 in 200) to make exactly 1000 mL, and use this solution as the standard solution. Pipet 10 mL each of the sample solution and standard solution, to each add 10 mL of a mixture of chloroform and hexane (2:1), shake, and allow to stand. Pipet 3 mL each of the water layers, and to each add 2 mL of boric acid-potassium chloride-sodium hydroxide buffer solution (pH 10.0), 2 mL of zincon TS and water to make exactly 25 mL. Determine the absorbances, \( A_T \) and \( A_S \), obtained from the sample solution and standard solution, respectively, at 620 nm as directed under Ultraviolet-visible Spectrophotometry, using the solution prepared in the same manner with 3 mL of water as the blank.

\[ M_5: \text{Amount (mg) of zinc sulfate hydrate (ZnSO}_4\cdot7\text{H}_2\text{O)} \times \frac{A_T}{A_S} \times 4.398 \]

\[ M_5: \text{Amount (mg) of zinc in 10 mL of Standard Zinc Stock Solution} \]

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

### Iodine, Salicylic Acid and Phenol Spirit

ヨード・サリチル酸・フェノール精

Iodine, Salicylic Acid and Phenol Spirit contains not less than 1.08 w/v% and not more than 1.32 w/v% of iodine (I: 126.90), not less than 0.72 w/v% and not more than 0.88 w/v% of potassium iodide (KI: 166.00), not less than 4.5 w/v% and not more than 5.5 w/v% of salicylic acid (C_6H_5O: 138.12), not less than 1.8 w/v% and not more than 2.2 w/v% of phenol (C_6H_5O: 94.11), and not less than 7.2 w/v% and not more than 8.8 w/v% of benzoic acid (C_6H_5CO: 122.12).

### Method of preparation

<table>
<thead>

</tbody>
</table>

Prepare as directed under Spirits, with the above ingredients. It may be prepared with an appropriate quantity of Ethanol and Purified Water or Purified Water in Containers in place of Ethanol for Disinfection.

### Identification

1. To a mixture of 1 mL of starch TS and 9 mL of water add 1 drop of Iodine, Salicylic Acid and Phenol Spirit: a dark blue-purple color develops (iodine).

2. To 1 mL of Iodine, Salicylic Acid and Phenol Spirit add 5 mL of ethanol (95) and water to make 50 mL. To 1 mL of this solution add hydrochloric acid-potassium chloride buffer solution (pH 2.0) to make 50 mL, and to 15 mL of this solution add 5 mL of a solution of iron (III) nitrate enneahydrate (1 in 200): a red-purple color is produced (salicylic acid).

3. Shake 1 mL of Iodine, Salicylic Acid and Phenol Spirit with 1 mL of sodium thiosulfate TS, add 20 mL of water and 5 mL of dilute hydrochloric acid, and extract with 25 mL of diethyl ether. Wash the diethyl ether extract with two 25-mL portions of sodium hydrogen carbonate TS, and extract with 10 mL of dilute sodium hydroxide TS. Shake 1 mL of the extract with 1 mL of sodium nitrite TS and 1 mL of dilute hydrochloric acid, and add 3 mL of sodium hydroxide TS: a yellow color is developed (phenol).

4. Shake 1 mL of Iodine, Salicylic Acid and Phenol Spirit with 1 mL of sodium thiosulfate TS, add 20 mL of water and 5 mL of dilute hydrochloric acid, extract with 10 mL of diethyl ether, and use the diethyl ether extract as the sample solution. Dissolve 25 mg of salicylic acid, 10 mg of phenol and 40 mg of benzoic acid in 5 mL each of diethyl ether, respectively, and use these solutions as the standard solutions (1), (2) and (3). Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 5 µL each of the sample solution and standard solutions (1), (2) and (3) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetone and acetic acid (100:45:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the 3
spots from the sample solution show the same Rf value as the corresponding spots of the standard solutions (1), (2) and (3). Spray evenly iron (III) chloride TS on the plate: the spot from standard solution (1) and the corresponding spot from the sample solution acquires a purple color.

**Assay** (1) Iodine—Pipet 4 mL of Iodine, Salicylic Acid and Phenol Spirit, add ethanol (95) to make exactly 50 mL, and use this solution as the sample solution. On the other hand, weigh accurately about 1.2 g of iodine for assay and about 0.8 g of potassium iodide for assay, previously dried at 105°C for 4 hours, and dissolve in ethanol (95) to make exactly 100 mL. Pipet 4 mL of this solution, add ethanol (95) to make exactly 50 mL, and use this solution as the standard solution. Pipet 3 mL each of the sample solution and standard solution, to each add exactly 25 mL of a mixture of chloroform and hexane (2:1), and shake. Further add exactly 10 mL of water, shake and separate the chloroform-hexane layers [use the water layers in (2)]. Filter through a pledget of absorbent cotton, and determine the absorbances of the filtrates from the sample solution and standard solution, respectively, $A_T$ and $A_S$, at 512 nm as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, using a mixture of chloroform and hexane (2:1) as the blank.

Amount (mg) of iodine (I) = $M_S \times A_T/A_S \times 1/25$

$M_S$: Amount (mg) of iodine for assay taken

(2) Potassium iodide—Separate the water layers of the sample solution and standard solution obtained in the Assay (1), pipet 8 mL each of the water layers, and add 1 mL of diluted dilute hydrochloric acid (1 in 2) and 1 mL of sodium nitrite TS. Immediately after shaking, add exactly 10 mL of a mixture of chloroform and hexane (2:1), shake, and proceed in the same manner as for the Assay (1).

Amount (mg) of potassium iodide (KI) = $M_S \times A_T/A_S \times 1/25$

$M_S$: Amount (mg) of potassium iodide for assay taken

(3) Salicylic acid, phenol and benzoic acid—Pipet 2 mL of Iodine, Salicylic Acid and Phenol Spirit, add 20 mL of diluted methanol (1 in 2) and 0.1 mol/L sodium thiosulfate VS until the color of iodine disappears, add exactly 20 mL of the internal standard solution, then add diluted methanol (1 in 2) to make 200 mL, and use this solution as the sample solution. Weigh accurately about 0.2 g of salicylic acid for assay, previously dried in a desiccator (silica gel) for 3 hours, about 80 mg of phenol for assay, and 0.32 g of benzoic acid, previously dried in a desiccator (silica gel) for 3 hours, dissolve in diluted methanol (1 in 2) to make exactly 50 mL. Pipet 25 mL of this solution, add exactly 20 mL of the internal standard solution and diluted methanol (1 in 2) to make 200 mL, and use this solution as the standard solution. Perform the test with 3 mL of the sample solution and standard solution as directed under Liquid Chromatography $<2.07>$ according to the following conditions. Calculate the ratios, $Q_{Ta}$, $Q_{Tb}$ and $Q_{Tc}$, of the peak areas of salicylic acid, phenol and benzoic acid to those of the internal standard of the sample solution, and the ratios, $Q_{Sa}$, $Q_{Sb}$ and $Q_{Sc}$, of the peak areas of salicylic acid, phenol and benzoic acid to those of the internal standard of the standard solution.

Amount (mg) of salicylic acid (C$_7$H$_6$O$_3$) = $M_{Sc} \times Q_{Ta}/Q_{Sc} \times 1/2$

Amount (mg) of phenol (C$_7$H$_6$O) = $M_{Sc} \times Q_{Tb}/Q_{Sc} \times 1/2$

Amount (mg) of benzoic acid (C$_7$H$_5$O$_2$) = $M_{Sc} \times Q_{Tc}/Q_{Sc} \times 1/2$

$M_{Sc}$: Amount (mg) of salicylic acid for assay taken

$M_{Sc}$: Amount (mg) of phenol for assay taken

$M_{Sc}$: Amount (mg) of benzoic acid taken

**Internal standard solution**—A solution of theophylline in methanol (1 in 1000).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 270 nm).
Column: A stainless steel column about 4 mm in inside diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: Room temperature.
Mobile phase: A mixture of 0.1 mol/L phosphate buffer solution (pH 7.0) and methanol (3:1).
Flow rate: Adjust so that the retention time of salicylic acid is about 6 minutes.
Selection of column: Dissolve 0.2 g of benzoic acid, 0.2 g of salicylic acid and 50 mg of theophylline in 100 mL of diluted ethanol (1 in 2). To 10 mL of this solution add 90 mL of diluted methanol (1 in 2). Proceed with 10 mL of this solution under the above operating conditions. Use a column giving elution of benzoic acid, salicylic acid and theophylline in this order, and clearly dividing each peak.

**Containers and storage**—Containers—Tight containers.
Storage—Light-resistant.

---

**Iodoform**

ヨードホルム

CH$_3$: 393.73
Triiodomethane [75-47-8]

Iodoform, when dried, contains not less than 99.0% of iodoform (CH$_3$I).

**Description** Iodoform occurs as lustrous, yellow crystals or crystalline powder. It has a characteristic odor.

It is freely soluble in diethyl ether, sparingly soluble in ethanol (95), and practically insoluble in water.

It is slightly volatile at ordinary temperature.

Melting point: about 120°C (with decomposition).

**Identification** Heat 0.1 g of Iodoform: a purple gas is evolved.

**Purity** (1) Water-soluble colored substances and acidity or alkalinity—Shake well 2.0 g of Iodoform, previously powdered, with 5 mL of water for 1 minute, allow to stand, and filter the supernatant liquid: the filtrate is colorless and neutral.

(2) Chloride $<1.07>$—Shake well 3.0 g of Iodoform, previously powdered, with 75 mL of water for 1 minute, allow to stand, and filter the supernatant liquid. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(3) Sulfate $<1.14>$—To 25 mL of the filtrate obtained in
(2) Add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.017%).

**Loss on drying** Not more than 0.5% (1 g, silica gel, 24 hours).

**Residue on ignition** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Iodoform, previously dried, in a 500-mL glass-stoppered flask, and dissolve it in 20 mL of ethanol (95). Add exactly 30 mL of 0.1 mol/L silver nitrate VS and 10 mL of nitric acid, stopper the flask, shake well, and allow to stand in a dark place over 16 hours. Add 150 mL of water, and titrate with excess silver nitrate VS (indicator: 0.1 mol/L ammonium iron (III) sulfate TS). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L silver nitrate VS
$= 13.12$ mg of CH$_3$I

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant.

**Iohexol**

[Chemical structure diagram]

Iohexol is a mixture of endo- and exo-products of iohexol.

It contains not less than 98.5% and not more than 101.0% of iohexol (C$_{39}$H$_{56}$I$_{5}$N$_{4}$O$_{7}$), calculated on the anhydrous basis.

**Description** Iohexol occurs as a white powder.

It is very soluble in water, freely soluble in methanol and sparingly soluble in ethanol (99.5).

It dissolves in a solution of sodium hydroxide (1 in 20).

A solution of Iohexol (1 in 20) shows no optical rotation.

**Identification** (1) Determine the absorption spectrum of a solution of Iohexol (13 in 1,000,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Iohexol, previously dried at 105°C for 6 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.1 g of Iohexol in 10 mL of methanol, and use this solution as the sample solution. Perform the test with the sample solution as directed under Thin-layer Chromatography <2.07>. Spot 10 μL of the sample solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100:50:25:11) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the number of principal spots obtained from the sample solutions is two, and their Rf values are about 0.2 and about 0.3, respectively.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of Iohexol in 5 mL of water is clear and colorless.

(2) Aromatic primary amine—Conduct this procedure using light-resistant vessels. Dissolve 0.20 g of Iohexol in 15 mL of water, cool in ice for 5 minutes, add 1.5 mL of 6 mol/L hydrochloric acid TS and 1 mL of a solution of sodium nitrite (1 in 50), prepared before use, stir, and cool in ice for 4 minutes. Add 1 mL of a solution of amidosulfuric acid (standard reagent) (1 in 25), stir, and cool in ice for 1 minute. Then, add 0.5 mL of a solution, prepared by dissolving 0.3 g of N-1-naphthylethylenediamine dihydrochloride in diluted propylene glycol (7 in 10) to make 100 mL, and add water to make exactly 25 mL. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry <2.24> within 20 minutes, using a solution prepared in the same manner with 15 mL of water as the blank: the absorbance at 495 nm is not more than 0.21.

(3) Chloride <1.07>—Perform the test with 2.0 g of Iohexol. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.007%).

(4) Iodine and iodide—Dissolve 1.0 g of Iohexol in 4 mL of water, add 1 mL of dilute sulfuric acid, and allow to stand for 10 minutes while occasional shaking. Add 5 mL of chloroform, shake well, and allow to stand: the chloroform layer is colorless. Then, add 1 mL of sodium nitrite solution (1 in 50), prepared before use, shake, allow to stand, and determine the absorbance of collected chloroform layer as directed under Ultraviolet-visible Spectrophotometry <2.24> using a chloroform layer prepared in the same manner with 4.0 mL of water as the blank: the absorbance at 510 nm is not larger than that of chloroform layer obtained from the following control solution.

Control solution: Dissolve exactly 0.131 g of potassium iodide in water to make exactly 100 mL. Pipet 1 mL of this solution, and add water to make exactly 100 mL. Pipet 3 mL of this solution, add 1 mL of water and 1 mL of dilute sulfuric acid, then proceed in the same manner.

(5) Heavy metals <1.07>—Proceed with 2.0 g of Iohexol according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) 3-Chloro-1,2-propanediol—To exactly 1.0 g of Iohexol, add exactly 2 mL of diethyl ether, and sonicate for 10 minutes under cooling. Centrifuge, and use the diethyl ether layer as the sample solution. Separately, dissolve exactly 0.5 g of 3-chloro-1,2-propanediol in diethyl ether to make exactly 50 mL. Pipet 1 mL of this solution, and add diethyl ether to make exactly 100 mL. Pipet 5 mL of this solution, add diethyl ether to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as di-
rected under Gas Chromatography (2.07), and determine the peak areas, $A_r$ and $A_{bs}$, of 3-chloro-1,2-propanediol in each solution: $A_r$ is not larger than 2.5 times $A_{bs}$.

**Operating conditions—**

- Detector: A hydrogen flame-ionization detector.
- Column: A fused silica column 0.25 mm in inside diameter and 30 m in length, coated the inside surface with a layer about 0.25 μm thick of 5% diphenyl-95% dimethylpolysiloxane for gas chromatography.
- Column temperature: A constant temperature of about 70°C.
- Injection port and detector temperature: A constant temperature of about 230°C.
- Carrier gas: Helium.
- Flow rate: Adjust so that the retention time of 3-chloro-1,2-propanediol is about 7 minutes.
- Split ratio: 1:40.

**System suitability—**

- System performance: To 1 mL of a solution of 3-chloro-1,2-propanediol in diethyl ether (1 in 200) and 1 mL of a solution of 1-hexanol in diethyl ether (1 in 800) add diethyl ether to make 200 mL. When the procedure is run with 5 μL of this solution under the above operating conditions, 1-hexanol and 3-chloro-1,2-propanediol are eluted in this order with the resolution between these peaks being not less than 20.

- System system accuracy: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 3-chloro-1,2-propanediol is not more than 15%.

(7) Related substance—(i) Dissolve 1.0 g of Iohexol in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 25 mL. Pipet 1 mL of this solution, add the methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.07). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, 2-propanol, ammonia solution (28) and methanol (10:7:4:4) to a distance about 14 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): a spot, other than the principal spot obtained from the sample solution, having the relative RF value of 1.4 to the spot from the standard solution, is not more intense than the spot from the standard solution.

(ii) Dissolve 0.15 g of Iohexol in water to make 100 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine the peak area by the automatic integration method, and calculate the amounts by the area percentage method: the total amount of O-alkyl substances, having the relative retention time between 1.2 and 1.5 to the second principal peak (having bigger retention time) among the two principal peaks of iohexol, is not more than 0.6%, the amount of the peaks, which are eluted after the peak of iohexol and other than O-alkyl substances, is not more than 0.1%, respectively, and the total amount of the peaks, which are eluted after iohexol and other than O-alkyl substances, is not more than 0.3%.

**Operating conditions—**

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase A: Acetonitrile.
- Mobile phase B: Water.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 1</td>
<td>1</td>
<td>99</td>
</tr>
<tr>
<td>1 – 46</td>
<td>1 → 10</td>
<td>99 → 90</td>
</tr>
</tbody>
</table>

Flow rate: Adjust so that the retention time of the second principal peak (iohexol exo-product) is about 19 minutes.

Time span of measurement: About 2 times as long as the retention time of iohexol exo-product.

**System suitability—**

- Test for required detectability: To 1 mL of the sample solution add water to make 50 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add water to make exactly 20 mL. Confirm that the peak area of iohexol exo-product obtained with 10 μL of this solution is equivalent to 3.5 to 6.5% of that with 10 μL of the solution for system suitability test.

- System performance: When the procedure is run with 10 μL of the solution for system suitability test under the above operating conditions, the resolution between the adjacent two peaks, which appear at the retention time of about 18 minutes, is not less than 1.5.

- System system accuracy: When the test is repeated 3 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of iohexol exo-product is not more than 3.0%.

**Water (2.48) Not more than 4.0% (0.3 g, volumetric titration, direct titration).**

**Residue on ignition (2.44) Not more than 0.1% (1 g).**

**Assay** Weigh accurately about 0.5 g of Iohexol, dissolve in 25 mL of a solution of sodium hydroxide (1 in 20), add 0.5 g of zinc powder, boil under a reflux condenser for 30 minutes, and filter after cooling. Wash the flask and filter paper with 200 mL of water, combine the washings and filter, add 5 mL of acetic acid (100), and titrate (2.50) with 0.1 mol/L silver nitrate VS (indicator: 1 mL of tetrabromophenolphthalein ethyl ester TS) until the color of the precipitate changes from yellow to green.

Each mL of 0.1 mol/L silver nitrate VS = 27.37 mg of C₂₇H₂₇N₂O₇_

**Containers and storage** Containers—Tight containers.
Iohexol Injection

イオヘキソール注射液

Iohexol Injection is an aqueous injection.
It contains not less than 95.0% and not more than 105.0% of the labeled amount of iohexol (C₂₀H₂₄I₆N₄O₉: 821.14).

Method of preparation Prepare as directed under Injections, with iohexol.

Description Iohexol Injection is a clear and colorless liquid.

Identification To a volume of Iohexol Injection, equivalent to 0.65 g of iohexol, add water to make 500 mL. To 1 mL of this solution add water to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 243 nm and 247 nm.

pH Being specified separately when the drug is granted approval based on the Law.

Purity (1) Aromatic primary amine—Conduct this procedure using light-resistant vessels. To a volume of Iohexol Injection, equivalent to 0.20 g of iohexol add 15 mL of water, cool in ice for 5 minutes, add 1.5 mL of 6 mol/L hydrochloric acid TS and 1 mL of solution of sodium nitrite (1 in 50), prepared before use, shake, and cool in ice for 4 minutes. Then, proceed as directed in the Purity (2) under Iohexol: the absorbance of a solution so obtained is not more than 0.23.

(2) Iodine and iodide—To a volume of Iohexol Injection, equivalent to 1.0 g of iohexol, add 4 mL of water and 1 mL of dilute sulfuric acid, and allow to stand for 10 minutes while occasional shaking. Then, proceed as directed in the Purity (2) under Iohexol: the absorbance of a chloroform layer so obtained is not more than 0.14.

Bacterial endotoxins Less than 0.47 EU/mL.

Extractable volume It meets the requirement.

Foreign insoluble matter Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter It meets the requirement.

Sterility Perform the test according to the Membrane filtration method: it meets the requirement.

Assay To an exactly measured volume of Iohexol Injection, equivalent to about 1.5 g of iohexol (C₂₀H₂₄I₆N₄O₉), add water to make exactly 25 mL. Pipet 10 mL of this solution, add 25 mL of a solution of sodium hydroxide (1 in 20) and 0.5 g of zinc powder, and boil under a reflux condenser for 30 minutes. After cooling, wash down the inside of the condenser with 20 mL of water, and filter. Then, proceed as directed in the Assay under Iohexol.

Each mL of 0.1 mol/L silver nitrate VS = 27.37 mg of C₂₀H₂₄I₆N₄O₉.

Containers and storage Containers—Hermetic containers. Colored containers and plastic containers for aqueous injections may be used.

Iopamidol

イオパミドール

Iopamidol, when dried, contains not less than 99.0% of iopamidol (C₁₇H₂₂I₃N₃O₅).

Description Iopamidol occurs as a white crystalline powder.

It is very soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol (99.5).

Identification (1) To 50 mg of Iopamidol add 5 mL of hydrochloric acid, heat for 10 minutes in a water bath: the test solution responds to Qualitative Tests for primary aromatic amines.

(2) Heat 0.1 g of Iopamidol over a flame: a purple gas is evolved.

(3) Determine the infrared absorption spectrum of Iopamidol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation [d]₂₄₀° = −4.6 – 5.2° (after drying, 4 g, water, warm, after cooling, 10 mL, 100 nm).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Iopamidol in 10 mL of water: the solution is clear and colorless.

(2) Primary aromatic amines—Dissolve 0.60 g of Iopamidol in 8 mL of water, add 1 mL of a solution of sodium nitrite (1 in 50) and 12 mL of 2 mol/L hydrochloric acid TS, shake, and allow to stand for 2 minutes. Add 1 mL of a solution of ammonium amidosulfate (1 in 10), shake well, allow to stand for 1 minute, and add 1 mL of naphthylethylenediamine TS and water to make exactly 50 mL. Determine the absorbance of this solution at 495 nm as directed under Ultraviolet-visible Spectrophotometry, using a solution, prepared in the same manner, as the blank: the absorbance is not more than 0.12 (not more than 0.020%).

(3) Iodine—Dissolve 2.0 g of Iopamidol in 25 mL of water, add 5 mL of 1 mol/L sulfuric acid TS and 5 mL of toluene, shake well, and allow to stand: the toluene layer is colorless.

(4) Free iodine ion—Weigh accurately about 5 g of Iopamidol, dissolve in 70 mL of water, and adjust the pH to about 4.5 with dilute acetic acid. To this solution add 2 mL of 0.1 mol/L sodium chloride TS, and titrate [d]₂₅₀° with 0.001 mol/L silver nitrate VS (potentiometric titration).
Each mL of 0.001 mol/L silver nitrate VS = 0.1269 mg of I

Content of iodine ion in Iopamidol is not more than 0.001%.

(5) Heavy metals <2.07>—Moisten 1.0 g of Iopamidol with a small quantity of sulfuric acid, heat gradually to almost incinerate by a possibly lower temperature. After cooling, moisten again with a small quantity of sulfuric acid, heat gradually until white fumes no longer are evolved, and incinerate by ignition between 450 to 550°C. Proceed as directed in Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.1 g of Iopamidol in water to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of \( N,N'\text{-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamo-2,4,6-triiodoisophthalamide} \) in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area of the both solutions by the automatic integration method: each area of the peaks other than the peak of iopamidol from the sample solution is not larger than the peak area of the standard solution, and the total of these areas is not larger than 2.5 times of the peak area of the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase A: Water.

Mobile phase B: A mixture of water and methanol (3:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phase A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 6</td>

<td>35 → 92</td>
</tr>
<tr>
<td>30 – 34</td>
<td>8</td>
<td>92</td>
</tr>
</tbody>
</table>

Flow rate: 1.5 mL per minute.

Time span of measurement: About 4.3 times as long as the retention time of iopamidol.

**System suitability—**

System performance: Dissolve 1 mL of the sample solution and 10 mg of \( N,N'\text{-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamo-2,4,6-triiodoisophthalamide} \) in water to make 100 mL. When the procedure is run with 20 \( \mu L \) of this solution under the above operating conditions, \( N,N'\text{-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamo-2,4,6-triiodoisophthalamide} \) and iopamidol are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of \( N,N'\text{-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetylamo-2,4,6-triiodoisophthalamide} \) is not more than 1.0%.

**Loss on drying <2.47>** Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Iopamidol, previously dried, transfer to a saponification flask, dissolve in 40 mL of sodium hydroxide TS, add 1 g of zinc powder, boil for 30 minutes under a reflux condenser, cool, and filter. Wash the flask and the filter paper with 50 mL of water, and combine the washing with the filtrate. Add 5 mL of acetic acid (100) to this solution, and titrate with 0.1 mol/L silver nitrate VS (potentiometric titration).

Each mL of 0.1 mol/L silver nitrate VS = 25.90 mg of \( C_{13}H_{22}I_3N_5O_8 \)

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

**Iopamidol Injection**

Iオパミドル注射液

Iopamidol Injection is an aqueous injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of iopamidol (\( C_{13}H_{22}I_3N_5O_8 \); 777.09).

**Method of preparation** Prepare as directed under Injections, with Iopamidol.

**Description** Iopamidol Injection occurs as a clear, colorless or faint yellow, liquid, having slight viscosity.

It is gradually colored to faint yellow by light.

**Identification (1)** To a volume of Iopamidol Injection, equivalent to 0.3 g of Iopamidol, add 0.2 mL of sulfuric acid, and mix. When heat the solution over a flame, the color of the solution changes from colorless to purplish brown, and a purple gas is evolved.

(2) To a volume of Iopamidol Injection, equivalent to 0.6 g of Iopamidol, add water to make 100 mL, and use this solution as the sample solution. Separately, dissolve 60 mg of iopamidol for assay in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 4 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, 2-butanol and ammonia solution (28:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultra-violet light (main wavelength: 254 nm): the \( Rf \) value of the principal spot obtained from the sample solution is the same as that from the standard solution.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity (1)** Primary aromatic amines—To a volume of Iopamidol Injection, equivalent to 0.18 g of Iopamidol, add 6 mL of water and mix. Add 1 mL of a solution of sodium nitrite (1 in 50) and 12 mL of 2 mol/L hydrochloric acid TS, shake the solution and allow to stand for 2 minutes. Add 1 mL of a solution of ammonium amidosulfate (1 in 10),
Perform the test according to the Membrane filtration method: it meets the requirement.

(2) Iodine—Take a volume of Iopamidol Injection, equivalent to 2.0 g of Iopamidol, and add 2 mL of 1 mol/L sulfuric acid TS and 1 mL of toluene. Then shake well and allow to stand: the toluene layer is colorless.

(3) Free iodine ion—To exactly 10 mL of Iopamidol Injection add a suitable amount of water, and adjust the pH to about 4.5 with diluted 0.25 mol/L sulfuric acid TS (1 in 10). Titrate $<2.50$ with 0.001 mol/L silver nitrate VS (potentiometric titration): the amount of iodine ion contained in Iopamidol Injection is not more than 40 μg per mL.

Each mL of 0.001 mol/L silver nitrate VS = 0.1269 mg of I

Bacterial endotoxins $<4.0\%$ Less than 1.5 EU/mL.

Extractable volume $<6.0\%$ It meets the requirement.

Foreign insoluble matter $<6.0\%$ Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter $<6.0\%$ It meets the requirement.

Sterility $<4.0\%$ Perform the test according to the Membrane filtration method: it meets the requirement.

Assay To exactly 1 mL of Iopamidol Injection add water to make exactly 200 mL. Take exactly $V'$ mL of this solution, add water to make exactly $V$ mL so that each mL contains about 80 μg of iopamidol ($C_{17}H_{23}I_{3}N_{4}O_4$), and use this solution as the sample solution. Separately, weigh accurately about 20 mg of iopamidol for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 10 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography $<2.0D$ according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of iopamidol in each solution.

$$M_S = \frac{A_T}{A_S} \times \frac{V}{V'} \times \frac{V'}{V} \times \frac{M}{5}$$

$M_S$: Amount (mg) of iopamidol ($C_{17}H_{23}I_{3}N_{4}O_4$)

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase A: Water.

Mobile phase B: A mixture of water and methanol (3:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>

Flow rate: 1.5 mL per minute.

System suitability—

System performance: Dissolve 1 mg each of iopamidol for assay and $N,N'$-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetamide-2,4,6-triiodoisophthalamide in water to make 100 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, $N,N'$-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-hydroxyacetamide-2,4,6-triiodoisophthalamide and iopamidol are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of iopamidol is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

Storage—Light-resistant.

Iotalamic Acid

イオタラム酸

$C_{11}H_{13}I_{3}N_{4}O_4$: 613.91
3-Acetylamino-2,4,6-triiodo-5-(methylaminocarbonyl)benzoic acid [2276-90-6]

Iotalamic Acid, when dried, contains not less than 99.0% of iotalamic acid ($C_{11}H_{13}I_{3}N_{4}O_4$).

Description Iotalamic Acid occurs as a white powder. It is odorless.

It is sparingly soluble in ethanol (95), very slightly soluble in water, and practically insoluble in diethyl ether.

It dissolves in sodium hydroxide TS.

It gradually colored by light.

Identification (1) Heat 0.1 g of Iotalamic Acid over a flame: a purple gas is evolved.

(2) Determine the infrared spectrum of Iotalamic Acid, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Clarity and color of solution—Dissolve 2.0 g of Iotalamic Acid in 10 mL of sodium hydroxide TS: the solution is clear and colorless.

(2) Primary aromatic amines—To 0.50 g of Iotalamic
Acid add 15 mL of water, and dissolve it in 1 mL of sodium hydroxide TS while ice-cooling. Add 4 mL of a solution of sodium nitrite (1 in 100) to the solution, immediately add 12 mL of 1 mol/L hydrochloric acid TS, and shake gently. Then allow the mixture to stand for exactly 2 minutes, add 8 mL of ammonium amidosulfate TS, and shake occasionally for 5 minutes. Add 3 drops of a solution of 1-naphthol in ethanol (95) (1 in 10), allow to stand for 1 minute, add 3.5 mL of ammonia-ammonium chloride buffer solution (pH 10.7), mix, and immediately add water to make 50 mL. Determine within 20 minutes the absorbance of this solution at 485 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), using a solution, prepared in the same manner, as the blank: the absorbance is not more than 0.25.

(3) Soluble halides—Dissolve 0.5 g of Iotalamic Acid in 20 mL of distilled ammonia TS (1 in 40), add 6 mL of dilute nitric acid, shake, allow to stand for 5 minutes, and filter. Transfer the filtrate to a Nessler tube, wash the residue with 20 mL of water, combine the filtrate and the washings, and add water to make 50 mL. Proceed as directed for Chloride Limit Test \(<1.03\rangle\) using this solution as the test solution. Prepare the control solution as follows: to 0.10 mL of 0.01 mol/L hydrochloric acid TS and add 20 mL of distilled ammonia TS (1 in 40), 6 mL of dilute nitric acid and water to make 50 mL.

(4) Iodine—Dissolve 0.20 g of Iotalamic Acid in 2.0 mL of sodium hydroxide TS, add 2.5 mL of 0.5 mol/L sulfuric acid TS, and allow to stand for 5 minutes with occasional shaking. Add 5 mL of chloroform, shake well, and allow to stand: the chloroform layer remains colorless.

(5) Heavy metals \(<1.07\rangle\)—Proceed with 1.0 g of Iotalamic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution \(\leq 0.20 \text{ ppm}\).

(6) Arsenic \(<1.11\rangle\)—Prepare the test solution with 0.6 g of Iotalamic Acid according to Method 3, and perform the test \(\leq 0.3 \text{ ppm}\).

Loss on drying \(<2.41\rangle\) Not more than 0.5% \((1 \text{ g, } 105^\circ \text{C, 4 hours})\).

Residue on ignition \(<2.44\rangle\) Not more than 0.1% \((1 \text{ g})\).

Assay Weigh accurately about 0.4 g of Iotalamic Acid, previously dried, place it in a saponification flask, dissolve in 40 mL of sodium hydroxide TS, add 1 g of zinc powder, and heat for 30 minutes under a reflux condenser. Cool, filter, wash the flask and the filter paper with 50 mL of water, and combine the washings and the filtrate. Add 5 mL of acetic acid \((100)\) to this solution, and titrate \(<2.50\rangle\) with 0.1 mol/L silver nitrate VS, until the color of the precipitate changes from yellow to green (indicator: 1 mL of tetrabromophenol-phthalein ethyl ester TS).

Each mL of 0.1 mol/L silver nitrate VS = 20.46 mg of C10H14I4N4O4

Containers and storage Containers—Tight containers. Storage—Light-resistant.

### Iotroxic Acid

**イオトロックス酸**

C22H18I2N2O6: 1215.81
3,3’-(3,6,9-Trioxaundecanediroyl)diiminobis(2,4,6-triiodobenzoic acid)

\[\text{Iotroxic Acid} \] contains not less than 98.5% of iotroxic acid \((C_{22}H_{18}I_{2}N_{2}O_{6})\), calculated on the anhydrous basis.

**Description** Iotroxic Acid occurs as a white crystalline powder.

It is soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether. It is gradually colored by light.

**Identification**

(1) Heat 0.1 g of Iotroxic Acid over a flame: a purple gas evolves.

(2) Dissolve a suitable amount of Iotroxic Acid in a suitable amount of methanol, evaporate the methanol under reduced pressure, and determine the infrared absorption spectrum of the residue so obtained as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Iotroxic Acid in 10 mL of diluted sodium hydroxide TS \((1 \text{ in } 5)\): the solution is clear and colorless.

(2) Primary aromatic amines—Dissolve 0.20 g of Iotroxic Acid in 5 mL of water and 1 mL of sodium hydroxide TS, add 4 mL of a solution of sodium nitrite \((1 \text{ in } 100)\) and 10 mL of 1 mol/L hydrochloric acid TS, mix, and allow to stand for 2 minutes. Add 5 mL of ammonium amidosulfate TS, shake well, allow to stand for 1 minute, then add 0.4 mL of a solution of \(\alpha\)-naphthol in ethanol \((95)\) \((1 \text{ in } 10)\), 15 mL of sodium hydroxide TS and water to make exactly 50 mL. Read the absorbance of this solution at 485 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), using a blank solution obtained in the same manner as above: the absorbance is not more than 0.22.

(3) Iodine—Dissolve 0.20 g of Iotroxic Acid in 2.0 mL of sodium hydrogen carbonate TS, add 5 mL of toluene, mix well, and allow to stand: the toluene layer is colorless.

(4) Free iodine—Weigh accurately about 5.0 g of Iotroxic Acid, dissolve in 12 mL of a solution of meglumine \((3 \text{ in } 20)\), add water to make 70 mL, and adjust the pH to about 4.5 with acetic acid \((100)\). To this solution add 2 mL of 0.1 mol/L sodium chloride TS, and titrate \(<2.50\rangle\) with 0.001 mol/L silver nitrate VS (potentiometric titration).

Each mL of 0.001 mol/L silver nitrate VS = 0.1269 mg of I

Content of iodine ion in Iotroxic Acid, calculated on the anhydrous basis, is not more than 0.004%.

(5) Heavy metals \(<1.07\rangle\)—Heat strongly 1.0 g of Iotroxic Acid add 15 mL of water, and dissolve it in 1 mL of sodium hydroxide TS while ice-cooling. Add 4 mL of a solution of sodium nitrite (1 in 100) to the solution, immediately add 12 mL of 1 mol/L hydrochloric acid TS, and shake gently. Then allow the mixture to stand for exactly 2 minutes, add 8 mL of ammonium amidosulfate TS, and shake occasionally for 5 minutes. Add 3 drops of a solution of 1-naphthol in ethanol (95) (1 in 10), allow to stand for 1 minute, add 3.5 mL of ammonia-ammonium chloride buffer solution (pH 10.7), mix, and immediately add water to make 50 mL. Determine within 20 minutes the absorbance of this solution at 485 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), using a solution, prepared in the same manner, as the blank: the absorbance is not more than 0.25.

(3) Soluble halides—Dissolve 0.5 g of Iotalamic Acid in 20 mL of distilled ammonia TS (1 in 40), add 6 mL of dilute nitric acid, shake, allow to stand for 5 minutes, and filter. Transfer the filtrate to a Nessler tube, wash the residue with 20 mL of water, combine the filtrate and the washings, and add water to make 50 mL. Proceed as directed for Chloride Limit Test \(<1.03\rangle\) using this solution as the test solution. Prepare the control solution as follows: to 0.10 mL of 0.01 mol/L hydrochloric acid TS and add 20 mL of distilled ammonia TS (1 in 40), 6 mL of dilute nitric acid and water to make 50 mL.

(4) Iodine—Dissolve 0.20 g of Iotalamic Acid in 2.0 mL of sodium hydroxide TS, add 2.5 mL of 0.5 mol/L sulfuric acid TS, and allow to stand for 5 minutes with occasional shaking. Add 5 mL of chloroform, shake well, and allow to stand: the chloroform layer remains colorless.

(5) Heavy metals \(<1.07\rangle\)—Proceed with 1.0 g of Iotalamic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution \(\leq 0.20 \text{ ppm}\).

(6) Arsenic \(<1.11\rangle\)—Prepare the test solution with 0.6 g of Iotalamic Acid according to Method 3, and perform the test \(\leq 0.3 \text{ ppm}\).

Loss on drying \(<2.41\rangle\) Not more than 0.5% \((1 \text{ g, } 105^\circ \text{C, 4 hours})\).

Residue on ignition \(<2.44\rangle\) Not more than 0.1% \((1 \text{ g})\).

Assay Weigh accurately about 0.4 g of Iotalamic Acid, previously dried, place it in a saponification flask, dissolve in 40 mL of sodium hydroxide TS, add 1 g of zinc powder, and heat for 30 minutes under a reflux condenser. Cool, filter, wash the flask and the filter paper with 50 mL of water, and combine the washings and the filtrate. Add 5 mL of acetic acid \((100)\) to this solution, and titrate \(<2.50\rangle\) with 0.1 mol/L silver nitrate VS, until the color of the precipitate changes from yellow to green (indicator: 1 mL of tetrabromophenol-phthalein ethyl ester TS).

Each mL of 0.1 mol/L silver nitrate VS = 20.46 mg of C10H14I4N4O4

Containers and storage Containers—Tight containers. Storage—Light-resistant.
Acid as directed under Residue on Ignition Test \(<2.44\), then proceed according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.15 g of Iotroxic Acid in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, acetone and formic acid (6:4:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Water** \(<2.48\) 1.0 – 2.0\% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** \(<2.44\) Not more than 0.1\% (1 g).

**Assay** Weigh accurately about 0.5 g of Iotroxic Acid, dissolve in 40 mL of sodium hydroxide TS in a saponification flask, add 1 g of zinc powder, and boil for 30 minutes under a reflux condenser. After cooling, filter, wash the flask and filter paper with 50 mL of water, and combine the washings to the filtrate. To this solution add 5 mL of acetic acid (100), and titrate \(<2.50\) with 0.1 mol/L silver nitrate VS (potentiometric titration).

Each mL of 0.1 mol/L silver nitrate VS = 20.26 mg of C\(_2\)H\(_4\)InN\(_3\)O\(_2\).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

### Ipratropium Bromide Hydrate

イプラトロピウム臭化物水和物

\[
\begin{align*}
\text{C}_2\text{H}_8\text{BrNO}_3\text{H}_2\text{O}: & 430.38 \\
(1R,3r,5S)-3\{(2RS)-3\text{-Hydroxy-2-phenylpropanoyloxy}\}-8\text{-methyl}-8\{-1\text{-methylallyl}\}-8\text{-azoniabicyclo[3.2.1]octane bromide monohydrate} & [66985-17-9]
\end{align*}
\]

Ipratropium Bromide Hydrate, when dried, contains not less than 99.0\% of ipratropium bromide (C\(_2\)H\(_4\)BrNO\(_3\)): 412.36.

**Description** Ipratropium Bromide Hydrate occurs as a white crystalline powder.

It is freely soluble in water, soluble in ethanol (99.5), slightly soluble in acetonitrile and in acetic acid (100), and practically insoluble in diethyl ether.

The \(pH\) of a solution of 1.0 g of Ipratropium Bromide Hydrate in 20 mL of water is between 5.0 and 7.5.

Melting point: about 223\°C (with decomposition, after drying).

**Identification** (1) To 5 mg of Ipratropium Bromide Hydrate add 0.5 mL of fuming nitric acid, and evaporate on a water bath to dryness. After cooling, dissolve the residue in 5 mL of acetone, and add 2 drops of potassium hydroxide-ethanol TS: a purple color develops.

(2) Determine the absorption spectrum of a solution of Ipratropium Bromide Hydrate in 0.01 mol/L hydrochloric acid TS (3 in 2000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Ipratropium Bromide Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) The solution of Ipratropium Bromide Hydrate (1 in 100) responds to Qualitative Tests \(<1.09\rangle\) for bromide.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Ipratropium Bromide Hydrate in 20 mL of water: the solution is clear and colorless.

(2) Sulfate \(<1.14\rangle\)—Perform the test with 1.0 g of Ipratropium Bromide Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024\%).

(3) Heavy metals \(<1.07\rangle\)—Proceed with 2.0 g of Ipratropium Bromide Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic \(<1.11\rangle\)—Prepare the test solution with 2.0 g of Ipratropium Bromide Hydrate according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 1 ppm).

(5) Isopropylatropine bromide—Dissolve 25 mg of Ipratropium Bromide Hydrate in the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Perform the test with 25 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(<2.07\rangle\) according to the following conditions. Determine the peak area, \(A_9\), of ipratropium and the peak area, \(A_{10}\), having the relative retention time to ipratropium about 1.3 by the automatic integration method: \(A_9/(A_9 + A_{10})\) is not more than 0.01, and no peak other than the peak of ipratropium and the peak having the relative retention time to ipratropium about 1.3 appears within about 14 minutes of the retention time after the solvent peak.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wave-length: 200 nm).

Column: A stainless steel column about 4 mm in inside diameter and 10 to 15 cm in length, packed with octylsilated silica gel for liquid chromatography (5 \(\mum\) in particle diameter).

Column temperature: Room temperature.

Mobile phase: A mixture of diluted phosphoric acid (1 in 200), acetonitrile and methanesulfonic acid (1000:120:1).

Flow rate: Adjust so that the retention time of ipratropium is about 7 minutes.

Selection of column: Heat a solution of Ipratropium Bromide Hydrate in 1 mol/L hydrochloric acid TS (1 in 100) at 100\°C for 1 hour, and cool. To 2.5 mL of this solution add the mobile phase to make 100 mL. Proceed with 25 \(\mu\)L of this solution under the above operating conditions, and calculate the resolution. Use a column showing a resolution not less than 3 between the peak of ipratropium and the peak
having the relative retention time to ipratropium about 0.6.

Detection sensitivity: Adjust so that the peak height of ipratropium obtained with 25 μL of the sample solution composes 50 to 80% of the full scale.

(6) Apo-compounds—Dissolve 0.14 g of Ipratropium Bromide Hydrate in 0.01 mol/L hydrochloric acid TS to make 100 mL. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A1 and A2, at 246 nm and 263 nm, respectively: A1/A2 is not more than 0.91.

Loss on drying <2.41> 3.9 – 4.4% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Ipratropium Bromide Hydrate, previously dried, dissolve in 40 mL of acetic acid (100), add 40 mL of 1,4-dioxane and 2.5 mL of bismuth nitrate TS, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 41.24 mg of CsH5BrNO3

Containers and storage Containers—Tight containers.

Ipriflavone

イプリフラボン

C18H16O3; 280.32
7-(1-Methylethyl)oxy-3-phenyl-4H-chromen-4-one [35212-22-7]

Ipriflavone, when dried, contains not less than 98.5% and not more than 101.0% of ipriflavone (C18H16O3).

Description Ipriflavone occurs as white to yellowish white, crystals or crystalline powder.

It is soluble in acetonitrile, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

It gradually turns yellow on exposure to light.

Identification (1) Determine the absorption spectrum of a solution of Ipriflavone in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ipriflavone RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ipriflavone as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ipriflavone RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.60> 116 – 119°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Ipriflavone according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.1D>—Prepare the test solution with 1.0 g of Ipriflavone according to Method 4, and perform the test. Prepare the test solution with 10 mL of dilute hydrochloric acid instead of using 3 mL of hydrochloric acid. Prepare the standard color with 1.0 mL of Standard Arsenic Solution (not more than 1 ppm).

(3) Related substances—Dissolve 30 mg of Ipriflavone in 50 mL of acetonitrile. To 5 mL of this solution add acetonitrile to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of this solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions.

System suitability—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of ipriflavone, beginning after the solvent peak.

System performance—

Test for required detectability: Pipet 2 mL of the standard solution, and add acetonitrile to make exactly 20 mL. Confirm that the peak area of ipriflavone obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ipriflavone are not less than 2000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ipriflavone to that of the internal standard is not more than 2.0%.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 30 mg each of Ipriflavone and Ipriflavone RS, previously dried, dissolve separately in acetonitrile to make exactly 50 mL. Pipet 5 mL of each of these solutions, add exactly 5 mL of the internal standard solution and acetonitrile to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of ipriflavone to that of the internal standard.

\[
M2 = \frac{M1 \times Q1}{Q2}
\]

M2: Amount (mg) of Ipriflavone RS taken

Internal standard solution—A solution of di-n-butyl phtha-
late in acetonitrile (1 in 100).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of acetonitrile and water (3:2).

Flow rate: Adjust so that the retention time of iripiflavone is about 6 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, iripiflavone and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times under the same operating conditions, the relative standard deviation of the ratio of the peak area of iripiflavone to that of the internal standard is not more than 1.0%.

Containers and storage

Containers—Tight containers.

Storage—Light-resistant.

Ipriflavone Tablets

イプリフラボン錠

Ipriflavone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ipriflavone (C_{13}H_{16}O_3: 280.32).

Method of preparation

Prepare as directed under Tablets, with Ipriflavone.

Identification

To a quantity of powdered Ipriflavone Tablets, equivalent to 11 mg of Ipriflavone, add 100 mL of methanol, shake vigorously for 10 minutes, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, it exhibits maxima between 247 nm and 251 nm, and between 297 nm and 301 nm.

Uniformity of dosage units <6.02>

It meets the requirement of the Mass variation test.

Dissolution

Being specified separately when the drug is granted approval based on the Law.

Assay

Weigh accurately the mass of not less than 20 Ipriflavone Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 30 mg of iripiflavone (C_{13}H_{16}O_3), add 30 mL of acetonitrile, shake vigorously for 15 minutes, add acetonitrile to make exactly 50 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and add acetonitrile to make 50 mL. Determine each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 0.8 to iripiflavone, obtained from the sample solution is not larger than 1.5 times the peak area of ipriflavone to that of the internal standard is not more than 3.

After dissolving the sample in acetonitrile (1 in 100), add 30 mL of acetonitrile, shake vigorously for 10 minutes, and centrifuge. If any difference appears between the spectra, dissolve the sample in acetonitrile (1 in 100) and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Purity (1)

Heavy metals <1.07>—Proceed with 1.0 g of Ipriflavone according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Ipriflavone in 50 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 20 mL. Pipet 1 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 0.8 to iripiflavone, obtained from the sample solution is not larger than 1.5 times the

Irbesartan

イルベサルタン

Irbesartan contains not less than 99.0% and not more than 101.0% of irbesartan (C_{25}H_{25}N_5O_3), calculated on the anhydrous basis.

Description

Irbesartan occurs as a white crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in ethanol (99.5) and practically insoluble in water.

It shows crystal polymorphism.

Identification (1) Determine the absorption spectrum of a solution of Irbesartan in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Irbesartan as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve the Irbesartan in methanol, evaporate the solvent, dry the residue, and perform the test using the residue.
peak area of irbesartan from the standard solution, the area of the peak other than irbesartan and the peak mentioned above from the sample solution is not larger than the peak area of irbesartan from the standard solution, and the total area of the peaks other than irbesartan from the sample solutions is not larger than 2 times the peak area of irbesartan from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: To 5.5 mL of phosphoric acid add 950 mL of water, and adjust to pH 3.2 with triethylamine. To 670 mL of this solution add 330 mL of acetonitrile for liquid chromatography.
Flow rate: 1.0 mL per minute.
Time span of measurement: About 1.4 times as long as the retention time of irbesartan, beginning after the solvent peak.
System suitability—
Test for required detectability: Pipet 5 mL of the standard solution, and add methanol to make exactly 10 mL. Confirm that the peak area of irbesartan obtained with 10 μL of this solution is equivalent to 35 to 65% of that with 10 μL of the standard solution.
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of irbesartan are not less than 5000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of irbesartan is not more than 3.0%.

(3) Azides—Being specified separately when the drug is granted approval based on the Law.

Water \(<2.48\) Not more than 0.5% (1 g, volumetric titration, back titration).
Residue on ignition \(<2.44\) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Irbesartan, dissolve in 50 mL of acetic acid (100), and titrate \(<2.50\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 42.85 mg of C₂₅H₂₈N₆O₆

Containers and storage Containers—Tight containers.

**Irbesartan Tablets**

**イルベサルタン錠**

Irbesartan Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of irbesartan (C₂₅H₂₈N₆O₆: 428.53).

**Method of preparation** Prepare as directed under Tablets, with Irbesartan.

**Identification** To a quantity of powdered Irbesartan Tablets, equivalent to about 25 mg of Irbesartan, add 2 mL of acetone, shake, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Evaporate the filtrate to dryness, and determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\> it exhibits absorptions at the wave numbers of about 1733 cm⁻¹, 1617 cm⁻¹, 1435 cm⁻¹ and 758 cm⁻¹.

**Uniformity of dosage unit** \(<6.02\> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Irbesartan Tablets add 1.5 mL of water, shake vigorously to disintegrate, and add 15 mL of methanol. Shake vigorously for 15 minutes, add methanol to make exactly 20 mL, and centrifuge. Pipet V mL of the supernatant liquid, equivalent to about 20 mg of irbesartan (C₂₅H₂₈N₆O₆), and add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 20 mL. Pipet 2.5 mL of this solution, add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 20 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of irbesartan (C₂₅H₂₈N₆O₆)

\[ Mₐ = Mₜ \times Aₕ / Aₗ \times 16 / V \]

Mₜ: Amount (mg) of irbesartan for assay taken, calculated on the anhydrous basis

**Dissolution** \(<6.10\> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 45 minutes of 50-mg and 100-mg tablets is not less than 85%, respectively, and that in 60 minutes of a 200-mg tablet is not less than 70%.

Start the test with 1 tablet of Irbesartan Tablets, withdraw not less than 10 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 3 mL of the first filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 22 μg of irbesartan (C₂₅H₂₈N₆O₆), and use this solution as the sample solution. Separately, weigh accurately about 44 mg of irbesartan for assay (separately determine the water \(<2.48\> in the same manner as Irbesartan), and dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, Aₚ and Aₗ, of the sample solution and standard solution at 244 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.2ₕ\> using the dissolution medium as the control.

Dissolution rate (%) with respect to the labeled amount of irbesartan (C₂₅H₂₈N₆O₆)

\[ Mₗ = Mₜ \times Aₗ / Aₕ \times V / V \times 1 / C \times 45 \]

Mₗ: Amount (mg) of irbesartan for assay taken, calculated on the anhydrous basis
C: Labeled amount (mg) of irbesartan (C₂₅H₂₈N₆O₆) in 1 tablet

**Assay** To 10 Irbesartan Tablets add 15 mL of water, shake vigorously to disintegrate, and add 150 mL of methanol. Shake vigorously for 15 minutes, add methanol to make exactly 200 mL, and centrifuge. Pipet V mL of the supernatant liquid, equivalent to about 20 mg of irbesartan (C₂₅H₂₈N₆O₆), and add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 20 mL. Pipet...
2.5 mL of this solution, add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of irbesartan for assay (separately determine the water $<2.49\%$ in the same manner as Irbesartan), and dissolve in methanol to make exactly 10 mL. Pipet 2.5 mL of this solution, add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 15 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions, and determine the peak areas, $A_1$ and $A_5$, of irbesartan in each solution.

Amount (mg) of irbesartan ($C_{21}H_{19}N_5O$) in 1 tablet

$$M_5 = M_5 \times A_1 \times A_5 \times 16/V$$

$M_5$: Amount (mg) of irbesartan for assay taken, calculated on the anhydrous basis

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm). Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 $\mu$m in particle diameter). Column temperature: A constant temperature of about 25°C. Mobile phase: To 5.5 mL of phosphoric acid add 950 mL of water, adjust to pH 3.0 with triethylamine, and add water to make 1000 mL. To 3 volume of this solution add 2 volume of acetonitrile for liquid chromatography. Flow rate: Adjust so that the retention time of irbesartan is about 13 minutes. System suitability—

- System performance: When the procedure is run with 15 $\mu$L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of irbesartan are not less than 10,000 and not more than 1.5, respectively.
- System repeatability: When the test is repeated 6 times with 15 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of irbesartan is not more than 1.0%. **Containers and storage**

Containers—Tight containers.

### Irbesartan and Amlodipine Besilate Tablets

イルベサルタン・アムロジピンベシル酸塩錠

Irbesartan and Amlodipine Besilate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of irbesartan ($C_{21}H_{19}N_5O$: 428.53) and amlodipine besilate ($C_{29}H_{25}ClN_3O_5$: 567.05). **Method of preparation**

Prepare as directed under Tablets, with Irbesartan and Amlodipine Besilate.

**Identification**

1. Perform the test with 5 $\mu$L each of the sample solution and standard solution obtained in the Assay (1) as directed under Liquid Chromatography $<2.01>$ according to the following conditions: the retention time of the peak of irbesartan in the chromatogram from the sample solution is the same with that of the principal peak in the chromatogram from the standard solution, and both absorption spectra of these peaks exhibit similar intensities of absorption at the same wavelengths.

**Operating conditions—**

- Column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay (1).

**System suitability—**

- System performance: Proceed as directed in the system suitability in the Assay (1).

2. Perform the test with 5 $\mu$L each of the sample solution and standard solution obtained in the Assay (2) as directed under Liquid Chromatography $<2.01>$ according to the following conditions: the retention time of the peak of amlodipine in the chromatogram from the sample solution is the same with that of the principal peak in the chromatogram from the standard solution, and both absorption spectra of these peaks exhibit similar intensities of absorption at the same wavelengths.

**Operating conditions—**

- Column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay (1).

**Uniformity of dosage unit $<6.02>$**

1. Irbesartan—Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Irbesartan and Amlodipine Besilate Tablets add 4 mL of 0.02 mol/L phosphate buffer solution (pH 3.0), and sonicate. Add 16 mL of methanol, shake vigorously until the tablet is disintegrated completely, and add the mobile phase to make exactly 100 mL. Pipet $V$ mL of this solution, add the mobile phase to make exactly $V\times V$ mL so that each mL contains about 1 mg of irbesartan ($C_{21}H_{19}N_5O$), and filter through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed under the Assay (1).

**Amount (mg) of irbesartan ($C_{21}H_{19}N_5O$)**

$$M_5 = M_5 \times A_1 \times A_5 \times V/V \times 2$$

$M_5$: Amount (mg) of irbesartan for assay taken, calculated on the anhydrous basis

2. Amlodipine besilate—Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Irbesartan and Amlodipine Besilate Tablets add 4 mL of 0.02 mol/L phosphate buffer solution (pH 3.0), and sonicate. Add 16 mL of methanol, shake vigorously until the tablet is disintegrated completely, and add the mobile phase to make exactly 100 mL. Pipet $V$ mL of this solution, add the mobile phase to make exactly $V\times V$ mL so that each mL contains about 69 $\mu$g of amlodipine besilate ($C_{29}H_{25}ClN_3O_5$: $C_{29}H_{25}O_5$), and filter through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed under the Assay (2).

**Amount (mg) of amlodipine besilate**

$$M_5 = M_5 \times A_1 \times A_5 \times V/V \times 1/5$$

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 3.)
M₅: Amount (mg) of Amlodipine Besilate RS taken, calculated on the anhydrous basis

**Dissolution C.16.10** (1) Irbesartan—When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Irbesartan and Amlodipine Besilate Tablets is not less than 70%.

Start the test with 1 tablet of Irbesartan and Amlodipine Besilate Tablets, withdraw not less than 15 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V’ mL of the subsequent filtrate, and add the mobile phase to make exactly V’ mL so that each mL contains about 0.11 mg of irbesartan (C₂₇H₂₃N₅O₂). Pipet 2 mL of this solution, add exactly 2 mL of the mobile phase, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of irbesartan for assay (separately determine the water C₂₄H₂₇O₃ in the same manner as Irbesartan), dissolve in the mobile phase to make exactly 25 mL, and use this solution as the irbesartan standard stock solution. Pipet 7 mL of the irbesartan standard stock solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the dissolution medium, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography C.2.01 according to the following conditions, and determine the peak areas, A₁ and A₅, of irbesartan in each solution.

Dissolution rate (%) with respect to the labeled amount of irbesartan (C₂₇H₂₃N₅O₂) = M₅ × A₁/ A₅ × V’/V × 1/C × 504

M₅: Amount (mg) of irbesartan for assay taken, calculated on the anhydrous basis

C: Labeled amount (mg) of irbesartan (C₂₇H₂₃N₅O₂) in 1 tablet

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay (1).

**System suitability**—
System performance: To 7 mL of the irbesartan standard stock solution obtained in (1) and 5 mL of the amlodipine besilate standard stock solution add the mobile phase to make exactly 50 mL. To 5 mL of this solution add 5 mL of the dissolution medium. When the procedure is run with 10 μL of this solution under the above operating conditions, amlodipine besilate and irbesartan are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of amlodipine is not more than 2.0%.

**Assay (1) Irbesartan**—To 10 tablets of Irbesartan and Amlodipine Besilate Tablets add 20 mL of 0.02 mol/L phosphate buffer solution (pH 3.0), and sonicate. Add 120 mL of methanol, shake vigorously until the tablets are disintegrated completely, and add the mobile phase to make exactly 200 mL. Pipet V’ mL of this solution, add the mobile phase to make exactly V’ mL so that each mL contains about 1 mg of amlodipine besilate (C₂₉H₂₈ClN₂O₈·C₄H₉O₄S), and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of irbesartan for assay (separately determine the water C₂₄H₂₇O₃ in the same manner as Irbesartan), dissolve in methanol to make exactly 25 mL, and use this solution as the irbesartan standard stock solution. Pipet 10 mL of the irbesartan standard stock solution, add 2 mL of methanol, add 0.02 mol/L phosphate buffer solution (pH 3.0) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography C.2.01 according to the following conditions, and determine the peak areas, A₁ and A₅, of irbesartan in each solution.

Amount (mg) of irbesartan (C₂₇H₂₃N₅O₂) in 1 tablet = M₅ × A₁/ A₅ × V’/V × 2/5
Irinotecan Hydrochloride Hydrate

C_{19}H_{19}Cl_{2}N_{4}O_{8}HCl.3H_{2}O: 677.18
(4S)-4,11-Diethyl-4-hydroxy-3,14-dioxo-3,4,12,14-tetrahydro-
1H-pyrazino[3′,4′;6,7]indolizino[1,2-b]quinolin-9-yl [1,4′-
bipiperidin-1′-carboxylate monohydrochloride trihydrate
[136757-09-3]

Irinotecan Hydrochloride Hydrate contains not less than
99.0% and not more than 102.0% of irinotecan hydrochloride
(C_{19}H_{19}Cl_{2}N_{4}O_{8}, HCl: 623.14), calculated on the anhydrous basis.

**Identification**

(1) Determine the absorption spectrum of a solution of Irinotecan Hydrochloride Hydrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Irinotecan Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 1 g of Irinotecan Hydrochloride Hydrate add 50 mL of water, dissolve by heating, and cool: the solution responds to Qualitative Tests <1.09> (2) for chloride.

**Optical rotation**

<2.49> [a]_{D}: +64 – +69° (0.5 g calculated on the anhydrous basis, water, heat, after cooling, 50 mL, 100 mm).

**pH**

<2.54> Dissolve 1 g of Irinotecan Hydrochloride Hydrate in 50 mL of water by heating, and cool: the pH of this solution is between 3.5 and 4.5.

**Purity**

(1) Heavy metals <1.07>—Proceed with 2.0 g of Irinotecan Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Irinotecan
Irinotecan Hydrochloride Hydrate in a suitable amount of a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) and 1 mL of 1 mol/L hydrochloric acid TS, and add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make 20 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.0) according to the following conditions. Determine each peak area by the automatic integration method: the peak areas of the related substances A and B, having the relative retention times of about 0.8 to irinotecan, and related substances C and D, having the relative retention times of about 1.6, obtained from the sample solution are not larger than 1/5 times the peak area of irinotecan from the standard solution, and the area of the peak other than irinotecan and the peaks mentioned above from the sample solution is not larger than 1/10 times the peak area of irinotecan from the standard solution. Furthermore, the total area of the peaks other than irinotecan from the sample solution is not larger than 4/5 times the peak area of irinotecan from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.22 g of sodium 1-decanesulfonate in a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make 1000 mL.

Flow rate: Adjust so that the retention time of irinotecan is about 12 minutes.

Time span of measurement: About 3 times as long as the retention time of irinotecan.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make exactly 20 mL. Confirm that the peak area of irinotecan obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of irinotecan are not less than 6000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of irinotecan is not more than 2.0%.

(3) Enantiomer—Being specified separately when the drug is granted approval based on the Law.

**Water (2.48)**

7.5 - 9.5% (0.1 g, volumetric titration, direct titration).

**Residue on ignition (2.44)**

Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.44 g of Irinotecan Hydrochloride Hydrate, dissolve in 120 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50% with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.16 mg of C_{13}H_{17}N_{2}O_{6}.HCl

**Containers and storage**—Tight containers. Storage—Light-resistant.

![Related substance D](image)
Irinotecan Hydrochloride Injection

イリノテカン塩酸塩注射液

Irinotecan Hydrochloride Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of irinotecan hydrochloride hydrate (C_{33}H_{38}N_{6}O_{6}.HCl.3H_{2}O: 677.18).

**Method of preparation** Prepare as directed under Injections, with Irinotecan Hydrochloride Hydrate.

**Description** Irinotecan Hydrochloride Injection is a clear and pale yellow liquid.

It is gradually decomposed by light.

**Identification** To a volume of Irinotecan Hydrochloride Injection, equivalent to 20 mg of Irinotecan Hydrochloride Hydrate, add water to make 10 mL. To 1 mL of this solution add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 253 nm and 257 nm, between 354 nm and 358 nm, and between 368 nm and 372 nm.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Purity** Related substances—To a volume of Irinotecan Hydrochloride Injection, equivalent to 40 mg of Irinotecan Hydrochloride Hydrate, add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) and 1 mL of 1 mol/L hydrochloric acid TS to make 20 mL, and use this solution as the sample solution. Pipet 1 mL of this solution, add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of related substance IA, having the relative retention time of about 0.3 to irinotecan, obtained from the sample solution is not larger than 1/2 times the peak area of irinotecan from the standard solution, the area of related substances A and B, having the relative retention time of about 0.8, from the sample solution are not larger than 3/10 times the peak area of irinotecan from the standard solution, the area of related substance IB, having the relative retention time of about 1.3, from the sample solution is not larger than 1/3 times the peak area of irinotecan from the standard solution, the areas of related substances C and D, having the relative retention time of about 1.6, and the related substance IC, having the relative retention time of about 2.2, from the sample solution are not larger than 1/5 times the peak area of irinotecan from the standard solution, and the area of the peak other than irinotecan and the peaks mentioned above from the sample solution is not larger than 1/10 times the peak area of irinotecan from the standard solution. Furthermore, the total area of the peaks other than irinotecan from the sample solution is not larger than 1.5 times the peak area of irinotecan from the standard solution.

**Operating conditions**—

Proceed as directed in the operating conditions in the Purity (2) under Irinotecan Hydrochloride Hydrate.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, add a mixture of diluted 0.1 mol/L potassium dihydrogen phosphate TS (1 in 10), methanol and acetonitrile (6:4:3) to make exactly 20 mL. Confirm that the peak area of irinotecan obtained with 25 μL of this solution is equivalent to 3.5 to 6.5% of that with 25 μL of the standard solution.

**System performance**: When the procedure is run with 25 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of irinotecan are not less than 6000 and not more than 2.0, respectively.

**System repeatability**: When the test is repeated 6 times with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of irinotecan is not more than 2.0%.

**Bacterial endotoxins** <4.01> Less than 1.8 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Pipet a volume of Irinotecan Hydrochloride Injection, equivalent to about 20 mg of irinotecan hydrochloride hydrate (C_{33}H_{38}N_{6}O_{6}.HCl.3H_{2}O), and add a mixture of methanol and acetic acid-sodium acetate buffer solution (pH 4.0) (11:9) to make exactly 50 mL. Pipet 10 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of irinotecan hydrochloride hydrate for assay (separately determine the water <2.48> in the same manner as Irinotecan Hydrochloride Hydrate), dissolve in a mixture of methanol and acetic acid-sodium acetate buffer solution (pH 4.0) (11:9) to make exactly 50 mL. Pipet 10 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_{T} and Q_{S}, of the peak area of irinotecan to that of the internal standard.

\[
M_{S} = \frac{\text{Amount (mg) of irinotecan hydrochloride hydrate}}{\text{Equivalent (mg) of irinotecan hydrochloride hydrate}}
\]

\[
M_{T} = Q_{T}/Q_{S} \times 1.087
\]

**Internal standard solution**—Dissolve 33.3 mg of propyl parahydroxybenzoate in a mixture of methanol and acetic acid-sodium acetate buffer solution (pH 4.0) (11:9) to make 1000 mL.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.01 g of sodium 1-heptanesul-
Determine the infrared absorption spectrum of Irsogladine Maleate.

Dissolve 10 mg of Irsogladine Maleate in 1 mL of water to make 100 mL. Pipet 1 mL of this solution, add water to make 20 mL. Take 2 mL of this solution, and add hydrochloric acid and disperse immediately.

Flow rate: Adjust so that the retention time of irinotecan is about 7 minutes.

System Suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, irinotecan and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of irinotecan to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers. Storage—Light-resistant.

Irsogladine Maleate, when dried, contains not less than 99.0% and not more than 101.0% of irsogladine maleate (C_{37}H_{38}Cl_{2}N_{4}O_{4}).

Description
Irsogladine Maleate occurs as white, crystals or crystalline powder. It has a slightly bitter taste.

It is sparingly soluble in acetic acid (10%) and in ethylene-glycol, slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification (1) Dissolve 20 mg of Irsogladine Maleate in methanol to make 20 mL. Take 2 mL of this solution, and add water to make 20 mL. To 2 mL of this solution add water to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Irsogladine Maleate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 10 mg of Irsogladine Maleate in 1 mL of dilute hydrochloric acid and 4 mL of water, and add 3 drops of potassium permanganate TS: the color of the solution is discharged immediately.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Irsogladine Maleate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Irsogladine Maleate in 10 mL of ethylene glycol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethylene glycol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than the peaks of maleic acid and irsogladine obtained from the sample solution is not larger than 1/10 times the peak area of irsogladine from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 250 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
ter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanesulfonic acid solution (1 in 1000) and methanol (4:1).

Flow rate: Adjust so that the retention time of irsogladine is about 8 minutes.

Time span of measurement: About 3 times as long as the retention time of irsogladine, beginning after the solvent peak.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, and add ethylene glycol to make exactly 10 mL. Confirm that the peak area of irsogladine obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of irsogladine are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of irsogladine is not more than 2.0%.

Loss on drying <2.4> Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.4> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Irsogladine Maleate, previously dried, dissolve in 25 mL of acetic acid (100), add 25 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 18.61 mg of C₉H₇Cl₂N₂O₇C₄H₄O₄

Containers and storage Containers—Well-closed containers.

## Irsogladine Maleate Fine Granules

イルソグラジンマレイン酸塩細粒

Irsogladine Maleate Fine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of irsogladine maleate (C₁₉H₂₁Cl₂N₂O₇C₄H₄O₄: 372.16).

Method of preparation Prepare as directed under Granules, with Irsogladine Maleate.

Identification To a quantity of powdered Irsogladine Maleate Fine Granules, equivalent to 2 mg of Irsogladine Maleate, add 5 mL of methanol, shake for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 2 mg of irsogladine maleate in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of petroleum ether, acetone and acetic acid (100) (12:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wave-length: 254 nm): the spot from the sample solution has the same Rf value as the spot from the standard solution.

Uniformity of dosage units <6.02> Perform the test according to the following method: Irsogladine Maleate Fine Granules in single-dose packages meet the requirement of the Content uniformity test.

Take out the total contents of 1 package of Irsogladine Maleate Fine Granules, add 2 mL of water, add 2 mL methanol per mg of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄), sonicate for 10 minutes with occasional shaking, and add water to make exactly V mL so that each mL contains about 40 μg of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄). Centrifuge this solution, pipet 1 mL of the supernatant liquid, and add water to make exactly 20 mL. Filter this solution through a membrane filter with a pore size not exceeding 0.5 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of irsogladine maleate for assay, previously dried at 105°C for 4 hours, dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank, and determine the absorbances, A₁ and A₅, at 210 nm.

Amount (mg) of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄) = Mₛ × A₁ / A₅ × V / 500

Mₛ: Amount (mg) of irsogladine maleate for assay taken

Dissolution rate <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Irsogladine Maleate Fine Granules is not less than 70%.

Start the test with an accurately weighed amount of Irsogladine Maleate Fine Granules, equivalent to about 4 mg of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard not less than 10 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of irsogladine maleate for assay, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, and add water to make exactly 20 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank, and determine the absorbances, A₁ and A₅, at 210 nm.

Dissolution rate (%) with respect to the labeled amount of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄) = Mₛ / M₁ × A₁ / A₅ × 1/C × 9

Mₛ: Amount (mg) of irsogladine maleate for assay taken
M₁: Amount (g) of Irsogladine Maleate Fine Granules taken
C: Labeled amount (mg) of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄) in 1 g

Assay Weigh accurately an amount of powdered Irsogladine Maleate Fine Granules, equivalent to about 5 mg of irsogladine maleate (C₁₉H₂₁Cl₂N₂C₄H₄O₄), add exactly 5 mL of the internal standard solution, shake until it is dispersed,
and add 5 mL of water. To the solution add 25 mL of ethy-
line glycol, sonicate for 10 minutes with occasional shaking,
and add ethylene glycol to make 50 mL. Filter this solution
through a membrane filter with a pore size not exceeding 0.5
μm, discard the first 10 mL of the filtrate, and use the subse-
quent filtrate as the sample solution. Separately, weigh accu-
rately about 25 mg of irsogladine maleate for assay, previ-
sely dried at 105°C for 4 hours, and dissolve in ethylene
glycol to make exactly 25 mL. Pipet 5 mL of this solution,
add exactly 5 mL of the internal standard solution, add 5 mL
of water and ethylene glycol to make 50 mL, and use this so-
lution as the standard solution. Perform the test with 5 μL
each of the sample solution and standard solution as directed
under Liquid Chromatography <2.07> according to the fol-
lowing conditions, and calculate the ratios, \( Q_t \) and \( Q_s \),
of the peak area of irsogladine to that of the internal standard.

\[
L_s = M_s \times \frac{Q_t}{Q_s} \times \frac{1}{5}
\]

\( M_s \): Amount (mg) of irsogladine maleate for assay taken

**Internal standard solution**—A solution of ethyl para-
hydroxybenzoate in methanol (1 in 2500).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wave-
length: 250 nm).

Column: A stainless steel column 4.6 mm in inside diam-
ter and 15 cm in length, packed with octadecylsilanized silica
gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about
25°C.

Mobile phase: A mixture of water, acetonitrile and acetic
acid (100:750:250:3).

Flow rate: Adjust so that the retention time of irsogladine
is about 9 minutes.

**System suitability**—
System performance: When the procedure is run with 5 μL
of the standard solution under the above operating condi-
tions, irsogladine and the internal standard are eluted in this
order with the resolution between these peaks being not less
than 10.

System repeatability: When the test is repeated 6 times
with 5 μL of the standard solution under the above operating
conditions, the relative standard deviation of the ratio of the
peak area of irsogladine to that of the internal standard is
not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Irsogladine Maleate Tablets

**イルソグラジンマレイン酸塩錠**

Irsogladine Maleate Tablets contain not less than
93.0% and not more than 107.0% of the labeled
amount of irsogladine maleate (C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂; 372.16).

**Method of preparation** Prepare as directed under Tablets,
with Irsogladine Maleate.

**Identification** To a quantity of powdered Irsogladine Male-
ate Tablets, equivalent 2 mg of Irsogladine Maleate, add 5
mL of methanol, shake for 10 minutes, centrifuge, and use
the supernatant liquid as the sample solution. Separately,
dissolve 2 mg of irsogladine maleate in 5 mL of methanol,
and use this solution as the standard solution. Perform the
test with these solutions as directed under Thin-layer Chroma-
matography <2.07>. Spot 10 μL each of the sample solution
and standard solution on a plate of silica gel with fluorescent
indicator for thin-layer chromatography. Develop the plate
with a mixture of petroleum ether, acetone and acetic acid
(100) (12:4:1) to a distance of about 10 cm, and air-dry the
plate. Examine under ultraviolet light (main wavelength: 254
nm): the spot from the sample solution has the same \( R_f \)
value as the spot from the standard solution.

**Uniformity of dosage units** <6.02> Perform the test accord-
ing to the following method: it meets the requirement of the
Content uniformity test.

To 1 tablet of Irsogladine Maleate Tablets add 2 mL of
water, add 2 mL of methanol per mg of irsogladine maleate
(C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂), sonicate for 10 minutes with occa-
sional shaking, add water to make exactly \( V \) mL so that
each mL contains about 40 μg of irsogladine maleate
(C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂). Centrifuge this solution, pipet 1 mL of
the supernatant liquid, and add water to make exactly 20
mL. Filter this solution through a membrane filter with a
pore size not exceeding 0.5 μm, discard the first 10 mL of the
filtrate, and use the subsequent filtrate as the sample solu-
tion. Separately, weigh accurately about 20 mg of irsogla-
dine maleate for assay, previously dried at 105°C for 4
hours, and dissolve in methanol to make exactly \( V \) mL.

Pipet 2 mL of this solution, and add water to make exactly
20 mL. Pipet 2 mL of this solution, add water to make ex-
actly 100 mL, and use this solution as the standard solution.
Perform the test with the sample solution and standard solu-
tion as directed under Ultraviolet-visible Spectrophotometry
<2.24>, using water as the blank, and determine the absor-
bances, \( A_t \) and \( A_s \), at 210 nm.

\[
L_s = M_s \times A_t / A_s \times \sqrt{500}
\]

\( M_s \): Amount (mg) of irsogladine maleate for assay taken

**Dissolution** <6.10> When the test is performed at 50 revolu-
tions per minute according to the Paddle method, using 900
mL of water as the dissolution medium, the dissolution rate
in 30 minutes of Irsogladine Maleate Tablets is not less than
80%.

Start the test with 1 tablet of Irsogladine Maleate Tablets,
withdraw not less than 20 mL of the medium at the specified
minute after starting the test, and filter through a membrane
filter with a pore size not exceeding 0.5 μm. Discard not
less than 10 mL of the first filtrate, pipet \( V \) mL of the
subsequent filtrate, add water to make exactly \( V' \) mL so that
each mL contains about 2.2 μg of irsogladine maleate
(C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂), and use this solution as the sample
solution. Separately, weigh accurately about 20 mg of irsogla-
dine maleate for assay, previously dried at 105°C for 4
hours, and dissolve in methanol to make exactly 20 mL.

Pipet 2 mL of this solution, and add water to make exactly
20 mL. Pipet 2 mL of this solution, add water to make ex-
actly 100 mL, and use this solution as the standard solution.
Perform the test with the sample solution and standard solu-
tion as directed under Ultraviolet-visible Spectrophotometry
<2.24>, using water as the blank, and determine the absor-
bances, \( A_t \) and \( A_s \), at 210 nm.

**Dissolution rate (%) with respect to the labeled amount
of irsogladine maleate** (C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂)

\[
L_s = M_s \times A_t / A_s \times \sqrt{V' / V \times 1 / \sqrt{C \times 9}}
\]

\( M_s \): Amount (mg) of irsogladine maleate for assay taken

**C**: Labeled amount (mg) of irsogladine maleate
(C₂₆H₂₄Cl₂N₂₂C₂₄H₂₄O₁₂) in 1 tablet
Isepamicin Sulfate

イセパマイシン硫酸塩

\[ \text{C}_{22}\text{H}_{34}\text{N}_{6}\text{O}_{12}\cdot\gamma\text{H}_{2}\text{SO}_{4} \]

6-Amino-6-deoxy-\(\beta\)-d-glucopyranosyl-(1→4)-
[3-deoxy-4-C-methyl-3-methylamino-\(\beta\)-l-arabinopyranosyl-
(1→6)]-2-deoxy-1-N-[(2S)-3-amino-2-hydroxypropanoyl]-
\(\beta\)-streptamine sulfate

[67814-76-0]

Isepamicin Sulfate is the sulfate of a derivative of gentamycin B, an aminoglycoside substance, having antibacterial activity produced by the growth of Micromonospora purpurea.

It contains not less than 680 \(\mu\)g (potency) and not more than 780 \(\mu\)g (potency) per mg, calculated on the anhydrous basis. The potency of Isepamicin Sulfate is expressed as mass (potency) of isepamicin (\(\text{C}_{22}\text{H}_{34}\text{N}_{6}\text{O}_{12}\)): 569.60.

**Description**

Isepamicin Sulfate occurs as a white to pale yellow-white powder.

It is very soluble in water, and practically insoluble in methanol and in ethanol (95).

It is hygroscopic.

**Identification**

(1) Dissolve 20 mg of Isepamicin Sulfate in 1 mL of water, add 3 mL of anthrone TS, shake, and allow to stand: a blue-purple color develops.

(2) Dissolve 10 mg each of Isepamicin Sulfate and Isepamicin Sulfate R5 in 5 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer chromatography. Spot 5 \(\mu\)L of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia water (28), ethanol (99.5), 1-butanol and chloroform (5:5:4:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly 0.2\% ninhydrin-water saturated 1-butanol TS on the plate, and heat the plate at about 100°C for about 10 minutes: the principal spots from the sample solution and the spot from the standard solution exhibit a red-brown color and show the same Rf value.

(3) Dissolve 10 mg of Isepamicin Sulfate in 1 mL of water, and add 1 drop of barium chloride TS: a white precipitate is produced.

**Optical rotation**

\(<\\text{2.40}^\circ\>\) \([\alpha]_{D}^{20}: +100 – +120^\circ\) (0.25 g calculated on the anhydrous bases, water, 25 mL, 100 mm).

**pH**

\(<\text{2.54}^\circ\>

Dissolve 0.5 g of Isepamicin Sulfate in 5 mL of water: the pH of the solution is between 5.5 and 7.5.

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g
Isepamicin Sulfate Injection / Official Monographs

1194 Isepamicin Sulfate Injection

of Isepamicin Sulfate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Isepamicin Sulfate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method, and calculate the amounts of their peaks by the area percentage method: the amount of HAP-gentamicin-B equivalent to about 0.4 of the relative retention time to isepamicin is not more than 5.0%, and gentamicin B equivalent to about 1.3 of that is not more than 3.0%. For the peak area of gentamicin B, multiply the correction factor, 1.11.

Operating conditions—

Apparatus, detector, column, column temperature, reaction coil, mobile phase, reagent, reaction temperature, flow rate of mobile phase, and flow rate of reagent: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of isepamicin.

System suitability—

System performance and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To 1 mL of the sample solution, add water to make 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add water to make exactly 10 mL. Confirm that the peak area of isepamicin obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the solution for system suitability test.

Water <2.48>—Not more than 12.0% (0.2 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Residue on ignition <2.44>—Not more than 1.0% (1 g).

Assay Weigh accurately an amount of Isepamicin Sulfate and Isepamicin Sulfate RS, equivalent to about 20 mg (potency), dissolve each in water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A<sub>T</sub> and A<sub>S</sub>, of isepamicin in each solution.

\[
\text{Amount [μg (potency)] of isepamicin (C<sub>22</sub>H<sub>43</sub>N<sub>4</sub>O<sub>12</sub>)} = M_5 \times A_T / A_S \times 1000
\]

M<sub>5</sub>: Amount [mg (potency)] of Isepamicin Sulfate RS taken

Operating conditions—

Apparatus: Consist of two pumps for the mobile phase and the reagent transport, inject port, column, reaction coil, detector and recorder. Use a reaction coil with thermostat.

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Reaction coil: A column 0.25 mm in inside diameter and 5 m in length.

Mobile phase: Dissolve 28.41 g of anhydrous sodium sulfate and 5.23 g of sodium 1-pentane sulfonate in 900 mL of water, add 1 mL of acetic acid (100), and add water to make exactly 1000 mL.

Reagent: To 500 mL of boric acid-potassium chloride-sodium hydroxide buffer solution (pH 10.0) add 5 mL of a solution of α-thalaldehyde in ethanol (95) (2 in 25), 1 mL of 2-mercaptoethanol and 2 mL of a solution of lauramidopropyl betaine (1 in 4).

Reaction temperature: A constant temperature of about 45°C.

Flow rate of mobile phase: About 0.6 mL per minute.

Flow rate of reagent: About 0.5 mL per minute.

System suitability—

System performance: Dissolve 2 mg of gentamicin B in 10 mL of the standard solution. When the procedure is run with 5 μL of this solution under the above operating conditions, isepamicin and gentamicin B are eluted in this order with the resolution between these peaks being not less than 1.0.

System repeatability: When the test is repeated 5 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of isepamicin is not more than 3.0%.

Containers and storage Containers—Tight containers.

Isepamicin Sulfate Injection

イセパマイシン硫酸塩注射液

Isepamicin Sulfate Injection is an aqueous injection. It contains not less than 90.0% and not more than 110.0% of the labeled potency of isepamicin (C<sub>22</sub>H<sub>43</sub>N<sub>4</sub>O<sub>12</sub>: 569.60).

Method of preparation Prepare as directed under Injections, with Isepamicin Sulfate.

Description Isepamicin Sulfate Injection is a clear, colorless liquid.

Identification To a volume of Isepamicin Sulfate Injection, equivalent to 20 mg (potency) of Isepamicin Sulfate, add water to make 10 mL, and use this solution as the sample solution. Separately, dissolve an amount of Isepamicin Sulfate RS, equivalent to 20 mg (potency) in 10 mL of water, and use this solution as the standard solution. Proceed with these solutions as directed in the Identification (2) under Isepamicin Sulfate.

Osmotic pressure ratio Being specified separately when the drug is granted approval based on the Law.

pH <2.54> 5.5 – 7.5.

Purity Related substances—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amounts of their peaks by the area percentage method: the amount of isoserine, having the relative retention time of about 0.3 to isepamicin, is not more than 2.0%, and the amount of gentamicin B, having the relative retention time of about 1.3, is not more than 4.0%. For the peak area of gentamicin B, multiply the correction factor, 1.11.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Operating conditions—
Apparatus, detector, column, column temperature, reaction coil, mobile phase, reaction reagent, reaction temperature, flow rate of mobile phase, and flow rate of reaction reagent: Proceed as directed in the operating conditions in the Assay under Isepamicin Sulfate.

Time span of measurement: About 2 times as long as the retention time of isispamicin.

System suitability—
System performance and system repeatability: Proceed as directed in the Assay under Isepamicin Sulfate.
Test for required detectability: To 1 mL of the solution add water to make 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add water to make exactly 10 mL. Confirm that the peak area of isispamicin obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the solution for system suitability test.

Bacterial endotoxins <4.01> Less than 0.50 EU/mg (potency).

Extractable volume <6.05> It meets the requirement.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Pipet a volume of Isepamicin Sulfate Injection, equivalent to about 0.2 g (potency) of Isepamicin Sulfate, add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Isepamicin Sulfate RS, equivalent to about 20 mg (potency), dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Isepamicin Sulfate.

Amount [mg (potency)] of isepamicin (C\textsubscript{3}H\textsubscript{5}ClF\textsubscript{3}O\textsubscript{2})
\[
= M_5 \times A_T \times A_S \times 10
\]

M\textsubscript{5}: Amount [mg (potency)] of Isepamicin Sulfate RS taken

Containers and storage Containers—Hermetic containers.

Shelf life 24 months after preparation.

Isoflurane

イソフルラン

\[
\text{C}_3\text{H}_2\text{ClF}_3\text{O} \quad 184.49
\]

(2RS)-2-Chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane [26675-46-7]

Isoflurane contains not less than 99.0% and not more than 101.0% of isoflurane (C\textsubscript{3}H\textsubscript{2}ClF\textsubscript{3}O), calculated on the anhydrous basis.

Description Isoflurane occurs as a clear, colorless fluid liquid.

It is miscible with ethanol (99.5), with methanol and with o-xylene.

It is slightly soluble in water.

It is volatile, and has no inflammability.

It shows no optical rotation.

Refractive index \(n_0^D\): about 1.30

Boiling point: about 47 – 50°C

Identification (1) The test solution obtained by Oxygen Flask Combustion Method <1.06> with 50 μL of Isoflurane, using 40 mL of water as the absorbing liquid, responds to Qualitative Tests <1.09> for chloride and fluoride.

(2) Determine the infrared absorption spectrum of Isoflurane as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Isoflurane RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Specific gravity <2.56> \(d^2_{4,0} \quad 1.500 – 1.520

Purity (1) Acidity or alkalinity—To 10 mL of Isoflurane add 5 mL of freshly boiled and cooled water, and shake for 1 minute: the water layer is neutral.

(2) Soluble chloride—To 60 g of Isoflurane add 40 mL of water, shake thoroughly, and separate the water layer. To 20 mL of the layer add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as directed under Chloride Limit Test <1.03>. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 3 ppm).

(3) Soluble fluoride—To 6 g of Isoflurane add 12 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), and shake for 10 minutes. Transfer 4.0 mL of the water layer into a Nessler tube, add 30 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium (III) nitrate TS (1:1:1), add water to make 50 mL, allow to stand for 60 minutes, and use this solution as the standard solution. Separately, to 0.4 mL of the fluorine standard solution and 4.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in a Nessler tube add 30 mL of the mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution (pH 4.3) and cerium (III) nitrate TS (1:1:1), then proceed in the same manner as for the preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances of the sample solution and standard solution at 600 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, obtained by proceeding in the same manner as above with 4.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), as the blank: the absorbance of the sample solution is not more than that of the standard solution (not more than 2 ppm).

Fluorine standard solution: Dissolve exactly 2.21 g of sodium fluoride in water to make exactly 1000 mL. Pipet 10 mL of this solution, and add water to make exactly 1000 mL. Each mL of this solution contains 0.01 mg of fluorine (F).

(4) Related substances—Use Isoflurane as the sample solution. To exactly 1 mL of the sample solution add o-xylene to make exactly 100 mL. Pipet 1 mL of this solution, add o-xylene to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than isoflurane from sample solution is not larger than the peak area of...
isoflurane from the standard solution, and the total area of the peaks other than isoflurane from the sample solution is not larger than 3 times the peak area of isoflurane from the standard solution.

Operating conditions—
Detector, column, column temperature, carrier gas, and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 5 times as long as the retention time of isoflurane.

System suitability—
System performance and system repeatability: Proceed as directed in the system suitability in the Assay.
Test for required detectability: To exactly 1 mL of the standard solution add o-xylene to make exactly 2 mL. Confirm that the peak area of isoflurane obtained with 5 μL of this solution is equivalent to 35 to 65% of that with 5 μL of the standard solution.
(5) Peroxide—Take 10 mL of Isoflurane in a Nessler tube add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), shake vigorously, and allow to stand in a dark place for 1 hour: the water layer is not yellow.
(6) Residue on evaporation—Pipet 65 mL of Isoflurane, evaporate on a water bath, and dry the residue at 105°C for 1 hour: not more than 1.0 mg.

Water <2.48> Not more than 0.1% (2 g, Coulometric titration).

Assay To exactly 5 mL each of Isoflurane and Isoflurane RS (separately determined the water <2.48> in the same manner as Isoflurane), add exactly 3 mL of ethyl acetate as the internal standard, then add o-xylene to make 50 mL each. To 5 mL each of these solutions add o-xylene to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 2 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of isoflurane to that of the internal standard.

\[
\text{Amount (mg) of isoflurane (C₅H₂ClF₂O) in 5 mL of Isoflurane} = V_s \times Q_1/Q_2 \times 1000 \times 1.506
\]

\(V_s:\) Amount (mL) of Isoflurane RS taken, calculated on the anhydrous basis

1.506: Specific gravity (d₂₀₀) of isoflurane

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A stainless steel column 3 mm in inside diameter and 3.5 m in length, packed with siliceous earth for gas chromatography (125 – 149 μm in particle size), coated in 10% with nonylphenoxypoly(ethylenoxy)ethanol for gas chromatography and in 15% with polyalkylene glycol for gas chromatography.
Column temperature: A constant temperature of about 80°C.
Carrier gas: Nitrogen.
Flow rate: Adjust so that the retention time of isoflurane is about 7 minutes.

System suitability—
System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, isoflurane and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isoflurane is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—At a temperature not exceeding 30°C.

L-Isoleucine
l-イソロイシン

C₅H₁₃NO₂: 131.17
(2S,3R)-2-Amino-3-methylpentanoic acid
[73-32-5]

L-Isoleucine, when dried, contains not less than 98.5% of L-Isoleucine (C₅H₁₃NO₂).

Description L-Isoleucine occurs as white, crystals or crystalline powder. It is odorless or has a faint characteristic odor, and has a slightly bitter taste.
It is freely soluble in formic acid, sparingly soluble in water, and practically insoluble in ethanol (95).
It dissolves in dilute hydrochloric acid.

Identification Determine the infrared absorption spectrum of L-Isoleucine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D₂₀: +39.5 – +41.5° (after drying, 1 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of L-Isoleucine in 100 mL of water: the pH of this solution is between 5.5 and 6.5.

Purity (1) Clarity and color of solution—Dissolve 0.5 g of L-Isoleucine in 10 mL of 1 mol/L hydrochloric acid TS: the solution is clear and colorless.
(2) Chloride <1.03>—Perform the test with 0.5 g of L-Isoleucine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).
(3) Sulfate <1.14>—Perform the test with 0.6 g of L-Isoleucine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).
(4) Ammonium <1.02>—Perform the test with 0.25 g of L-Isoleucine. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).
(5) Heavy metals <1.07>—Dissolve 1.0 g of L-Isoleucine in 40 mL of water and 2 mL of dilute acetic acid by warming, cool, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).
(6) Arsenic <1.11>—Prepare the test solution with 1.0 g of L-Isoleucine according to Method 2, and perform the test (not more than 2 ppm).
(7) Related substances—Dissolve 0.10 g of L-Isoleucine in 25 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.01\). Spot 5 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly the plate with a solution of ninhydrin in acetone (1 in 50), and heat the plate at 80°C for 5 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41\> Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition** \(<2.44\> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.13 g of \(L\)-Isoleucine, previously dried, and dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate \(<2.50\>with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 13.12 mg of \(C_6H_{13}NO_2\)

**Containers and storage** Containers—Tight containers.

**I-L-Isoleucine, L-Leucine and L-Valine Granules**

イソロイシン・ロイシン・バリシン顆粒

\(L\)-Isoleucine, \(L\)-Leucine and \(L\)-Valine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of \(L\)-isoleucine \((C_6H_{13}NO_2: 131.17)\), \(L\)-leucine \((C_6H_{13}NO_2: 131.17)\) and \(L\)-valine \((C_6H_{13}NO_2: 117.15)\).

**Method of preparation** Prepare as directed under Granules, with \(L\)-Isoleucine, \(L\)-Leucine and \(L\)-Valine.

**Identification** Dissolve an amount of powdered \(L\)-Isoleucine, \(L\)-Leucine and \(L\)-Valine Granules, equivalent to about 92 mg of \(L\)-Isoleucine, in the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, dissolve 0.46 g of \(L\)-isoleucine, 0.92 g of \(L\)-leucine and 0.55 g of \(L\)-valine in the mobile phase to make 100 mL. Take 10 mL of this solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 \(\mu\)L each of the sample solution and the standard solution as directed under Liquid Chromatography \(<2.01\> according to the following conditions: the retention times of the peak in the chromatograms obtained from the sample solution and the standard solution are the same.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (3 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 31.2 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust to \(pH\) 2.8 with phosphoric acid. To 970 mL of this solution add 30 mL of acetonitrile.

Flow rate: Adjust so that the retention time of \(L\)-valine is about 2.5 minutes.

**System suitability—**

System performance: When the procedure is run with 20 \(\mu\)L of the standard solution under the above operating conditions, valves, isoleucine and leucine are eluted in this order, and the resolution between the peaks of isoleucine and leucine is not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviations of the retention time of isoleucine, leucine and valine are not more than 1.0%, respectively.

**Uniformity of dosage units** \(<6.02\> Perform the test according to the following method: the Granules in single-dose package meets the requirement of the Content uniformity test.

To the total content of 1 package of \(L\)-Isoleucine, \(L\)-Leucine and \(L\)-Valine Granules add exactly \(V/25\) mL of the internal standard solution, and add 0.1 mol/L hydrochloric acid TS to make \(V\) mL so that each mL contains about 3.8 mg of \(L\)-isoleucine \((C_6H_{13}NO_2)\). To 2 mL of this solution add 0.02 mol/L hydrochloric acid TS to make 200 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\begin{align*}
\text{Amount (mg) of} \ L\text{-isoleucine} & = M_{\text{sc}} \times Q_{\text{sa}} \times V/50 \ \\
\text{Amount (mg) of} \ L\text{-leucine} & = M_{\text{sb}} \times Q_{\text{sa}} \times V/50 \ \\
\text{Amount (mg) of} \ L\text{-valine} & = M_{\text{sc}} \times Q_{\text{sc}} \times V/50
\end{align*}
\]

\(M_{\text{sc}}\): Amount (mg) of \(L\)-isoleucine for assay taken

\(M_{\text{sb}}\): Amount (mg) of \(L\)-leucine for assay taken

\(M_{\text{sc}}\): Amount (mg) of \(L\)-valine for assay taken

**Internal standard solution—** A solution of glycine in 0.1 mol/L hydrochloric acid TS (1 in 20).

**Disintegration** \(<6.09\> It meets the requirement. Carry out the test for 15 minutes.

**Assay** Powder the total amount of the content of not less than ten packages of \(L\)-Isoleucine, \(L\)-Leucine and \(L\)-Valine Granules. Weigh accurately a portion of the powder, equivalent to about 0.95 g of \(L\)-isoleucine \((C_6H_{13}NO_3)\), add exactly 10 mL of the internal standard solution, dissolve in 0.1 mol/L hydrochloric acid TS to make 250 mL. To 2 mL of this solution add 0.02 mol/L hydrochloric acid TS to make 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.2 g of \(L\)-isoleucine for assay, about 0.4 g of \(L\)-leucine for assay and about 0.24 g of \(L\)-valine for assay, previously these are dried at 105°C for 3 hours, add exactly 2 mL of the internal standard solution, dissolve in 0.1 mol/L hydrochloric acid TS to make 100 mL. To 2 mL of this solution add 0.02 mol/L hydrochloric acid TS to make 100 mL, and use this solution as the standard solution. Perform the test with 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\> according to the following conditions. Calculate the ratios, \(Q_{\text{Tsa}}, Q_{\text{Tsb}}\) and \(Q_{\text{Tsc}}\) of the peak area of \(L\)-isoleucine, \(L\)-leucine and \(L\)-valine to that of the internal standard obtained from the sample solution, and the ratios, \(Q_{\text{sa}}, Q_{\text{sb}}\) and \(Q_{\text{sc}}\) of the peak area of \(L\)-isoleucine, \(L\)-leucine and \(L\)-valine to that of the internal standard from the standard solution.
Isomalt Hydrate / Official Monographs

Amount (mg) of L-isoleucine (C₆H₁₳NO₂)
= Mₛₒ × Q₂ₛ/Q₂ₛ × 5
Amount (mg) of L-leucine (C₆H₁₳NO₂)
= Mₛₒ × Q₂ₛ/Q₂ₛ × 5
Amount (mg) of L-valine (C₆H₁₳NO₂)
= Mₛₒ × Q₂ₛ/Q₂ₛ × 5

Switching of mobile phase: Switch the mobile phases A, B, C, D and E sequentially so that when proceed with 20 μL of the standard solution under the conditions above, the internal standard, valine, isoleucine and leucine are eluted in this order with the resolution between the peaks of isoleucine and leucine being not less than 1.2.

Reaction reagent: Dissolve 407 g of lithium acetate dihydrate in an appropriate amount of water, add 245 mL of acetic acid (100), 801 mL of 1-methoxy-2-propanol and water to make 2000 mL, pass nitrogen for 10 minutes, and use this solution as Solution (I). Separately, to 1957 mL of 1-methoxy-2-propanol add 77 g of ninhydrin, pass nitrogen for 5 minutes, add 0.161 g of sodium borohydride, and pass nitrogen for 30 minutes. To this solution add an equal volume of the Solution (I). Prepare before use.

Flow rate of mobile phase: 0.40 mL per minute.
Flow rate of reaction regent: 0.35 mL per minute.
System suitability—
System performance: When the test is run with 20 μL of the standard solution under the above operating conditions, the internal standard, valine, isoleucine and leucine are eluted in this order with the resolution between the peaks of isoleucine and leucine being not less than 1.2.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the ratio of the peak area of isoleucine, leucine and valine to that of the internal standard are not more than 1.0%, respectively.

Containers and storage—Containers—Tight containers.

Isomalt Hydrate

イソマル水和物

6-O-α-D-Glucopyranosyl-d-glucitol C₁₂H₂₁O₁₁: 344.31
1-O-α-D-Glucopyranosyl-d-mannitol dihydrate C₁₂H₂₁O₁₁·2H₂O: 380.34
6-O-α-D-Glucopyranosyl-d-glucitol—1-O-α-D-glucopyranosyl-
-d-mannitol dihydrate [64519-82-0]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (●), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (●). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Isomalt Hydrate is a mixture of 6-O-α-D-glucopyranosyl-d-sorbitol and 1-O-α-D-glucopyranosyl-d-mannitol.

It contains not less than 98.0% and not more than 102.0% as the mixture of 6-O-α-D-glucopyranosyl-d-sorbitol (C₁₂H₂₁O₁₁) and 1-O-α-D-glucopyranosyl-d-mannitol (C₁₂H₂₁O₁₁), calculated on the anhydrous basis, and the amount of each component is not less than 3.0%, respectively.

The label states the contents (%) of 6-O-α-D-glucopyranosyl-d-sorbitol and 1-O-α-D-glucopyranosyl-d-mannitol.

Description—Isomalt Hydrate occurs as a white, powder or grains.

It is freely soluble in water, and practically insoluble in ethanol (95).

Optical rotation [α]₁₀₂°: about + 92° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).
Identification

(1) To 1 mL of a solution of Isomalt Hydrate (1 in 100) add 1 mL of a solution of catechol (1 in 10) prepared before use, shake thoroughly, add 2 mL of sulfuric acid rapidly, and shake: a reddish purple to red-purple color develops.

(2) Perform the test with 20 μL each of the sample solution and standard solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, and compare the chromatograms obtained from these solutions: the two principal peaks in the chromatogram obtained from the sample solution are similar in retention time to respective two peaks from the standard solution.

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

Proceed as directed in the system suitability in the Assay.

Purity

(1) Heavy metals <1.07>—Proceed with 2.0 g of Isomalt Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Nickel—Weigh exactly an amount of Isomalt Hydrate, equivalent to 10.0 g calculated on the anhydrous basis, dissolve in 30 mL of 2 mol/L acetic acid TS, and add water to make exactly 100 mL. Add exactly 2 mL of a solution of ammonium pyrrolidinedithiocarbamate (1 in 100) and exactly 10 mL of water-saturated 4-methyl-2-pentanone, and shake for 30 seconds protected from light. Allow the layers to separate, and use the 4-methyl-2-pentanone layer as the sample solution. Separately, take in three vessels three exact portions of Isomalt Hydrate, each equivalent to 10.0 g calculated on the anhydrous basis, dissolve in 30 mL of 2 mol/L acetic acid TS, then add exactly 0.5 mL, 1.0 mL, and 1.5 mL respectively of Standard Nickel Solution for Atomic Absorption Spectrophotometry, and add water to make them exactly 100 mL. Then, proceed in the same manner as the sample solution, and use the solutions so obtained as the standard solutions. Separately, prepare 4-methyl-2-pentanone layer by proceeding in the same manner as the sample solution but omitting the substance to be examined, and use this solution as the blank solution. Perform the test with the sample solution and standard solution as directed in the standard addition method under Atomic Absorption Spectrophotometry <2.22> according to the following conditions. The blank solution is used to set the zero of the instrument, and to ascertain that the readings return to zero after rinsing the sample introduction system with water between each measurement: the amount of nickel is not more than 1 ppm. Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Nickel hollow-cathode lamp.

Wavelength: 232.0 nm.

(3) Related substances—Weigh exactly 0.20 g of Isomalt Hydrate, dissolve in water to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh exactly 10.0 mg of p-sorbitol and 10.0 mg of p-mannitoll, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of p-mannitoll, having the relative retention time of about 1.6 to 1-O-α-D-glucopyranosyl-p-mannitoll, and p-sorbitol, having the relative retention time of about 2.0, obtained from the sample solution are not larger than the area of the corresponding peak from the standard solution (not more than 0.5%), and the area of the peak other than 1-O-α-D-glucopyranosyl-p-mannitoll and 6-O-α-D-glucopyranosyl-p-sorbitol having the relative retention time of about 1.2 and the peaks mentioned above from the sample solution is not larger than the peak area of p-sorbitol from the standard solution (not more than 0.5%). In addition, the total area of the peaks other than 1-O-α-D-glucopyranosyl-p-mannitoll and 6-O-α-D-glucopyranosyl-p-sorbitol from the sample solution is not larger than 4 times the peak area of p-sorbitol from the standard solution (not more than 2.0%). However, the peaks which area is not larger than 1/5 times the peak area of p-sorbitol from the standard solution are disregarded (not more than 0.1%).

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of 1-O-α-D-glucopyranosyl-p-mannitoll.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 2 mL of the standard solution, and add water to make exactly 10 mL. Confirm that the peak area of p-sorbitol obtained with 20 μL of this solution is equivalent to 14 to 26% of that with 20 μL of the standard solution.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of p-mannitoll and p-sorbitol are not more than 2.0%, respectively.

(4) Reducing sugars—Dissolve 3.3 g of Isomalt Hydrate in 10 mL of water with the aid of gentle heat, cool, and add 20 mL of copper (II) citrate TS. Add a few amount of boiling chips, heat so that the boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, add 100 mL of a solution of acetic acid (100) (3 in 125) and exactly 20 mL of 0.025 mol/L iodine VS. With continuous shaking, add 25 mL of a mixture of water and hydrochloric acid (47:3). When the precipitate has dissolved, titrate <2.50> the excess of iodine with 0.05 mol/L sodium thiosulfate VS, until the blue color due to 1 mL of soluble starch TS added at near of the end point disappears: not less than 12.8 mL of 0.05 mol/L sodium thiosulfate VS is required (not more than 0.3% as glucose).

Conductivity <2.51>—Dissolve 20 g of Isomalt Hydrate in a suitable amount of freshly boiled and cooled water with the aid of gentle heat at 40–50°C, cool, add the same water to make exactly 100 mL, and use this solution as the sample solution. Measure the conductivity (25°C) of the sample solution at 25 ± 0.1°C while gently stirring with a magnetic stirrer: not more than 20 μS cm⁻¹.

Water <2.48>—Not more than 7.0% (0.3 g, volumetric titration, direct titration. Use a mixture of methanol for water determination and formamide for water determination (1:1) heated at 50 ± 5°C instead of methanol for water determination).

Assay Weight accurately about 0.2 g of Isomalt Hydrate, dissolve in water to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.2 g of Isomalt RS (separately determine the water <2.48> in the same manner as Isomalt Hydrate), dissolve in
water to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_T$, and $A_S$, of 1-O-α-D-glucopyranosyl-D-mannitol and 6-O-α-D-glucopyranosyl-D-sorbitol in each solution.

Amount (g) of 1-O-α-D-glucopyranosyl-D-mannitol
(C$_{12}$H$_{22}$O$_{11}$)

$$M_S = M_g \times K_g / 100 \times A_T / A_S$$

Amount (g) of 6-O-α-D-glucopyranosyl-D-sorbitol
(C$_{12}$H$_{22}$O$_{11}$)

$$M_S = M_g \times K_g / 100 \times A_T / A_S$$

$M_S$: Amount (g) of Isomalt RS taken, calculated on the anhydrous basis

$K_g$: Content (%) of 1-O-α-D-glucopyranosyl-D-mannitol (C$_{12}$H$_{22}$O$_{11}$) in Isomalt RS

$K_g$: Content (%) of 6-O-α-D-glucopyranosyl-D-sorbitol (C$_{12}$H$_{22}$O$_{11}$) in Isomalt RS

Operating conditions—

Detector: A differential refractometer maintained at a constant temperature (40°C for example).

Column: Two stainless steel columns, 4.6 mm in inside diameter and 3 cm in length, and 7.8 mm in inside diameter and 30 cm in length, both packed with strongly acidic ion-exchange resin (Ca type) for liquid chromatography with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with divinylbenzene (degree of cross-linkage: 8%) (9 μm in particle diameter). These are used as the pre-column and the separation column, respectively.

Column temperature: 80 ± 3°C.

Mobile phase: Water.

Flow rate: 0.5 mL per minute (retention time of 1-O-α-D-glucopyranosyl-D-mannitol is about 12 minutes).

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, 1-O-α-D-glucopyranosyl-D-mannitol and 6-O-α-D-glucopyranosyl-D-sorbitol are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of 1-O-α-D-glucopyranosyl-D-mannitol and 6-O-α-D-glucopyranosyl-D-sorbitol are not more than 2.0%, respectively.

Containers and storage Containers—Well-closed containers.

---

**Isoniazid**

イソニアジド

Isoniazid, when dried, contains not less than 98.5% of isoniazid (C$_{3}H_{5}N_{4}O$).

Description Isoniazid occurs as colorless crystals or a white crystalline powder. It is odorless.

It is freely soluble in water and in acetic acid (100%), sparingly soluble in ethanol (95), slightly soluble in acetic anhydride, and very slightly soluble in diethyl ether.

Identification (1) Dissolve about 20 mg of Isoniazid in water to make 200 mL. To 5 mL of the solution add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make 50 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Isoniazid, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelength numbers.

pH <2.54> Dissolve 1.0 g of Isoniazid in 10 mL of freshly boiled and cooled water: the pH of this solution is between 6.5 and 7.5.

Melting point <2.60> 170 – 173°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Isoniazid in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Isoniazid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1D>—Prepare the test solution with 0.40 g of Isoniazid according to Method 3, and perform the test. In this case, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), then add 1.5 mL of hydrogen peroxide (30), and ignite the ethanol to burn (not more than 5 ppm).

Hydrazine—Dissolve 0.1 g of Isoniazid in 5 mL of water, add 0.1 mL of a solution of salicylaldehyde in ethanol (95) (1 in 20), shake immediately, and allow to stand for 5 minutes: no turbidity is produced.

Loss on drying <2.4f> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.4f> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Isoniazid, previously dried, dissolve in 50 mL of acetic acid (100) and 10 mL of acetic anhydride, and titrate <2.5D> with 0.1 mol/L per-
chloric acid VS until the color of the solution changes from yellow to green (indicator: 0.5 mL of p-naphtholbenzein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 13.71 mg of C$_6$H$_7$N$_2$O

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

### Isoniazid Tablets

**イソニアジド錠**

Isoniazid Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of isoniazid (C$_6$H$_7$N$_2$O: 137.14).

**Method of preparation** Prepare as directed under Tablets, with Isoniazid.

**Description** Isoniazid Tablets are an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of isoniazid (C$_6$H$_7$N$_2$O: 137.14).

**Method of preparation** Prepare as directed under Injections, with Isoniazid.

**Description** Isoniazid Injection occurs as a clear, colorless liquid.

**pH:** 6.5 – 7.5

**Identification** To a volume of Isoniazid Injection, equivalent to 20 mg of Isoniazid, and add water to make 200 mL. To 5 mL of the solution add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24); it exhibits a maximum between 264 nm and 268 nm.

**Bacterial endotoxins** Less than 0.50 EU/mg.

**Extractable volume** It meets the requirement.

**Foreign insoluble matter** Perform the test according to Method 1; it meets the requirement.

**Insoluble particulate matter** It meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method; it meets the requirement.

**Assay** To an exactly measured volume of Isoniazid Injection, equivalent to about 50 mg of isoniazid (C$_6$H$_7$N$_2$O), add water to make exactly 100 mL. Pipet 5 mL of the solution, add exactly 5 mL of the internal standard solution and the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of isoniazid for assay, previously dried at 105°C for 2 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution and the mobile phase to make 50 mL, and use this solution as the sample solution. Each of the sample solution and standard solution as directed under Liquid Chromatography (2.24) according to the following conditions, and calculate the ratios, $Q_T$ and $Q_s$, of the peak area of isoniazid to that of the internal standard.

Amount (mg) of isoniazid (C$_6$H$_7$N$_2$O) = $M_s \times Q_T/Q_s$

$M_s$: Amount (mg) of isoniazid for assay taken

**Internal standard solution**—A solution of propyl parahydroxybenzoate (1 in 4000).

**Operating conditions**—Detector: An ultraviolet absorption photometer (wave-length: 265 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL. Separately, to 5.76 g of phosphoric acid add water to make 1000 mL. Mix these solutions to make a solution having pH 2.5. To 500 mL of this solution add 500 mL of methanol, and add 2.86 g of sodium tridecanesulfonate to dissolve.

Flow rate: Adjust so that the retention time of isoniazid is about 5 minutes.

**System suitability**—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, isoniazid and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of isoniazid to that of the internal standard is not more than 1.3%.

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

### Isoniazid Tablets

**イソニアジド錠**

Isoniazid Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of isoniazid (C$_6$H$_7$N$_2$O: 137.14).

**Method of preparation** Prepare as directed under Tablets, with Isoniazid.

**Identification** Take a quantity of powdered Isoniazid Tablets, equivalent to 20 mg of Isoniazid, add 200 mL of water, shake well, and filter. To 5 mL of the filtrate add 1 mL of 0.1 mol/L hydrochloric acid TS and water to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24); it exhibits a maximum between 264 nm and 268 nm.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Isoniazid Tablets add water to make exactly 10 mL so that each mL contains about 0.5 mg of isoniazid (C$_6$H$_7$N$_2$O), and shake well to disintegrate. Filter this solution, discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of isoniazid (C$_6$H$_7$N$_2$O) = $M_s \times A_T/A_s \times V/100$

$M_s$: Amount (mg) of isoniazid for assay taken

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 20 minutes of Isoniazid Tablets is not less than 75%.
Start the test with 1 tablet of Isoniazid Tablets. Withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size of not more than 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of isoniazid for assay, previously dried at 105°C for 2 hours, dissolve in water to make exactly 100 mL, then pipet 5 mL of this solution, add water to make exactly 50 mL, and then pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, $A_r$ and $A_s$, of the sample solution and standard solution at 267 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) with respect to the labeled amount of isoniazid (C$_6$H$_3$N$_2$O) = $M_s \times A_r/A_s \times 1/\ell \times 90$

$M_s$: Amount (mg) of isoniazid for assay taken
C: Labeled amount (mg) of isoniazid (C$_6$H$_3$N$_2$O) in 1 tablet

**Assay**

Weigh accurately and powder not less than 20 Isoniazid Tablets. Weigh accurately a quantity of the powder, equivalent to about 0.1 g of isoniazid (C$_6$H$_3$N$_2$O), add 150 mL of water, shake for 30 minutes, then add water to make exactly 200 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of isoniazid for assay, previously dried at 105°C for 2 hours, dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas, $A_r$ and $A_s$, of isoniazid in each solution.

Amount (mg) of isoniazid (C$_6$H$_3$N$_2$O) = $M_s \times A_r/A_s \times 2$

$M_s$: Amount (mg) of isoniazid for assay taken

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL. Separately, to 5.76 g of phosphoric acid add water to make 1000 mL. Mix these solutions to adjust the pH to 2.5. To 400 mL of this solution add 600 mL of methanol, and add 2.86 g of sodium triedecanesulfonate to dissolve.

Flow rate: Adjust so that the retention time of isoniazid is about 5 minutes.

**System suitability**—

System performance: Dissolve 5 mg of Isoniazid and 5 mg of isonicotinic acid in 100 mL of the mobile phase. When the procedure is run with 10 μL of this solution under the above operating conditions, isonicotinic acid and isoniazid are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isoniazid is not more than 1.0%.

**Containers and storage**

Containers—Tight containers. Storage—Light-resistant.

---

**l-Isoprenaline Hydrochloride**

{lイソプレナリン塩酸塩}

**Identification (1)**

1. Dissolve 10 mg of l-Isoprenaline Hydrochloride in 5 mL of water, and add 1 drop of iron (III) chloride TS: a deep green color develops, and changes through yellow-green to brown on standing.

2. Dissolve 1 mg each of l-Isoprenaline Hydrochloride in 1 mL of water in the test tubes A and B. Add 10 mL of potassium hydrogen phthalate buffer solution (pH 3.5) to A, and add 10 mL of phosphate buffer solution (pH 6.5) to B. To each of the test tubes add 1 mL of iodine TS, allow to stand for 5 minutes, and add 2 mL each of sodium thiosulfate TS: a red color develops in the test tube A, and a deep red color develops in the test tube B.

3. Dissolve 10 mg of l-Isoprenaline Hydrochloride in 1 mL of water, and add 1 mL of phosphotungstic acid TS: a light brown precipitate is produced.

(4) Determine the absorption spectrum of a solution of l-Isoprenaline Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) A solution of l-Isoprenaline Hydrochloride (1 in 10) responds to Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49> $[\alpha]_D^{20}$: $-36$ to $-41^\circ$ (after drying, 0.25 g, water, 25 mL, 100 mm).

**pH** <2.54>

Dissolve 0.10 g of l-Isoprenaline Hydrochloride in 10 mL of water: the pH of the solution is between 4.5 and 5.5.

**Purity (1)**

Clarity and color of solution—Dissolve 1.0 g of l-Isoprenaline Hydrochloride in 20 mL of 0.1 mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.10 g of l-
Isopropanol is a clear, colorless liquid. It has a
not more than 0.2
l.

Isoproterenone—Dissolve 50 mg of l-Isoproterenol Hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and determine the absorbance of the solution at 310 nm as directed under Ultraviolet-visible Spectrophotometry <2.24> not more than 0.040.

Residue on drying <2.44> Not more than 0.5% (1 g, in vacuum, silica gel, 4 hours).

Assay Weigh accurately about 0.5 g of l-Isoproterenol Hydrochloride, previously dried, dissolve in 100 mL of a mixture of acetic acid (100) and acetic anhydride (3:2) by warming, cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 24.77 mg of C$_{11}$H$_7$NO$_5$HCl

Containers and storage Containers—Tight containers.
Storage—Remote from fire.

Isopropylantipyrine

Propyphenazon

イソプロピルアンチピリン

C$_{14}$H$_{18}$N$_2$O: 230.31
1,5-Dimethyl-4-(1-methylethyl)-2-phenyl-1,2-dihydro-3H-pyrazol-3-one
[479-92-5]

Isopropylantipyrine, when dried, contains not less than 98.0% of isopropylantipyrine (C$_{14}$H$_{18}$N$_2$O).

Description Isopropylantipyrine occurs as white, crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in acetic acid (100), freely soluble in ethanol (95) and in acetone, soluble in diethyl ether, and slightly soluble in water.

Identification (1) To 2 mL of a solution of Isopropylantipyrine (1 in 500) add 1 drop of iron (III) chloride TS: a light red color develops. Further add 3 drops of sulfuric acid to this solution: the color changes to pale yellow.

(2) Add 5 mL of a solution of Isopropylantipyrine (1 in 500) to a mixture of 5 mL of potassium hexacyanoferrate (III) TS and 1 to 2 drops of iron (III) chloride TS: a dark green color gradually develops.

(3) To 2 mL of a solution of Isopropylantipyrine (1 in 500) add 2 to 3 drops of tannic acid TS: a white precipitate is produced.

Melting point <2.60> 103 – 105°C

Purity (1) Chloride <1.07>—Dissolve 1.0 g of Isopropylantipyrine in 30 mL of dilute ethanol, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid, 30 mL of dilute ethanol and water to make 50 mL (not more than 0.014%).

(2) Sulfate <1.14>—Dissolve 1.0 g of Isopropylantipyrine in 30 mL of dilute ethanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and 30 mL of dilute ethanol, and dilute with water to make 50 mL (not more than 0.019%).

(3) Heavy metals <1.07>—Dissolve 1.0 g of Isopropylantipyrine in 25 mL of acetone, add 2 mL of dilute acetic acid
Isosorbide

イソソルビド

C_6H_12O_6; 146.14
1,4:3,6-Dianhydro-β-D-glucitol
[652-67-5]

Isosorbide contains not less than 98.5% of isosorbide (C_6H_12O_6), calculated on the anhydrous basis.

Description
Isosorbide occurs as white, crystals or masses. It is odorless, or has a faint, characteristic odor, and has a bitter taste.

It is very soluble in water and in methanol, freely soluble in ethanol (95), and slightly soluble in diethyl ether.

Identification
(1) To 0.1 g of Isosorbide add 6 mL of diluted sulfuric acid (1 in 2), and dissolve by heating in a water bath. After cooling, shake well with 1 mL of a solution of potassium permanganate (1 in 30), and heat in a water bath until the color of potassium permanganate disappears. To this solution add 10 mL of 2,4-dinitrophenylhydrazine TS, and heat in a water bath: an orange precipitate is formed.

(2) To 2 g of Isosorbide add 30 mL of pyridine and 4 mL of benzoyl chloride, boil under a reflux condenser for 50 minutes, cool, and pour gradually the solution into 100 mL of cold water. Filter the formed precipitate by suction through a glass filter (G3), wash with water, recrystallize twice from ethanol (95), and dry in a desiccator (in vacuum, silica gel) for 4 hours: it melts <2.60° between 102°C and 103°C.

(3) Determine the infrared absorption spectrum of Isosorbide as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation

<2.44> [α]_D^20 + 45.0 to +46.0° (5 g calculated on the anhydrous basis, water, 50 mL, 100 mm).

Purity
(1) Clarity and color of solution—Take 25 g of Isosorbide in a Nessler tube, and dissolve in 50 mL of water: the solution is clear, and has no more color than the following control solution.

Control solution: To a mixture of 1.0 mL of Cobalt (II) Chloride CS, 3.0 mL of Iron (III) Chloride CS and 2.0 mL of Copper (II) Sulfate CS add water to make 10.0 mL. To 3.0 mL of this solution add water to make 50 mL.

(2) Sulphate—Prepare the test solution with 1.0 mL of Standard Lead Solution VS (not more than 0.024 mol/L sulfuric acid VS).

(3) Heavy metals—Proceed with 5.0 g of Isosorbide according to Method 1, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 5 ppm).

(4) Arsenic—Prepare the test solution with 1.0 g of Isosorbide according to Method 1, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.10 g of Isosorbide in 10 mL of methanol, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.67). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (95) and cyclohexane (1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of ethanol (95) and sulfuric acid (9:1) on the plate, and heat the plate at 150°C for 30 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Water—Not more than 1.5% (2 g, volumetric titration, direct titration).

Residue on ignition—Not more than 0.1% (1 g).

Assay
Weigh accurately about 10 g of Isosorbide, calculated on the anhydrous basis, and dissolve in water to make exactly 100 mL. Determine the optical rotation <2.44>, α_D, of this solution at 20 ± 1°C in a 100-mm cell.

Amount (g) of isosorbide (C_6H_12O_6) = α_D × 2.1978

Containers and storage
Containers—Tight containers.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Isosorbide Dinitrate

**Description** Isosorbide Dinitrate occurs as white, crystals or crystalline powder. It is odorless or has a faint odor like that of nitric acid.

It is very soluble in N,N-dimethylformamide and in acetone, freely soluble in chloroform and in toluene, soluble in methanol, in ethanol (95) and in diethyl ether, and practically insoluble in water.

It explodes if heated quickly or subjected to percussion.

**Identification**

(1) Dissolve 10 mg of Isosorbide Dinitrate in 1 mL of water, and dissolve by adding 2 mL of sulfuric acid cautiously. After cooling, superimpose 3 mL of iron (II) sulfate TS, and allow to stand for 5 to 10 minutes: a brown ring is produced at the zone of contact.

(2) Dissolve 0.1 g of Isosorbide Dinitrate in 6 mL of diluted sulfuric acid (1 in 2) by heating in a water bath. After cooling, add 1 mL of a solution of potassium permanganate (1 in 30), stir well, and heat in a water bath until the color of potassium permanganate disappears. Add 10 mL of 2,4-dinitro-phenylhydrazine TS, and heat in a water bath: an orange precipitate is produced.

**Optical rotation** $<2.49^\circ$ $[\alpha]_D^20$: +134° to $+139°$ (1 g calculated on the anhydrous basis, ethanol (95), 100 mL, 100 mm).

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Isosorbide Dinitrate in 10 mL of acetone: the solution is clear and colorless.

(2) Sulfate $<1.14^\circ$—Dissolve 1.5 g of Isosorbide Dinitrate in 15 mL of N,N-dimethylformamide, add 60 mL of water, cool, and filter. Wash the filter paper with three 20-mL portions of water, combine the washings with the filtrate, and add water to make 150 mL. To 40 mL of this solution add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 30 mL of acetone, 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).

**Water** $<2.48^\circ$ Not more than 1.5% (0.3 g, volumetric titration, direct titration).

**Assay** Weigh accurately about 0.1 g of Isosorbide Dinitrate in a Kjeldahl flask as described under the Nitrogen Determination $<1.08^\circ$. Dissolve in 10 mL of methanol, add 3 g of Devarda’s alloy and 50 mL of water, and connect the flask with the distillation apparatus as described under the Nitrogen Determination $<1.08^\circ$. Measure exactly 25 mL of 0.05 mol/L sulfuric acid VS in an absorption flask, add 5 drops of bromocresol green-methyl red TS, and immerse the lower end of the condenser tube in it. Add 15 mL of a solution of sodium hydroxide (1 in 2) through the funnel, cautiously rinse the funnel with 20 mL of water, immediately close the clampattached to the rubber tubing, then begin the distillation with steam gradually, and continue the distillation until the distillate measures 100 mL. Remove the absorption flask, rinse the end of the condenser tube with a small quantity of water, and titrate $<2.50^\circ$: the distillate and the rinsings with 0.1 mol/L sodium hydroxide VS until the color of the solution changes from red through light red-purple to light blue-green. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS $= 11.81$ mg of $\text{C}_8\text{H}_8\text{N}_2\text{O}_6$

**Containers and storage** Containers—Tight containers. Storage—Light-resistant, and in a cold place.

Isosorbide Dinitrate Tablets

Isosorbide Dinitrate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of isosorbide dinitrate ($\text{C}_8\text{H}_8\text{N}_2\text{O}_6$: 236.14).

**Method of preparation** Prepare as directed under Tablets, with Isosorbide Dinitrate.

**Identification** Weigh a quantity of powdered Isosorbide Dinitrate Tablets, equivalent to 0.1 g of Isosorbide Dinitrate, add 50 mL of diethyl ether, shake well, and filter. Measure 5 mL of the filtrate, evaporate to dryness cautiously, add 1 mL of water to the residue, and dissolve by adding 2 mL of sulfuric acid cautiously. After cooling, superimpose 3 mL of iron (II) sulfate TS, and allow to stand for 5 to 10 minutes: a brown ring is produced at the zone of contact.

**Purity** Nitrate—Weigh accurately a quantity of powdered Isosorbide Dinitrate Tablets, equivalent to 50 mg of Isosorbide Dinitrate, transfer to a separator, add 30 mL of toluene, shake thoroughly, extract with three 20-mL portions of water, and proceed as directed in Purity (3) under Isosorbide Dinitrate.

**Uniformity of dosage units** $<0.02^\circ$ Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Isosorbide Dinitrate Tablets add 1 mL of
water, and shake to disintegrate. To this solution add a mixture of water and methanol (1:1) to make exactly V mL so that each mL contains about 0.1 mg of isosorbide dinitrate (C$_6$H$_8$N$_2$O$_4$), and shake for 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Proceed as directed in the Assay.

Amount (mg) of isosorbide dinitrate (C$_6$H$_8$N$_2$O$_4$)

= $M_S \times A_T / A_S \times V \times 1/500$

$M_S$: Amount (mg) of isosorbide dinitrate for assay taken, calculated on the anhydrous basis

Disintegration (%6.09) It meets the requirement.

For Sublingual Tablets, the time limit of the test is 2 minutes, and omit the use of the disk.

Assay Weigh accurately the mass of not less than 20 tablets of Isosorbide Dinitrate Tablets, and add 1 g of the powder, equivalent to about 5 mg of isosorbide dinitrate (C$_6$H$_8$N$_2$O$_4$), dissolve a mixture of water and methanol (1:1) to make exactly 50 mL, and shake for 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of isosorbide dinitrate for assay (separately, determine the water %2.48% in the same manner as Isosorbide Dinitrate), dissolve in a mixture of water and methanol (1:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of isosorbide dinitrate in each solution.

Amount (mg) of isosorbide dinitrate (C$_6$H$_8$N$_2$O$_4$)

= $M_S \times A_T / A_S \times 1/10$

$M_S$: Amount (mg) of isosorbide dinitrate for assay taken, calculated on the anhydrous basis

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octade-cylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and methanol (11:9).

Flow rate: Adjust so that the retention time of isosorbide dinitrate is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of isosorbide dinitrate are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isosorbide dinitrate is not more than 1.0%.

Containers and storage Containers—Tight containers.

Isosorbide Mononitrate 70% / Lactose 30%

C$_6$H$_8$NO$_4$: 191.14
1,4:3,6-Dianhydro-d-glucitol 5-nitrate [16051-77-7, Isosorbide mononitrate]

Isosorbide Mononitrate 70%/Lactose 30%, when dried, contains not less than 68.0% and not more than 72.0% of isosorbide mononitrate (C$_6$H$_8$NO$_4$).

Description Isosorbide Mononitrate 70%/Lactose 30% occurs as a white, powder, crystalline powder, or masses.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

Identification (1) Shake thoroughly 1 g of Isosorbide Mononitrate 70%/Lactose 30% with 30 mL of ethyl acetate, and filter. Wash the residue with a small quantity of ethyl acetate, combine the filtrate and the washings, evaporate to dryness on a water bath, then dry in vacuum at room temperature for 4 hours. Determine the infrared absorption spectrum of the crystals obtained as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum of isosorbide mononitrate: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dry the residue obtained in (1) at 80°C for 2 hours. Determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum of Lactose Hydrate or the spectrum of Lactose for Identification RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]$_D$ = +116° – +124° (after drying, 1 g, water, 100 mL, 100 mm).

Purity (1) Nitrates—Dissolve an exact quantity of Isosorbide Mononitrate 70%/Lactose 30%, equivalent to 50 mg of isosorbide mononitrate (C$_6$H$_8$NO$_4$), in water to make exactly 100 mL. Pipet 25 mL of this solution, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, to exactly 5 mL of Standard Nitric Acid Solution add water to make exactly 150 mL. Pipet 25 mL of this solution, add water to make exactly 150 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area of nitric acid of each solution by the automatic integration method: the peak area of nitric acid obtained from the sample solution is not larger than the peak area of nitric acid from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 5 cm in length, packed with gel type strong basic ion-exchange resin for liquid chromatography (10 μm in particle diameter).
diameter). Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 16.0 g of sodium gluconate, 18.0 g of boric acid, 25.0 g of sodium tetraborate decahydrate, and 250 mL of glycerin in water to make 1000 mL. To 20 mL of this solution add 20 mL of 1-butanol, 120 mL of acetonitrile, and add water to make 1000 mL.

Flow rate: Adjust so that the retention time of nitric acid is about 5.3 minutes.

**System suitability**—

System performance: When the procedure is run with 100 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of nitric acid are not less than 800 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 100 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of nitric acid is not more than 2.0%.

1. **Heavy metals** <1.077>—Proceed with 1.0 g of Isosorbide Mononitrate 70%/Lactose 30% according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

2. **Isosorbide**—To an amount of Isosorbide Mononitrate 70%/Lactose 30%, equivalent to 1.0 g of isosorbide mononitrate (C$_6$H$_9$NO$_3$), add 10 mL of acetone, shake well, centrifuge, and filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.5 µm. To the residue add 2 mL of acetone and proceed in the same manner, and combine the filtrates. Evaporate the combined filtrate to dryness on a water bath, and further dry the residue in vacuum for 30 minutes. Dissolve the residue in the mobile phase to make 10 mL, and use this solution as the sample solution. Perform the test with exactly 20 µL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, the number of theoretical plates and the symmetry factor of the peak of isosorbide mononitrate, obtained from the sample solution, and the peak of isosorbide mononitrate from the standard solution. For the area of the peak, having the relative retention time of about 4.5 to isosorbide mononitrate, multiply the correction factor, 0.62.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay. Time span of measurement: About 5 times as long as the retention time of isosorbide mononitrate, beginning after the solvent peak.

**System suitability**—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 10 mL. Confirm that the peak area of isosorbide mononitrate obtained with 10 µL of this solution is equivalent to 7 to 13% of that with 10 µL of the standard solution.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isosorbide mononitrate is not more than 2.0%.

**Loss on drying** <2.41>—Not more than 0.5% (1 g, in vacuum, silica gel, 4 hours).

**Water** <2.49>—Between 1.0% and 2.0% (0.4 g, volumetric titration, direct titration). Use a mixture of methanol for water determination and formamide for water determination (2:1) instead of methanol for water determination.

**Residue on ignition** <2.44>—Not more than 0.1% (0.5 g).

**Assay**—Weigh accurately an amount of Isosorbide Mononitrate 70%/Lactose 30%, previously dried, equivalent to about 0.2 g of isosorbide mononitrate (C$_6$H$_9$NO$_3$), and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 20 mL of the internal standard solution, then add water to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of isosorbide mononitrate for assay, previously dried, and dissolve in 60 mL of water, add exactly 20 mL of the internal standard solution, then, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_t$ and $Q_s$, of the peak area of isosorbide mononitrate to that of the internal standard.

Amount (mg) of isosorbide mononitrate (C$_6$H$_9$NO$_3$)

\[
M_s = M_5 \times \frac{Q_t}{Q_s} \times 5
\]

$M_s$: Amount (mg) of isosorbide mononitrate for assay taken
Internal standard solution—A solution of benzyl alcohol (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 214 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and methanol (4:1).
Flow rate: Adjust so that the retention time of isosorbide mononitrate is about 4.5 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, isosorbide mononitrate and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of isosorbide mononitrate to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Tight containers.

Isosorbide Mononitrate Tablets
一硝酸イソソルビド錠

Isosorbide Mononitrate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of isosorbide mononitrate (C₆H₇NO₃·191.14).

Method of preparation  Prepare as directed under Tablets, with Isosorbide Mononitrate 70%/Lactose 30%.

Identification  Shake well a portion of powdered Isosorbide Mononitrate Tablets, equivalent to 50 mg of isosorbide mononitrate (C₆H₇NO₃), with 5 mL of acetone, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of isosorbide mononitrate for assay in 1 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (2:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly a solution of potassium permanganate in potassium hydroxide TS (1 in 50), and allow to stand for about 50 minutes: the principal spot obtained with the sample solution and the spot from the standard solution are yellow, and their RF values are the same.

Uniformity of dosage units <6.02>  Perform the test according to the following method: it meets the requirement of the Content uniformity test.
To 1 tablet of Isosorbide Mononitrate Tablets add 30 mL of water, allow standing to disintegrate the tablet, and disperse the fine particles by sonicating. Add exactly V/10 mL of the internal standard solution, and add water to make V mL so that each mL contains about 0.2 mg of isosorbide mononitrate (C₆H₇NO₃). Centrifuge this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of isosorbide mononitrate for assay, previously dried in vacuum (silica gel) for 4 hours, add 30 mL of water and exactly 10 mL of the internal standard solution, then add water to make 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of isosorbide mononitrate (C₆H₇NO₃) = Mₛ × Q₁/Qₛ × V/100
Mₛ: Amount (mg) of isosorbide mononitrate for assay taken

Internal standard solution—A solution of benzyl alcohol (1 in 1000).

Dissolution<6.10>  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Isosorbide Mononitrate Tablets is not less than 85%.
Start the test with 1 tablet of Isosorbide Mononitrate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 11 μg of isosorbide mononitrate (C₆H₇NO₃), and use this solution as the sample solution. Separately, weigh accurately about 22 mg of isosorbide mononitrate for assay, previously dried in vacuum (silica gel) for 4 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and Aₛ, of isosorbide mononitrate in each solution.

Dissolution rate (%) with respect to the labeled amount of isosorbide mononitrate (C₆H₇NO₃) = Mₛ × A₁/Aₛ × V’/V × 1/1C × 45
Mₛ: Amount (mg) of isosorbide mononitrate for assay taken
C: Labeled amount (mg) of isosorbide mononitrate (C₆H₇NO₃) in 1 tablet

Operating conditions—
Proceed as directed in the operating conditions in the Assay.

System suitability—
System performance: When the procedure is run with 15 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of isosorbide mononitrate are not less than 2000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isosorbide mononitrate is not more than 2.0%.

Assay  Weigh accurately the mass of not less than 20 Isosorbide Mononitrate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of isosorbide mononitrate (C₆H₇NO₃), add 30 mL of water, and disperse the fine particles by sonicating. Add exactly 10 mL of the internal standard solution and water to make 50 mL.
Centrifuge this solution, and filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of isosorbide mononitrate for assay, previously dried, and dissolve in 30 mL of water, add exactly 10 mL of the internal standard solution, then, add water to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( \mu \text{L} \) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of isosorbide mononitrate to that of the internal standard.

\[
\text{Amount (mg) of isosorbide mononitrate (C}_6\text{H}_7\text{NO}_3) = M_5 \times Q_1/Q_2
\]

\( M_5 \): Amount (mg) of isosorbide mononitrate for assay taken

**Internal standard solution—**A solution of benzyl alcohol (1 in 1000).

**Isoxsuprine Hydrochloride**

イソクスプリン塩酸塩

![Chemical Structure](image)

C\(_{18}\)H\(_{23}\)NO\(_3\).HCl: 337.84

\((1RS,2SR)-1-(4-Hydroxyphenyl)-2-[(2SR)-1-phenoxypyran-2-yl]amino[propan-1-ol monohydrochloride [379-56-6]

Isoxsuprine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of isoxsuprine hydrochloride (C\(_{18}\)H\(_{23}\)NO\(_3\).HCl).

**Description** Isoxsuprine Hydrochloride occurs as a white, powdery or crystalline powder.

It is soluble in formic acid and in methanol, and slightly soluble in water and in ethanol (99.5).

Melting point: about 204°C (with decomposition).

A solution of Isoxsuprine Hydrochloride in methanol (1 in 50) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Isoxsuprine Hydrochloride (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry \( \mu \text{L} \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Isoxsuprine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry \( \mu \text{L} \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.5 g of Isoxsuprine Hydrochloride in 50 mL of water by warming, and cool: the solution responds to Qualitative Tests \( \mu \text{L} \) for chloride.

**pH** \( \mu \text{L} \)—Dissolve 0.5 g of Isoxsuprine Hydrochloride in 50 mL of water by warming, and cool: the pH of the solution is between 4.5 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 0.1 g of Isoxsuprine Hydrochloride in 10 mL of water, add 50 mL of water by warming, and cool: the solution is clear and colorless.

(2) Heavy metals \( \mu \text{L} \)—Proceed with 1.0 g of Isoxsuprine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 20 mg of Isoxsuprine Hydrochloride in 20 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of the sample solution and standard solution as directed under Liquid Chromatography \( \mu \text{L} \) according to the following conditions. Determine each peak area by the automatic integration method: each peak area other than isoxsuprine obtained from the sample solution is not larger than the peak area of isoxsuprine from the standard solution, and the total area of the peaks other than the peak of isoxsuprine from the sample solution is not larger than 2 times the peak area of isoxsuprine from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 269 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 4.3 g of diammonium hydrogen phosphate and 3.2 g of sodium 1-pentane sulfonate in water to make 1000 mL, and adjust to pH 2.5 with phosphoric acid. To 770 mL of this solution add 230 mL of acetonitrile.

Flow rate: Adjust so that the retention time of isoxsuprine is about 18 minutes.

Time span of measurement: About 3 times as long as the retention time of isoxsuprine, beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution.
solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of isoxsuprine obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: To 1 mL of the sample solution add 2.5 mL of a solution of methyl parahydroxybenzoate (1 in 25,000) and the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, methyl parahydroxybenzoate and isoxsuprine are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isoxsuprine is not more than 2.5%.

Loss on drying <2.4> Not more than 0.5% (1 g, 105°C, 1 hour).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Isoxsuprine Hydrochloride, previously dried, in 5 mL of formic acid, add 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 33.78 mg of C18H23NO3.HCl

Containers and storage Containers—Well-closed containers.

Isoxsuprine Hydrochloride Tablets

イソクスプリン塩酸塩錠

Isoxsuprine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of isoxsuprine hydrochloride (C18H23NO3.HCl: 337.84).

Method of preparation Prepare as directed under Tablets, with Isoxsuprine Hydrochloride.

Identification To a quantity of powdered Isoxsuprine Hydrochloride Tablets, equivalent to 10 mg of Isoxsuprine Hydrochloride, add 150 mL of water, shake, and then add water to make 200 mL. Centrifuge this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of filtrate, and determine the absorption spectrum of the subsequent filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 267 nm and 271 nm, and between 272 nm and 276 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

Add methanol to 1 tablet of Isoxsuprine Hydrochloride Tablets, and shake to disintegrate. Add methanol to make exactly V mL so that each mL contains about 0.4 mg of isoxsuprine hydrochloride (C18H23NO3.HCl). Centrifuge this solution, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of isoxsuprine hydrochloride (C18H23NO3.HCl) = M' × A'/A × V × 1/100

M': Amount (mg) of isoxsuprine hydrochloride for assay taken

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Isoxsuprine Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Isoxsuprine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 11 μg of isoxsuprine hydrochloride (C18H23NO3.HCl), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of isoxsuprine hydrochloride for assay, previously dried at 105°C for 1 hour, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A3, of isoxsuprine in each solution.

Dissolution rate (%) with respect to the labeled amount of isoxsuprine hydrochloride (C18H23NO3.HCl) = M' × A'/A × V' × V / 1000 × 36

M': Amount (mg) of isoxsuprine hydrochloride for assay taken
C: Labeled amount (mg) of isoxsuprine hydrochloride (C18H23NO3.HCl) in 1 tablet

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of isoxsuprine are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isoxsuprine is not more than 2.0%.

Assay Weigh accurately not less than 20 Isoxsuprine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 40 mg of isoxsuprine hydrochloride (C18H23NO3.HCl), add 60 mL of methanol, shake for 20 minutes, and then add methanol to make exactly exactly 100 mL. Centrifuge a portion of this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of isoxsuprine hydrochloride for assay, previously dried at 105°C for 1 hour, and dissolve in methanol to make exactly 100 mL. Filter through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A3, of isoxsuprine in each solution.
Amount (mg) of isoxsuprine hydrochloride
(C_{18}H_{22}NO_{3}, HCl)

= M_{5} \times \frac{A_{1}}{A_{5}}

M_{5}; Amount (mg) of isoxsuprine hydrochloride for assay taken

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 269 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 4.3 g of diammonium hydrogen phosphate and 3.2 g of sodium 1-pentane sulfonate in water to make 1000 mL, and adjust to pH 2.5 with phosphoric acid. To 600 mL of this solution add 400 mL of methanol.
Flow rate: Adjust so that the retention time of isoxsuprine is about 9 minutes.

System suitability—
System performance: To exactly 1 mL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of isoxsuprine are not less than 2000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of isoxsuprine is not more than 1.0%.

Containers and storage—Containers—Well-closed containers.

Itraconazole

イトラコナゾール

C_{35}H_{39}Cl_{2}N_{8}O_{3}; 705.63
4-(4-[4-[4-[(2RS,4SR)-2-(2,4-Dichlorophenyl)-2-[(1H-1,2,4-triazol-1-yl)methyl]-1,3-dioxolane-4-ylmethoxy]phenyl]piperazin-1-yl]phenyl)-2-[(1RS)-1-methylpropyl]-2,4-dihydro-3H-1,2,4-triazol-3-one
4-(4-4-[4-[4-[(2SR,4RS)-2-(2,4-Dichlorophenyl)-2-[(1H-1,2,4-triazol-1-yl)methyl]-1,3-dioxolane-4-ylmethoxy]phenyl]piperazin-1-yl]phenyl)-2-[(1RS)-1-methylpropyl]-2,4-dihydro-3H-1,2,4-triazol-3-one

Itraconazole contains not less than 98.5% and not more than 101.0% of itraconazole (C_{35}H_{39}Cl_{2}N_{8}O_{3}), calculated on the dried basis.

Description
Itraconazole occurs as a white powder.
It is soluble in N,N-dimethylformamide, very slightly soluble in ethanol (99.5), and practically insoluble in water and in 2-propanol.
A solution of Itraconazole in N,N-dimethylformamide (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Itraconazole in 2-propanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.2.2>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Itraconazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.2.5>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Itraconazole as directed under Flame Coloration Test <1.07> (2); a green color appears.

Melting point <2.60> 166−170°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Itraconazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.10 g of Itraconazole in 10 mL of a mixture of methanol and tetrahydrofuran (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of methanol and tetrahydrofuran (1:1) to make exactly 100 mL. Pipet 5 mL of this solution, add the mixture of methanol and tetrahydrofuran (1:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0.1> according to the following conditions. Determine each peak area of each solution by the automatic integration method: the area of each peak other than itraconazole obtained from the sample solution is not larger than the peak area of itraconazole from the standard solution. Furthermore, the total area of the peaks other than itraconazole from the sample solution is not larger than 2.5 times the peak area of itraconazole from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 225 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase A: A solution of tetrabutylammonium hydrogensulfate (17 in 625).
Mobile phase B: Acetonitrile.
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Josamycin / Official Monographs

Flow rate: 1.5 mL per minute.
Time span of measurement: About 2 times as long as the retention time of itraconazole, beginning after the solvent peak.

System suitability—
Test for required detectability: To exactly 1 mL of the standard solution add the mixture of methanol and tetrahydrofuran (1:1) to make exactly 10 mL. Confirm that the peak area of itraconazole obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: Dissolve 1 mg of Itraconazole and 1 mg of miconazole nitrate in 20 mL of the mixture of methanol and tetrahydrofuran (1:1). When the procedure is run with 10 μL of this solution under the above operating conditions, miconazole and itraconazole are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of itraconazole is not more than 2.0%.

Loss on drying <2.4% Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.4% Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Itraconazole, dissolve in 70 mL of a mixture of 2-butanone and acetic acid (100) (7:1), and titrate <2.30> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.28 mg of C₃₀H₄₃Cl₂N₄O₇

Containers and storage Containers—Tight containers.

Josamycin

ジョサマイシン

Josamycin is a macrolide substance having antibacterial activity produced by the growth of Streptomyces narbonensis var. josamyceticus.

It contains not less than 900 μg (potency) and not more than 1100 μg (potency) per mg, calculated on the dried basis. The potency of Josamycin is expressed as mass (potency) of josamycin (C₂₉H₄₈NO₁₄).

Description Josamycin occurs as a white to yellowish white powder.

It is very soluble in methanol and in ethanol (99.5), and very slightly soluble in water.

Identification (1) Determine the absorption spectrum of a solution of Josamycin in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.3D, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Josamycin RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Josamycin and Josamycin RS in 1 mL of methanol, add diluted methanol (1 in 2) to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and compare the chromatograms obtained from these solutions: the retention time of the main peak from the sample solution is the same as that of the peak of josamycin from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (2).

Purity (1) Heavy metals <1.0%—Proceed with 1.0 g of Josamycin according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 50 mg of Josamycin in 5 mL of methanol, add diluted methanol (1 in 2) to make 50 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography 2.01 according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of josamycin and the related substances by the area percentage method: the amounts of the peaks other than josamycin are not more than 6%, and the total of these peaks is not more than 20%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 231 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 119 g of sodium perchlorate monohydrate in water to make 1000 mL, and adjust the pH to 2.5 with 1 mol/L hydrochloric acid TS. To 600 mL of this solution add 400 mL of acetonitrile.
Flow rate: Adjust so that the retention time of josamycin is about 10 minutes.
Time span of measurement: About 4 times as long as the retention time of josamycin, beginning after the solvent peak.

System suitability—
Test for required detectability: Measure 3 mL of the sample solution, add diluted methanol (1 in 2) to make 50 mL, and use this solution as the solution for system suitability test. Measure exactly 2 mL of the solution for system suitability test, and add diluted methanol (1 in 2) to make exactly 20 mL. Confirm that the peak area of josamycin obtained
with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the solution for system suitability test.

System performance: Dissolve about 0.05 g of Josamycin in 50 mL of 0.1 mol/L potassium dihydrogen phosphate TS (pH 2.0) and allow to stand at 40°C for 3 hours. Adjust the pH of this solution to 6.8 to 7.2 with 2 mol/L sodium hydroxide TS, and add 50 mL of methanol. When the procedure is run with 10 μL of this solution under the above operating conditions, the resolution between the peaks of josamycin S<sub>1</sub>, which relative retention time to josamycin is about 0.9, and josamycin is not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of josamycin is not more than 1.5%.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Perform the test according to the Cylindrical-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633
(ii) Culture medium—Use the medium ii in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.9 to 8.1 after sterilization.
(iii) Standard solutions—Weigh accurately an amount of Josamycin RS, equivalent to about 30 mg (potency), dissolve in 5 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add water to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
(iv) Sample solutions—Weigh accurately an amount of Josamycin, equivalent to about 30 mg (potency), dissolve in 5 mL of methanol, and add water to make exactly 100 mL. Take exactly a suitable amount of this solution, add water to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Josamycin Tablets**

**ジョサマイシン錠**

Josamycin Tablets contain not less than 90.0% and not more than 110.0% of the labeled potency of josamycin (C<sub>22</sub>H<sub>30</sub>N<sub>15</sub>O<sub>17</sub>): 827.99.

**Method of preparation** Prepare as directed under Tablets, with Josamycin.

**Identification** To a quantity of powdered Josamycin Tablets, equivalent to 10 mg (potency) of Josamycin, add 100 mL of methanol, shake vigorously, and centrifuge. To 5 mL of the supernatant liquid, add methanol to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 229 nm and 233 nm.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, in vacuum, 60°C, 3 hours).

**Uniformity of dosage units** <6.02>—Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take 1 tablet of Josamycin Tablets, add 5 mL of water, and shake vigorously to disintegrate the tablet. Add methanol and sonicate to disperse the particles, add methanol to make exactly V mL so that each mL contains about 2 mg (potency) of Josamycin, and centrifuge. Pipet 3 mL of the supernatant liquid, and add methanol to make exactly 100 mL. Pipet 10 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the sample solution. Separately, accurately weigh about 50 mg (potency) of Josamycin RS, dissolve in 5 mL of water and methanol to make exactly 25 mL. Pipet 3 mL of this solution, and add methanol to make exactly 100 mL. Pipet 10 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A<sub>T</sub> and A<sub>S</sub>, of the sample solution and standard solution at 231 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. However, X in the formula for calculation of acceptance value is the result of the assay.

Amount [mg (potency)] of josamycin (C<sub>22</sub>H<sub>30</sub>N<sub>15</sub>O<sub>17</sub>):

\[ M_5 = M_S \times \frac{A_T}{A_S} \times \frac{V}{25} \]

\[ M_S: \text{Amount [mg (potency)] of Josamycin RS taken} \]

**Disintegration** <6.09> Perform the test using the disk: it meets the requirement.

**Assay** Perform the test according to the Cylindrical-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, and standard solutions—Proceed as directed in the Assay under Josamycin.
(ii) Sample solutions—Weigh accurately the mass of not less than 20 Josamycin Tablets and powder. Weigh accurately a portion of the powder, equivalent to about 0.3 g (potency) of Josamycin, add 50 mL of methanol, shake vigorously, and add water to make exactly 1000 mL. Take exactly an appropriate amount of this solution, add water to prepare solutions containing 30 μg (potency) and 7.5 μg (potency) per mL, and use these solutions as the high and the low concentration sample solutions, respectively.

**Containers and storage** Containers—Tight containers.

[16846-24-5, Josamycin]

Josamycin Propionate is a derivative of josamycin.

It contains not less than 843 μg (potency) and not more than 1000 μg (potency) per mg, calculated on the dried basis. The potency of Josamycin Propionate is expressed as mass (potency) of josamycin (C32H59O15: 827.99).

Description
Josamycin Propionate occurs as a white to light yellow-white crystalline powder.

It is very soluble in acetonitrile, freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Josamycin Propionate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Josamycin Propionate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Josamycin Propionate and Josamycin Propionate RS in 50 mL of diluted acetonitrile (1 in 2), and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and compare the chromatograms obtained from these solutions: the retention time of the peak of josamycin propionate from the sample solution is the same with that of the peak of josamycin propionate from the standard solution.

Purity (1) Heavy metals (1.07) — Proceed with 1.0 g of Josamycin Propionate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances — Dissolve 50 mg of Josamycin Propionate in the mobile phase to make 50 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of each peak other than josamycin propionate by the area percentage method: the amount of any peak other than josamycin is not more than 6%, and the total of these peaks is not more than 22%.

Operating conditions——

Detector: An ultraviolet absorption photometer (wavelength: 234 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 10 mL of triethylamine add water to make 1000 mL, and adjust the pH to 4.3 with acetic acid (100). To 500 mL of this solution add 500 mL of acetonitrile.

Flow rate: Adjust so that the retention time of josamycin propionate is about 24 minutes.

Time span of measurement: About 3.5 times as long as the retention time of josamycin propionate, beginning after the solvent peak.

System suitability——

Test for required detectability: Measure 3 mL of the sample solution, add the mobile phase to make 50 mL, and use this solution as the solution for system suitability test. Measure exactly 2 mL of the solution for system suitability test, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of josamycin propionate obtained with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the solution for system suitability test.

System performance: Dissolve 5 mg of Josamycin Propionate and 2 mg of josamycin in 50 mL of the mobile phase. When the procedure is run with 10 μL of this solution under the above operating conditions, josamycin and josamycin propionate are eluted in this order with the resolution between these peaks being not less than 25.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of josamycin propionate is not more than 1.5%.

Loss on drying (2.41) — Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

Residue on ignition (2.44) — Not more than 0.1% (1 g).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics (4.02) according to the following conditions.

(i) Test organism — Bacillus subtilis ATCC 6633

(ii) Culture medium — Use the medium ii in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.9 to 8.1 after sterilization.

(iii) Standard solutions — Weigh accurately an amount of Josamycin Propionate RS, equivalent to about 20 mg (potency), dissolve in 10 mL of methanol, add 1/15 mol/L phosphate buffer solution (pH 5.6) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 3 days. Take exactly a suitable amount of the standard stock solution before use, add 1/15 mol/L phosphate buffer solution (pH 5.6) to make solutions so that each mL contains 80 μg (potency) and 20 μg (potency), and use these solutions as

Kainic Acid Hydrate
カイニン酸水和物

![Chemical Structure](image)

C₈H₁₃N₂O₅·H₂O: 231.25
(2S,3S,4S)-3-(Carboxymethyl)-4-(1-methylethynyl)pyrroldin-2-carboxylic acid monohydrate
[487-79-6, anhydride]

Kainic Acid Hydrate, when dried, contains not less than 99.0% of kainic acid (C₈H₁₃N₂O₅: 213.23).

Description  Kainic Acid Hydrate occurs as white, crystals or crystalline powder. It is odorless, and has an acid taste. It is sparingly soluble in water and in warm water, very slightly soluble in acetic acid (100) and in ethanol (95), and practically insoluble in diethyl ether.

It dissolves in dilute hydrochloric acid and in sodium hydroxide TS.

The pH of a solution of 1.0 g of Kainic Acid Hydrate in 100 mL of water is between 2.8 and 3.5.

Melting point: about 252°C (with decomposition).

Identification  (1) To 5 mL of a solution of Kainic Acid Hydrate (1 in 5000) add 1 mL of ninhydrin TS, and warm in a water bath at a temperature between 60°C and 70°C for 5 minutes: a yellow color is produced.

(2) Dissolve 50 mg of Kainic Acid Hydrate in 5 mL of acetic acid (100), and add 0.5 mL of bromine TS: the color of bromine disappears immediately.

Optical rotation 2.49° [α]D = -13° to -17° (0.5 g, water, 50 mL, 200 mm).

Purity  (1) Clarity and color of solution—Dissolve 0.1 g of Kainic Acid Hydrate in 10 mL of water: the solution is clear and colorless.

(2) Chloride 2.03°—Take 0.5 g of Kainic Acid Hydrate in a platinum crucible, dissolve in 5 mL of sodium carbonate TS, and evaporate on a water bath to dryness. Heat the crucible slowly at first, and then ignite until the sample is almost incinerated. After cooling, add 12 mL of dilute nitric acid to the residue, dissolve by warming, and filter. Wash the residue with 15 mL of water, combine the washings and the filtrate, and add water to make 50 mL. Perform the test using this solution as the test solution.

Control solution: Add 5 mL of sodium carbonate TS to 0.30 mL of 0.01 mol/L hydrochloric acid VS, and proceed as directed above (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.5 g of Kainic Acid Hydrate in 40 mL of water by warming. Cool, add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium <1.02>—Take 0.25 g of Kainic Acid Hydrate, and perform the test. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Kainic Acid Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Arsenic <1.11>—Dissolve 1.0 g of Kainic Acid Hydrate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

(7) Amino acid and other imino acid—Dissolve 0.10 g of Kainic Acid Hydrate in 10 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test as directed under Thin-layer Chromatography <2.03> with these solutions. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the supernatant liquid of a mixture of water, 1-butanol and acetic acid (100) (5:4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and dry the plate at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> 6.5–8.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (0.5 g).

Assay  Weigh accurately about 0.4 g of Kainic Acid Hydrate, previously dried, and dissolve in 50 mL of warm water, cool and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 10 drops of bromothymol blue TS).

Each mL of 0.1 mol/L sodium hydroxide VS = 21.32 mg of C₈H₁₃N₂O₅.

Containers and storage  Containers—Tight containers.

Kainic Acid and Santonin Powder
カイニン酸・サントニン散

Kainic Acid and Santonin Powder contains not less than 9.0% and not more than 11.0% of santonin (C₁₅H₁₂O₄: 246.30), and not less than 1.80% and not more than 2.20% of kainic acid hydrate (C₈H₁₃N₂O₅·H₂O: 231.25).

</table>

To make 1000 g

Prepare as directed under Powders, with the above ingre-
dients.

**Description** Kainic Acid and Santonin Powder occurs as a white powder.

**Identification (1)** Shake 1 g of Kainic Acid and Santonin Powder with 10 mL of chloroform, and filter [use the residue for the test (2)]. Distill off the chloroform of the filtrate, and dissolve the residue in 2 mL of potassium hydroxide-ethanol TS: a red color is produced (santonin).

(2) Shake the residue obtained in (1) with 20 mL of warm water, and to 1 mL of the filtrate add 10 mL of water and 1 mL of ninhydrin-l-ascorbic acid TS. Warm in a water bath between 60°C and 70°C for 5 minutes: a yellow color is produced (kainic acid).

**Assay (1)** Santonin—Weigh accurately about 0.25 g of Kainic Acid and Santonin Powder and about 25 mg of santonin for assay, add 20 mL each of ethanol (95), shake thoroughly for 5 minutes, and filter. Wash the residue with three 10-mL portions of ethanol (95), and filter. Combine the filtrate and the washings, and add ethanol (95) to make exactly 50 mL. Pipet 2 mL each of these solutions, add ethanol (95) to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Determine the absorbances, \( A_1 \) and \( A_2 \), of the sample solution and standard solution at 240 nm as directed under Ultraviolet-visible Spectrophotometry 22.24.

\[
\text{Amount (mg) of santonin (C}_{19}\text{H}_{19}\text{O}_{3}) = M_5 \times \frac{A_1}{A_2} / \frac{A_3}{A_4} \]

\( M_5 \): Amount (mg) of santonin for assay taken

(2) Kainic acid—Weigh accurately about 1.25 g of Kainic Acid and Santonin Powder, add 20 mL of diluted pyridine (1 in 10), shake thoroughly for 5 minutes, and filter. Wash the residue with three 10-mL portions of diluted pyridine (95), and filter. Combine the filtrate and the washings, and add diluted pyridine (1 in 10) to make exactly 50 mL. Pipet 2 mL of this solution, add diluted pyridine (1 in 10) to make exactly 25 mL, and use this solution as the sample solution. Separately, dissolve about 25 mg of kainic acid hydrate for assay, previously dried at 105°C for 4 hours and accurately weighed, in diluted pyridine (1 in 10) to make exactly 50 mL. Pipet 2 mL of this solution, add diluted pyridine (1 in 10) to make exactly 25 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and standard solution, add 2 mL of ninhydrin-l-ascorbic acid TS, and heat on a water bath for 30 minutes. After cooling immediately, shake vigorously for 2 minutes, add water to make exactly 20 mL, and allow to stand for 15 minutes. Determine the absorbances, \( A_1 \) and \( A_2 \), of these solutions at 425 nm as directed under Ultraviolet-visible Spectrophotometry 22.24, using the solution prepared in the same manner with 2 mL of diluted pyridine (1 in 10) instead of the sample solution as the blank.

\[
\text{Amount (mg) of kainic acid hydrate (C}_{19}\text{H}_{19}\text{O}_{3}\text{H}_{2} \text{O}) = M_5 \times \frac{A_1}{A_2} \times 1.085 \]

\( M_5 \): Amount (mg) of kainic acid hydrate for assay taken

**containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

---

**Kallidinogenase**

**カリジノガナーゼ**

Kallidinogenase is an enzyme obtained from healthy porcine pancreas, and has kinin-releasing activity based on cleavage of kininogen.

It contains not less than 25 Kallidinogenase Units per mg. Usually, it is diluted with Lactose Hydrate or the like.

Kallidinogenase contains not less than 90% and not more than 110% of the labeled Units.

**Description** Kallidinogenase occurs as a white to light brown powder. It is odorless or has a faint, characteristic odor.

It is freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

The pH of a solution of Kallidinogenase (1 in 300) is between 5.5 and 7.5.

**Identification (1)** Weigh accurately an appropriate amount of Kallidinogenase according to the labeled Units, and dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to prepare a solution containing 10 Kallidinogenase Units per mL. Pipet 5 mL of this solution, and add exactly 1 mL of trypsin inhibitor TS and 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL. Pipet 4 mL each of this solution into two separate test tubes, add exactly 1 mL each of aprotinin TS and 0.05 mol/L phosphate buffer solution (pH 7.0) separately to each test tube, allow them to stand at room temperature for 20 minutes, and use these solutions as the sample solutions 1 and 2. Separately, pipet 1 mL of trypsin inhibitor TS, and add 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL. Pipet 4 mL each of this solution into two separate test tubes, add exactly 1 mL each of aprotinin TS and 0.05 mol/L phosphate buffer solution (pH 7.0) separately to each tube, allow them to stand at room temperature for 20 minutes, and use these solutions as the sample solutions 3 and 4. Then, pipet 2.5 mL of substrate TS for kallidinogenase assay (1), previously warmed at 30.0 ± 0.5°C for 5 minutes, place in a 1-cm cell, add exactly 0.5 mL of the sample solution 1 warmed at 30.0 ± 0.5°C for 5 minutes, and start simultaneously a chronograph. Perform the test at 30.0 ± 0.5°C as directed under Ultraviolet-visible Spectrophotometry 22.24 using water as the blank, and determine the absorbances at 405 nm, \( A_{3,4} \) and \( A_{3,4} \), of the solution, after having allowed it to stand for exactly 2 and 6 minutes. Perform the same test with the sample solutions 2, 3 and 4, and determine the absorbances, \( A_{2,3} \), \( A_{3,4} \), \( A_{3,4} \), \( A_{2,3} \) and \( A_{3,4} \) of these solutions. Calculate \( I \) by using the following equation: the value of \( I \) does not exceed 0.2.

\[
I = \frac{(A_{3,4} - A_{3,4}) - (A_{3,4} - A_{3,4})}{(A_{2,3} - A_{2,3}) - (A_{2,3} - A_{2,3})} 
\]

(2) Pipet 2.9 mL of substrate TS for kallidinogenase assay (2), previously warmed at 30.0 ± 0.5°C for 5 minutes, place in a 1-cm cell, add exactly 0.1 mL of the sample solution obtained in the Assay, and start simultaneously a chronograph. Perform the test at 30.0 ± 0.5°C as directed under Ultraviolet-visible Spectrophotometry 22.24, and determine the change of the absorbance at 253 nm for 4 to 6 minutes. Separately, pipet 1 mL of trypsin inhibitor TS, and add 0.05 mol/L phosphate buffer solution (pH 7.0) to make
Perform the test with Kallidinogenase as calculated by the following equation: the value of $R$ is between 0.12 and 0.16.

$$R = A/0.0385 \times 1/(a \times b)$$

- $a$: Amount (mg) of Kallidinogenase in 1 mL of the sample solution
- $b$: Amount (Unit) of kallidinogenase in 1 mg of Kallidinogenase obtained in the assay

**Specific activity** Perform the test with Kallidinogenase as directed under Nitrogen Determination $<1.00>$ to determine the nitrogen content, convert 1 mg of nitrogen (N: 14.01) into 6.25 mg of protein, and calculate the specific activity using the amount (Units) of Kallidinogenase obtained in the assay: it is not less than 100 Kallidinogenase Units per 1 mg of protein.

**Purity**

1. Fat—To 1.0 g of Kallidinogenase add 20 mL of diethyl ether, extract with occasional shaking for 30 minutes, and filter. Wash the residue with 10 mL of diethyl ether, combine the washing with the filtrate, evaporate the diethyl ether, and dry the residue at 105°C for 2 hours: the mass of the residue is not more than 1 mg.

2. Kininase—
   - (i) Bradykinin solution: Weigh an appropriate amount of bradykinin, and dissolve in gelatin-phosphate buffer solution (pH 7.4) to prepare a solution containing 0.200 μg of bradykinin per mL.
   - (ii) Kallidinogenase solution: Weigh accurately a suitable amount of Kallidinogenase according to the labeled unit, dissolve in gelatin-phosphate buffer solution (pH 7.4) to make a solution containing 1 unit of Kallidinogenase per mL.
   - (iii) Sample solution: Pipet 0.5 mL of bradykinin solution, warm at 30 ± 0.5°C for 5 minutes, then add exactly 0.5 mL of Kallidinogenase solution previously warmed at 30 ± 0.5°C for 5 minutes, and mix immediately. After allowing this solution to stand at 30 ± 0.5°C for exactly 150 seconds, add exactly 0.2 mL of a solution of trichloroacetic acid (1 in 5), and shake. Boil for 3 minutes, then cool in ice immediately, centrifuge, and allow to stand at a room temperature for 15 minutes. Pipet 0.5 mL of the supernatant liquid, add exactly 0.5 mL of gelatin-tris buffer solution (pH 8.0), and shake. Pipet 0.1 mL of this solution, add exactly 0.9 mL of trichloroacetic acid-gelatin-tris buffer solution, and mix. Pipet 0.2 mL of this solution, add exactly 0.6 mL of trichloroacetic acid-gelatin-tris buffer solution, shake, and use this solution as the sample solution.
   - (iv) Control solution: Proceed with 0.5 mL of gelatin-phosphate buffer solution (pH 7.4) as described in (iii), and use the solution so obtained as the control solution.
   - (v) Procedure: Add 0.1 mL of anti-bradykinin antibody TS to goat anti-rabbit IgG antibody-coated wells of a 96-well microplate, shake, and allow to stand at a constant temperature of about 25°C for 1 hour. Remove the anti-bradykinin antibody TS, add 0.3 mL of phosphate buffer solution for microplate washing to the wells, then remove. Repeat this procedure 3 times, take off the washings thoroughly, then add 100 μL each of the sample solution and control solution, and 50 μL of gelatin-phosphate buffer solution (pH 7.0), shake, and allow to stand at a constant temperature of about 25°C for 1 hour. Then add 50 μL of peroxidase-labeled bradykinin TS, shake, and allow to stand in a cold place for a night. Take off the reaction solution, add 0.3 mL of phosphate buffer solution for microplate washing, and remove. Repeat this procedure more 4 times, take off the washings thoroughly, add 100 μL of substrate solution for peroxidase determination, and allow to stand at a constant temperature of about 25°C for exactly 30 minutes while protecting from light. Then add 100 μL of diluted sulfuric acid (23 in 500), shake, and determine the absorbance at 490 – 492 nm. Separately, dissolve a suitable amount of bradykinin in gelatin-phosphate buffer solution (pH 7.0) to make solutions containing exactly 100 ng, 25 ng, 6.25 ng, 1.56 ng, 0.39 ng and 0.098 ng of bradykinin per mL, and use these solutions as the standard solution (1), the standard solution (2), the standard solution (3), the standard solution (4), the standard solution (5) and the standard solution (6), respectively. Use 1 mL of gelatin-phosphate buffer solution (pH 7.0) as the standard solution (7). To each of the well add 50 μL each of the standard solutions and 100 μL of trichloroacetic acid-gelatin-tris buffer solution, and proceed in the same manner as for the sample solution and for the control solution.

Prepare the calibration curve from the amounts of bradykinin in the standard solutions and their absorbances, and calculate the amounts of bradykinin, $B_T$ (pg) and $B_S$ (pg), of the sample solution and the control solution.

- (vi) Judgment: The value $R$ calculated by the following equation is not less than 0.8.

$$R = B_T/B_S$$

(3) Trypsin-like substances—Pipet 4 mL of the sample stock solution prepared for the assay, add exactly 1 mL of trypsin inhibitor TS and 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL, and use this solution as the sample solution. Pipet 2.5 mL of substrate TS for kallidinogenase assay (1), previously warmed at 30 ± 0.5°C for 5 minutes, place in a 1-cm cell, add exactly 0.5 mL of the sample solution, warmed at 30 ± 0.5°C for 5 minutes, and start simultaneously a chronograph. Perform the test at 30 ± 0.5°C as directed under Ultraviolet-visible Spectrophotometry $<2.2>$ using water as the blank, and determine the absorbances at 405 nm, $A_2$ and $A_6$, of this solution after having allowed it to stand for exactly 2 and 6 minutes. Separately, pipet 4 mL of the sample stock solution prepared for the assay, add 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL, and use this solution as the control solution. Perform the same test with the control solution, and determine the absorbances, $A_2$ and $A_6$. Calculate $T$ by using the following equation: the value of $T$ does not exceed 0.05.

$$T = \frac{(A_6 - A_2) - (A_6 - A_2)}{(A_6 - A_2)}$$

(4) Protease—Weigh accurately an appropriate amount of Kallidinogenase according to the labeled Units, dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to prepare a solution containing 1 Kallidinogenase Unit per mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, place in a test tube, and allow to stand at 35 ± 0.5°C for 5 minutes. Then, pipet 5 mL of substrate TS for kallidinogenase assay (3), previously warmed to 35 ± 0.5°C, add quickly to the sample solution in the test tube, and allow it to stand for exactly 2 and 6 minutes, respectively, centrifuge, and allow to stand at 35 ± 0.5°C for exactly 20 minutes. Then add exactly 5 mL of trichloroacetic acid TS, shake well, allow to stand at room temperature for 1 hour, and filter through a membrane filter (5 μm in pore size). Discard the first 3 mL of the filtrate, and determine the absorbance, $A$, of the subsequent filtrate at 280 nm within 2 hours as directed under Ultraviolet-visible Spectrophotometry $<2.2>$, using water as the blank. Separately, pipet 1 mL of the sample solution, add exactly 5 mL of trichloroacetic acid TS, shake well, and...
add exactly 5 mL of the substrate TS for kallidinogenase assay (3). Proceed in the same manner as described for the sample solution, and determine the absorbance, $A_{0}$, of this solution. Calculate the value of $(A - A_{0})$: it is not more than 0.2.

**Loss on drying**<sup>2.4</sup> Not more than 2.0% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on Ignition**<sup>2.4</sup> Not more than 3% (0.5 g, 650–750°C).

**Kinin-releasing activity**

(i) Kallidinogenase solution: Weigh accurately a suitable amount of Kallidinogenase, according to the labeled unit, dissolve in 0.02 mol/L phosphate buffer solution (pH 8.0) to make a solution containing 0.1 unit of kallidinogenase per mL. Perform this procedure by using glassware.

(ii) Sample solution: Pipet 0.5 mL of kininogen TS, warm at 30 ± 0.5°C for 5 minutes, then add exactly 0.5 mL of kallidinogenase solution previously warmed at 30 ± 0.5°C for 5 minutes, and mix immediately. After allow this solution to stand at 30 ± 0.5°C for exactly 2 minutes, add exactly 0.2 mL of a solution of trichloroacetic acid (1 in 5), and shake. Boil for 3 minutes, then cool in ice immediately, centrifuge, and allow to stand at a room temperature for 15 minutes. Pipet 0.5 mL of the supernatant liquid, add exactly 0.5 mL of gelatin-tris buffer solution (pH 8.0), and shake. Pipet 0.1 mL of this solution, add exactly 1.9 mL of trichloroacetic acid-gelatin-tris buffer solution, shake, and use this solution as the sample solution.

(iii) Procedure: Perform the test with the sample solution as directed in the Purity (2), and determine the amount, $B$ (pg), of kinin per well. The kinin-releasing activity per 1 unit of Kallidinogenase calculated by the following equation is not less than 500 ng bradykinin equivalent/minute/unit.

Kinin-releasing activity (ng bradykinin equivalent/minute/unit) per 1 unit of Kallidinogenase = $B \times 4.8$

**Assay**

Weigh accurately an appropriate amount of Kallidinogenase according to the labeled Units, dissolve in 0.05 mol/L phosphate buffer solution (pH 7.0) to prepare a solution containing about 10 Kallidinogenase Units per mL, and use this solution as the sample stock solution. Pipet 4 mL of the sample stock solution, add exactly 1 mL of trypsin inhibitor TS and 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL, and use this solution as the sample solution. Pipet 2.5 mL of substrate TS for kallidinogenase assay (1), previously warmed at 30 ± 0.5°C for 5 minutes, place in a 1-cm cell, add exactly 0.5 mL of the sample solution, warmed at 30 ± 0.5°C for 5 minutes, and start simultaneously a chronograph. Perform the test at 30 ± 0.5°C as directed under the Ultraviolet-visible Spectrophotometry<sup>2.2</sup> using water as the blank, and determine the absorbances at 405 nm, $A_{28}$ and $A_{25}$, of this solution after allowing to stand for exactly 2 and 6 minutes. Separately, dissolve Kallidinogenase RS in 0.05 mol/L phosphate buffer solution (pH 7.0) to make a solution so that each mL contains exactly 10 Units, and use this solution as the standard stock solution. Pipet 4 mL of the stock solution, add exactly 1 mL of trypsin inhibitor TS and 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL, and use this solution as the standard solution. Take exactly 0.5 mL of the standard solution, perform the test in the same manner as described for the sample solution, and determine the absorbances, $A_{25}$ and $A_{28}$, of the solution after allowing to stand for exactly 2 and 6 minutes. Separately, take exactly 1 mL of the trypsin inhibitor TS, and add 0.05 mol/L phosphate buffer solution (pH 7.0) to make exactly 10 mL. Pipet 0.5 mL of this solution, perform the test in the same manner as described for the sample solution, and determine the absorbances, $A_{02}$ and $A_{00}$, of the solution after allowing to stand for exactly 2 and 6 minutes.

Units per 1 mg of Kallidinogenase

$$\frac{(A_{28} - A_{02}) - (A_{25} - A_{00})}{M_S} \times \frac{a}{b}$$

$M_S$: Amount (Units) of Kallidinogenase RS taken
$a$: Volume (mL) of the standard stock solution
$b$: Amount (ng) of Kallidinogenase in 1 mL of the sample stock solution

**Containers and storage**

Containers—Tight containers.

**Kanamycin Monosulfate**

カナマイシン一硫酸塩

C$_{14}$H$_{16}$N$_2$O$_{11}$·H$_2$SO$_4$: 582.58
3-Amino-3-deoxy-α-D-glucopyranosyl-(1→6)-[6-amino-6-deoxy-α-D-glucopyranosyl-(1→4)]-2-deoxy-D-streptamine monosulfate

[25389-94-0]

Kanamycin Monosulfate is the sulfate of an aminoglycoside substance having antibacterial activity produced by the growth of Streptomyces kanamyceticus.

It contains not less than 750 μg (potency) and not more than 832 μg (potency) per mg, calculated on the dried basis. The potency of Kanamycin Monosulfate is expressed as mass (potency) of kanamycin (C$_{16}$H$_{26}$N$_4$O$_{11}$): 484.50.

**Description**

Kanamycin Monosulfate occurs as a white crystalline powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

**Identification**

(1) Dissolve 50 mg of Kanamycin Monosulfate in 3 mL of water, and add 6 mL of anthrone TS: a blue-purple color develops.

(2) Dissolve 20 mg each of Kanamycin Monosulfate and Kanamycin Monosulfate RS in 1 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography<sup>2.0</sup>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the supernatant layer of a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of 0.2% nin-
hydridin-water saturated 1-butanol TS on the plate, and heat the plate at 100°C for 10 minutes: the principal spot obtained from the sample solution and the spot from the standard solution show a purple-brown color and the same $R_f$ value.

(3) To a solution of Kanamycin Monosulfate (1 in 5) add 1 drop of barium chloride TS: a white precipitate is formed.

**Optical rotation** $\angle 2.49^\circ \rightarrow [\alpha]_D^{20}: +112^\circ - +123^\circ \ (0.2 \ g \ calculated \ on \ the \ dried \ basis, \ water, \ 20 mL, \ 100 \ mm).

**Sulfuric acid** Weigh accurately about 0.25 g of Kanamycin Monosulfate, dissolve in 100 mL of water, adjust the pH to 11.0 with ammonia solution (28), add exactly 10 mL of 0.1 mol/L barium chloride VS, and titrate $\angle 2.50^\circ$ with 0.1 mol/L disodium dihydrogen ethylenediamine tetracetate VS until the color of the solution, blue-purple, disappears (indicator: 0.5 mg of phthalein purple). At a near of the end-point add 50 mL of ethanol (99.5). Perform a blank determination in the same manner. The amount of sulfuric acid ($SO_4$) is not less than 15.0% and not more than 17.0%, calculated on the dried basis.

Each mL of 0.1 mol/L barium chloride VS

$= 9.606 \ \text{mg of } SO_4$

**Purity** (1) Heavy metals $\angle 1.07\%$—Proceed with 2.0 g of Kanamycin Monosulfate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic $\angle 1.11\%$—Prepare the test solution with 2.0 g of Kanamycin Monosulfate according to Method 4, and perform the test (not more than 1 ppm).

(3) Related substances—Dissolve 0.30 g of Kanamycin Monosulfate in water to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 45 mg of Kanamycin Monosulfate RS in water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $\angle 2.03\%$. Spot 1 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solution of potassium dihydrogen phosphate (3 in 40) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in 1-butanol (1 in 100) on the plate, and heat the plate at 110°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** $\angle 2.41\%$ Not more than 4.0% (5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Residue on ignition** $\angle 2.44\%$ Not more than 0.5% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics $\angle 4.02\%$ according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Kanamycin Monosulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution (pH 6.0) (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution between 5 and 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 $\mu$g (potency) and 5 $\mu$g (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Kanamycin Monosulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 $\mu$g (potency) and 5 $\mu$g (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

---

**Kanamycin Sulfate**

カナマイシン硫酸塩

C$_{13}$H$_{15}$N$_2$O$_{11}$·xH$_2$SO$_4$

3-Amino-3-deoxy-α-D-glucopyranosyl-(1→6)-[6-amino-6-deoxy-α-D-glucopyranosyl-(1→4)]-2-deoxy-β-streptamine sulfate [133-92-6]

Kanamycin Sulfate is the sulfate of an aminoglycoside substance having antibacterial activity produced by the growth of *Streptomyces kanamyceticus*.

It contains not less than 690 $\mu$g (potency) and not more than 740 $\mu$g (potency) per mg, calculated on the dried basis. The potency of Kanamycin Sulfate is expressed as mass (potency) of kanamycin (C$_{13}$H$_{15}$N$_2$O$_{11}$: 484.50).

**Description** Kanamycin Sulfate occurs as a white to yellow-white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification** (1) Dissolve 20 mg each of Kanamycin Sulfate and Kanamycin Monosulfate RS in 1 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $\angle 2.03\%$. Spot 5 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat the plate at 100°C for 10 minutes: the principal spot obtained from the sample solution and the spot from the standard solution show a purple-brown color and the same $R_f$ value.

(2) A solution of Kanamycin Sulfate (1 in 10) responds
Perform the test according to the Cylinder-plate Carbonate—Stir 1.0 g of Kaolin with 5 mL of water.

Purity (1) Clarity and color of solution—Dissolve 1.5 g of Kanamycin Sulfate in 5 mL of water: the solution is clear. Determine the absorbance of this solution at 400 nm as directed under Ultraviolet-visible Spectrophotometry \( <2.50 \); not more than 0.15.

(2) Heavy metals \( <1.00 \)—Proceed with 1.0 g of Kanamycin Sulfate according to Method 4, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(3) Arsenic \( <1.10 \)—Prepare the test solution with 2.0 g of Kanamycin Sulfate according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.30 g of Kanamycin Sulfate in water to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 9.0 mg of Kanamycin Monosulfate RS in water to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.03 \). Spot 1 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solution of potassium dihydrogen phosphate (3 in 40) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in 1-butanol (1 in 100) on 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in 1-butanol (1 in 100) on the plate, and heat the plate at 110°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying \( <2.42 \) Not more than 5.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay \( <4.02 \) according to the following conditions.

(i) Test organism—*Racillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer having pH 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Kanamycin Monosulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution (pH 6.0) (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Kanamycin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Kaolin

Kaolin is a native, hydrous aluminum silicate.

**Description** Kaolin occurs as white or nearly white, fragmentary masses or powder. It has a slightly clay-like odor. It is practically insoluble in water, in ethanol (99.5) and in diethyl ether. It is insoluble in dilute hydrochloric acid and in sodium hydroxide TS.

When moistened with water, it darkens and becomes plastic.

**Identification** (1) Heat 1 g of Kaolin with 10 mL of water and 5 mL of sulfuric acid in a porcelain dish, and evaporate the mixture nearly to dryness. Cool, add 20 mL of water, boil for 2 to 3 minutes, and filter: the color of the residue is gray.

(2) The filtrate obtained in (1) responds to Qualitative Test \( <1.09 \) (1), (2) and (4) for aluminum salt.

**Purity** (1) Acid or alkalii—Add 25 mL of water to 1.0 g of Kaolin, agitate thoroughly, and filter: the pH of the filtrate is between 4.0 and 7.5.

(2) Acid-soluble substances—Add 20 mL of dilute hydrochloric acid to 1.0 g of Kaolin, agitate for 15 minutes, and filter. Evaporate 10 mL of the filtrate to dryness, and heat strongly between 450°C and 550°C to constant mass: the mass of the ignited residue is not more than 10 mg.

(3) Carbonate—Stir 1.0 g of Kaolin with 5 mL of water, then add 10 mL of diluted sulfuric acid (1 in 2): no effervescence occurs.

(4) Heavy metals \( <1.07 \)—Boil 1.5 g of Kaolin gently with 50 mL of water and 5 mL of hydrochloric acid for 20 minutes with frequent agitation, cool, centrifuge, and separate the supernatant liquid. Wash the precipitate twice with 10 mL of water, centrifuge each time, and combine the supernatant liquid and the washings. Add dropwise ammonia solution (28) to this solution until a slight precipitate occurs, then add dilute hydrochloric acid dropwise while agitating strongly to complete solution. Add 0.45 g of hydroxyllammonium chloride, and heat. Cool, add 0.45 g of sodium acetate trihydrate and 6 mL of dilute acetic acid, filter if necessary, and wash with 10 mL of water. Combine the filtrate and the washings, and add water to make 150 mL. Perform the test using 50 mL of this solution as the test solution. To 2.5 mL of Standard Lead Solution add 0.15 g of hydroxyllammonium chloride, 0.15 g of sodium acetate trihydrate, 2 mL of dilute acetic acid and water to make 50 mL, and use this solution as the control solution (not more than 50 ppm).

(5) Iron \( <1.10 \)—Add 10 mL of dilute hydrochloric acid to 40 mg of Kaolin, and heat for 10 minutes with shaking in a water bath. After cooling, add 0.5 g of L-tartaric acid, dissolve with shaking, prepare the test solution with this solution according to Method 2, and perform the test according to Method B. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 500 ppm).

(6) Arsenic \( <1.11 \)—Add 5 mL of water and 1 mL of sulfuric acid to 1.0 g of Kaolin, and heat on a sand bath until white fumes begin to evolve. Cool, and add water to make 5 mL. Perform the test with this solution as the test solution (not more than 2 ppm).

(7) Foreign matter—Place 5 g of Kaolin in a beaker, add 100 mL of water, stir, and decant to leave sand. Repeat this procedure several times with 100-mL portions of water: no
Ketamine Hydrochloride

ケタミン塩酸塩

\[
\text{C}_{13}\text{H}_{15}\text{ClNO.HCl}: 274.19 \\
(2R)-2-(2-Chlorophenyl)-2-(methylamino)cyclohexanone monohydrochloride
\]

Ketamine Hydrochloride, when dried, contains not less than 99.0% of ketamine hydrochloride (C\(_{13}\)H\(_{15}\)ClNO.HCl).

**Description**  Ketamine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in formic acid, freely soluble in water and in methanol, sparingly soluble in ethanol (95) and in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

A solution of Ketamine Hydrochloride (1 in 10) shows no optical rotation.

Melting point: about 258°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Ketamine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 3000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

\(\text{H}\)

(2) Determine the infrared absorption spectrum of Ketamine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Ketamine Hydrochloride (1 in 10) responds to Qualitative Tests \(<1.09\rangle\) (2) for chloride.

**Absorbance** \(<2.25\rangle\  E_{1\%}^{1cm} (269 nm): 22.0 - 24.5 \) (after drying, 30 mg, 0.1 mol/L hydrochloric acid TS, 100 mL).

**pH** \(<2.54\rangle\ Dissolve 1.0 g of Ketamine Hydrochloride in 10 mL of freshly boiled and cooled water: the pH of the solution is between 3.5 and 4.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ketamine Hydrochloride in 5 mL of water: the solution is clear and colorless.

(2) Heavy metals \(<1.07\rangle\—Proceed with 1.0 g of Ketamine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Residue on ignition \(<2.41\rangle\ Not more than 0.5% (1 g, 105°C, 3 hours).

**Ketoconazole**

ケトコナゾール

\[
\text{C}_{26}\text{H}_{28}\text{Cl}_{2}\text{N}_{2}\text{O}_{5}: 531.43 \\
1-N-(4-[[2RS,4SR]-2-(2,4-dichlorophenyl)-4-yl][methoxy]phenyl)piperazine [65277-42-1]
\]

Ketoconazole, when dried, contains not less than 99.0% and not more than 101.0% of ketoconazole (C\(_{26}\)H\(_{28}\)Cl\(_{2}\)N\(_{2}\)O\(_{5}\)).

**Description**  Ketoconazole occurs as a white to light yellow-white powder.

It is soluble in methanol, sparingly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Ketoconazole in methanol (1 in 20) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Ketoconazole in methanol (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\,\text{and compare the spectrum with the Reference Spectrum:}\)
both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ketoconazole as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Ketoconazole as directed under Flame Coloration Test <1.06> (2): a green color appears.

**Melting point** <2.60> 148–152°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Ketoconazole according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related Substances—Dissolve 0.10 g of Ketoconazole in 10 mL of methanol, and use this solution as the sample solution. Pipet 5 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.06> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak other than ketoconazole obtained from the sample solution is not larger than 2/5 times the peak area of ketoconazole from the standard solution, and the total area of the peaks other than ketoconazole from the sample solution is not larger than the peak area of ketoconazole from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: Acetonitrile for liquid chromatography.
Mobile phase B: A solution of tetrabutylammonium hydrogensulfate (17 in 5000).
Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 10</td>
<td>5 → 50</td>
<td>95 → 50</td>
</tr>
<tr>
<td>10 – 15</td>
<td>50</td>
<td>50</td>
</tr>
</tbody>
</table>

Flow rate: 2.0 mL per minute.
Time span of measurement: For 15 minutes after injection, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Pipet 2 mL of the standard solution, and add methanol to make exactly 20 mL. Confirm that the peak area of ketoconazole obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ketoconazole are not less than 40,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ketoconazole is not more than 2.5%.

**Loss on drying** <2.4> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.4> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Ketoconazole, previously dried, dissolve in 70 mL of a mixture of 2-butanol and acetic acid (100:7:1), and titrate <2.5> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 26.57 mg of C₂₆H₃₆Cl₂N₄O₪

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Ketoconazole Cream**

このクリームは95.0%以上の純度と105.0%以上の標示量のケトコナゾール（C₂₆H₃₆Cl₂N₄O₪）を含む。

**Method of preparation** Prepare as directed under Creams, with Ketoconazole.

**Identification** To a quantity of Ketoconazole Cream, equivalent to 0.1 g of Ketoconazole, add 20 mL of 2-propanol, shake for 20 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of ketoconazole in 5 mL of 2-propanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.06>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol, and ammonia solution (28:40:40:25:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution has the same RI value as the spot from the standard solution.

**Assay** Weigh accurately about 25 mg of ketoconazole (C₂₆H₃₆Cl₂N₄O₪), dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 4 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of ketoconazole for assay, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 4 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of ketoconazole to that of the internal standard.

Amount (mg) of ketoconazole (C₂₆H₃₆Cl₂N₄O₪) = Mₛ × Q₁/Q₂

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
Ketoconazole Lotion

Ketoconazole Lotion is an emulsion lotion.
It contains not less than 93.0% and not more than 107.0% of the labeled amount of ketoconazole (C_{26}H_{28}Cl_{2}N_{4}O_{3}: 531.43).

Method of preparation Prepare as directed under Lotions, with Ketoconazole.

Description Ketoconazole Lotion occurs as a white emulsion.

Identification Shake well and take an amount of Ketoconazole Lotion, equivalent to 0.1 g of Ketoconazole, add 20 mL of 2-propanol, shake for 20 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of ketoconazole in 5 mL of 2-propanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 5 mL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol, water and ammonia solution (28:40:25:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 5 mL each of the sample solution and standard solution on a plate of silica gel with fluoro-
Ketoprofen

Ketoprofen, when dried, contains not less than 99.0% and not more than 100.5% of ketoprofen (C_{16}H_{20}O_3).

**Description** Ketoprofen occurs as a white crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (95) and in acetone, and practically insoluble in water.

A solution of Ketoprofen in ethanol (99.5) (1 in 100) shows no optical rotation.

It is colored to pale yellow by light.

**Identification (1)** Determine the absorption spectrum of a solution of Ketoprofen in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry (2.2), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ketoprofen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 2.60° - 94° - 97°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ketoprofen in 10 mL of acetone: the solution is clear, and has no more color than the following control solution.

Control solution: To a mixture of 0.6 mL of Cobalt (II) Chloride CS and 2.4 mL of Iron (III) Chloride CS add distilled hydrochloric acid (1 in 10) to make 10 mL. To 5.0 mL of this solution add distilled hydrochloric acid (1 in 10) to make 100 mL.

(2) Heavy metals (1,07)—Proceed with 2.0 g of Ketoprofen according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure with a minimum of exposure to light, using light-resistant vessels. Dissolve 20 mg of Ketoprofen in 20 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.20) according to the following conditions, and determine each peak area by the automatic integration method: the areas of the peaks, having the relative retention time of about 1.5 and about 0.3 to ketoprofen obtained from the sample solution, are not larger than 1.0% of the peak area of ketoprofen to that of the internal standard.

**Containers and storage** Containers—Tight containers.

**pH** Being specified separately when the drug is granted approval based on the Law.

**Assay** To an exact amount of Ketoconazole Solution, equivalent to about 10 mg of ketoconazole (C_{26}H_{32}Cl_{2}N_{2}O_{4}), add exactly 5 mL of the internal standard solution, and add 15 mL of methanol. To 1 mL of this solution add methanol to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of ketoconazole for assay, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make 20 mL. Take 1 mL of this solution, add methanol to make 25 mL, and use this solution as the standard solution. Perform the test with 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) <2.01>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**System suitability**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

- System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, ketoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.
- System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ketoconazole to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Ketotifen Fumarate

**Description** Ketotifen Fumarate occurs as a white to light yellow-white crystalline powder.

It is sparingly soluble in methanol and in acetic acid (100), and slightly soluble in water, in ethanol (99.5) and in acetic anhydride.

Melting point: about 190°C (with decomposition).

**Identification (1)** Prepare the test solution with 30 mg of Ketotifen Fumarate as directed under Oxygen Flask Combustion Method (<1.06> using 20 mL of water as the absorbing liquid: the test solution responds to Qualitative Tests (<1.06> for sulfate.

(2) Determine the absorption spectrum of a solution of Ketotifen Fumarate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry (<2.24>), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Ketotifen Fumarate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (<2.25>), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Chloride (<1.07>—Dissolve 0.6 g of Ketotifen Fumarate in 2.5 mL of sodium carbonate TS in a crucible, heat on a water bath to dryness, and ignite at about 500°C. Dissolve the residue in 15 mL of water, filter if necessary, neutralize with diluted nitric acid (3 in 10), and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.25 mL of 0.01 mol/L hydrochloric acid VS add 2.5 mL of sodium carbonate TS, the used amount of diluted nitric acid (3 in 10) for the neutralization, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.015%).

(2) Heavy metals (<1.07>—Procede with 1.0 g of Ketotifen Fumarate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Ketotifen Fumarate in 10 mL of a mixture of methanol and ammonia TS (99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of methanol
and ammonia TS (99:1) to make exactly 25 mL. Pipet 1 mL of this solution, add a mixture of methanol and ammonia TS (99:1) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetonitrile, water and ammonia solution (28)(90:10:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying and then hydrogen peroxide TS on the plate: the number of the spot other than the principal spot obtained from the sample solution is not more than four, and they are not more intense than the spot from the standard solution.

**Loss on drying <2.41>** Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Ketotifen Fumarate, previously dried, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid (100)(7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 42.55 mg of C_{19}H_{19}NOS.C_{4}H_{4}O_{4}

**Containers and storage** Containers—Tight containers.

---

**Kitasamycin**

Kitasamycin is a mixture of macrolide substances having antibacterial activity produced by the growth of Streptomyces kitasatoensis.

It contains not less than 1450 μg (potency) and not more than 1700 μg (potency) per mg, calculated on the anhydrous basis. The potency of Kitasamycin is expressed as mass (potency) of kitasamycin corresponding to the mass of leucomycin A_5 (C_{39}H_{65}NO_{14}: 771.93). One mg (potency) of kitasamycin is equiva-
lent to 0.530 mg of leucomycin A₅ (C₃₀H₆₅NO₁₂).

**Description** Kitasamycin occurs as a white to light yellow-white powder.

It is very soluble in acetonitrile, in methanol and in ethanol (95), and practically insoluble in water.

**Identification** Determine the absorption spectrum of a solution of Kitasamycin in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.4>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Content ratio of the active principle** Dissolve 20 mg of Kitasamycin in diluted acetonitrile (1 in 2) to make 20 mL, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and measure each peak area by the automatic integration method. Calculate the amounts of leucomycin A₁, leucomycin A₂, leucomycin A₃, and leucomycin A₄ by the area percentage method: the amounts of leucomycin A₁, leucomycin A₂, leucomycin A₃, and leucomycin A₄ are 40 to 70%, 5 to 25% and 3 to 12%, respectively. Relative retention times of leucomycin A₁ and leucomycin A₂ to leucomycin A₅ are about 1.2 and about 1.5, respectively.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 232 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To a volume of a solution of ammonium acetate (77 in 5000) add diluted phosphoric acid (1 in 150) to adjust to pH 5.5. To 370 mL of this solution add 580 mL of methanol and 50 mL of acetonitrile.

Flow rate: Adjust so that the retention time of leucomycin A₁ is about 8 minutes.

Time span of measurement: About 3 times as long as the retention time of leucomycin A₁.

System suitability—

System performance: Dissolve about 20 mg each of Leucomycin A₁ RS and Josamycin RS in 20 mL of diluted acetone (1 in 2). When the procedure is run with 5 μL of this solution under the above operating conditions, leucomycin A₁ and josamycin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 5 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of leucomycin A₁ is not more than 1.0%.

**Water** <2.48> Not more than 3.0% (0.1 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (i) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Leucomycin A₁ RS equivalent to about 30 mg (potency), dissolve in 10 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 3 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Kitasamycin equivalent to about 30 mg (potency), dissolve in 10 mL of methanol, and add water to make exactly 100 mL. Take exactly a suitable amount of the solution, add phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

[178234-32-7, Leucomycin Acetate]

Leucomycin Acetate is a derivative of kitasamycin.

It contains not less than 680 μg (potency) and not more than 790 μg (potency) per mg, calculated on the anhydrous basis. The potency of Kitasamycin Acetate is expressed as mass (potency) of kitasamycin corresponding to the mass of leucomycin A<sub>2</sub> (C<sub>39</sub>H<sub>65</sub>NO<sub>14</sub>: 771.93). One mg (potency) of kitasamycin is equivalent to 0.530 mg of leucomycin A<sub>2</sub> (C<sub>39</sub>H<sub>65</sub>NO<sub>14</sub>).

**Description**

Kitasamycin Acetate occurs as a white to light yellow-white powder.

It is very soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification (1)**

Determine the absorption spectrum of a solution of Kitasamycin Acetate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.2.4>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Kitasamycin Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.2.5>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Water**<sup>2.4.8</sup> Not more than 5.0% (0.1 g, volumetric titration, direct titration).

**Assay**

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (i) Agar media for seed and base layer.

(iii) Standard solution—Weigh accurately an amount of Leucomycin A<sub>2</sub> RS equivalent to about 30 mg (potency), dissolve in 10 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 3 days. Take exactly the same amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solution—Weigh accurately an amount of Kitasamycin Acetate equivalent to about 30 mg (potency), dissolve in 25 mL of methanol, add water to make exactly 50 mL, shake well, and allow to stand at 37 ± 2°C for 24 hours. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage**

[37280-56-1, Kitasamycin Tartrate]

Kitasamycin Tartrate is the tartrate of Kitasamycin.

It contains not less than 1300 μg (potency) and not more than 1500 μg (potency) per mg, calculated on the anhydrous basis. The potency of Kitasamycin Tartrate is expressed as mass (potency) of kitasamycin based on the amount of leucomycin A₃ (C₉₃H₆₅NO₁₄: 771.93). One mg (potency) of Kitasamycin Tartrate is equivalent to 0.350 mg of leucomycin A₃ (C₉₃H₆₅NO₁₄).

Description Kitasamycin Tartrate occurs as a white to light yellow-white powder.

It is very soluble in water, in methanol and in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Kitasamycin Tartrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Kitasamycin Tartrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 1 g of Kitasamycin Tartrate in 20 mL of water, add 3 ml of sodium hydroxide TS, add 20 mL of n-butyl acetate, shake well, and discard the n-butyl acetate layer. To the aqueous layer add 20 mL of n-butyl acetate, and shake well. The aqueous layer so obtained responds to Qualitative Tests <1.09> (1) for tartrate.

pH <2.54> Dissolve 3.0 g of Kitasamycin Tartrate in 100 mL of water: the pH of the solution is between 3.0 and 5.0.

Content ratio of the active principle Dissolve 20 mg of Kitasamycin Tartrate in diluted acetone (1 in 2) to make 20 mL, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, determine the peak areas by the automatic integration method, and calculate the amounts of leucomycin A₆, leucomycin A₇ and leucomycin A₈ by the area percentage method: the amount of leucomycin A₆ is 40 – 70%, leucomycin A₇ is 5 – 25%, and leucomycin A₈ is 3 – 12%. The relative retention times of leucomycin A₆ and leucomycin A₇ to leucomycin A₈ are about 1.2 and about 1.5, respectively.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 232 nm).
Column: A stainless steel column 4.0 mm in inside diameter and 15 cm in length, packed with octysilsanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To a suitable amount of a solution of ammonium acetate (77 in 5000) add diluted phosphoric acid (1 in 150) to adjust the pH to 5.5. To 370 mL of this solution add 580 mL of methanol and 50 mL of acetone.
Flow rate: Adjust so that the retention time of leucomycin A₆ is about 8 minutes.
Time span of measurement: About 3 times as long as the retention time of leucomycin A₆.

System suitability—
System performance: Dissolve about 20 mg each of Leucomycin A₆, RS and Josamycin RS in 20 mL of diluted acetone (1 in 2). When the procedure is run with 5 μL of this solution under the above operating conditions, leucomycin A₆ and josamycin are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 5 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of leucomycin A₆ is not more than 1.0%.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Kitasamycin Tartrate in 10 mL of water: the solution is clear and colorless or light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Kitasamycin Tartrate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

Water <2.48> Not more than 3.0% (0.1 g, volumetric titration, direct titration).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.
(i) Test organism—Bacillus subtilis ATCC 6633
(ii) Culture medium—Use the medium i in 1 under (1)
Agar media for seed and base layer.
(iii) Standard solutions—Weigh accurately an amount of
Leucomyacin A₂, RS, equivalent to about 30 mg (potency), dissolve in 10 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C, and use within 3 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Kitasamycin Tartrate, equivalent to about 30 mg (potency), and dissolve in water to make exactly 100 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution (pH 8.0) to make solutions so that each mL contains 30 μg (potency) and 7.5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

### Labetalol Hydrochloride

ラベタロール塩酸塩

C₁₉H₂₄N₂O₅·HCl: 364.87
2-Hydroxy-5-{[(1RS)-1-hydroxy-2-[(1RS)-1-methyl-3-phenylpropylamino]ethyl]benzamide monohydrochloride
2-Hydroxy-5-{[(1RS)-1-hydroxy-2-[(1SR)-1-methyl-3-phenylpropylamino]ethyl]benzamide monohydrochloride

Labetalol Hydrochloride, when dried, contains not less than 98.5% and not more than 101.0% of labetalol hydrochloride (C₁₉H₂₄N₂O₅·HCl).

Description Labetalol Hydrochloride occurs as a white crystalline powder.

It is freely soluble in methanol, and sparingly soluble in water and in ethanol (99.5).

It dissolves in 0.05 mol/L sulfuric acid TS.

Melting point: about 181°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Labetalol Hydrochloride in 0.05 mol/L sulfuric acid TS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Labetalol Hydrochloride as directed in the potassium chloride disc method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Labetalol Hydrochloride (1 in 50) responds to Qualitative Tests <1.09> for chloride.

pH <2.54> The pH of a solution prepared by dissolving 0.5 g of Labetalol Hydrochloride in 50 mL of water is between 4.0 and 5.0.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Labetalol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.8 g of Labetalol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, 2-propanol, water, and ammonia solution (28) (25:15:8:2) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 30 minutes: the spots other than the principal spot obtained from the sample solution do not exceed 2 in number and are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Isomer ratio Dissolve 5 mg of Labetalol Hydrochloride in 0.7 mL of a solution of n-butyloboric acid in dehydrated pyridine (3 in 250), allow to stand for 20 minutes, and use this solution as the sample solution. Perform the test with 2 μL of the sample solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the areas of two adjacent peaks, A₁ and A₂, where A₁ is the peak area of the shorter retention time and A₂ is the peak area of the longer retention time, using the automatic integration method: the ratio A₂/(A₁ + A₂) is between 0.45 and 0.55.

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A fused silica column 0.53 mm in inside diameter and 25 m in length, coated inside with methyl silicone polymer for gas chromatography in 5 μm thickness.

Column temperature: A constant temperature of about 290°C.

Injection port temperature: A constant temperature of about 350°C.

Carrier gas: Helium.

Flow rate: Adjust so that the retention time of the peak showing earlier elution of the two peaks of labetalol is about 9 minutes.

System suitability—

System performance: Proceed with 2 μL of the sample solution under the above conditions: the resolution between the two labetalol peaks is not less than 1.5.

System repeatability: Repeat the test 6 times under the above conditions with 2 μL of the sample solution: the relative standard deviation of the ratio of the peak area of labetalol with the shorter retention time to that of the longer
retention time is not more than 2.0%.

**Assay** Weigh accurately about 0.3 g of Labetalol Hydrochloride, previously dried, dissolve in 100 mL of a mixture of acetic anhydride and acetic acid (100:7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = \(36.49 \text{ mg of } C_{19}H_{23}N_2O_3 \cdot \text{HCl}\)

**Containers and storage** Containers—Tight containers.

**Labetalol Hydrochloride Tablets**

ラベタロール塩酸塩錠

Labetalol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl: 364.87).

**Method of preparation** Prepare as directed under Tablets, with Labetalol Hydrochloride.

**Identification (1)** To a quantity of powdered Labetalol Hydrochloride Tablets equivalent to 5 mg of Labetalol Hydrochloride, add 100 mL of 0.05 mol/L sulfuric acid TS, shake, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>:\) it exhibits a maximum between 300 nm and 304 nm.

(2) To a quantity of powdered Labetalol Hydrochloride Tablets equivalent to 0.25 g of Labetalol Hydrochloride, add 25 mL of methanol, shake vigorously for 30 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 10 mg of labetalol hydrochloride in 1 mL of methanol, and use this solution as the standard solution. Perform the test using these solutions as directed under Thin-layer Chromatography \(<2.02\>\). Spot 5 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, 2-propanol, water, and ammonia solution (28:25:15:8:2) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same \(R_f\) value.

**Uniformity of dosage units \(<6.02\>** Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Labetalol Hydrochloride Tablets add 5 mL of 0.5 mol/L sulfuric acid TS and 30 mL of water, shake vigorously for 30 minutes, add water to make exactly 50 mL, and filter. Discard the first 5 mL of the filtrate, pipet 4 mL of the subsequent filtrate, add 0.05 mol/L sulfuric acid TS to make exactly \(V\) mL so that each mL contains about 40 \(\mu\)g of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl), and use this solution as the sample solution. Separately, weigh accurately about 20 mg of labetalol hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in 0.05 mol/L sulfuric acid TS to make exactly 50 mL. Pipet 5 mL of this solution, add 0.05 mol/L sulfuric acid TS to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, \(A_T\) and \(A_S\), of the sample solution and standard solution at 302 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\). Amount (mg) of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl) \(= M_S \times A_T/A_S \times V/40\)

\(M_S\): Amount (mg) of labetalol hydrochloride for assay taken

**Dissolution \(<6.10\>** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Labetalol Hydrochloride Tablets is not less than 75%.

Start the test with 1 tablet of Labetalol Hydrochloride Tablets, withdraw not less than 20 mL of the medium at specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 \(\mu\)m. Discard not less than 10 mL of the first filtrate, pipet \(V\) mL of the subsequent filtrate, and add water to make exactly \(V\) mL so that each mL contains about 50 \(\mu\)g of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl), and use this solution as the sample solution. Separately, weigh accurately about 50 mg of labetalol hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and determine the absorbances, \(A_T\) and \(A_S\), at 302 nm.

Dissolution rate (%) with respect to the labeled amount of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl) \(= M_S \times A_T/A_S \times V'/V \times 1/C \times 90\)

\(M_S\): Amount (mg) of labetalol hydrochloride for assay taken

\(C\): Labeled amount (mg) of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl) in 1 tablet

**Assay** Weigh accurately about less than 20 Labetalol Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 1 g of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl), add 100 mL of 0.5 mol/L sulfuric acid TS and 600 mL of water, shake vigorously for 30 minutes, add water to make exactly 1000 mL, and filter. Discard the first 5 mL of the filtrate, pipet 5 mL of the subsequent filtrate, and add 0.05 mol/L sulfuric acid TS to make exactly 25 mL. Pipet 5 mL of this solution, add 0.05 mol/L sulfuric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of labetalol hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in 0.05 mol/L sulfuric acid TS to make exactly 100 mL. Pipet 5 mL of this solution, add 0.05 mol/L sulfuric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and determine the absorbances, \(A_T\) and \(A_S\), at 302 nm.

Amount (mg) of labetalol hydrochloride (C₁₉H₂₃N₂O₃·HCl) \(= M_S \times A_T/A_S \times 25\)

\(M_S\): Amount (mg) of labetalol hydrochloride for assay taken

**Containers and storage** Containers—Tight containers.

乳酸

\[ \text{乳酸} \]

\[ \text{C}_3\text{H}_6\text{O}_3; \ 90.08 \]

(2RS)-2-Hydroxypropanoic acid

[50-21-5]

Lactic Acid is a mixture of lactic acid and lactic anhydride.

It contains not less than 85.0% and not more than 92.0% of lactic acid (\( \text{C}_3\text{H}_6\text{O}_3 \)).

Description Lactic Acid occurs as a clear, colorless or light yellow, viscous liquid. It is odorless or has a faint, unpleasant odor.

It is miscible with water, with ethanol (95) and with diethyl ether.

It is hygroscopic.

Specific gravity \( d_{20}^{10} \) about 1.20

Identification A solution of Lactic Acid (1 in 50) changes blue litmus paper to red and responds to Qualitative Tests <1.09> for lactate.

Purity (1) Chloride <1.05>—Perform the test with 1.0 g of Lactic Acid. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Sulfate <1.14>—Perform the test with 2.0 g of Lactic Acid. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.010%).

(3) Heavy metals <1.07>—To 2.0 g of Lactic Acid add 10 mL of water and 1 drop of phenolphthalein TS, and add ammonia TS dropwise until a pale red color appears. Add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution from 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to 50 mL (not more than 10 ppm).

(4) Iron <1.10d>—Prepare the test solution with 4.0 g of Lactic Acid according to Method 1, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 5 ppm).

(5) Sugars—To 1.0 g of Lactic Acid add 10 mL of water, and neutralize with sodium hydroxide TS. Boil the mixture with 10 mL of Fehling’s TS for 5 minutes: no red precipitate is produced.

(6) Citric, oxalic, phosphoric and L-tartaric acid—To 1.0 g of Lactic Acid add 1.0 mL of water, followed by 40 mL of calcium hydroxide TS. Boil the mixture for 2 minutes: no change occurs.

(7) Glycerin or mannitol—Shake 10 mL of Lactic Acid with 12 mL of diethyl ether: no turbidity is produced.

(8) Volatile fatty acids—Warm Lactic Acid: it does not produce any acetic acid-like or butyric acid-like odor.

(9) Cyanide—Transfer 1.0 g of Lactic Acid to a Nessler tube, add 10 mL of water and 1 drop of phenolphthalein TS, and add dropwise a solution of sodium hydroxide (1 in 10) by shaking until a red color develops, add 1.5 mL of a solution of sodium hydroxide (1 in 10) and water to make 20 mL, and heat in a water bath for 10 minutes. Cool, add dropwise dilute acetic acid until a red color of the solution disappears, add 1 drop of dilute acetic acid, add 10 mL of phosphate buffer solution (pH 6.8), and 0.25 mL of sodium toluenesulfonchloramide TS, stopper immediately, mix gently, and allow to stand for 5 minutes. To the solution add 15 mL of pyridine-pyrazoline TS and water to make 50 mL, and allow to stand at 25°C for 30 minutes: the solution has no more color than the following control solution.

Control solution: Pipet 1.0 mL of Standard Cyanide Solution, and add water to make exactly 20 mL. Transfer 1.0 mL of this solution to a Nessler tube, add 10 mL of water and 1 drop of phenolphthalein TS, and then proceed as described above.

(10) Readily carbonizable substances—Superimpose slowly 5 mL of Lactic Acid, previously kept at 15°C, upon 5 mL of sulfuric acid for readily carbonizable substances, previously kept at 15°C, and allow to stand at 15°C for 15 minutes: no dark color develops at the zone of contact.

Residue on ignition <2.49> Not more than 0.1% (1 g).

Assay Weigh accurately about 3 g of Lactic Acid, transfer in a conical flask, add accurately measured 40 mL of 1 mol/L sodium hydroxide VS, invert a watch glass over the flask, and heat on a water bath for 10 minutes. Titrate <2.50> the excess sodium hydroxide with 0.5 mol/L sulfuric acid VS immediately (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner.

Each mL of 1 mol/L sodium hydroxide VS

\[ = \ 90.08 \text{ mg of C}_3\text{H}_6\text{O}_3 \]

Containers and storage Containers—Tight containers.

L-Lactic Acid

L-乳酸

\[ \text{L-乳酸} \]

\[ \text{C}_3\text{H}_6\text{O}_3; \ 90.08 \]

(2S)-2-Hydroxypropanoic acid

[79-33-4]

L-Lactic Acid is a mixture of L-lactic acid and L-lactic anhydride.

It contains not less than 85.0% and not more than 92.0% of L-lactic acid (\( \text{C}_3\text{H}_6\text{O}_3 \)).

Description L-Lactic Acid occurs as a clear, colorless or light yellow, viscous liquid. It is odorless or has a faint, no unpleasant odor.

It is miscible with water, with ethanol (99.5) and with diethyl ether.

It is hygroscopic.

Specific gravity \( d_{20}^{10} \) about 1.20

Identification A solution of L-Lactic Acid (1 in 50) changes the color of blue litmus paper to red, and responds to Qualitative Tests <1.09> for lactate.

Optical rotation <2.49> \[ [\alpha]_D^2: -46 \sim -52^\circ \] Weigh accurately an amount of L-Lactic Acid, equivalent to about 2 g of L-lactic acid (\( \text{C}_3\text{H}_6\text{O}_3 \)), add exactly 25 mL of 1 mol/L sodium hydroxide VS, cover with a watch glass, and heat on a water bath for 15 minutes. Cool, and adjust to pH 7.0 with 1 mol/L hydrochloric acid VS. Dissolve 5.0 g of hexammonium heptamolybdate tetrahydrate in this solution, add water to make exactly 50 mL, and determine the optical rotation using a 100-mm cell.

Purity (1) Chloride <1.05>—Perform the test with 1.0 g of L-Lactic Acid. Prepare the control solution with 1.0 mL of
Glycerin or mannitol—Shake 10 mL of Sulfate Containers—Tight containers. Weigh ac-

Citric, oxalic, phosphoric and Anhydrous Lactose Cyanide—Transfer 1.0 g of Heavy metals Sugars—To 1.0 g of Readily carbonizable substances—Superimpose Volatile fatty acids—Warm:

90.08 mg of C

1.07

Iron (1 g).

—Prepare the test solution with 4.0 g of L-Lactic Acid according to Method 1, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 5 ppm).

—To 1.0 g of L-Lactic Acid add 10 mL of water, and neutralize with sodium hydroxide TS. Boil the mixture with 10 mL of Fehling’s TS for 5 minutes: no red precipitate is produced.

—Warm L-Lactic Acid: it does not produce any acetic acid-like or butyric acid-like odor.

—Transfer 1.0 g of L-Lactic Acid to a Nessler tube, add 10 mL of water and 1 drop of phenolphthalein TS, and add dropwise a solution of sodium hydroxide (1 in 10) and water to make 50 mL, and heat in a water bath for 10 minutes. After cooling, add dropwise dilute acetic acid until a red color of the solution disappears, add 1 drop of dilute acetic acid, 10 mL of phosphate buffer solution (pH 6.8) and 0.25 mL of sodium toluenesulphonchloramide TS, stopper immediately, mix gently, and allow to stand for 5 minutes. To the solution add 15 mL of pyridine-pyrazolone TS, and water to make 50 mL, and allow to stand at 25°C for 30 minutes: the solution has no more color than the following control solution.

Control solution: Pipet 1.0 mL of Standard Cyanide Solution, and add water to make 20 mL. Transfer 1.0 mL of this solution to a Nessler tube, add 10 mL of water and 1 drop of phenolphthalein TS, and then proceed as described above.

—Readily carbainizable substances—Superimpose slowly 5 mL of L-Lactic Acid, previously kept at 15°C, upon 5 mL of sulfuric acid for readily carbainizable substances, previously kept at 15°C, and allow to stand at 15°C for 15 minutes: no dark color develops at the zone of contact.

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 3 g of L-Lactic Acid, transfer in a conical flask, add accurately measured 40 mL of 1 mol/L sodium hydroxide VS, invert a watch glass over the flask, and heat on a water bath for 10 minutes. Titrate <2.50> the excess sodium hydroxide with 0.5 mol/L sulfuric acid VS immediately (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner.

Each mL of 1 mol/L sodium hydroxide VS = 90.08 mg of C₃H₂O₇

Containers and storage Containers—Tight containers.

Anhydrous Lactose

C₁₃H₂₆O₁₁: 342.30
β-d-Galactopyranosyl-(1→4)-β-d-glucopyranosyl-α-Lactose
(β-lactose)
β-d-Galactopyranosyl-(1→4)-α-d-glucopyranosyl-β-Lactose (α-lactose)
[63-42-3, Anhydrous Lactose]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (∗, ◆), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (∗, ◇).

Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Anhydrous Lactose is β-lactose or a mixture of β-lactose and α-lactose.
◆ The relative quantities of α-lactose and β-lactose in Anhydrous Lactose is labeled as the isomer ratio.◆

Description Anhydrous Lactose occurs as white, crystals or powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).◆

Identification Determine the infrared absorption spectrum of Anhydrous Lactose, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Anhydrous Lactose for Identification RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]₀°: +54.4 → +55.9° Weigh accurately about 10 g of Anhydrous Lactose, calculated on the anhydrous basis, dissolve in 80 mL of water warmed to 50°C, and add 0.2 mL of ammonia TS after cooling. After standing for 30 minutes, add water to make exactly 100 mL, and determine the optical rotation of this solution in a 100-mm cell.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Anhydrous Lactose in 10 mL of boiling water, and allow to cool: the solution is clear, and colorless or nearly colorless and has no more color than the following control solution. Determine the absorbance at 400 nm of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>,

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)

JP XVIII

Official Monographs / Anhydrous Lactose 1233
Lactose Hydrate / Official Monographs

using water as the control solution: not more than 0.04.

Control solution: To a mixture of 2.5 mL of Cobalt (II) Chloride CS, 6.0 mL of Iron (III) Chloride CS and 1.0 mL of Copper (II) Sulfate CS, add diluted dilute hydrochloric acid (1 in 10) to make 1000 mL.

(2) Acidity or alkalinity—Dissolve 6 g of Anhydrous Lactose by heating in 25 mL of freshly boiled and cooled water, and after cooling, add 0.3 mL of phenolphthalein TS: the solution is colorless, and not more than 0.4 mL of 0.1 mol/L sodium hydroxide VS is required to produce a pink or red color.

○(3) Heavy metals <1.07>—Proceed with 4.0 g of Anhydrous Lactose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 5 ppm). ○

(4) Proteins and light absorbing substances—Dissolve 1.0 g of Anhydrous Lactose in water to make 100 mL, and use this solution as the sample solution. Determine the absorbances of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the control solution: not more than 0.25 at between 210 nm and 220 nm, and not more than 0.07 at between 270 nm and 300 nm.

Loss on drying <2.41> Not more than 0.5% (1 g, 80°C, 2 hours).

Water <2.49> Not more than 1.0% (1 g, volumetric titration, direct titration. Use a mixture of methanol for water determination and formamide for water determination (2:1) instead of methanol for water determination).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Microbial limit <4.05> The acceptance criteria of TAMC and TYMC are 10^5 CFU/g and 5 x 10^5 CFU/g, respectively, and ○Salmonella and ○Escherichia coli are not observed.

Isomer ratio Place 10 mg of Anhydrous Lactose in a screw capped reaction vial for gas chromatography, add 4 mL of a mixture of pyridine, trimethylsilylimidazole and dimethylsulfoxide (117:44:39), stopper, and sonicate at room temperature for 20 minutes. After cooling, transfer 400 μL of this solution into a vial for injection, add 1 mL of pyridine, stopper tightly, mix, and use this fluid as the sample solution. Perform the test with 0.5 μL of the sample solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the peak areas of α-lactose and β-lactose, A1 and A2, and calculate the contents (%) of α-lactose and β-lactose in Anhydrous Lactose by the following equations.

\[
\text{Content (α-lactose)} = \frac{A_1}{(A_1 + A_2)} \times 100
\]

\[
\text{Content (β-lactose)} = \frac{A_2}{(A_1 + A_2)} \times 100
\]

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A fused silica column 0.25 mm in inside diameter and 15 m in length, coated with 5% diphenyl-95% dimethylpolysiloxane in 0.25 μm thickness. Use a middle polar inertness fused silica column 0.53 mm in inside diameter and 2 m in length as a guard column.

Column temperature: Maintain the temperature at 80°C for 1 minute after injection, raise to 150°C at a rate of 35°C per minute, then raise to 300°C at a rate of 12°C per minute, and maintain at 300°C for 2 minutes.

Injection port temperature: A constant temperature of about 275°C, or use cold-on-column injection.

Detector temperature: A constant temperature of about 325°C.

Carrier gas: Helium.

Flow rate: 2.8 mL per minute (Retention time of β-lactose is about 12 minutes).

Splitless.

System suitability—

System performance: Prepare a solution with 10 mg of a mixture of α-lactose and β-lactose (1:1) in the same manner as for preparing the sample solution, and proceed with 0.5 μL of this solution under the above operating conditions, and determine the retention times of the peaks of α-lactose and β-lactose: the relative retention time of α-lactose to β-lactose is about 0.9 with the resolution between these peaks being not less than 3.0.

System repeatability: When the test is repeated 6 times with 0.5 μL of the solution used in the system performance under the above operating conditions, the relative standard deviation of the peak area of β-lactose is not more than 5.0%.

Containers and storage Containers—Well-closed containers.

Lactose Hydrate

乳糖和水

C_{12}H_{22}O_{11}.H_2O: 360.31
β-D-Galactopyranosyl-(1→4)-α-D-glucopyranose monohydrate

[64044-51-5, Mixture of α- and β-lactose monohydrate]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia.

The corresponding part of the attributes/provisions which are agreed as non-harmonized within the scope of the harmonization is marked with symbols (●), and the corresponding parts which are agreed as the JP local requirement other than the scope of the harmonization are marked with symbols (○). Information on the harmonization with the European Pharmacopoeia and the U.S. Pharmacopeia is available on the website of the Pharmaceuticals and Medical Devices Agency.

Lactose Hydrate is the monohydrate of β-D-galactopyranosyl-(1→4)-α-D-glucopyranose.

● It is a disaccharide obtained from milk, consist of one unit of glucose and one unit of galactose. ○

The label states the effect where it is the granulated powder.

● Description Lactose Hydrate occurs as white, crystals, powder or granulated powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

Identification Determine the infrared absorption spectrum of Lactose Hydrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectropho-
Lactulose

ラクツロース

C_{12}H_{22}O_{11}: 342.30
β-D-Galactopyranosyl-(1→4)-D-fructose
[4618-18-2]

Lactulose is a solution of lactulose prepared by isomerizing lactose under the existing of alkaline and purified by ion-exchange resin.

It contains not less than 50.0% and not more than 56.0% of lactulose (C_{12}H_{22}O_{11}).

**Description** Lactulose occurs as a clear, colorless or light yellow, viscous liquid. It is odorless, and has a sweet taste.

It is miscible with water and with formamide.

**Identification (1)** To 0.7 g of Lactulose add 10 mL of water, 10 mL of a solution of hexammonium heptamolybdate tetrahydrate (1 in 25) and 0.2 mL of acetic acid (100), and heat in a water bath for 5 to 10 minutes: a blue color develops.

(2) Mix 0.3 g of Lactulose and 30 mL of water, add 16 mL of 0.5 mol/L iodine TS, then immediately add 2.5 mL of 8 mol/L sodium hydroxide TS, allow to stand for 7 minutes, and add 2.5 mL of diluted sulfuric acid (3 in 20). To this solution add a saturated solution of sodium sulfite heptahydrate until the solution turns light yellow, then add 3 drops of methyl orange TS, neutralize with a solution of sodium hydroxide (4 in 25), and add water to make 100 mL. To 10 mL of this solution add 5 mL of Fehling’s TS, and boil for 5 minutes: a red precipitate is produced.

**pH** 〈2.54〉 To 2.0 g of Lactulose add 15 mL of water: the pH of the solution is between 3.5 and 5.5.

**Specific gravity** 〈2.56〉 d_{20}^\text{\textdegree}: 1.320 – 1.360

**Purity (1)** Heavy metals 〈1.07〉—Proceed with 5.0 g of Lactulose according to Method 4, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution 1 and 1 mL of 0.1 mol/L hydrochloric acid TS (not more than 5 ppm).

(2)Arsenic 〈1.11〉—Prepare the test solution with 1.0 g of Lactulose according to Method 1, and perform the test (not more than 2 ppm).

(3) Galactose and lactose—Determine the heights of the peaks corresponding to galactose and lactose respectively, on the chromatogram obtained in Assay from the sample solution and the standard solution, and calculate the ratios of the peak heights of galactose and lactose to that of the internal standard from the sample solution, Q_{ts} and Q_{ts}, and then from the standard solution, Q_{bs} and Q_{bs}, it contains galactose of not more than 11%, and lactose of not more than 6%.

Amount (mg) of galactose (C_{6}H_{12}O_{6})

\[ M_S \times Q_{ts}/Q_{bs} \]
M₄: Amount (mg) of galactose taken

\[ \text{Amount (mg) of lactose (C₁₂H₂₂O₁₁, H₂O)} = M₄ \times \frac{Q_m}{Q_s} \]

M₅: Amount (mg) of lactose hydrate taken

Loss on drying \(<2.4\%>\): Not more than 35% (0.5 g, in vacuum, 80°C, 5 hours).

Residue on ignition \(<2.4\%>\): Not more than 0.1% (1 g).

Assay Weigh accurately about 1 g of Lactulose, add exactly 10 mL of the internal standard solution and water to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of Lactulose RS, about 80 mg of p-galactose and about 40 mg of lactose monohydrate, add exactly 10 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak height of lactulose to that of the internal standard.

\[ \text{Amount (mg) of lactulose (C₁₂H₂₂O₁₁)} = M₅ \times \frac{Q_1}{Q_2} \]

M₆: Amount (mg) of Lactulose RS taken

Internal standard solution—A solution of D-mannitol (1 in 20).

Operating conditions—
Detector: A differential refractometer.
Column: A stainless steel column 8 mm in inside diameter and 50 cm in length, packed with gel type strongly acidic ion-exchange resin for liquid chromatography (degree of crosslinkage: 6%) (11 μm in particle diameter).
Column temperature: A constant temperature of about 75°C.
Mobile phase: Water.
Flow rate: Adjust so that the retention time of lactulose is about 18 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lactulose and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak heights of lactulose, galactose and lactose to the height of the internal standard are not more than 2.0%, respectively.

Containers and storage Containers—Tight containers.

Lafutidine ラフチジン

C₂₂H₂₉N₂O₅S: 431.55

Lafutidine, when dried, contains not less than 99.0% and not more than 101.0% of lafutidine (C₂₂H₂₉N₂O₅S).

Description Lafutidine occurs as a white to pale yellow-white crystalline powder.
It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in ethanol (99.5), and practically insoluble in water.
A solution of Lafutidine in methanol (1 in 100) shows no optical rotation.
Lafutidine shows crystal polymorphism.

Identification (1) Determine the absorption spectrum of a solution of Lafutidine in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Lafutidine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Heavy metals \(<1.0\%>\)—Proceed with 2.0 g of Lafutidine according to Method 2, and perform the test.
Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.10 g of Lafutidine in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.85 to lafutidine, obtained from the sample solution is not larger than 3/10 times the peak area of lafutidine from the standard solution, the area of the peak other than lafutidine and the peak mentioned above, from the sample solution is not larger than 1/10 times the peak area of lafutidine from the standard solution, and the total area of the peaks other than lafutidine from the sample solution is not larger than 2/5 times the peak area of lafutidine from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 0.87 g of sodium 1-pentanesulfonate in 1000 mL of diluted phosphoric acid (1 in 1000). To 850 mL of this solution add 150 mL of acetonitrile.

Flow rate: Adjust so that the retention time of lafutidine is about 15 minutes.

Time span of measurement: About 6 times as long as the retention time of lafutidine.

System suitability—

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of lafutidine obtained with 5 μL of this solution is equivalent to 3.5 to 6.5% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lafutidine are not less than 8000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lafutidine is not more than 2.0%.

Loss on drying <2.41> Not more than 0.5% (1 g, reduced pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Lafutidine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 21.58 mg of C₂₂H₂₇N₂O₄S

Containers and storage Containers—Tight containers.

Lafutidine Tablets

ラフチジン錠

Lafutidine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of lafutidine (C₂₂H₂₇N₂O₄S: 431.55).

Method of preparation Prepare as directed under Tablets, with Lafutidine.

Identification Powder Lafutidine Tablets. To a portion of the powder, equivalent to 10 mg of lafutidine, add 10 mL of methanol, shake thoroughly, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.25>: it exhibits an absorption maximum between 271 nm and 275 nm.

Purity Related substances—To 10 Lafutidine Tablets add 4V/5 mL of the mobile phase, disintegrate the tablets by sonicating, then shake vigorously for not less than 30 minutes, and add the mobile phase to make V mL so that each mL contains about 1 mg of lafutidine (C₂₂H₂₇N₂O₄S). Centrifuge, and use the supernatant liquid as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, other than lafutidine and the peak having the relative retention time of about 0.85 to lafutidine, obtained from the sample solution is not larger than 1/5 times the peak area of lafutidine from the standard solution, and the total area of the peaks, other than lafutidine and the peak having the relative retention time of about 0.85, from the sample solution is not larger than 3/5 times the peak area of lafutidine from the standard solution.

Operating conditions—

Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Time span of measurement: About 6 times as long as the retention time of lafutidine.

System suitability—

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of lafutidine obtained with 5 μL of this solution is equivalent to 3.5 to 6.5% of that with 5 μL of the standard solution.

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lafutidine are not less than 8000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lafutidine is not more than 2.0%.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Lafutidine Tablets add exactly V mL of the internal standard solution so that each mL contains about 2 mg of lafutidine (C₂₂H₂₇N₂O₄S), disintegrate the tablet by sonicating, then shake vigorously for 30 minutes. Centrifuge this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 0.1 g of lafutidine for assay, previously dried under a reduced pressure (not exceeding 0.67 kPa) using phosphorus (V) oxide as desiccant for 4 hours, dissolve in exactly 50 mL of the internal standard solution, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of lafutidine (C₂₂H₂₇N₂O₄S) = Mₛ × Qₙ/ₜ / Qₜ × V/50

Mₛ: Amount (mg) of lafutidine for assay taken

Internal standard solution—A solution of ethyl aminobenzoate in a mixture of acetonitrile and water (4:1) (3 in 10,000).

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Lafutidine Tablets is not less than 75%.

Start the test with 1 tablet of Lafutidine Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter.
with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet V’ mL of the subsequent filtrate, add the dissolution medium to make exactly V’ mL so that each mL contains about 5.6 μg of lafutidine (C₂₃H₂₆N₃O₅S), and use this solution as the sample solution. Separately, weigh accurately about 25 mg of lafutidine for assay, previously dried under a reduced pressure (not exceeding 0.67 kPa) using phosphorus (V) oxide as desiccant for 4 hours, and dissolve in the dissolution medium to make exactly 100 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 25 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₂, of lafutidine in each solution.

Dissolution rate (%) with respect to the labeled amount of lafutidine (C₂₃H₂₆N₃O₅S)

\[ M_S = \frac{M_L}{C} \times A_1/A_2 \times V/V' \times 1/C \times 18 \]

Mₕ: Amount (mg) of lafutidine for assay taken

C: Labeled amount (mg) of lafutidine (C₂₃H₂₆N₃O₅S) in 1 tablet

**Operating conditions—**

Proceed as directed in the operating conditions in the Assay.

**System suitability—**

System performance: When the procedure is run with 25 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lafutidine are not less than 7000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lafutidine to that of the internal standard is not more than 1.0%.

**Assay**

To 20 Lafutidine Tablets add 4 V/5 mL of the internal standard solution, disintegrate the tablets with the aid of ultrasonic waves, then shake vigorously for 30 minutes. Add the internal standard solution to make exactly V mL so that each mL contains about 2 mg of lafutidine (C₂₃H₂₆N₃O₅S), centrifuge, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 0.1 g of lafutidine for assay, previously dried under a reduced pressure (not exceeding 0.67 kPa) using phosphorus (V) oxide as desiccant for 4 hours, and dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the sample solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of lafutidine to that of the internal standard.

**Internal standard solution—** A solution of ethyl aminobenzoate in a mixture of acetonitrile and water (4:1) (3 in 10,000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 0.87 g of sodium 1-pentanesulfonate in 1000 mL of diluted phosphoric acid (1 in 1000). To 850 mL of this solution add 150 mL of acetonitrile.

**Flow rate:** Adjust so that the retention time of lafutidine is about 15 minutes.

**System suitability—**

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, lafutidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lafutidine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

**Lanoconazole**

ラノコナゾール

![Chemical Structure](image)

C₁₄H₁₆ClN₅S₂: 319.83
(2E)-2-[(4RS)-4-(2-Chlorophenyl)-1,3-dithiolan-2-ylidene]-2-(1H-imidazol-1-yl)acetonitrile

[101530-10-3]

Lanoconazole, when dried, contains not less than 98.0% and not more than 102.0% of lanoconazole (C₁₄H₁₆ClN₅S₂).

**Description** Lanoconazole occurs as white to pale yellow, crystals or crystalline powder.

It is soluble in acetone, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

It is gradually colored to yellow by light.

A solution of Lanoconazole in acetone (1 in 25) shows no optical rotation.

**Identification** (1) To 0.1 g of Lanoconazole add 0.5 g of sodium hydroxide, heat gradually to melt, and carbonize. After cooling, add 10 mL of dilute hydrochloric acid: the gas evolved darkens moistened lead (II) acetate paper.

(2) Perform the test with Lanoconazole as directed under Flame Coloration Test <1.04> (2): a green color appears.

(3) Determine the absorption spectrum of a solution of Lanoconazole in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Lanoconazole RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Lanoconazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Lanoconazole RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 141 – 146°C

---

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
**Purity** (1) Heavy metals $<1.0\%$—Proceed with 2.0 g of Lanoconazole according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 0.10 g of Lanoconazole in 100 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography $2.0 / 17$ according to the following conditions. Determine each peak area by the automatic integration method: the total area of the peaks other than lanoconazole obtained from the sample solution is not larger than 1/2 times the peak area of lanoconazole from the standard solution.

**Operating conditions**—

Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase: Dissolve 0.576 g of sodium 1-nonanesulfonate in 1000 mL of a mixture of methanol, water and acetic acid (100): (55:44:1). Flow rate: Adjust so that the retention time of lanoconazole is about 7 minutes.

Time span of measurement: About 3 times as long as the retention time of lanoconazole, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 2.5 mL of the standard solution, and add methanol to make exactly 50 mL. Confirm that the peak area of lanoconazole obtained with 5 µL of this solution is equivalent to 3.5 to 6.5% of that with 5 µL of the standard solution.

System performance: Put 20 mL of the sample solution in a colorless vessel, and expose to ultraviolet light (main wavelength: 365 nm) for 30 minutes. When the procedure is run with 5 µL of this solution under the above operating conditions, the resolution between the peaks having the relative retention time of about 0.8 to lanoconazole and the peak of lanoconazole is not less than 1.5.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lanoconazole to that of the internal standard is not more than 1.0%.

**Loss on drying** $<2.4 / 1$ Not more than 0.4% (1 g, 105°C, 2 hours).

**Residue on ignition** $<2.44$ Not more than 0.1% (1 g).

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately about 50 mg each of Lanoconazole and Lanoconazole RS, both previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography $2.0 / 17$ according to the following conditions, and calculate the ratios, $Q_1$ and $Q_2$, of the peak area of lanoconazole to that of the internal standard.

\[
\text{Amount (mg) of lanoconazole (C}_{14}\text{H}_{10}\text{ClN}_2\text{S}_2) = M_S \times \frac{Q_1}{Q_2}
\]

\[
M_S: \text{Amount (mg) of Lanoconazole RS taken}
\]

**Internal standard solution**—A solution of diisopropyl 1,3-dithiolan-2-ylidenemalonate in methanol (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 295 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A mixture of methanol and water (11:9). Flow rate: Adjust so that the retention time of lanoconazole is about 9 minutes.

**System suitability**—

System performance: When the procedure is run with 5 µL of the standard solution under the above operating conditions, lanoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lanoconazole to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

### Lanoconazole Cream

ラノコナゾールクリーム

Lanoconazole Cream contains not less than 95.0% and not more than 105.0% of the labeled amount of lanoconazole (C$_{14}$H$_{10}$ClN$_2$S$_2$: 319.83).

**Method of preparation** Prepare as directed under Creams, with Lanoconazole.

**Identification** Warm Lanoconazole Cream to soften, if necessary. To a quantity of Lanoconazole Cream, equivalent to 50 mg of Lanoconazole, add 10 mL of diluted hydrochloric acid (1 in 6) saturated with sodium chloride, previously warmed, shake vigorously for 15 minutes to disperse, and centrifuge. Filter the supernatant liquid, wash the residue with 1.5 mL of diluted hydrochloric acid (1 in 6) saturated with sodium chloride, filter, and combine the washing with the filtrate. To the combined filtrate add 2.5 g of sodium hydrogen carbonate to dissolve, and extract with 10 mL of diethyl ether. Wash the diethyl ether layer with three 10-mL portions of water, and dry under reduced pressure. Dissolve the residue in 15 mL of acetone, and use this solution as the sample solution. Separately, dissolve 10 mg of lanoconazole in 10 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $2.0 / 17$. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, toluene, methanol and ammonia solution (28) (400:400:20:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same $R_f$ value.

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately a quantity of Lanoconazole Cream,
Lanoconazole Cutaneous Solution / Official Monographs

**System suitability**—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lanoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lanoconazole to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Lanoconazole Ointment**

Lanoconazole Ointment contains not less than 93.0% and not more than 107.0% of the labeled amount of lanoconazole (C₁₄H₁₉ClN₅S₂: 319.83).

**Method of preparation** Prepare as directed under Ointments, with Lanoconazole.

**Identification** To a quantity of Lanoconazole Ointment, equivalent to 50 mg of Lanoconazole, add 15 mL of hexane, sonicate to disperse, add 10 mL of methanol, and shake for 10 minutes. Centrifuge this solution, discard the hexane layer, and take the methanol layer. Wash the residue with a small amount of methanol if necessary, and combine the methanol layer with the aqueous layer. Evaporate the combined methanol layer to dryness and dissolve the residue in methanol, and add exactly 10 mL of the internal standard solution. Add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography for related substances. Spot 10 μL each of the standard solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, toluene, methanol and ammonia solution (28:400:400:20:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same Rf value.

**Assay** Conduct this procedure using light-resistant vessels. Pipet a volume of Lanoconazole Ointment, equivalent to about 50 mg of lanoconazole (C₁₄H₁₉ClN₅S₂), and add methanol to make exactly 50 mL. Pipet 15 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 15 mg of Lanoconazole RS, previously dried at 105°C for 2 hours, dissolve in methanol, and add exactly 10 mL of the internal standard solution. Add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with the standard solution and sample solution as directed under Liquid Chromatography for related substances, lanoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lanoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lanoconazole to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
washing with the methanol layer. Dry the combined methanol layer under reduced pressure, dissolve the residue in 40 mL of acetone, and use this solution as the sample solution. Separately, dissolve 10 mg of lanoconazole in 10 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, toluene, methanol and ammonia solution (28:400:400:20:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same \(RI\) value.

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately a quantity of Lanoconazole Vial equivalent to about 15 mg of lanoconazole (\(C_{16}H_{16}ClN_2S_2\)), add 20 mL of tetrahydrofuran, sonicate to disperse, and add exactly 10 mL of the internal standard solution. Add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 15 mg of Lanoconazole RS, previously dried at 105°C for 2 hours, dissolve in methanol, and add exactly 10 mL of the internal standard solution. Add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of lanoconazole to that of the internal standard.

\[
M_5:\text{Amount (mg) of Lanoconazole RS taken} = M_5 \times \frac{Q_T}{Q_S}
\]

**Internal standard solution**—A solution of diisopropyl 1,3-dithiolan-2-ylidenemalonate in methanol (1 in 1000).

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay under Lanoconazole.

**System suitability**—
System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, lanoconazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lanoconazole to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Lansoprazole**

ランソプラゾール

\[
\text{C}_{16}\text{H}_{16}\text{F}_{3}\text{N}_2\text{O}_2\text{S}: \text{369.36} \\
(RS)-2\text{-(3-Methyl-4-(2,2,2-trifluoroethoxy)pyridin-2-yl)[methyl]sulfinyl]-1H-benzimidazole} \\
[1H3577-45-3]
\]

Lansoprazole contains not less than 99.0% and not more than 101.0% of lansoprazole (\(C_{16}H_{16}F_3N_2O_2S\)), calculated on the anhydrous basis.

**Description** Lansoprazole occurs as a white to brownish white crystalline powder.

It is freely soluble in \(N, N\)-dimethylformamide, soluble in methanol, sparingly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Lansoprazole in \(N, N\)-dimethylformamide (1 in 10) shows no optical rotation.

Melting point: about 166°C (with decomposition).

It shows crystal polymorphism.

**Identification** (1) Determine the absorption spectrum of a solution of Lansoprazole in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Lansoprazole RS prepared in the same manners as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Lansoprazole as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum or the spectrum of Lansoprazole RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Lansoprazole in 20 mL of \(N, N\)-dimethylformamide: the solution is clear and not more colored than Matching Fluid G.

(2) Heavy metals \(<1.07\)—Proceed with 1.0 g of Lansoprazole in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \(<1.11\)—Prepare the test solution with 1.0 g of Lansoprazole in a platinum crucible according to Method 3, using a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5), and perform the test. Prepare the standard color with 1.0 mL of Standard Arsenic Solution (not more than 1 ppm).

(4) Related substances—Dissolve 50 mg of Lansoprazole in a mixture of dilute sodium hydroxide TS and methanol (3:1) to make 20 mL. To 2 mL of this solution add a mixture of dilute sodium hydroxide TS and methanol (3:1) to make 20 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of dilute sodium hydroxide TS and methanol (3:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 40 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine
Lansoprazole Delayed-release Capsules / Official Monographs

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)

Lansoprazole Delayed-release Capsules

ランソプラゾール腸溶カプセル

Lansoprazole Delayed-release Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of Lansoprazole (C_{13}H_{21}F_{3}N_{2}O_{5}S: 369.36).

Method of preparation Prepare as directed under Capsules, with Lansoprazole.

Identification Take out the contents of Lansoprazole Delayed-release Capsules, and powder. To a portion of the powder, equivalent to 5 mg of Lansoprazole, add 5 mL of methanol, shake thoroughly, and centrifuge. To 0.1 mL of the supernatant liquid add 10 mL of methanol, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (<2.2.4>: it exhibits a maximum between 282 nm and 286 nm.)

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lansoprazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

Flow rate: Adjust so that the retention time of lansoprazole is about 7 minutes.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lansoprazole to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Light-resistant. Storage—Light-resistant.

Each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 1.1 to lansoprazole, obtained from the sample solution is not larger than 2/5 times the peak area of lansoprazole from the standard solution, and the area of the peak other than lansoprazole and the peaks mentioned above from the sample solution is not larger than 1/10 times the peak area of lansoprazole from the standard solution. Furthermore, the total area of the peaks other than lansoprazole from the sample solution is not larger than 3/5 times the peak area of lansoprazole from the standard solution. For the area of the peaks, having the relative retention time of about 0.8, about 1.1 and about 1.2, multiply their correction factors, 0.8, 1.2, and 1.3, respectively.

Detector—An ultraviolet absorption photometer (wavelength: 285 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Water.

Mobile phase B: A mixture of acetonitrile, water and triethylamine (160:40:1), adjusted to pH 7.0 with phosphoric acid.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 40</td>
<td>90 → 20</td>
<td>10 → 80</td>
</tr>
<tr>
<td>40 – 50</td>
<td>20</td>
<td>80</td>
</tr>
</tbody>
</table>

Flow rate: About 0.8 mL per minute (the retention time of lansoprazole is about 29 minutes).

Time span of measurement: About 1.7 times as long as the retention time of lansoprazole.

Test for required detectability—Pipet 1 mL of the standard solution, and add a mixture of dilute sodium hydroxide TS and methanol (3:1) to make exactly 20 mL. Confirm that the peak area of lansoprazole obtained with 40 μL of this solution is equivalent to 4% to 6% of that with 40 μL of the standard solution.

System performance: When the procedure is run with 40 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lansoprazole are not less than 150,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 40 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lansoprazole is not more than 3.0%.

Water <2.4.8> Not more than 0.10% (0.5 g, coulometric titration).

Residue on ignition <2.4.4> Not more than 0.1% (1 g, platinum crucible).

Assay Weigh accurately about 50 mg each of Lansoprazole and Lansoprazole RS (separately determine the water <2.4.8> in the same manner as Lansoprazole), and dissolve each in exactly 10 mL of the internal standard solution. To 1 mL each of both solutions add diluting solution to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0.1> according to the following conditions, and calculate the ratios, Q_{1} and Q_{2}, of the peak area of lansoprazole to that of the internal standard.

\[
M_{S} = \frac{M_{S}}{Q_{1}/Q_{2}}
\]

\(M_{S}:\) Amount (mg) of Lansoprazole RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of 4'-ethoxyacetophenone in diluting solution (1 in 400).

Diluting solution: A mixture of water, acetonitrile and triethylamine (60:40:1), adjusted to pH 11.0 with phosphoric acid.

Detector—An ultraviolet absorption photometer (wavelength: 285 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica polymer coated silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and triethylamine (60:40:1), adjusted to pH 7.0 with phosphoric acid.

Flow rate: Adjust so that the retention time of lansoprazole is about 7 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lansoprazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lansoprazole to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Light-resistant.

Storage—Light-resistant.
Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take out the contents of 1 capsule of Lansoprazole Delayed-release Capsules, add 3V/10 mL of dilute sodium hydroxide TS, and sonicate with occasional stirring to disintegrate the contents completely. Add acetonitrile to make exactly V mL so that each mL contains about 0.15 mg of lansoprazole (C_{16}H_{18}F_{3}N_{2}O_{5}S). Centrifuge this solution, filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 5 mL of the filtrate, pipet 4 mL of the subsequent filtrate, add a mixture of acetonitrile and dilute sodium hydroxide TS (7:3) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Lansoprazole RS (separately determine the water <2.48> in the same manner as Lansoprazole), and dissolve in 60 mL of dilute sodium hydroxide TS, and add acetonitrile to make exactly 200 mL. Pipet 4 mL of this solution, add a mixture of acetonitrile and dilute sodium hydroxide TS (7:3) to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_{T} and A_{S}, at 294 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of lansoprazole (C_{16}H_{18}F_{3}N_{2}O_{5}S) = M_{S} \times A_{T}/A_{S} \times V/200

M_{S}: Amount (mg) of Lansoprazole RS taken, calculated on the anhydrous basis

Dissolution Being specified separately when the drug is granted approval based on the Law.

Assay Take out the contents of not less than 20 capsules of Lansoprazole Delayed-release Capsules. Weigh accurately the mass of the contents, and powder. Weigh accurately a portion of the powder, equivalent to about 0.3 g of lansoprazole (C_{16}H_{18}F_{3}N_{2}O_{5}S), add 60 mL of dilute sodium hydroxide TS, sonicate, and shake thoroughly. To this solution add 20 mL of acetonitrile and exactly 20 mL of the internal standard solution, shake thoroughly, and centrifuge. To 1 mL of the supernatant liquid add diluting solution to make 30 mL, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard not less than 5 mL of the first filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 30 mg of Lansoprazole RS (separately determine the water <2.48> in the same manner as Lansoprazole), dissolve in 6 mL of dilute sodium hydroxide TS and 2 mL of acetonitrile, and add exactly 2 mL of the internal standard solution. To 1 mL of this solution add diluting solution to make 30 mL, and use this solution as the standard solution. Perform the test with 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_{T} and Q_{S}, of the peak area of lansoprazole to that of the internal standard.

Amount (mg) of lansoprazole (C_{16}H_{18}F_{3}N_{2}O_{5}S) = M_{S} \times Q_{T}/Q_{S} \times 10

M_{S}: Amount (mg) of Lansoprazole RS taken, calculated on the anhydrous basis

Internal standard solution—A solution of 4'-ethoxyacetophenone in acetonitrile (3 in 400). Diluting solution: A mixture of water, acetonitrile and triethylamine (60:40:1), adjusted to pH 11.0 with phosphoric acid.

Operating conditions—Proceed as directed in the operating conditions in the Assay under Lansoprazole.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lansoprazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lansoprazole to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Lansoprazole Delayed-release Orally Disintegrating Tablets

ランソプラゾール腸溶性口腔内崩壊錠

Lansoprazole Delayed-release Orally Disintegrating Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of lansoprazole (C_{16}H_{18}F_{3}N_{2}O_{5}S: 369.36).

Method of preparation Prepare as directed under Tablets, with Lansoprazole.

Identification Powder 10 tablets of Lansoprazole Delayed-release Orally Disintegrating Tablets. To a portion of the powder, equivalent to 5 mg of Lansoprazole, add 5 mL of methanol, shake thoroughly, and centrifuge. To 0.1 mL of the supernatant liquid add 10 mL of methanol, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>：it exhibits a maximum between 282 nm and 286 nm.

Purity Related substances—Keep the sample solution and standard solution at not exceeding 5°C, and use them within 12 hours. Powder not less than 10 tablets of Lansoprazole Delayed-release Orally Disintegrating Tablets. To a portion of the powder, equivalent to 25 mg of Lansoprazole, add 10 mL of a mixture of dilute sodium hydroxide TS and methanol (3:1), sonicate, shake thoroughly, and centrifuge. To 2 mL of the supernatant liquid add diluting solution to make 20 mL, filter through a membrane filter with a pore size not exceeding 0.5 μm, and use the filtrate as the sample solution. Pipet 1 mL of the sample solution, add diluting solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 40 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having a relative retention time of about 1.1 to lansoprazole, obtained from the sample solution is not larger than 2/5 times the peak area of lansoprazole from the standard solution, and the area of the peak other than lansoprazole and the peak mentioned above from the sample solution is not larger than 1/5 times the peak area of lansoprazole from the standard solution. Furthermore, the total area of the peaks other than lansoprazole from the sample solution is not larger than 1.6 times the peak area of lansoprazole from the standard solution.

Diluting solution: A mixture of acetonitrile, water and
Assay Weigh accurately the mass of not less than 20 tablets of Lansoprazole Delayed-release Orally Disintegrating Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.3 g of lansoprazole (C₁₆H₁₃F₃N₂O₅S), add 60 mL of dilute sodium hydroxide TS, sonicate, and shake thoroughly. To this solution add 20 mL of acetonitrile and exactly 20 mL of the internal standard solution, shake thoroughly, and centrifuge. To 1 mL of the supernatant liquid add diluting solution to make 30 mL, and filter through a membrane filter with a pore size not exceeding 0.5 µm. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 30 mg of Lansoprazole RS (separately determine the water <2.48%) in the same manner as Lansoprazole), dissolve in 6 mL of dilute sodium hydroxide TS and 2 mL of acetonitrile, and add exactly 2 mL of the internal standard solution. To 1 mL of this solution add diluting solution to make 30 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.017 according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of lansoprazole to that of the internal standard.

\[
\text{Amount (mg) of lansoprazole (C}_{16}\text{H}_{13}\text{F}_3\text{N}_2\text{O}_5\text{S}) = M_5 \times \frac{Q_1}{Q_2} \times 10
\]

\[M_5: \text{Amount (mg) of Lansoprazole RS taken, calculated on the anhydrous basis}\]

Internal standard solution—A solution of 4’-ethoxyacetophenone in acetonitrile (3 in 400).

Diluting solution: A mixture of water, acetonitrile and triethylamine (60:40:1), adjusted to pH 11.0 with phosphoric acid.

Operating conditions—Proceed as directed in the operating conditions in the Assay under Lansoprazole.

System suitability—System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lansoprazole is not more than 3.0%.

Uniformity of dosage units <6.02>

Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Lansoprazole Delayed-release Orally Disintegrating Tablets add 3V/10 mL of dilute sodium hydroxide TS, and sonicate with occasional stirring to disintegrate the tablet completely. Add acetonitrile to make exactly V mL so that each mL contains about 0.15 mg of lansoprazole (C₁₆H₁₃F₃N₂O₅S). Centrifuge this solution, and filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.5 µm. Discard the first 5 mL of the filtrate, and use this solution as the sample solution. To 1 mL of this solution add diluting solution to make 30 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.017 according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of lansoprazole to that of the internal standard.

\[
\text{Amount (mg) of lansoprazole (C}_{16}\text{H}_{13}\text{F}_3\text{N}_2\text{O}_5\text{S}) = M_5 \times \frac{A_1}{A_5} \times \frac{V}{200}
\]

\[M_5: \text{Amount (mg) of Lansoprazole RS taken, calculated on the anhydrous basis}\]

Disintegration Being specified separately when the drug is granted approval based on the Law.
Latamoxef Sodium

ラタモキセフナトリウム

C₉H₁₈N₅Na₂O₅S; 564.44
Disodium (6R,7R)-7-[2-carboxylato-2-(4-hydroxyphenyl)acetamidino]-7-methoxy-3-(1-methyl-1H-tetrazol-5-ylsulfanyl)methyl)-8-oxo-5-oxa-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

Latamoxef Sodium contains not less than 830 \( \mu \)g (potency) and not more than 940 \( \mu \)g (potency) per mg, calculated on the anhydrous basis. The potency of Latamoxef Sodium is expressed as mass (potency) of latamoxef (C₉H₁₈N₅O₅S: 520.47).

Description Latamoxef Sodium occurs as white to light yellow-white, powder or masses.

It is very soluble in water, freely soluble in methanol, and slightly soluble in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Latamoxef Sodium (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Latamoxef Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the \(^1\)H spectrum of a solution of Latamoxef Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A and B, at around \( \delta \) 3.5 ppm and at around \( \delta \) 4.0 ppm. The ratio of the integrated intensity of these signals, A:B, is about 1:1.

(4) Latamoxef Sodium responds to Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> \([\alpha]_D^{20}\) –32 – –40° (0.5 g calculated on the anhydrous basis, phosphate buffer solution (pH 7.0), 50 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 1.0 g of Latamoxef Sodium in 10 mL of water is between 5.0 and 7.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Latamoxef Sodium in 10 mL of water: the solution is clear and has no more color than the following control solution.

Control solution: To a mixture of 3.0 mL of Cobalt (II) Chloride CS and 36 mL of Iron (III) Chloride CS add 11 mL of diluted dilute hydrochloric acid (1 in 10). To 2.5 mL of this solution add 7.5 mL of diluted dilute hydrochloric acid (1:10).

(2) Heavy metals <1.07>—Carbonize 1.0 g of Latamoxef Sodium by heating gently, previously powdered if it is masses. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (1 in 10), and burn the ethanol. After cooling, add 1 mL of sulfuric acid. Proceed according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution by dissolving 1.0 g of Latamoxef Sodium in 20 mL of water, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 25 mg of Latamoxef Sodium in water to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of 1-methyl-1H-tetrazole-5-thiol, having the relative retention time of about 0.5 to the first eluted peak of the two peaks of latamoxef, obtained from the sample solution is not larger than the peak area of latamoxef from the standard solution, and the peak area of decarboxyllatamoxef, having the relative retention time of about 1.7 to the first peak of the two peaks of latamoxef, is not larger than 2 times that of latamoxef from the standard solution. For the peak area of 1-methyl-1H-tetrazole-5-thiol, multiply its correction factor, 0.52. Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of latamoxef is not more than 2.0%.

Water <2.48> Not more than 5.0% (0.5 g, volumetric titration, back titration).

Isomer ratio Dissolve 25 mg of Latamoxef Sodium in water to make 50 mL, and use this solution as the sample solution. Perform the test with 5 \( \mu \)L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas, \( A_1 \) and \( A_2 \), of the two peaks in order of elution, which appear close to each other at the retention time of about 10 minutes: \( A_1/A_2 \) is between 0.3 and 1.7.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 7.7 g of ammonium acetate in water to make 1000 mL. To 950 mL of this solution add 50 mL of methanol.

Flow rate: Adjust so that the retention time of the first eluted peak of latamoxef is about 8 minutes.

System suitability—

System performance: When the procedure is run with 5 \( \mu \)L of the sample solution under the above operating conditions,
the resolution between the two peaks of latamoxef is not less than 3.

System repeatability: When the test is repeated 3 times with 5 μL of the sample solution under the above operating conditions, the relative standard deviation of the area of the first eluted peak of latamoxef is not more than 2.0%.

Assay Weigh accurately an amount of Latamoxef Sodium and Latamoxef Ammonium RS, equivalent to about 25 mg (potency) each, dissolve in exactly 5 mL of the internal standard solution, add water to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.2.1) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of latamoxef to that of the internal standard.

Amount [μg (potency)] of latamoxef (C₂₁H₂₃N₂O₂·S) = Mₛ × Q₁/Q₂ × 1000

Mₛ: Amount [mg (potency)] of Latamoxef Ammonium RS taken

Internal standard solution—A solution of m-cresol (3 in 200).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 6.94 g of potassium dihydrogen phosphate, 3.22 g of disodium hydrogen phosphate dodecahydrate and 1.60 g of tetra-n-butylammonium bromide in water to make exactly 1000 mL. To 750 mL of this solution add 250 mL of methanol.
Flow rate: Adjust so that the retention time of latamoxef is about 7 minutes.
System suitability—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, latamoxef and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of latamoxef to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Not exceeding 5°C.

Lauromacrogol

ラウロマクロゴール

Lauromacrogol is a polyoxyethylene ether prepared by the polymerization of ethylene oxide with lauryl alcohol.

Description Lauromacrogol is a colorless or light yellow, clear liquid or a white, petrolatum-like or waxy solid. It has a characteristic odor, and a somewhat bitter and slightly irritating taste.

It is very soluble in ethanol (95) and in diethyl ether. It is freely soluble or dispersed as fine oily drops in water.

Identification (1) Shake thoroughly 0.5 g of Lauromacrogol with 10 mL of water and 5 mL of ammonium thiocyanate-cobalt nitrate TS, then shake with 5 mL of 1-butanol, and allow to stand: the 1-butanol layer becomes blue in color.

(2) Warm Lauromacrogol to melt, if necessary, and determine the infrared absorption spectrum as directed in the liquid film method under Infrared Spectrophotometry (2.2.25): it exhibits absorption at the wave numbers of between 3500 cm⁻¹ and 3400 cm⁻¹, and about 2920 cm⁻¹, 1530 cm⁻¹, 1250 cm⁻¹, and 1115 cm⁻¹.

Purity (1) Acidity—Transfer 10.0 g of Lauromacrogol into a flask, and add 50 mL of neutralized ethanol. Heat on a water bath nearly to boil, shaking once or twice while heating. Cool, and add 5.3 mL of 0.1 mol/L sodium hydroxide VS and 5 drops of phenolphthalein TS: a red color develops.

(2) Unsaturated compound—Shake 0.5 g of Lauromacrogol with 10 mL of water, and add 5 drops of bromine TS: the color of the solution does not disappear.

Residue on ignition <2.4> Not more than 0.2% (1 g).

Lenampicillin Hydrochloride

レナンピシリン塩酸塩

[C₂₁H₂₃N₂O₂·S·HCl: 497.95
5-Methyl-2-oxo[1,3]dioxol-4-ylmethyl (2S,5R,6R)-6-[(2R)-2-amino-2-phenylacetylamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrochloride [80734-02-7]

Lenampicillin Hydrochloride is the hydrochloride of ampicillin methylxodioxolenylmethyl ester.

It contains not less than 653 μg (potency) and not more than 709 μg (potency) per mg, calculated on the anhydrous basis and corrected by the amount of the residual solvents. The potency of Lenampicillin Hydrochloride is expressed as mass (potency) of ampicillin (C₁₆H₁₇N₂O₂S: 349.40).

Description Lenampicillin Hydrochloride occurs as a white to light yellow-white powder.

It is very soluble in water, in methanol and in ethanol (95), and freely soluble in N,N-dimethylformamide.

Identification (1) Determine the infrared absorption spectrum of Lenampicillin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry (2.2.25), and compare the spectrum with the Reference Spectrum or the spectrum of Lenampicillin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 1 mL of a solution of Lenampicillin Hydrochloride (1 in 100) add 0.5 mL of dilute nitric acid and 1 drop of
silver nitrate TS: a white precipitate is formed.  

Optical rotation $\angle 2.49^\circ \ [\alpha]_D^{20} : +174^\circ \ +194^\circ \ (0.2 \ g \ \text{calculated on the anhydrous basis and corrected on the amount of neutral solvent, ethanol (95), } 20 \ mL, 100 \ mm)$. 

**Purity** (1) Heavy metals $<1.07^\circ$—Proceed with 2.0 g of Lenampicillin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic $<1.1D$—Prepare the test solution with 1.0 g of Lenampicillin Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(3) Free ampicillin—Weigh accurately about 0.1 g of Lenampicillin Hydrochloride, dissolve in exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately an amount of Ampicillin RS, equivalent to about 25 mg (potency), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. The sample solution should be used to the following test immediately after the solution is prepared. Perform the test with 10 $\mu$L each of the sample solution and standard solution as directed under Liquid chromatography $<2.6D$ according to the following conditions, and calculate the ratios, $Q_t$ and $Q_o$, of the peak height of ampicillin to that of the internal standard: the amount of ampicillin is not more than 1.0%.

Amount (% ) of ampicillin ($C_6H_{13}N_2O_3S$) 

$$M_3 = M_s/M_t \times Q_t/Q_o \times 2$$

$M_3$: Amount [mg (potency)] of Ampicillin RS taken

$M_t$: Amount (mg) of Lenampicillin Hydrochloride taken

**Internal standard solution**—A solution of anhydrous caffeine in the mobile phase (1 in 50,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 $\mu$m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.22 g of potassium dihydrogen phosphate in water to make 900 mL, and add 100 mL of acetonitrile.

Flow rate: Adjust so that the retention time of ampicillin is about 7 minutes.

**System suitability**—

System performance: When the procedure is run with 10 $\mu$L of the standard solution under the above operating conditions, ampicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak height of ampicillin to that of the internal standard is not more than 5%.

(4) Penicilloic acid—Weigh accurately about 0.1 g of Lenampicillin Hydrochloride, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Pipet 10 mL of the sample solution, add 10 mL of potassium hydrogen phthalate buffer solution (pH 4.6) and exactly 10 mL of 0.005 mol/L iodine VS, allow to stand for exactly 15 minutes while protecting from exposure to light, and titrate $<2.5D$ with 0.01 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction: the amount of penicilloic acid ($C_6H_{13}N_2O_3S$: 367.42) is not more than 3.0%.

Each mL of 0.01 mol/L sodium thiosulfate VS 

$$= 0.45 \ mg \ of \ C_6H_{13}N_2O_3S$$

(5) Residual solvent $<2.4D$—Weigh accurately about 0.25 g of Lenampicillin Hydrochloride, dissolve in exactly 1 mL of the internal standard solution, add N,N-dimethylformamide to make 5 mL, and use this solution as the sample solution. Separately, weigh accurately about 80 mg of 2-propanol and about 0.12 g of ethyl acetate, and add N,N-dimethylformamide to make exactly 100 mL. Pipet 1 mL and 3 mL of this solution, add exactly 1 mL each of the internal standard solution, add N,N-dimethylformamide to make 5 mL, and use these solutions as the standard solution (1) and the standard solution (2), respectively. Perform the test with 4 $\mu$L each of the sample solution, standard solution (1) and (2) as directed under Gas Chromatography $<2.0D$ according to the following conditions, and calculate the ratios, $Q_2$ and $Q_3$, of the peak height of 2-propanol and ethyl acetate to that of the internal standard of the sample solution, the ratios, $Q_{5a1}$ and $Q_{5a2}$, of the peak height of 2-propanol and ethyl acetate to that of the internal standard of the standard solution (1) and the ratios, $Q_{5b1}$ and $Q_{5b2}$, of the peak height of 2-propanol and ethyl acetate to that of the internal standard of the standard solution (2). Calculate the amounts of 2-propanol and ethyl acetate by the following equations: not more than 0.7% and not more than 1.7%, respectively.

Amount (%) of 2-propanol 

$$= M_{5a1}/M_t \times (2Q_2 - 3Q_{5a1} + Q_{5a2})/(Q_{5a2} - Q_{5a1})$$

Amount (%) of ethyl acetate 

$$= M_{5b1}/M_t \times (2Q_3 - 3Q_{5b1} + Q_{5b2})/(Q_{5b2} - Q_{5b1})$$

$M_{5a1}$: Amount of 2-propanol taken

$M_{5b1}$: Amount of ethyl acetate taken

$M_t$: Amount (g) of the Lenampicillin Hydrochloride taken

**Internal standard solution**—A solution of cyclohexane in N,N-dimethylformamide (1 in 1000).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 3 m in length, packed with siliceous earth for gas chromatography (180 – 250 $\mu$m in particle diameter) coated with tetra-kishydroxypropylethylendiamine for gas chromatography at the ratio of 10 to 15%.

Column temperature: A constant temperature of about 80°C.

Injection port temperature: A constant temperature of about 160°C.

Carrier gas: Nitrogen.

Flow rate: Adjust so that the retention time of the internal standard is about 1 minute.

**System suitability**—

System performance: When the procedure is run with 4 $\mu$L of the standard solution (2) under the above operating conditions, the internal standard, ethyl acetate and 2-propanol are eluted in this order, and the resolution between the peaks of the internal standard and ethyl acetate is not less than 2.0.

System repeatability: When the test is repeated 3 times with 4 $\mu$L of the standard solution (2) under the above operating conditions, the relative standard deviation of the ratios of the peak height of ethyl acetate to that of the internal standard is not more than 5.0%.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 3.)
Lenograstim (Genetical Recombination)

**Water** Not more than 1.5% (1 g, volumetric titration, direct titration).

**Residue on ignition** Not more than 0.2% (1 g).

**Assay** Weigh accurately an amount of Lenampicillin Hydrochloride and Lenamicillin Hydrochloride RS, equivalent to about 0.1 g (potency), dissolve each in the internal standard solution to make exactly 10 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Qₜ and Qₛ, of the peak area of lenamicillin to that of the internal standard.

\[
\text{Amount [μg (potency)] of ampicillin (C₁₆H₁₉N₃O₄S)} = Mₛ \times \frac{Qₜ}{Qₛ} \times 1000
\]

\[
Mₛ: \text{Amount [mg (potency)] of Lenampicillin Hydrochloride RS taken}
\]

**Internal standard solution** — A solution of ethyl aminobenzoate in the mobile phase (1 in 4000).

**System suitability**—When the procedure is run with 5 μL of the standard solution under the above operating conditions, lenamicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**—When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of lenamicillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

Lenograstim (Genetical Recombination)

LENOGRASTIM (GENETICAL RECOMBINATION)

**Protein moiety**

\[
\text{C₈₄0H₁₃₃0N₂₂₂O₂₄₂S₈: 18667.41 (Protein moiety)} \quad [135968-09-1]
\]

Lenograstim (Genetical Recombination) is an aqueous solution in which a desired product is a recombinant human granulocyte colony-stimulating factor produced in Chinese hamster ovary cells. It is a glycoprotein (molecular mass: ca. 20,000) consisting of 174 amino acid residues.

It contains not less than 0.40 mg and not more than 0.60 mg of protein per mL, and not less than 1.02 × 10⁸ units sperm gon protein.

**Description** Lenograstim (Genetical Recombination) occurs as a clear and colorless liquid.

**Identification (1)** Use Lenograstim (Genetical Recombination) and Lenograstim RS as the sample solution and the standard solution, respectively. Perform the test with a volume each of the sample solution and standard solution, equivalent to 20 μg of protein, as directed under Liquid Chromatography according to the following conditions: the retention times of the two peaks of lenograstim in the chromatogram obtained from the sample solution and of those in the chromatogram obtained from the standard solution are the same.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 215 nm).

**Column:** A stainless steel column 7.5 mm in inside diameter and 7.5 cm in length, packed with diethylaminoethyl group binding synthetic polymer for liquid chromatography (10 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 9.53 g of potassium dihydrogen phosphate in water to make exactly 700 mL, and add acetonitrile to make exactly 1000 mL.

**Flow rate:** Adjust so that the retention time of lenamicillin is about 6 minutes.

**System performance**—When the procedure is run with 5 μL of the standard solution under the above operating conditions, lenamicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**—When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of lenamicillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Flow rate: Adjust so that the retention time of the first appeared peak of lenograstim is about 27 minutes.

System suitability—
System performance: When the procedure is run with a volume of the standard solution, equivalent to 20 μg of protein, under the above operating conditions, the resolution between the two peaks of lenograstim is not less than 4.

(2) Desalt 2 mL each of Lenograstim (Genetical Recombination) and Lenograstim RS by a suitable method, and assign them as the desalted sample and the desalted reference standard, respectively. Add the desalted sample and the desalted reference standard in 100 mL each of a solution of V8 protease in 0.05 mol/L ammonium hydrogen carbonate solution. Add 20 μL each of a solution of V8 protease in 0.05 mol/L ammonium hydrogen carbonate solution (1 in 1000), and allow to stand at 37°C for 18 hours. Then, add 10 μL of 2-mercaptoethanol to them, and allow to stand at 37°C for 4 hours. To these solutions add a solution of 27 mg of iodoacetic acid in 150 mL of sodium hydroxide TS, and react at 37°C for 15 minutes, avoiding exposure to light. Remove the reagents from these reaction solution by a suitable method, and assign obtained these substances as the reduced carboxymethylated sample and the reduced carboxymethylated reference standard. To these substances add 100 μL each of a mixture of water and 1-propanol (3:2), add 4 mL of urea-EDTA TS, and allow them to stand at 37°C for 18 hours. Then, add 10 μL of sodium hydroxide TS, and allow to stand for 10 minutes. Evaporate the solution to dryness at about 50°C under reduced pressure, add 200 μL of methanol to the residue, and evaporate to dryness at 50°C under reduced pressure. To the residue add 50 μL of a mixture of pyridine, 1,1,1,3,3,3-hexamethyldisilazane and chlorotrimethylsilane (10:2:1), stopper tightly, shake vigorously for 30 seconds, and warm at 50°C for 10 minutes. After cooling, add 300 μL of pentane, stir gently, then add 300 μL of water, and stir gently. Separate the upper layer, evaporate to concentrate to about 10 μL under a stream of nitrogen, and use this as the sample solution. Separately, weigh accurately about 54 mg of d-galactose and about 33 mg of N-acetylgalactosamine, dissolve them separately in water to make exactly 20 mL each, and use these solutions as the reference solution and N-acetylgalactosamine solution, respectively. Weigh accurately about 9.3 mg of N-acetylneuraminic acid, add exactly 1 mL of the d-galactose solution and exactly 2 mL of the N-acetylgalactosamine solution to dissolve, and add water to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 1 mL of the internal standard solution, and freeze-dry 40 μL of this solution. Dissolve the freeze-dried substance in 250 μL of a mixture of methanol and acetyl chloride (9:1), seal the tube, and heat at 90°C for 2 hours. After cooling, open the tube, and dry the content under reduced pressure. To the residue add 200 μL of methanol, and evaporate to dryness under reduced pressure. Dissolve the residue in 200 μL of a solution of pyridine in methanol (1 in 10) and 50 μL of acetic anhydride, stopper the tube tightly, and allow to stand for 10 minutes. Evaporate the solution to dryness at about 50°C under reduced pressure, add 200 μL of methanol to the residue, and evaporate to dryness at 50°C under reduced pressure. To the residue add 50 μL of a mixture of pyridine, 1,1,1,3,3,3-hexamethyldisilazane and chlorotrimethylsilane (10:2:1), stopper tightly, shake vigorously for 30 seconds, and warm at 50°C for 10 minutes. After cooling, add 300 μL of pentane, stir gently, then add 300 μL of water, and stir gently. Separate the upper layer, evaporate to concentrate to about 10 μL under a stream of nitrogen, and use this as the sample solution. Separately, weigh accurately about 54 mg of d-galactose and about 33 mg of N-acetylgalactosamine, dissolve them separately in water to make exactly 20 mL each, and use these solutions as the reference solution and N-acetylgalactosamine solution, respectively. Weigh accurately about 9.3 mg of N-acetylneuraminic acid, add exactly 1 mL of the d-galactose solution and exactly 2 mL of the N-acetylgalactosamine solution to dissolve, and add water to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 1 mL of the internal standard solution, and freeze-dry 40 μL of this solution. Dissolve the freeze-dried substance in 250 μL of a mixture of methanol and acetyl chloride (9:1), then proceed in the same manner as the sample solution, and use the solution obtained as the monosaccharide standard solution. Perform the test with 2 μL each of the sample solution and the monosaccharide standard solution as directed under Gas Chromatography 2.02 according to the following conditions, and compare the chromatograms from these solutions: both chromatograms show the similar peaks at the corresponding retention time.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of water, acetonitrile for liquid chromatography and trifluoroacetic acid (950:50:1).
Mobile phase B: A mixture of acetonitrile for liquid chromatography, water, and trifluoroacetic acid (800:200:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>

</tbody>
</table>

Flow rate: Adjust so that the retention time of the first appeared peak is about 33 minutes.

System suitability—
System performance: When the procedure is run with the standard solution under the above operating conditions, the resolution between the first appeared peak and the second appeared peak is not less than 15.

Monosaccharide composition Put exactly 2 mL of Lenograstim (Genetical Recombination) into a precolunn, packed with 0.36 g of octadecylsilanized silica gel for pretreatment, wash the column with 5 mL of a mixture of water, acetonitrile and trifluoroacetic acid (600:400:1), then elute with a mixture of acetonitrile, water and trifluoroacetic acid (800:200:1), and collect exactly 5 mL of the first eluate. Pipet 1.5 mL of the eluate in a test tube, add exactly 20 μL of the internal standard solution, and lyophilize. Dissolve the lyophilized substance in 250 μL of a mixture of methanol and acetyl chloride (9:1), seal the tube, and heat at 90°C for 2 hours. After cooling, open the tube, and dry the content under reduced pressure. To the residue add 200 μL of methanol, and evaporate to dryness under reduced pressure. Dissolve the residue in 200 μL of a solution of pyridine in methanol (1 in 10) and 50 μL of acetic anhydride, stopper the tube tightly, and allow to stand for 10 minutes. Evaporate the solution to dryness at about 50°C under reduced pressure, add 200 μL of methanol to the residue, and evaporate to dryness at 50°C under reduced pressure. To the residue add 50 μL of a mixture of pyridine, 1,1,1,3,3,3-hexamethyldisilazane and chlorotrimethylsilane (10:2:1), stopper tightly, shake vigorously for 30 seconds, and warm at 50°C for 10 minutes. After cooling, add 300 μL of pentane, stir gently, then add 300 μL of water, and stir gently. Separate the upper layer, evaporate to concentrate to about 10 μL under a stream of nitrogen, and use this as the sample solution. Separately, weigh accurately about 54 mg of d-galactose and about 33 mg of N-acetylgalactosamine, dissolve them separately in water to make exactly 20 mL each, and use these solutions as the reference solution and N-acetylgalactosamine solution, respectively. Weigh accurately about 9.3 mg of N-acetylneuraminic acid, add exactly 1 mL of the d-galactose solution and exactly 2 mL of the N-acetylgalactosamine solution to dissolve, and add water to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 1 mL of the internal standard solution, and freeze-dry 40 μL of this solution. Dissolve the freeze-dried substance in 250 μL of a mixture of methanol and acetyl chloride (9:1), then proceed in the same manner as the sample solution, and use the solution obtained as the monosaccharide standard solution. Perform the test with 2 μL each of the sample solution and the monosaccharide standard solution as directed under Gas Chromatography 2.02 according to the following conditions, and calculate the ratios of each peak area of d-galactose, N-acetylgalactosamine and N-acetylenuraminic acid to that of the internal standard, Q1 and Q2. Calculate the amount (mol/mol of lenograstim) of each monosaccharide by the following formula: the amounts of d-galactose, N-acetylgalactosamine and N-acetylenuraminic acid are between 0.7 and 1.2, between 0.7 and 1.2, and between 1.0 and 2.0, respectively.

Amount (mol/mol of lenograstim) of each monosaccharide = M/(Mn × Dd) × Q1/Q2 × 18,667/C × 5/3

M: Amount (mg) of each monosaccharide taken
Mn: Molecular mass of each monosaccharide
Dd: Dilution rate of each monosaccharide
N-galactose: 180.16
N-acetylgalactosamine: 221.21
N-acetylenuraminic acid: 309.27
Dd: Dilution rate of each monosaccharide
d-galactose: 20,000
N-acetylgalactosamine and: 10,000
N-acetylmuramic acid: 1000
C: Protein concentration (mg/mL) of Lenograstim
(Genetical Recombination)
18,667: Molecular mass of protein moiety of lenograstim

Internal standard solution—Dissolve 48 mg of myoinositol
in water to make 50 mL. To 1 mL of this solution add water
to make 20 mL.

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A fused silica column 0.25 mm in inside diameter
and 30 m in length, coated the inside surface with 7% cyanopropyl-7% phenyl-methyl silicon polymer for gas chro-
matography 0.25 μm in thickness.
Column temperature: Rise the temperature at a rate of
10°C per minute from 110°C to 185°C, then at a rate of 2°C
per minute to 210°C, and to 260°C at a rate of 8°C per
minute, and maintain 260°C for 15 minutes.
Carrier gas: Helium.
Flow rate: Adjust so that the retention time of the internal
standard is about 24 minutes.

System suitability—
System performance: When the procedure is run with 2 μL
of the monosaccharide standard solution under the above
operating conditions, D-galactose, the internal standard, N-
acetylgalactosamine and N-acetylmuramic acid are eluted
in this order, and the resolution between the peaks of the
internal standard and N-acetylgalactosamine is not less than 10.

pH $\leq 2.54$ 7.7 – 8.3

Purity (1) Related substances—Perform the test with a
volume of Lenograstim (Genetical Recombination), equiva-
 lent to 30 μg of protein, as directed under Liquid Chroma-
tography $\leq 2.0\%$ according to the following conditions. De-
termine each peak area by the automatic integration method,
and calculate the amount of these peaks by the area percen-
tage method excluding the area of the solvent peak: the total
amount of the peaks other than lenograstim is not more than
1.0%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wave-
length: 215 nm).
Column: A stainless steel column 7.5 mm in inside diam-
er and 60 cm in length, packed with porous silica gel for liq-
uid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about
25°C.
Mobile phase: Dissolve 1.4 g of anhydrous disodium
dydrogen phosphate and 5.8 g of sodium chloride in water
to make 1000 mL (Solution A). Separately, dissolve 1.6 g of so-
dium dihydrogen phosphate dihydrate and 5.8 g of sodium
chloride in water to make 1000 mL (Solution B). Adjust the
pH of Solution A to 7.4 with Solution B.
Flow rate: Adjust so that the retention time of lenograstim
is about 21 minutes.
Time span of measurement: About 2 times as long as the
retention time of lenograstim.

System suitability—
Test for required detectability: When the procedure is run
with 60 μL of diluted Lenograstim RS with the solvent of
Lenograstim (Genetical Recombination) containing 0.1
vol% polysorbate 20 (1 in 500) under the above operating
conditions, the peak of lenograstim is detectable.
System performance: When the procedure is run using
Lenograstim RS under the above operating conditions, the
number of theoretical plates of the peak of lenograstim is
not less than 2700.

(2) Host cell proteins—Being specified separately when the
drug is granted approval based on the Law.

(3) Host cell DNA—Being specified separately when the
drug is granted approval based on the Law.

Assay (1) Protein—Use Lenograstim (Genetical Recom-
bination) and Lenograstim RS as the sample solution and the
standard solution, respectively. Perform the test with exactly
30 μL each of the sample solution and standard solution as
directed under Liquid Chromatography $\leq 2.0\%$ according to the
following conditions, and determine the peak areas, $A_1$
and $A_2$, of lenograstim in each solution.

Amount (mg) of protein in 1 mL of Lenograstim
(Genetical Recombination)

$$C_2 \times \frac{A_1}{A_2}$$

$C_2$: Concentration (mg/mL) of protein in Lenograstim RS

Operating conditions—
Detector: An ultraviolet absorption photometer (wave-
length: 220 nm).
Column: A stainless steel column 4.6 mm in inside diam-
er and 25 cm in length, packed with octadecylsilanized silica
gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about
25°C.
Mobile phase A: A mixture of water, acetonitrile for liq-
uid chromatography and trifluoroacetic acid (600:400:1).
Mobile phase B: A mixture of acetonitrile for liquid chro-
matography, water and trifluoroacetic acid (800:200:1).
Flowing of mobile phase: Control the gradient by mixing the
mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 40</td>
<td>80 → 30</td>
<td>20 → 70</td>
</tr>
</tbody>
</table>

Flow rate: Adjust so that the retention time of lenograstim
is about 35 minutes.

System suitability—
System performance: When the procedure is run with 30
μL of the standard solution under the above operating
conditions, the number of theoretical plates of the peak of
lenograstim is not less than 2900.

System repeatability: When the test is repeated 6 times
with 30 μL of the standard solution under the above operating
conditions, the relative standard deviation of the peak
area of lenograstim is not more than 4.0%.

(2) Specific activity—Dilute Lenograstim (Genetical Recom-
bination) with FBS-IMDM so that each mL contains an
estimate amount of 7.69 units, 10.0 units and 13.0 units,
and name them as the sample solution (1), the sample
solution (2) and the sample solution (3), respectively. Separa-
tely, dilute Lenograstim RS with FBS-IMDM so that each mL
contains 7.69 units, 10.0 units and 13.0 units, and name
them as the standard solution (1), the standard solution (2)
and the standard solution (3), respectively. Put exactly 100
μL each of the sample solutions and standard solutions in
wells of a sterile disposable multiple well plate, add 50 μL
each of NFS-60 cell suspension (prepared by adding FBS-
IMDM so the each mL contains about 5 x 10^6 cells) to each
well and mix to make homogenize, and place the plate in a
CO₂ incubator at 37°C. After incubation for 22 hours, add
15 μL of resazurin solution to each well, and determine the
absorbances at 570 nm, $A_{17}$, and 600 nm, $A_{172}$ and $A_{22}$. From the reaction values at each concentration of the standard solution and sample solution [difference of absorbance $(A_{17} - A_{172}2$ and $A_{17} - A_{172})$], determine the rate of potency $(Pr)$ of the sample solution to the standard solution by the parallel assay, and calculate the potency (unit) per 1 mg of protein of Lenograstim (Genetical Recombination).

$$Pr = \text{anti ln} (M)$$

$$M = (P_1 - P_2)/db$$

$$P_1 = T_1 + T_2 + T_3$$

$$P_2 = S_1 + S_2 + S_3$$

$$b = H_1(L_3 + L_1)/L_1h$$

$$H_1 = 62n/(d^2 - d)$$

$$S_1 = 1S_1 + 2S_2 + 3S_3 - 1/2(d + 1)P_2$$

$$S_1 = 1T_1 + 2T_2 + 3T_3 - 1/2(d + 1)P_2$$

$$d = 3$$

$$I = \ln 1.3$$

$$n = 3$$

$$h = 2$$

$T_1$: Mean of reaction values of the sample solution (1)

$T_2$: Mean of reaction values of the sample solution (2)

$T_3$: Mean of reaction values of the sample solution (3)

$S_1$: Mean of reaction values of the standard solution (1)

$S_2$: Mean of reaction values of the standard solution (2)

$S_3$: Mean of reaction values of the standard solution (3)

Specific activity (unit/mg of protein) of lenograstim

$$= S \times Pr \times D_1/D_2/C$$

$S$: Potency (unit/mL) of Lenograstim RS

$D_1$: Dilution rate of the sample solution (3)

$D_2$: Dilution rate of the standard solution (3)

$C$: Concentration (mg/mL) of protein of sample

**Containers and storage** Containers—Tight containers. Storage—At a temperature not exceeding $-20^\circ$C.

**L-Leucine**

L-リオシィン

$C_{6}H_{13}NO_{3}$: 131.17

(2S)-2-Amino-4-methylpentanoic acid

$[61-90-5]$A

L-Leucine, when dried, contains not less than 98.5% of L-leucine ($C_{6}H_{13}NO_{3}$).

**Description** L-Leucine occurs as white, crystals or crystalline powder. It is odorless or has a faint characteristic odor, and has a slightly bitter taste.

It is freely soluble in formic acid, sparingly soluble in water, and practically insoluble in ethanol (95).

It dissolves in dilute hydrochloric acid.

**Identification** Determine the infrared absorption spectrum of L-Leucine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** $<2.49>$ $[\alpha]_{D}^{20}$: $+14.5^\circ$ to $+16.0^\circ$ (after drying, 1 g, $6$ mol/L hydrochloric acid TS, $25$ mL, $100$ mm).

**pH** $<2.54>$ Dissolve 1.0 g of L-Leucine in $100$ mL of water:

the pH of this solution is between 5.5 and 6.5.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of L-Leucine in $10$ mL of $1$ mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Chloride $<1.05>$—Dissolve 0.5 g of L-Leucine in $40$ mL of water and $6$ mL of dilute nitric acid, and add water to make $50$ mL. Perform the test using this solution as the test solution. Prepare the control solution with $0.30$ mL of $0.01$ mol/L hydrochloric acid VS (not more than $0.021$%).

(3) Sulfate $<1.14>$—Dissolve 0.6 g of L-Leucine in $40$ mL of water and $1$ mL of dilute hydrochloric acid, and add water to make $50$ mL. Perform the test using this solution as the test solution. Prepare the control solution with $0.35$ mL of $0.005$ mol/L sulfuric acid VS (not more than $0.028$%).

(4) Ammonium $<1.02>$—Perform the test with $0.25$ g of L-Leucine. Prepare the control solution with $5.0$ mL of Standard Ammonium Solution (not more than $0.02$%).

(5) Heavy metals $<1.07>$—Proceed with $1.0$ g of L-Leucine according to Method 4, and perform the test. Prepare the control solution with $2.0$ mL of Standard Lead Solution (not more than $20$ ppm).

(6) Arsenic $<1.11>$—Prepare the test solution with $1.0$ g of L-Leucine according to Method 2, and perform the test (not more than $2$ ppm).

(7) Related substances—Dissolve 0.10 g of L-Leucine in water by warming, after cooling, add water to make $25$ mL, and use this solution as the sample solution. Pipet $1$ mL of the sample solution, and add water to make exactly $50$ mL. Pipet $5$ mL of this solution, add water to make exactly $20$ mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.09>$. Spot $5$ mL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about $10$ cm, and dry the plate at $80^\circ$C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat the plate at $80^\circ$C for 5 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** $<2.41>$ Not more than $0.30$% (1 g, $105^\circ$C, 3 hours).

**Residue on ignition** $<2.44>$ Not more than $0.1$% (1 g).

**Assay** Weigh accurately about $0.13$ g of L-Leucine, previously dried, and dissolve in $3$ mL of formic acid, add $50$ mL of acetic acid (100), and titrate $<2.50>$ with $0.1$ mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of $0.1$ mol/L perchloric acid VS

$= 13.12$ mg of $C_{6}H_{13}NO_{3}$

**Containers and storage** Containers—Well-closed containers.
Leuprorelin Acetate

リュープロレリン酢酸塩

\[
\text{C}_{9}\text{H}_{14}\text{N}_{10}\text{O}_{25} \cdot \text{C}_{2}\text{H}_{6}\text{O}_{2} \cdot \text{CH}_{3} \cdot \text{H}_{2}\text{C} \cdot \text{COOH}
\]

1269.45

[74581-53-6]

Leuprorelin Acetate contains not less than 96.0% and not more than 102.0% of Leuprorelin (C_{9}H_{14}N_{10}O_{25} \cdot C_{2}H_{6}O_{2} \cdot CH_{3} \cdot H_{2}C \cdot COOH), calculated on the anhydrous and residual acetic acid-free basis.

**Description**

Leuprorelin Acetate occurs as a white to yellowish white powder.

It is very soluble in water and in acetic acid (100), freely soluble in methanol, and sparingly soluble in ethanol (99.5).

It is hygroscopic.

**Identification**

Determine the infrared absorption spectrum of Leuprorelin Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Leuprorelin Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.45> [\theta]_{D}^{20} = -38 \text{ } – \text{ } -41^\circ (0.25 \text{ g} \text{ calculated on the anhydrous and residual acetic acid-free basis, diluted acetic acid (100) (1 in 100), 25 mL, 100 mm}).

**pH** <2.50> The pH of a solution of 0.10 g of Leuprorelin Acetate in 10 mL of water is 5.5 to 7.5.

**Constituent amino acids**

When hydrolyzed by Method 1 described in "1. Hydrolysis of Protein and Peptide" and performed the test by Method 1 described in "2. Methodologies of Amino Acid Analysis" under Amino Acid Analysis of Proteins <2.6>, histidine, glutamic acid, proline, tyrosine and arginine is 1 and leucine is 2, respectively.

**Procedure**

(i) Hydrolysis Weigh accurately about 50 mg of Leuprorelin Acetate, and dissolve in 1 mL of water. Put 0.1 mL of this solution in a test tube for hydrolysis, freeze-dry the content, and add 2 mL of a solution of phenol in 6 mol/L hydrochloric acid (1 in 100). Freeze the solution, seal the tube in vacuum, and heat the tube at 110°C for 24 hours. After cooling, open the tube, take out 0.1 mL of the hydrolyzate, add 1 mL of water, and freeze-dry. Dissolve the residue in 7.8 mL of diluting solution, and use this solution as the sample solution. Separately, weigh exactly 0.45 mg of l-alanine, 0.66 mg of l-aspartic acid, 1.05 mg of l-arginine hydrochloride, 0.74 mg of l-glutamic acid, 0.38 mg of glycine, 1.05 mg of l-histidine hydrochloride monohydrate, 0.66 mg of l-isoleucine, 0.66 mg of l-leucine, 0.58 mg of l-proline, 0.53 mg of l-serine, 0.60 mg of l-threonine and 0.91 mg of l-tyrosine, dissolve in diluting solution to make exactly 100 mL, and use this solution as the standard solution (1). Separately, dissolve 1 mg of l-tryptophan and 0.4 mg of ethylamine hydrochloride in diluting solution to make 100 mL, and use this solution as the standard solution (2).

(ii) Amino acid analysis Perform the test with exactly 100 μL each of the sample solution and the standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions: the peaks of histidine, glutamic acid, leucine, proline, tyrosine, arginine, serine and tryptophan appear on the chromatogram obtained from the sample solution. Apart from this, calculate the molar content of each constituent amino acid in 1 mL of the sample solution from the peak area of each amino acid obtained from the sample solution and standard solution (1), and further calculate the number of the constituent amino acids assuming that the sum of each molar content of histidine, glutamic acid, leucine, proline, tyrosine and arginine in 1 mole of leuprorelin acetate is 7.

**Operating conditions**

Detector: A visible spectrophotometer (wavelength: 440 nm and 570 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 6 cm in length, packed with strongly acidic ion-exchange resin (Na type) for liquid chromatography (3 μm in particle diameter).

Column temperature: Maintain a constant temperature of about 58°C for 18 minutes after injection, then maintain a constant temperature of about 70°C for a further 20 minutes.

Reaction vessel temperature: A constant temperature of about 135°C.

Mobile phase: Prepare the mobile phases A, B, C, D and E according to the following table, then add 0.1 mL of caprylic acid to each mobile phase.

Total amount: 1000 mL, 1000 mL, 1000 mL, 1000 mL, 1000 mL

Flowing mobile phase: Control the gradient by mixing the mobile phases A, B, C, D and E as directed in the following table.
Acetic acid

Weigh accurately about 0.1 g of Leuprorelin Acetate, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of acetic acid (100), add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas, *A*_1 and *A*_5, of acetic acid in each solution, and calculate the amount of acetic acid by the following equation: 4.7 × 8.0%.

\[
\text{Amount (mg) of acetic acid} = M_s/M_T \times \frac{A_1}{A_5} \times 10
\]

*M*_5: Amount (g) of acetic acid (100) taken

*M*_2: Amount (g) of Leuprorelin Acetate taken

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 0.7 mL of phosphoric acid add water to make 1000 mL, and adjust to pH 3.0 with a solution of sodium hydroxide (21 in 50). To 950 mL of this solution add 50 mL of methanol.

Flow rate: Adjust so that the retention time of acetic acid is 3 to 4 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the symmetry factor of the peak of acetic acid is not more than 1.5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of acetic acid is not more than 2.0%.

**Assay**

Weigh accurately about 0.1 g each of Leuprorelin Acetate and Leuprorelin Acetate RS (separately determine the water <2.48> and acetic acid in the same manner as Leuprorelin Acetate), dissolve separately in the mobile phase to make exactly 100 mL. To exactly 5 mL each of these solutions add the mobile phase to make them exactly 100 mL, and use so obtained solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, *A*_1 and *A*_5, of leuprorelin in each solution.

\[
\text{Amount (mg) of leuprorelin (C}_{9}H_{14}N_{2}O_{3}) = M_s \times \frac{A_1}{A_5}
\]

*M*_5: Amount (mg) of Leuprorelin Acetate RS taken, calculated on the anhydrous and de-acetic acid basis

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 15.2 g of triethylamine in 800 mL of water, adjust to pH 3.0 with phosphoric acid, and add
water to make 1000 mL. To 850 mL of this solution add 150 mL of a mixture of acetonitrile and 1-propanol (3:2).
Flow rate: Adjust so that the retention time of leuprorelin is 41 to 49 minutes (1.0 – 1.5 mL per minute).

System suitability—

System performance: Dissolve about 0.1 g of Leuprorelin Acetate RS in 100 mL of the mobile phase. To 5 mL of this solution add water to make to 50 mL. To 5 mL of this solution add 0.1 mL of sodium hydroxide TS, stopper the vessel, shake vigorously, then heat at 100°C for 60 minutes. After cooling, add 50 μL of 1 mol/L phosphoric acid solution, and shake vigorously. When the procedure is run with 20 μL of this solution under the above operating conditions, a peak having the relative retention time of about 0.90 to leuprorelin and leuprorelin are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of leuprorelin is not more than 1.5%

Containers and storage Containers—Hermetic containers.

Levallorphan Tartrate

レバロルファン酒石酸塩

C_{19}H_{25}NO.C_{4}H_{4}O_{5}: 433.49
17-Allylmorphinan-3-ol monotartrate
[71-82-9]

Levallorphan Tartrate, when dried, contains not less than 98.5% of levallorphan tartrate (C_{19}H_{25}NO.C_{4}H_{4}O_{5}).

Description Levallorphan Tartrate occurs as a white to pale yellow crystalline powder. It is odorless.

It is soluble in water and in acetic acid (100), sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

Identification (1) Determine the absorption spectrum of a solution of Levallorphan Tartrate in 0.01 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Levallorphan Tartrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Levallorphan Tartrate (1 in 30) responds to Qualitative Tests <1.099> (1) and (2) for tartrate.

Optical rotation <2.49> [α]_{D}^{25}: −37.0 – −39.2° (after drying, 0.2 g, water, 10 mL, 100 mm).

pH <2.44> Dissolve 0.2 g of Levallorphan Tartrate in 20 mL of water: the pH of this solution is between 3.3 and 3.8.

Melting point <2.60> 174 – 178°C

Purity (1) Clarity and color of solution—Dissolve 0.2 g of Levallorphan Tartrate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Levallorphan Tartrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.2 g of Levallorphan Tartrate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.08>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia TS (200:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 4 hours).

Residue on ignition <2.44> Not more than 0.10% (1 g).

Assay Weigh accurately about 0.5 g of Levallorphan Tartrate, previously dried, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 43.35 mg of C_{19}H_{25}NO.C_{4}H_{4}O_{5}

Containers and storage Containers—Well-closed containers.

Levallorphan Tartrate Injection

レバロルファン酒石酸塩注射液

Levallorphan Tartrate Injection is an aqueous injection.

It contains not less than 93.0% and not more than 107.0% of the labeled amount of levallorphan tartrate (C_{19}H_{25}NO.C_{4}H_{4}O_{5}: 433.49).

Method of preparation Prepare as directed under Injection, with Levallorphan Tartrate.

Description Levallorphan Tartrate Injection is a clear, colorless liquid.

pH: 3.0 – 4.5

Identification Take an exact volume of Levallorphan Tartrate Injection, equivalent to 3 mg of Levallorphan Tartrate, add 5 mL of water and 2 drops of dilute hydrochloric acid, and wash with five 15-mL portions of diethyl ether by a vigorous shaking. Take the water layer, evaporate the diethyl ether remaining by warming on a water bath, and after cooling, add 0.01 mol/L hydrochloric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it
Dissolve 3 mg of Levodopa in 0.001 mol/L hydrochloric acid.  

**Bacterial endotoxins** Less than 150 EU/mg.

**Extractable volume** It meets the requirement.

**Foreign insoluble matter** Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** It meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Take exactly a volume of Levallorphan Tartrate Injection, equivalent to about 2 mg of levallorphan tartrate (C_{19}H_{22}NO_3.C_6H_{12}O_6), add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of levallorphan tartrate for assay, previously dried at 80°C for 4 hours on phosphorus (V) oxide under reduced pressure, and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_4, and Q_3, of the peak area of levallorphan to that of the internal standard:

\[
\text{Amount (mg) of levallorphan tartrate (C_{19}H_{22}NO_3.C_6H_{12}O_6)} = \frac{M_2 \times Q_4}{Q_3} 	imes \frac{1}{50}
\]

\[M_2:\text{Amount (mg) of levallorphan tartrate for assay taken}\]

**Internal standard solution**—Dissolve 0.04 g of isobutyl parahydroxybenzoate in 10 mL of ethanol (95), add water to make 100 mL, and to 10 mL of this solution add water to make 100 mL.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of dilute phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 300 mL of this solution add 200 mL of acetonitrile.

Flow rate: Adjust so that the retention time of levallorphan is about 12 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and levallorphan are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of levallorphan to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Hermetic containers.

---

**Levodopa**

C_{6}H_{11}NO_3: 197.19

3-Hydroxy-L-tyrosine [59-92-7]

Levodopa, when dried, contains not less than 98.5% of levodopa (C_{6}H_{11}NO_3).

**Description**—Levodopa occurs as white or slightly grayish white, crystals or crystalline powder. It is odorless. It is freely soluble in formic acid, slightly soluble in water, and practically insoluble in ethanol (95).

It dissolves in dilute hydrochloric acid.

The pH of a saturated solution of Levodopa is between 5.0 and 6.5.

Melting point: about 275°C (with decomposition).

**Identification** (1) To 5 mL of a solution of Levodopa (1 in 1000) add 1 mL of ninhydrin TS, and heat for 3 minutes in a water bath: a purple color develops. (2) To 2 mL of a solution of Levodopa (1 in 5000) add 10 mL of 4-aminonitripyrine TS, and shake: a red color develops.

(3) Dissolve 3 mg of Levodopa in 0.001 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Absorbance** <2.24>  \(E_{1cm}^{1}(280 \text{ nm}) = 136 - 146\) (after drying, 30 mg, 0.001 mol/L hydrochloric acid TS, 1000 mL).

**Optical rotation** <2.40> \([\alpha]_D^{20} = -11.5^\circ -13.0^\circ\) (after drying, 2.5 g, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Levodopa in 20 mL of 1 mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.5 g of Levodopa in 6 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.40 g of Levodopa in 1 mL of dilute hydrochloric acid and 30 mL of water, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.005 mol/L sulfuric acid VS (not more than 0.030%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Levodopa according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Dissolve 1.0 g of Levodopa in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

(6) Related substances—Dissolve 0.10 g of Levodopa in 10 mL of sodium disulfite TS, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add sodium disulfite TS to make exactly 25 mL. Pipet 1 mL of this solution, add sodium disulfite TS to make exactly 20 mL,
and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.067>. Spot 5 μL each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, acetic acid (100) and methanol (10:5:5:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate and heat the plate at 90°C for 10 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Levodopa, previously dried, dissolve in 3 mL of formic acid, add 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to green (indicator: 3 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.72 mg of C₆H₁₇NO₄

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

### Levofloxacin Hydrate

レボフロキサシン水和物

Levofloxacin Hydrate contains not less than 99.0% and not more than 101.0% of levofloxacin (C₁₈H₂₇FN₃O₇·½H₂O: 361.37), calculated on the anhydrous basis.

**Description** Levofloxacin Hydrate occurs as light yellowish white to yellow-white, crystals or crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, and slightly soluble in ethanol (99.5).

It dissolves in 0.1 mol/L hydrochloric acid TS.

It gradually turns dark light yellow-white on exposure to light.

Melting point: about 226°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Levofloxacin Hydrate in 0.1 mol/L hydrochloric acid TS (1 in 150,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Levofloxacin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation <2.49>** [α]D: −92° to −99° (0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Levofloxacin Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 50 mg of Levofloxacin Hydrate in 10 mL of a mixture of water and methanol (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of water and methanol (1:1) to make exactly 10 mL. Pipet 1 mL of this solution, add a mixture of water and methanol (1:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak of the enantiomer of levofloxacin obtained from the sample solution is not larger than 2/5 times the peak area of levofloxacin from the standard solution, and the area of each peak other than the peaks of levofloxacin and the enantiomer from the sample solution is not larger than 1/5 times the peak area of levofloxacin from the standard solution. Furthermore, the total area of the peaks other than levofloxacin and the peak of the enantiomer from the sample solution is not larger than 3/10 times the peak area of levofloxacin from the standard solution.

**Operating conditions**—

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: Dissolve 1.76 g of L-valine, 7.71 g of ammonium acetate and 1.25 g of Copper (II) sulfate pentahydrate in water to make 1000 mL. To this solution add 250 mL of methanol.

Flow rate: Adjust so that the retention time of levofloxacin is about 22 minutes.

Time span of measurement: About 2 times as long as the retention time of levofloxacin, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of water and methanol (1:1) to make exactly 20 mL. Confirm that the peak area of levofloxacin obtained with 10 μL of this solution is equivalent to 4 to 6% of that with 10 μL of the standard solution.

System performance: Dissolve 10 mg of ofloxacin in 20 mL of a mixture of water and methanol (1:1). To 1 mL of this solution add a mixture of water and methanol (1:1) to make 10 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the resolution between the peaks of levofloxacin and the enantiomer is not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operat-
ing conditions, the relative standard deviation of the peak area of levofloxacin is not more than 3.0%.

**Water** &lt;2.48\(\times\) 2.1 - 2.7% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** &lt;2.44 Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.3 g of Levofloxacin Hydro-

drinate, dissolve in 100 mL of acetic acid (100), and titrate &lt;2.50 with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 36.14 mg of C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Levofloxacin Fine Granules**

レボフロキサシン細粒

Levofloxacin Fine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\): 361.37).

**Method of preparation** Prepare as directed under Gran-

eules, with Levofloxacin Hydrodate.

**Identification** To an amount of Levofloxacin Fine Gran-

eules, equivalent to 50 mg of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)), add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 50 mL, and stir for 20 minutes. Filter this solution through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m, discard the first 10 mL of the filtrate, and to 1 mL of the subsequent filtrate add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry &lt;2.24&gt;: it exhibits maxima between 225 nm and 229 nm and between 292 nm and 296 nm, and a shoulder between 321 nm and 331 nm.

**Uniformity of dosage units** &lt;6.02 Perform the test accord-

ing to the following method: the Granules in single-dose packages meet the requirement of the Content uniformity test.

To the total amount of the content of 1 package of Levofloxacin Fine Granules add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly \(V\) mL so that each mL contains about 1 mg of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)), and stir for 20 minutes. Filter this solution through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet 1 mL of the subsequent filtrate, add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of levofloxacin hydrate for assay (separately determine the water &lt;2.48 in the same manner as Levofloxacin Hydrodate), and dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Determine the absorbances, \(A_1\) and \(A_2\), at 289 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry &lt;2.24&gt;.

\[
\text{Amount (mg) of levofloxacin (C}_{18}\text{H}_{20}\text{FN}_{3}\text{O}_{4}) = M_2 \times A_1 / A_2 \times V / 25
\]

\(M_2\): Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis.

**Dissolution** &lt;6.10 When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 90 minutes of Levofloxacin Fine Granules is not less than 70%.

Start the test with an accurately weighed amount of Levofloxacin Fine Granules, equivalent to about 0.1 g of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)), withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of levofloxacin hydrate for assay (separately determine the water &lt;2.48 in the same manner as Levofloxacin Hydrodate), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_1\) and \(A_2\), at 289 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry &lt;2.24&gt;.

\[
\text{Dissolution rate (%) with respect to the labeled amount of levofloxacin (C}_{18}\text{H}_{20}\text{FN}_{3}\text{O}_{4}) = M_2 / M_1 \times A_1 / A_2 \times 1 / C \times 360
\]

\(M_1\): Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis.

\(M_2\): Amount (g) of Levofloxacin Fine Granules taken.

**C**: Labeled amount (mg) of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)) in 1 g.

**Assay** Weigh accurately an amount of Levofloxacin Fine Granules, powder if necessary, equivalent to about 50 mg of levofloxacin (C\(_{18}\)H\(_{20}\)FN\(_{3}\)O\(_{4}\)), add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 50 mL, stir for 20 minutes, and filter this solution through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of levofloxacin hydrate for assay (separately determine the water &lt;2.48 in the same manner as Levofloxacin Hydrodate), and dissolve in 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 50 mL. Pipet 5 mL of this solution, add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL each of the sample solution and standard solution as directed under Liquid Chromatography &lt;2.07&gt; according to the following conditions, and determine the peak areas, \(A_1\) and \(A_2\), of levofloxacin in each solution.

\[
\text{Amount (mg) of levofloxacin (C}_{18}\text{H}_{20}\text{FN}_{3}\text{O}_{4}) = M_2 \times A_1 / A_2
\]

\(M_2\): Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis.

**Operating conditions—**

Column: A stainless steel column 4.6 mm in inside diame-

ter and 15 cm in length, packed with octadecysilanized silica
Levofloxacin Injection

レボフロキサシン注射液

Levofloxacin Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of levofloxacin (C18H27FN3O2·H2O: 361.37).

Method of preparation Prepare as directed under Injections, with Levofloxacin Hydrate.

Description Levofloxacin Injection is yellow to greenish yellow, clear liquid.

Identification To a volume of Levofloxacin Injection, equivalent to 50 mg of levofloxacin (C18H27FN3O2·H2O), add diluted 1 mol/L hydrochloric acid TS (3 in 100) to make 50 mL. To 1 mL of this solution add diluted 1 mol/L hydrochloric acid TS (3 in 100) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (<4.01, 4.02): it exhibits maxima between 270 nm and 299 nm and between 292 nm and 296 nm, and a shoulder between 321 nm and 331 nm.

pH Being specified separately when the drug is granted approval based on the Law.

Bacterial endotoxin <4.01 Less than 0.60 EU/mg.

Extractable volume <6.05 It meets the requirement.

Foreign insoluble matter <6.06 Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07 It meets the requirement.

Sterility <4.06 Perform the test according to the Membrane filtration method: it meets the requirement.

Assay To an exact volume of Levofloxacin Injection, equivalent to about 50 mg of levofloxacin (C18H27FN3O2·H2O), add diluted 1 mol/L hydrochloric acid TS (3 in 100) to make exactly 50 mL. Pipet 5 mL of this solution, add diluted 1 mol/L hydrochloric acid TS (3 in 100) to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of levofloxacin hydrate for assay (separately determine the water <2.40> in the same manner as Levofloxacin Hydrate), and dissolve in diluted 1 mol/L hydrochloric acid TS (3 in 100) to make exactly 50 mL. Pipet 5 mL of this solution, add diluted 1 mol/L hydrochloric acid TS (3 in 100) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A3, of levofloxacin in each solution.

Amount (mg) of levofloxacin (C18H27FN3O2) = M5 × A1/A3

M5: Amount (mg) of levofloxacin for assay taken, calculated on the anhydrous basis

Operating conditions—
Detector, column, and column temperature: Proceed as directed in the operating conditions in the Purity (2) under Levofloxacin Hydrate.

Mobile phase: Dissolve 1.00 g of copper (II) sulfate pentahydrate, 1.41 g of L-valine and 6.17 g of ammonium acetate in 800 mL of water, and add 200 mL of methanol.

Flow rate: Adjust so that the retention time of levofloxacin is about 20 minutes.

System suitability—
System performance: Dissolve 10 mg of ofloxacin in 20 mL of dilute 3 mol/L hydrochloric acid TS (1 in 100). To 1 mL of this solution add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, levofloxacin and an enantiomer are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of levofloxacin is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Levofloxacin Ophthalmic Solution

レボフロキサシン点眼液

Levofloxacin Ophthalmic Solution is an aqueous ophthalmic preparation.

It contains not less than 95.0% and not more than 107.0% of the labeled amount of levofloxacin hydrate (C18H27FN3O2·H2O: 370.38).

Method of preparation Prepare as directed under Ophthalmic Liquids and Solutions, with Levofloxacin Hydrate.

Description Levofloxacin Ophthalmic Solution occurs as a clear, pale yellow to yellow liquid.

Identification (1) To a volume of Levofloxacin Ophthalmic Solution, equivalent to 5 mg of Levofloxacin Hydrate, add 0.01 mol/L hydrochloric acid TS to make 100 mL. To 2 mL of this solution add 0.01 mol/L hydrochloric acid TS to make 20 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 225 nm and 229 nm, and between 292 nm and 296 nm.
(2) To a volume of Levofloxacin Ophthalmic Solution, equivalent to 5 mg of Levofloxacin Hydrate, add a mixture of water and methanol (1:1) to make 5 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of levofloxacin hydrate for assay in 10 mL of a mixture of water and methanol (1:1), and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions: the retention time of the principal peaks in the chromatogram obtained from the sample solution and the standard solution is the same.

**Operating conditions**—

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: Dissolve 1.25 g of copper (II) sulfate pentahydrate, 1.76 g of L-valine, and 7.71 g of ammonium acetate in water to make 1000 mL, and add 250 mL of methanol.

Flow rate: Adjust so that the retention time of levofloxacin is about 22 minutes.

**System suitability**—

System performance: Dissolve 10 mg of ofloxacin in 20 mL of a mixture of water and methanol (1:1). To 1 mL of this solution add a mixture of water and methanol (1:1) to make 10 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of levofloxacin to that of the internal standard is not more than 1.0%.

**Containers and storage**—

Containers—Light-resistant.

Storage—Light-resistant.

---

**Levofloxacin Tablets**

レボフロキサシン錠

Levofloxacin Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of levofloxacin (C₁₈H₂₃FN₄O₃; 361.37).

**Method of preparation** Prepare as directed under Tablets, with Levofloxacin Hydrate.

**Identification** To an amount of powdered Levofloxacin Tablets, equivalent to 0.1 g of levofloxacin (C₁₈H₂₃FN₄O₃), add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 100 mL, and stir for 20 minutes. Filter this solution through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 10 mL of the filtrate, and to 1 mL of the subsequent filtrate add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits maxima between 225 nm and 229 nm and between 292 nm and 296 nm, and a shoulder between 321 nm and 331 nm.

**Uniformity of dosage units**<6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Levofloxacin Tablets add about 70 mL of diluted 3 mol/L hydrochloric acid TS (1 in 100), sonicate to disintegrate the tablet, add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly 100 mL, and stir for 20 minutes. Pipet V mL of the solution, add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make exactly V mL so that each mL contains about 50 μg of levofloxacin (C₁₈H₂₃FN₄O₃), and filter this solution through a membrane.
filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of levofloxacin (C₁₈H₂₃FN₃O₄) = M₅ × A₅ = 0.36 × V'/V × 1/5

M₅: Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis

Dissolution <6.10> (1) For a 100-mg Tablet When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 90 minutes is not less than 80%.

Start the test with 1 tablet of Levofloxacin Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of levofloxacin hydrate for assay (separately determine the water <2.48> in the same manner as Levofloxacin Hydrate), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, Aₙ and Aₚₙ, at 287 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of levofloxacin (C₁₈H₂₃FN₃O₄) = M₅ × Aₙ/ₘ₃ × 18/5 × 1.025

M₅: Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis

(2) For a 250-mg Tablet and 500-mg Tablet When the tests are performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes is not less than 80%.

Start the test with 1 tablet of Levofloxacin Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 10 mL of the first filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of levofloxacin hydrate for assay (separately determine the water <2.48> in the same manner as Levofloxacin Hydrate), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, Aₙ and Aₚₙ, at 287 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) with respect to the labeled amount of levofloxacin hydrate (C₁₈H₂₃FN₃O₄ ∙ 1/2H₂O) = M₅ × Aₙ/ₘ₃ × 18/5 × 1.025

M₅: Amount (mg) of levofloxacin hydrate for assay taken, calculated on the anhydrous basis

Operating conditions—

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: Dissolve 1.00 g of copper (II) sulfate pentahydrate, 1.41 g of L-valine and 6.17 g of ammonium acetate in 800 mL of water, and add 200 mL of methanol.

Flow rate: Adjust so that the retention time of levofloxacin is about 20 minutes.

System suitability—

System performance: Dissolve 10 mg of ofloxacin in 20 mL of diluted 3 mol/L hydrochloric acid TS (1 in 100). To 1 mL of this solution add diluted 3 mol/L hydrochloric acid TS (1 in 100) to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, levofloxacin and an enantiomer are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of levofloxacin is not more than 1.0%.

Containers and storage Containers—Tight containers.
Levomepromazine Maleate

レボメプロマジンマレイン酸塩

\[
\text{C}_{19}H_{23}N_2O_4 \cdot \text{C}_2H_4O_4: 444.54 \\
(2R)-3-(2-Methoxy-10H-phenothiazin-10-yl)-N,N,2-trimethylpropylamine monomaleate} [7104-38-3]
\]

Levomepromazine Maleate, when dried, contains not less than 98.0% of levomepromazine maleate (C_{19}H_{23}N_2O_4 \cdot \text{C}_2H_4O_4).

**Description** Levomepromazine Maleate occurs as white, crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in acetic acid (100), soluble in chloroform, sparingly soluble in methanol, slightly soluble in ethanol (95) and in acetone, very slightly soluble in water, and practically insoluble in diethyl ether.

Melting point: 184 – 190°C (with decomposition).

**Identification** (1) Dissolve 5 mg of Levomepromazine Maleate in 5 mL of sulfuric acid: a red-purple color develops, which slowly becomes deep red-purple. To this solution add 1 drop of potassium dichromate TS: a brownish yellow-red color is produced.

(2) To 0.2 g of Levomepromazine Maleate add 5 mL of sodium hydroxide TS and 20 mL of diethyl ether, and shake well. Separate the diethyl ether layer, wash twice with 10-mL portions of water, add 0.5 g of anhydrous sodium sulfate, filter, evaporate the diethyl ether on a water bath, and dry the residue at 105°C for 2 hours: the residue melts between 124°C and 128°C.

(3) To 0.5 g of Levomepromazine Maleate add 5 mL of water and 2 mL of ammonia solution (28), extract with three 5-mL portions of chloroform, separate and evaporate the water layer to dryness. To the residue add 2 to 3 drops of dilute sulfuric acid and 5 mL of water, and extract with four 25-mL portions of diethyl ether. Combine all the diethyl ether extracts, evaporate the diethyl ether in a water bath at a temperature of about 35°C with the aid of a current of air: the residue melts between 128°C and 136°C.

**Optical rotation** <2.49> [α]_D^25 : -13.5° to -16.5° (after drying, 0.5 g, chloroform, 20 mL, 200 mm).

**Purity** (1) Clarity and color of solution—To 0.5 g of Levomepromazine Maleate add 10 mL of methanol, and dissolve by warming: the solution is clear, and colorless or pale yellow.

(2) Chloride <1.03>—Dissolve 0.5 g of Levomepromazine Maleate in 40 mL of methanol, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS, 40 mL of methanol, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.02%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Levomepromazine Maleate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying** <2.41> Not more than 0.5% (2 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1 g of Levomepromazine Maleate, previously dried, and dissolve in a mixture of 40 mL of acetic acid (100) and 20 mL of acetone for nonaqueous titration. Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from red-purple through blue-purple to blue (indicated: 5 drops of brom cresol green-methylrosaniline chloride TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 44.45 mg of C_{19}H_{23}N_2O_4 \cdot \text{C}_2H_4O_4

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

Levomethyroxine Sodium Hydrate

レボチロキシンナトリウム水和物

\[
\text{C}_{13}\text{H}_{19}\text{L}_3\text{N}_2\text{NaO}_4 \cdot x\text{H}_2\text{O} \\
\text{Monosodium O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosinate hydrate} [25416-65-3]
\]

Levomethyroxine Sodium Hydrate contains not less than 97.0% of levomethyroxine sodium (C_{13}H_{19}L_3N_2NaO_4; 798.85), calculated on the dried basis.

**Description** Levomethyroxine Sodium Hydrate occurs as a pale yellow-white to light yellow-brown powder. It is odorless.

It is slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It dissolves in sodium hydroxide TS.

It is gradually colored by light.

**Identification** (1) Heat 0.1 g of Levomethyroxine Sodium Hydrate over a flame: a purple gas evolves.

(2) To 0.5 mg of Levomethyroxine Sodium Hydrate add 8 mL of a mixture of water, ethanol (95), hydrochloric acid and sodium hydroxide TS (6:5:2:2), warm in a water bath for 2 minutes, cool, and add 0.1 mL of sodium nitrite TS. Allow to stand in a dark place for 20 minutes, and add 1.5 mL of ammonia solution (28): a yellowish red color is produced.

(3) Determine the absorption spectrum of a solution of Levomethyroxine Sodium Hydrate in dilute sodium hydroxide TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Moisten Levomethyroxine Sodium Hydrate with sulfuric acid, and ignite: the residue responds to Qualitative Tests <1.09> (1) and (2) for sodium salt.

**Optical rotation** <2.49> [α]_D^25 : -5° to -6° (0.3 g calculated on the dried basis, a mixture of ethanol (95) and sodium hydroxide TS (2:1), 10 mL, 100 mm).
Purity  (1) Clarity and color of solution—Dissolve 0.3 g of Levothyroxine Sodium Hydrate in 10 mL of a mixture of ethanol (95) and sodium hydroxide TS (2:1) by warming: the solution is clear and pale yellow to pale yellow-brown in color.

(2) Soluble halides—Dissolve 0.01 g of Levothyroxine Sodium Hydrate in 10 mL of water and 1 drop of dilute nitric acid, shake for 5 minutes, and filter. To the filtrate add water to make 10 mL, then add 3 drops of silver nitrate TS, and mix: the solution has no more opalescence than the following control solution.

Control solution: To 0.20 mL of 0.01 mol/L hydrochloric acid VS add 10 mL of water and 1 drop of dilute nitric acid, and proceed as directed above.

(3) Related substances—Dissolve 20 mg of Levothyroxine Sodium Hydrate in 2 mL of a mixture of ethanol (95) and ammonia solution (28) (14:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of ethanol (95) and ammonia solution (28) (14:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of t-butyl alcohol, i-amyl alcohol, water, ammonia solution (28) and 2-butanone (59:32:17:15:7) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of 1-butanol and acetic acid (100) (97:3) on the plate, and heat the plate at 100°C for 3 minutes: the red-purple spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> 7 - 11% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

Assay Weigh accurately about 25 mg of Levothyroxine Sodium Hydrate, and proceed as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 10 mL of sodium hydroxide solution (1 in 100) and 1 mL of a freshly prepared sodium bisulfate solution (1 in 100) as the absorbing liquid, and prepare the test solution. Apply a small amount of water to the upper part of apparatus A, pull out C carefully, and wash C, B and the inner wall of A with 40 mL of water. To the test solution add 1 mL of bromine-acetic acid TS, insert the stopper C, and shake vigorously for 1 minute. Remove the stopper, rinse the stopper, the sample holder and the inner wall of the flask with 40 mL of water, and add 0.5 mL of formic acid. Stopper the flask with C, and shake vigorously for 1 minute again. Remove the stopper, and rinse the stopper, the sample holder and the inner wall of the flask with 40 mL of water. Bubble the solution with enough nitrogen gas in the flask to remove the oxygen and excess bromine, add 0.5 g of potassium iodide to the solution, and dissolve. Add immediately 3 mL of dilute sulfuric acid, mix, and allow to stand for 2 minutes. Titrate <2.50> the solution with 0.02 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.02 mol/L sodium thiosulfate VS = 0.6657 mg of C₂₁H₂₉I₄NaNO₃

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Levothyroxine Sodium Tablets

Levothyroxine Sodium Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of levothyroxine sodium (C₂₁H₂₉I₄NaNO₃: 798.85).

Method of preparation Prepare as directed under Tablets, with Levothyroxine Sodium Hydrate.

Identification (1) Weigh a quantity of powdered Levothyroxine Sodium Tablets, equivalent to 0.5 mg of Levothyroxine Sodium Hydrate, add 8 mL of a mixture of water, ethanol (95), hydrochloric acid and sodium hydroxide TS (6:5:2:2), warm in a water bath for 2 minutes, cool, and filter. To the filtrate add 0.1 mL of sodium nitrite TS, and allow to stand in a dark place for 20 minutes. Add 1.5 mL of ammonia solution (28): a yellowish red color develops.

(2) To a quantity of powdered Levothyroxine Sodium Tablets, equivalent to 1 mg of Levothyroxine Sodium Hydrate, add 10 mL of ethanol (95), shake, filter, and use the filtrate as the sample solution. Dissolve 0.01 g of levothyroxine sodium for thin-layer chromatography in 100 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of t-butyl alcohol, i-amyl alcohol, water, ammonia solution (28) and 2-butanone (59:32:17:15:7) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of 1-butanol and acetic acid (100) (97:3) on the plate, and heat the plate at 100°C for 3 minutes: the spots obtained from the sample solution and the standard solution show a red-purple color, and has the same Rf value.

Purity Soluble halides—Weigh a quantity of powdered Levothyroxine Sodium Tablets, equivalent to 2.5 mg of Levothyroxine Sodium Hydrate, add 25 mL of water, warm to 40°C, shake for 5 minutes, and proceed as directed above.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Place 1 tablet of Levothyroxine Sodium Tablets in a glass-stopped centrifuge tube, add exactly 10 mL of 0.01 mol/L sodium hydroxide TS, warm at 50°C for 15 minutes, and shake vigorously for 20 minutes. Centrifuge this solution, pipet 5 mL of the supernatant liquid, and add exactly 1 mL of the internal standard solution, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratio of the peak area of levothyroxine to that of the internal standard. Calculate the mean value from the ratios of each peak area of 10 samples: the deviation (%) of the mean value and the ratio of each peak area should be not more than 15%. When the deviation (%) is more than 15%, and 1 sam-
ple shows not more than 25%, perform another test with 20 samples. Calculate the deviation (%) of the mean value of the 30 samples used in the 2 tests and the ratio of each peak area: there should be not more than 1 sample with the deviation more than 15% but not more than 25%, and no sample should deviate by more than 25%.

**Internal standard solution**—A solution of ethinylestradiol in a mixture of acetonitrile and diluted phosphoric acid (1 in 10) (9:1) (3 in 40,000).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: a constant wavelength between 220 nm and 230 nm).
Column: A stainless steel column 4 to 6 mm in inside diameter and 10 to 25 cm in length, packed with octadecysilanized silica gel (5 μm in particle diameter).
Column temperature: A constant temperature at about 25°C.
Mobile phase: A mixture of methanol, water and phosphoric acid (1340:660:1).
Flow rate: Adjust so that the retention time of levothyroxine is about 9 minutes.
Selection of column: To 5 mL of a solution of levothyroxine sodium in 0.01 mol/L sodium hydroxide TS (1 in 200,000) add 1 mL of the internal standard solution. Proceed with 20 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of levothyroxine and the internal standard in this order with the resolution between these peaks being not less than 2.0.

**Dissolution** Being specified separately when the drug is granted approval based on the Law.

**Assay** Weigh accurately and powder not less than 20 Levothyroxine Sodium Tablets. Weigh accurately a portion of the powder, equivalent to about 3 mg of levothyroxine sodium (C₁₅H₂₀I₃N₃O₄), into a crucible, and add potassium carbonate amounting to twice the mass of the powder. In the case that the weighed powder is less than 4 g, add 8 g of potassium carbonate to the crucible. Mix well, and gently tap the crucible on the bench to compact the mixture. Overlay the crucible strongly at a temperature between 675°C and 700°C for 25 minutes. Cool, add 30 mL of water, heat gently to boiling, and filter into a flask. To the residue add 30 mL of water, boil, and filter into the same flask. Rinse the crucible and the char on the funnel with hot water until the filtrate measures 300 mL. Add slowly 7 mL of freshly prepared bromine TS and diluted phosphoric acid (1 in 2) in the ratio of 3.5 mL to 1 g of the added potassium carbonate, and boil until starch-potassium iodide paper is no longer colored blue by the evolved gas. Wash the inside of the flask with water, and continue boiling for 5 minutes. During the boiling add water from time to time to maintain a volume of not less than 250 mL. Cool, add 5 mL of a solution of phenol (1 in 20), again rinse the inside of the flask with water, and allow to stand for 5 minutes. Add 2 mL of diluted phosphoric acid (1 in 2) and 5 mL of potassium iodide TS, and titrate <2.5D> immediately the liberated iodine with 0.01 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.01 mol/L sodium thiosulfate VS = 0.3329 mg of C₁₅H₂₀I₃N₃O₄

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

### Lidocaine

**Description**
Lidocaine occurs as white to pale yellow, crystals or crystalline powder. It is very soluble in methanol and in ethanol (95), soluble in acetic acid (100) and in diethyl ether, and practically insoluble in water. It dissolves in dilute hydrochloric acid.

**Identification** (1) Dissolve 40 mg of Lidocaine in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.22>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Lidocaine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.29>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 66 – 69°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Lidocaine in 2 mL of dilute hydrochloric acid, and add water to make 10 mL: the solution is clear and colorless to light yellow.

(2) Chloride <1.05>—Dissolve 0.6 g of Lidocaine in 6 mL of dilute nitric acid, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.041%).

(3) Sulfate <1.14>—Dissolve 0.5 g of Lidocaine in 5 mL of dilute hydrochloric acid, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS, 5 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.096%).

(4) Heavy metals <1.07>—Carbonize 2.0 g of Lidocaine by gentle ignition. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), and fire the ethanol to burn. After cooling, add 1 mL of sulfuric acid, proceed according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Related substances—Dissolve 0.10 g of Lidocaine in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography.

**C₆H₁₆N₂O₂: 234.34**

2-Diethylamino-N-(2,6-dimethylphenyl)acetamide [137-58-6]
raphy. Develop the plate with a mixture of ethyl acetate, 2-butanol, water and formic acid (5:3:1:1) to a distance of about 10 cm, air-dry the plate, and dry more at 80°C for 30 minutes. After cooling, examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.4% Not more than 0.5% (1 g, in vacuum, silica gel, 24 hours).

**Residue on ignition** <2.4% Not more than 0.1% (1 g).

**Assay** Dissolve about 0.5 g of Lidocaine, previously dried and accurately weighed, in 20 mL of acetic acid (100), and titrate <2.5> with 0.1 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS) until the color of the solution changes from purple to blue-green through blue. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 23.43 mg of C₁₄H₂₂N₂O

**Containers and storage** Containers—Tight containers.

## Lidocaine Injection

**リンカイン注射液**

Lidocaine Injection is an aqueous injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of lidocaine hydrochloride (C₁₄H₂₂N₂O·HCl: 270.80).

**Method of preparation** Prepare as directed under Injections, with Lidocaine and an equivalent amount of Hydrochloric Acid.

No preservative is added in the case of intravenous injections.

**Description** Lidocaine Injection is a colorless, clear liquid. pH: 5.0 – 7.0

**Identification** To a volume of Lidocaine Injection, equivalent to 20 mg of lidocaine hydrochloride (C₁₄H₂₂N₂O·HCl), add 1 mL of sodium hydroxide TS, and extract with 20 mL of hexane. To 10 mL of the hexane extract add 20 mL of 1 mol/L hydrochloric acid TS, and shake vigorously. Determine the absorption spectrum of the water layer as directed under Ultraviolet-visible Spectrophotometry <2.26>; it exhibits a maximum between 261 nm and 265 nm.

**Bacterial endotoxins** <4.01> Less than 1.0 EU/mg.

**Extractable volume** <5.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** To an exactly measured volume of Lidocaine Injection, equivalent to about 0.1 g of lidocaine hydrochloride (C₁₄H₂₂N₂O·HCl), add exactly 10 mL of the internal standard solution and 0.001 mol/L hydrochloric acid TS to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 85 mg of lidocaine for assay, previously dried in a desiccator (in vacuum, silica gel) for 24 hours, dissolve in 0.5 mL of 1 mol/L hydrochloric acid TS and a suitable volume of 0.001 mol/L hydrochloric acid TS, and add exactly 10 mL of the internal standard solution, then add 0.001 mol/L hydrochloric acid TS to make 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₂ and Q₆, of the peak area of lidocaine to that of the internal standard.

\[
\text{Amount (mg) of lidocaine hydrochloride} = M_5 \times \frac{Q_2}{Q_6} \times 1.156
\]

M₅: Amount (mg) of lidocaine for assay taken

**Internal standard solution** — A solution of benzophenone in methanol (1 in 4000).

**Operating conditions**

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

- Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (10 μm in particle diameter).

- Column temperature: A constant temperature of about 25°C.

- Mobile phase: Dissolve 2.88 g of sodium lauryl sulfate in 1000 mL of a mixture of 0.02 mol/L phosphate buffer solution (pH 3.0) and acetonitrile (11:9).

- Flow rate: Adjust so that the retention time of lidocaine is about 6 minutes.

**System suitability**

- System performance: When proceed with 5 μL of the standard solution under the above operating conditions, lidocaine and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

- System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of lidocaine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Limaprost Alfadex

**リマプロスト アルファデックス**

![Structure of Limaprost](image)

C₁₄H₂₆O₃ : xC₆H₆O₆

(2E)-7-[(1R,2R,3R)-3-Hydroxy-2-[(1E,3S,5S)-3-hydroxy-5-methylnon-1-en-1-yl]-5-oxycyclopentyl] hept-2-enoic acid α-cyclodextrin

[L100459-01-6, limaprost:alfadex = 1:1; clathrate compound]

Limaprost Alfadex is a α-cyclodextrin clathrate compound of limaprost.

It contains not less than 2.8% and not more than 3.2% oflimaprost (C₁₄H₂₆O₃: 380.80), calculated on the anhydrous basis.
Description Limaprost Alfadex occurs as a white powder.

It is freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in ethyl acetate.

It is hygroscopic.

Identification (1) Dissolve 20 mg of Limaprost Alfadex in 5 mL of water, add 5 mL of ethyl acetate, shake, centrifuge, and use the upper layer as the sample solution (1). Separately, to 20 mg of Limaprost Alfadex add 5 mL of ethyl acetate, shake, centrifuge, and use the supernatant liquid as the sample solution (2). Evaporate the solvent of the sample solutions (1) and (2) under reduced pressure, add 2 mL of sulfuric acid to each of the residue, and shake them for 5 minutes: the solution obtained from the sample solution (1) develops an orange-yellow color while the solution obtained from the sample solution (2) does not develop any color.

(2) Dissolve 20 mg of Limaprost Alfadex in 5 mL of water, add 5 mL of ethyl acetate, shake, centrifuge, and evaporate the solvent of the upper layer under reduced pressure. Dissolve the residue in 2 mL of ethanol (95), 5 mL of 1,3-dinitrobenzene TS, add 5 mL of a solution of potassium hydroxide in ethanol (95) (17 in 100) while ice-cooling, and allow to stand in a dark place while ice-cooling for 20 minutes: a purple color develops.

(3) To 50 mg of Limaprost Alfadex add 1 mL of iodine TS, dissolve by heating in a water bath, and allow to stand: a dark blue precipitate is formed.

(4) Determine the absorption spectrum of a solution of Limaprost Alfadex in dilute ethanol (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \( \lambda_{	ext{max}} > 200 \text{ nm and } 400 \text{ nm} \): To 10 mL of this solution add 1 mL of potassium hydroxide-ethanol TS, and allow to stand for 15 minutes. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( \lambda_{	ext{max}} > 200 \text{ nm and } 400 \text{ nm} \) and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Optical rotation \( \Delta \alpha_{25}^D \): +125 – 135° (0.1 g calculated on the anhydrous basis, dilute ethanol, 20 mL, 100 mm).

Purity Related substances—Perform the test immediately after preparation of the sample solution. Dissolve 0.10 g of Limaprost Alfadex in 2 mL of water, add 1 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add dilute ethanol to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 3 mL of the standard solution (1), add dilute ethanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with exactly 3 \( \mu \)L each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography \( \Delta \alpha_{25}^D > 200 \text{ nm and } 400 \text{ nm} \) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak of 17-epi-isomer, having the relative retention time of about 1.1 to limaprost, and the area of the peak of 11-deoxy substance, having the relative retention time of about 2.1, obtained from the sample solution are not larger than the peak area of limaprost from the standard solution (1) and (2). When the sample solution is not larger than the peak area of limaprost from the standard solution (2), and the area of the peak other than the principal peak and the peaks mentioned above from the sample solution is not larger than 1/3 times the peak area of limaprost from the standard solution (2). The total area of the peaks other than limaprost from the samples solution is not larger than the peak area of limaprost from the standard solution (1).

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of limaprost beginning after the solvent peak.

System suitability—

System performance: Proceed as directed in the system suitability in the Assay.

Test for required detectability: To exactly 1 mL of the standard solution (1) add dilute ethanol to make exactly 10 mL. Confirm that the peak area of limaprost obtained with 3 \( \mu \)L of this solution is equivalent to 8 to 12% of that with 3 \( \mu \)L of the standard solution (1).

System repeatability: When the test is repeated 6 times with 3 \( \mu \)L of the standard solution (1) under the above conditions, the relative standard deviation of the peak area of limaprost is not more than 2.0%.

Water \( \Delta \alpha_{25}^D \): Not more than 6.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.1 g of Limaprost Alfadex, dissolve in 5 mL of water, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 3 mg of Limaprost RS, dissolve in exactly 5 mL of the internal standard solution, add 5 mL of water, and use this solution as the standard solution. Perform the test with 3 \( \mu \)L each of the sample solution and the standard solution as directed under Liquid Chromatography \( \Delta \alpha_{25}^D > 200 \text{ nm and } 400 \text{ nm} \) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of limaprost to that of the internal standard.

Amount (mg) of limaprost \( (C_22H_{30}O_3) = M_s \times Q_1/Q_2 \)

Amount (mg) of Limaprost RS taken

Internal standard solution—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

Operating conditions—

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, acetonitrile for liquid chromatography and 2-propanol for liquid chromatography (9:5:2).

Flow rate: Adjust so that the retention time of limaprost is about 12 minutes.

System suitability—

System performance: When the procedure is run with 3 \( \mu \)L of the standard solution under the above operating conditions, the internal standard and limaprost are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 3 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of limaprost to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant, at a temperature not exceeding –10°C.
Lincomycin Hydrochloride Hydrate

リンコマイシン塩酸塩水和物

\[
\text{C}_{18}\text{H}_{22}\text{N}_{3}\text{O}_{8}\text{S}.\text{HCl} \cdot \text{H}_{2}\text{O}: \quad 461.01
\]
Methyl 6,8-dIDEOXY-6-[(2S,4R)-1-methyl-4-propylpyrrolidine-2-carboxamido]-1-thio-\(\alpha\)-D-galacto-octopyranoside monohydrochloride monohydrate [7179-49-9]

Lincomycin Hydrochloride Hydrate is the hydrochloride of a substance having antibacterial activity produced by the growth of *Streptomyces lincolnensis* var. *lincolnensis*.

It contains not less than 850 \(\mu\)g (potency) and not more than 930 \(\mu\)g (potency) per mg, calculated on the anhydrous basis. The potency of Lincomycin Hydrochloride Hydrate is expressed as mass (potency) of lincomycin \((\text{C}_{18}\text{H}_{23}\text{N}_{3}\text{O}_{8}\text{S}): 406.54\).

**Description** Lincomycin Hydrochloride Hydrate occurs as white, crystals or crystalline powder.

It is freely soluble in water and in methanol, sparingly soluble in ethanol (95).

**Identification (1)** Determine the infrared absorption spectrum of Lincomycin Hydrochloride Hydrate as directed in the paste method under Infrared Spectrophotometry \(<2.25\>\), and compare the spectrum with the Reference Spectrum or the spectrum of Lincomycin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Lincomycin Hydrochloride Hydrate (1 in 100) responds to Qualitative Tests \(<1.09\>\) (2) for chloride.

**Optical rotation** \(<2.49\>\) \([\alpha]_{D}^{20}: +135 - +150^\circ\) (0.5 g, water, 25 mL, 100 mm).

**pH** \(<2.54\>\) Dissolve 0.10 g of Lincomycin Hydrochloride Hydrate in 1 mL of water: 3.0 - 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Lincomycin Hydrochloride Hydrate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals \(<1.07\>\)—Proceed with 2.0 g of Lincomycin Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 5 ppm).

(3) Lincomycin B—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 20 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(<2.01\>\) according to the following conditions, and determine the peak areas of lincomycin and lincomycin B, having the relative retention time of about 0.5 to lincomycin obtained from the sample solution, by the automatic integration method: the peak area of lincomycin B is not more than 2.0% of the sum of the peak areas of lincomycin and lincomycin B.

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay.

**System suitability**—
System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Measure exactly 1 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of lincomycin obtained from 20 \(\mu\)L of this solution is equivalent to 1.4 to 2.6% of that obtained from 20 \(\mu\)L of the sample solution.

**Water** \(<2.48\>\) 3.0 - 6.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Lincomycin Hydrochloride Hydrate and Lincomycin Hydrochloride RS, equivalent to about 10 mg (potency), dissolve each in the mobile phase to make exactly 10 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\>\) according to the following conditions, and determine the peak areas, \(A_{S}\) and \(A_{T}\), of lincomycin in each solution.

Amount \([\mu\text{g (potency)}]\) of lincomycin \((\text{C}_{18}\text{H}_{23}\text{N}_{3}\text{O}_{8}\text{S})\)
\[= \frac{M_{S} \times A_{T}}{A_{S} \times 1000}\]

\(M_{S}: \text{Amount [mg (potency)] of Lincomycin Hydrochloride RS taken}\)

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 46°C.

Mobile phase: To 13.5 mL phosphoric acid add 1000 mL of water, and adjust the pH to 6.0 with ammonia TS. To 780 mL of this solution add 150 mL of acetonitrile and 150 mL of methanol.

Flow rate: Adjust so that the retention time of lincomycin is about 9 minutes.

**System suitability**—
System performance: When the procedure is run with 20 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lincomycin are not less than 4000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lincomycin is not more than 2.0%.

**Containers and storage** Containers—Tight containers.
**Lincomycin Hydrochloride Injection**

Lincomycin Hydrochloride Injection is an aqueous injection. It contains not less than 93.0% and not more than 107.0% of the labeled potency of lincomycin (C₁₅H₂₂N₂O₆S; 406.54).

**Method of preparation** Prepare as directed under Injections, with Lincomycin Hydrochloride Hydrate.

**Description** Lincomycin Hydrochloride Injection is a clear, colorless liquid.

**Identification** To a volume of Lincomycin Hydrochloride Injection, equivalent to 30 mg (potency) of Lincomycin Hydrochloride Hydrate, add 30 mL of water, and use this solution as the sample solution. Separately, dissolve 10 mg (potency) of Lincomycin Hydrochloride RS in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.2.3): Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Dissolve 150 g of ammonium acetate in 800 mL of water, adjust the pH to 9.6 with ammonia solution and use this solution as the sample solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Dissolve 10 mg (potency) of Liothyronine Sodium in ethanol (95) (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry (2.2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Soluble halide—To 10 mL of Liothyronine Sodium solution add 5 mL of water and 1 drop of dilute nitric acid, shake, and filter. Add water to the filtrate to make 10 mL, and mix with 3 drops of silver nitrate TS: the solution shows no more turbidity than the following control solution.

Control solution: To 0.35 mL of 0.01 mol/L hydrochloric acid VS add 1 drop of dilute nitric acid and water to make 10 mL.

**Sterility** (4) Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Pipet a volume of Lincomycin Hydrochloride Injection, equivalent to about 0.3 g (potency) of Lincomycin Hydrochloride Hydrate, add the mobile phase to make exactly 30 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Lincomycin Hydrochloride RS, equivalent to 20 mg (potency), dissolve in the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Lincomycin Hydrochloride Hydrate.

Amount [mg (potency)] of lincomycin (C₁₅H₂₂N₂O₆S) = Mₙ × A₁/A₂ × 15

Mₙ: Amount [mg (potency)] of Lincomycin Hydrochloride RS taken

**Containers and storage** Containers—Hermetic containers.

**Containers and storage** Containers—Hermetic containers.

**Liothyronine Sodium**

Liothyronine Sodium contains not less than 95.0% of liothyronine sodium (C₁₅H₁₁I₃NaO₄), calculated on the dried basis.

**Description** Liothyronine Sodium occurs as a white to light brown powder. It is odorless.

It is slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It dissolves in sodium hydroxide TS and in ammonia TS.

**Identification** (1) To 5 mL of a solution of Liothyronine Sodium in ethanol (95) (1 in 1000) add 1 mL of ninhydrin TS, and warm in a water bath for 5 minutes: a purple color develops.

(2) Heat 0.02 g of Liothyronine Sodium with a few drops of sulfuric acid over a flame: a purple gas is evolved.

(3) Determine the absorption spectrum of a solution of Liothyronine Sodium in ethanol (95) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry (2.2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Ignite 0.02 g of Liothyronine Sodium until thoroughly charred. After cooling, add 5 mL of water to the residue, shake, and filter: the filtrate responds to Qualitative Tests (1.09) (1) for sodium salt.

**Optical rotation** (2.2.4) [α]²⁰D +18° to +22° (0.2 g calculated on the dried basis, a mixture of ethanol (95) and 1 mol/L hydrochloric acid TS (4:1), 10 mL, 100 mm).

**Purity** (1) Soluble halide—To 10 mg of Liothyronine Sodium add 10 mL of water and 1 drop of dilute nitric acid, shake for 5 minutes, and filter. Add water to the filtrate to make 10 mL, and mix with 3 drops of silver nitrate TS: the solution shows no more turbidity than the following control solution.

Control solution: To 0.35 mL of 0.01 mol/L hydrochloric acid VS add 1 drop of dilute nitric acid and water to make 10 mL.

(2) Iodine and iodide—Dissolve 0.10 g of Liothyronine Sodium in 10 mL of dilute hydroxide TS and 15 mL of water, add 5 mL of dilute sulfuric acid, and allow to stand for 10 minutes with occasional shaking. Filter the mixture into a Nessler tube, add 10 mL of chloroform and 3 drops of a solution of potassium iodate (1 in 100) to the filtrate, mix for 30 seconds, and allow to stand: the chloroform layer has no more color than the following control solution.

Control solution: Weigh exactly 0.111 g of potassium iodide, and dissolve in water to make 1000 mL. Pipet 1 mL of this solution, add 10 mL of dilute hydroxide TS, 14 mL of water and 5 mL of dilute sulfuric acid, and mix. Filter the mixture into a Nessler tube, and perform the test with the filtrate in the same manner as for the sample.
(3) Related substances—Dissolve 0.15 g of Liothyronine Sodium in 5 mL of diluted ammonia TS (1 in 3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted ammonia TS (1 in 3) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 1 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of t-butyl alcohol, t-amyl alcohol, water, ammonia solution (28) and 2-butane (59:32:17:15:7) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of 1-butanol and acetic acid (100) (97.3) on the plate, and dry the plate at 100°C for 3 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 4.0% (0.2 g, 105°C, 2 hours).

Assay Weigh accurately about 25 mg of Liothyronine Sodium, and proceed as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 10 mL of a solution of sodium hydroxide (1 in 100) and 1 mL of a freshly prepared solution of sodium bisulfate (1 in 100) as the absorbing liquid, and prepare the test solution. Apply a small amount of water to the upper part of apparatus A, pull out C carefully, and wash C, B and the inner wall of A with 40 mL of water. To the test solution add 1 mL of bromine-acetic acid TS, insert the stopper C, and shake vigorously for 1 minute. Remove the stopper, rinse the stopper, the sample holder and the inner wall of the flask with 40 mL of water, and add 0.5 mL of formic acid. Stopper the flask with C, and shake vigorously for 1 minute again. Remove the stopper, and rinse the stopper, the sample holder and the inner wall of the flask with 40 mL of water again. Bubble the solution with enough nitrogen gas in the flask to remove the oxygen and excess bromine, add 0.5 g of potassium iodide to the solution, and dissolve. Add immediately 3 mL of dilute sulfuric acid, mix, and allow to stand for 2 minutes. Titrate <2.50> the solution with 0.02 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.02 mol/L sodium thiosulfate VS = 0.7477 mg of C₁₂H₁₇I₃N₂NaO₄

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Liothyronine Sodium Tablets リオチロニンナトリウム錠

Liothyronine Sodium Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of liothyronine sodium (C₁₂H₁₇I₃N₂NaO₄: 672.96).

Method of preparation Prepare as directed under Tablets, with Liothyronine Sodium.

Identification (1) To a glass-stoppered centrifuge tube add a portion of finely powdered Liothyronine Sodium Tablets, equivalent to 0.1 mg of Liothyronine Sodium, add 30 mL of dilute sodium hydroxide TS, shake vigorously, and centrifuge. Transfer the supernatant liquid to a separator, add 10 mL of dilute hydrochloric acid, and extract with two 20-mL portions of ethyl acetate. Filter each extract successively through absorbent cotton previously overlaid with 8 g of anhydrous sodium sulfate. Evaporate the filtrate on a water bath to dryness with the aid of a current of nitrogen. Dissolve the residue in 0.5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 10 mg of liothyronine sodium for thin-layer chromatography in 50 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of t-butyl alcohol, t-amyl alcohol, water, ammonia solution (28) and 2-butane (59:32:17:15:7) to a distance of about 12 cm, and air-dry the plate. Spray evenly a solution of 0.3 g of ninhydrin in 100 mL of a mixture of 1-butanol and acetic acid (100) (97.3) on the plate, and dry the plate at 100°C for 3 minutes: the spots obtained from the sample solution and the standard solution show a red-purple color, and has the same Rf value.

(2) The colored solution obtained in the Assay is blue in color.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Place 1 tablet of Liothyronine Sodium Tablets in a glass-stoppered centrifuge tube, add exactly 10 mL of 0.01 mol/L sodium hydroxide TS, warm at 50°C for 15 minutes, and shake vigorously for 20 minutes. Centrifuge for 5 minutes, and filter the supernatant liquid, if necessary. Pipet a definite volume of this solution, and add a volume of 0.01 mol/L sodium hydroxide TS to prepare a definite volume of a solution containing about 0.5 μg of liothyronine sodium (C₁₂H₁₇I₃N₂NaO₄) per mL. Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the sample solution. Perform the test with 200 μL of the sample solution as directed under Liquid Chromatography <2.06> according to the following conditions, and calculate the ratio of the peak area of the liothyronine to that of the internal standard. Calculate the mean value of the ratios of each peak area of 10 samples: the deviation (%) of each ratio of the peak area from the mean value should be not more than 15%. When the deviation (%) is more than 15%, and 1 sample shows not more than 25%, perform another test with 20 samples. Calculate the deviation (%) of each ratio of the peak area from the mean value of the 30 samples used in the two tests: there should be not more than 1 sample with the deviation more than 15% but not more than 25%, and no sample should deviate by more than 25%.

Internal standard solution—A solution of propylparahydroxybenzoate in a mixture of methanol and dilute phosphoric acid (1 in 10) (9:1) (1 in 250,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Diluted methanol (57 in 100).

Flow rate: Adjust so that the retention time of liothyronine is about 9 minutes.
System suitability—

System performance: To 5 mL of a solution of liothyronine sodium in 0.01 mol/L sodium hydroxide TS (1 in 2,000,000) add 1 mL of the internal standard solution, and use this solution as the solution for system suitability test. When the procedure is run with 200 μL of this solution under the above operating conditions, the internal standard and liothyronine are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 200 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratios of the peak area of liothyronine to that of the internal standard is not more than 1.0%.

**Assay**

Weigh accurately not less than 20 Liothyronine Sodium Tablets, and finely powder. Place an accurately weighed portion of the powder, equivalent to about 50 μg of liothyronine sodium (C₁₅H₂₁I₃NaO₄), in an agate mortar, add 1 g of powdered potassium carbonate, and mix well. Transfer the mixture cautiously to a porcelain crucible, and compact the contents by gently tapping the crucible on a table. Add an additional 1.5 g of powdered potassium carbonate to the same agate mortar, mix well with any content adhering to the mortar, cautiously overlay the mixture on the top of the same porcelain crucible, and compact the charge again in the same manner. Ignite the combined mixture in the crucible between 675°C and 700°C for 30 minutes. Cool, add a few mL of water to the crucible, heat gently to boiling, and filter the contents of the crucible through a glass filter (G4) into a 20-mL volumetric flask. Wash the residue with water, and combine the washings with the filtrate. Cool, add water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 75 mg of potassium iodide for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 200 mL. Measure exactly 5 mL of the solution, and add a solution of potassium carbonate (1 in 8) to make exactly 100 mL. To 2 mL of this solution, exactly measured, add a solution of potassium carbonate (1 in 8) to make exactly 20 mL, and use the solution as the standard solution. Pipet 5 mL each of the sample solution and the standard solution into glass-stoppered test tubes, add 3.0 mL of diluted sulfuric acid (4 in 25) and 2.0 mL of potassium permanganate TS, and heat on a water bath for 15 minutes. Cool, add 1.0 mL of diluted sodium nitrite TS (1 in 10), swirl to mix, and add 1.0 mL of a solution of ammonium amidosulfate (1 in 10). Allow to stand at room temperature for 10 minutes with occasional shaking. Then add 1.0 mL of potato starch TS and 1.0 mL of a freshly prepared, diluted potassium iodide TS (1 in 40), swirl to mix, and transfer each solution to a 20-mL volumetric flask. Rinse the test tube with water, collect the washings in the volumetric flask, add water to make 20 mL, and allow to stand for 10 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry 2.24, using a solution prepared with 5 mL of potassium carbonate (1 in 8) in the same manner as the sample solution as the blank. Determine the absorbances, A₁ and A₂, of the subsequent solutions of the sample solution and the standard solution at the wavelength of maximum absorption at about 600 nm, respectively.

Amount (mg) of liothyronine sodium (C₁₅H₂₁I₃NaO₄) = M₂ × A₁/A₂ × 1/2000 × 1.351

M₂: Amount (mg) of potassium iodide for assay taken

Containers and storage—Containers—Tight containers.

Storage—Light-resistant.

---

**Lisinopril Hydrate**

リシンボプリル水和物

Lisinopril Hydrate contains not less than 98.5% and not more than 101.0% of lisinopril (C₂₉H₃₃N₇O₄: 405.49), calculated on the anhydrous basis.

Description—Lisinopril Hydrate occurs as a white crystalline powder, having a slight characteristic odor.

It is soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (99.5).

Melting point—about 160°C (with decomposition).

Identification

(1) Determine the absorption spectrum of a solution of Lisinopril Hydrate in methanol (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Lisinopril Hydrate as directed in the past method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation—<2,40> [α]D: −43.0 to −47.0° (0.25 g calculated on the anhydrous basis, 0.25 mol/L zinc acetate buffer solution (pH 6.4), 25 mL, 100 nm).

Purity

(1) Heavy metals—<0.07>—Proceed with 2.0 g of Lisinopril Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve about 0.10 g of Lisinopril Hydrate in 50 mL of water, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 1.2 to lisinopril obtained from the sample solution, is not larger than 1/5 times the peak area of lisinopril from the standard solution, the area of the peak other than lisinopril and the peak mentioned above from the sample solution, is not larger than 2/15 times the peak area of lisinopril from the standard solution, and the total area of the peaks other than lisinopril from the sample solution, is not larger than the peak area of lisinopril from the standard solution.

Operating conditions—

Column: A stainless steel column 4.0 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 60°C.

Mobile phase A: Diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2).

Mobile phase B: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile for liquid chromatography (3:2).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 10</td>
<td>90 → 50</td>
<td>10 → 50</td>
</tr>
<tr>
<td>10 – 25</td>
<td>50</td>
<td>50</td>
</tr>
</tbody>
</table>

Flow rate: About 1.5 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of lisinopril, beginning after the solvent peak.

System suitability—

Test for required detectability: Measure exactly 2.5 mL of the standard solution, and add water to make exactly 50 mL. Confirm that the peak area of lisinopril obtained with 15 μL of this solution is equivalent to 3.5 to 6.5% of that with 15 μL of the standard solution.

System performance: To 10 mg of lisinopril hydrate and 2 mL of a solution of anhydrous caffeine (1 in 1000) add water to make 200 mL. When the procedure is run with 15 μL of this solution under the above operating conditions, lisinopril and caffeine are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lisinopril is not more than 2.0%.

Water <2.48> Not less than 8.0% and not more than 9.5% (0.3 g, volumetric titration, back titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.66 g of Lisinopril Hydrate, dissolve in 80 mL of water, and titrate <2.59> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.55 mg of C21H31N3O5.

Containers and storage Containers—Well-closed containers.

Lisinopril Tablets

リシノプリル錠

Lisinopril Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of lisinopril (C21H31N3O5: 405.49).

Method of preparation Prepare as directed under Tablets, with Lisinopril Hydrate.

Identification To an amount of powdered Lisinopril Tablets, equivalent to 10 mg of lisinopril (C21H31N3O5), add 10 mL of methanol, shake for 20 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 10 mg of lisinopril in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 30 μL of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetonitrile, acetic acid (100), water and ethyl acetate (2:2:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and heat the plate at 120°C: the principal spot obtained from the sample solution and the spot from the standard solution show a red-purple color and their Rf values are the same.

Purity Related substances—Powder not less than 20 Lisinopril Tablets. Take a portion of the powder, equivalent to about 25 mg of lisinopril (C21H31N3O5), add 25 mL of water, shake for 20 minutes, filter, and use the filtrate as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of lisinopril diketopiperazine, having the relative retention time of about 0.2 to lisinopril obtained from the sample solution, is not less than 2.3 times the peak area of lisinopril from the standard solution.

Operating conditions—

Proceed as directed in the operating conditions in the Purity (2) under Lisinopril Hydrate.

System suitability—

System performance: Proceed as directed in the system suitability in the Purity (2) under Lisinopril Hydrate.

Test for required detectability: To exactly 2.5 mL of the standard solution add water to make exactly 50 mL. Confirm that the peak area of lisinopril obtained with 15 μL of this solution is equivalent to 3.5 to 6.5% of that with 15 μL of the standard solution.

System repeatability: When the test is repeated 6 times with 15 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lisinopril is not more than 2.0%.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Lisinopril Tablets add exactly 5 mL of the internal standard solution per 1 mg of lisinopril (C21H31N3O5), shake for 20 minutes, centrifuge, and use the supernatant liquid as the sample solution. Hereafter, proceed as directed in the Assay.

Amount (mg) of lisinopril (C21H31N3O5) = Mf × Qf/Qs × C/10

Mf: Amount (mg) of lisinopril for assay taken, calculated on the anhydrous basis
C: Labeled amount (mg) of lisinopril (C21H31N3O5) in 1 tablet

Internal standard solution—A solution of anhydrous caffeine (1 in 20,000).

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate
Weigh accurately the mass of not less than 20 g of Lithium Carbonate: a well-closed container—Well-closed container according to the following conditions, and calculate the ratios, \( A_1 \) and \( A_5 \), of Lithium Carbonate in each solution.

Dissolution rate (%) with respect to the labeled amount of lithium carbonate (\( C_2H_3N_2O_3 \))

\[
M_5: \text{Amount (mg) of lithium carbonate (C}_2\text{H}_3\text{N}_2\text{O}_3\text{) in 1 tablet}
\]

\[
M: \text{Labeled amount (mg) of lithium carbonate (C}_2\text{H}_3\text{N}_2\text{O}_3\text{) in 1 tablet}
\]

Operating conditions—

Detector, column temperature, and mobile phase: Proceed as directed in the operating conditions in the Assay.

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Flow rate: Adjust so that the retention time of lithium carbonate is about 7 minutes.

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of lithium carbonate are not less than 1000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of lithium carbonate is not more than 2.0%.

Assay—Weigh accurately the mass of not less than 20 g of Lithium Carbonate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 g of lithium carbonate (\( C_2H_3N_2O_3 \)), add exactly 25 mL of the internal standard solution, shake for 20 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 10 g of lithium carbonate for assay (separately determined in the same manner as Lithium Hydrate), add exactly 50 mL of the internal standard solution to dissolve, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_5 \), of the lithium carbonate to that of the internal standard.

Amount (mg) of lithium carbonate (\( C_2H_3N_2O_3 \))

\[
M_5: \text{Amount (mg) of lithium carbonate (C}_2\text{H}_3\text{N}_2\text{O}_3\text{) for assay taken, calculated on the anhydrous basis}
\]

Internal standard solution—A solution of anhydrous caffeine (1 in 20,000).

Operating conditions—

Column: A stainless steel column 4.0 mm in inside diameter and 20 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 60°C.

Mobile phase: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile for liquid chromatography (19:1).

Flow rate: Adjust so that the retention time of lithium carbonate is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, lithium carbonate and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of lithium carbonate to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Well-closed containers.

Lithium Carbonate

炭酸リチウム

Li₂CO₃: 73.89

Lithium Carbonate, when dried, contains not less than 99.5% of lithium carbonate (Li₂CO₃).

Description—Lithium Carbonate occurs as a white crystalline powder. It is odorless.

It is sparingly soluble in water, slightly soluble in hot water, and practically insoluble in ethanol (95) and in diethyl ether.

It dissolves in dilute acetic acid.

The pH of a solution dissolved 1.0 g of Lithium Carbonate in 100 mL of water is between 10.9 and 11.5.

Identification (1) Perform the test as directed under Flame Coloration Test <1.09> (1) with Lithium Carbonate: a persistent red color appears.

(2) Dissolve 0.2 g of Lithium Carbonate in 3 mL of dilute hydrochloric acid, and add 4 mL of sodium hydroxide TS and 2 mL of disodium hydrogen phosphate TS: a white precipitate is produced. To the precipitate add 2 mL of dilute hydrochloric acid: it dissolves.

(3) A solution of Lithium Carbonate (1 in 100) responds to Qualitative Tests <1.09> for carbonate.

Purity—(1) Clarity and color of solution—Dissolve 0.10 g of Lithium Carbonate in 10 mL of water by warming: the solution is clear and colorless.

(2) Acetic acid-insoluble substances—Take 1.0 g of Lithium Carbonate, dissolve in 40 mL of dilute acetic acid, filter the insoluble substances using filter paper for quantitative analysis, wash with five 10-mL portions of water, and ignite the insoluble substances together with the filter paper.
to incinerate: the mass of the residue is not more than 1.5 mg.

(3) Chloride $<1.02>\text{—To 0.40 g of Lithium Carbonate add 10 mL of water and 7 mL of dilute nitric acid, and dissolve by heating to boil. After cooling, add 6 mL of dilute nitric acid, and dilute with water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.02%).}$

(4) Sulfate $<1.14>\text{—To 0.40 g of Lithium Carbonate add 10 mL of water and 4 mL of dilute hydrochloric acid, and dissolve by heating to boil. After cooling, add 1 mL of dilute hydrochloric acid, and dilute with water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).}$

(5) Heavy metals $<1.07>\text{—To 4.0 g of Lithium Carbonate add 5 mL of water, gradually add 10 mL of hydrochloric acid while mixing, and dissolve. Evaporate the solution on a water bath to dryness. To the residue add 10 mL of water, and dissolve. Place the solution in a Nessler tube, add 1 drop of phenolphthalein TS, add ammonia TS until the solution shows a slight red color, then add 2 mL of dilute acetic acid, and dilute with water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: Evaporate 10 mL of hydrochloric acid on a water bath to dryness. To the residue add 10 mL of water, and dissolve. Place the solution in a Nessler tube, add 1 drop of phenolphthalein TS, add ammonia TS until the solution shows a pale red color, then add 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to make 50 mL (not more than 5 ppm).}$

(6) Iron $<1.10>\text{—Prepare the test solution with 1.0 g of Lithium Carbonate according to Method 2 using 11 mL of dilute hydrochloric acid, and perform the test according to Method B. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).}$

(7) Aluminum $\text{—To 5.0 g of Lithium Carbonate add 20 mL of water, add gradually 15 mL of hydrochloric acid while stirring, and evaporate to dryness on a water bath. To the residue add 50 mL of water to dissolve, filter if necessary, and assign this solution as solution A. Separately, evaporate 15 mL of hydrochloric acid to dryness on a water bath, then proceed in the same manner, and assign the solution so obtained as solution B. To 10 mL of solution A add 10 mL of water and 5 mL of acetic acid-sodium acetate buffer solution (pH 4.5), and shake. Add 1 mL of a solution of l-ascorbic acid (1 in 100), 2 mL of ammonium TS and water to make 50 mL, shake well, and allow to stand for 10 minutes: the solution has no more color than the following control solution.}$

Control solution: Dissolve 0.1758 g of aluminum potassium sulfate dodecahydrate in water to make 1000 mL. To 1.0 mL of this solution add 10 mL of solution B and water to make 20 mL, add 5 mL of acetic acid-sodium acetate buffer solution (pH 4.5), and proceed in the same manner.

(8) Barium $\text{—To 20 mL of solution A obtained in (7) add 6 mL of water, 0.5 mL of dilute hydrochloric acid, 3 mL of ethanol (95) and 2 mL of potassium sulfate TS, and allow to stand for 1 hour: the solution has no more turbidity than the following control solution.}$

Control solution: Dissolve 17.8 mg of barium chloride dihydrate in water to make 1000 mL. To 6 mL of this solution add 20 mL of solution B obtained in (7), 0.5 mL of dilute hydrochloric acid and 3 mL of ethanol (95), and proceed in the same manner.

(9) Calcium $\text{—Weigh accurately about 5 g of Lithium Carbonate, add 50 mL of water and 15 mL of hydrochloric acid, and dissolve. Remove carbon dioxide from the solution by boiling, add 5 mL of ammonium oxide TS, then make alkaline with ammonia TS, and allow to stand for 4 hours. Filter the produced precipitate through a glass filter (G4), wash with warm water until the turbidity of the washing is not produced with calcium chloride TS within 1 minute. Transfer the precipitate and the glass filter into a beaker, add water until the glass filter is covered with water, then add 3 mL of sulfuric acid, heat between 70°C and 80°C, and titrate $<2.50>\text{with 0.02 mol/L potassium permanganate VS until a pale red color persists for 30 seconds: the amount of calcium (Ca): 40.08 is not more than 0.05%.}$

Each mL of 0.02 mol/L potassium permanganate VS $= 2.004$ mg of Ca

(10) Magnesium $\text{—To 3.0 mL of solution A obtained in (7) add 0.2 mL of a solution of titan yellow (1 in 1000) and water to make 20 mL, then add 5 mL of sodium hydroxide (3 in 20), and allow to stand for 10 minutes: the solution has no more color than the following control solution.}$

Control solution: Dissolve 49.5 mg of magnesium sulfate heptahydrate, previously dried at 105°C for 2 hours and heated at 450°C for 3 hours, in water to make 1000 mL. To 6 mL of this solution add 3 mL of solution B obtained in (7), 0.2 mL of a solution of titanium yellow (1 in 1000) and water to make 20 mL, and proceed in the same manner.

(11) Potassium $\text{—Dissolve 1.0 g of Lithium Carbonate in water to make 100 mL, and use this solution as the sample solution. To 5 mL of the sample solution add 1.0 mL of dilute acetic acid, shake, add 5 mL of a solution of sodium tetraphenylborate (1 in 30), shake immediately, and allow to stand for 10 minutes: the solution has no more turbidity than the following control solution.}$

Control solution: Dissolve 9.5 mg of potassium chloride in water to make 1000 mL. To 5 mL of this solution add 1.0 mL of dilute acetic acid, shake, and proceed in the same manner.

(12) Sodium $\text{—Weigh accurately about 0.8 g of Lithium Carbonate, dissolve in water to make exactly 100 mL, and use this solution as the sample stock solution. Measure exactly 25 mL of the sample stock solution, add water to make exactly 100 mL, and use this solution as the sample solution (1). Separately, weigh accurately 25.4 mg of sodium chloride, dissolve in water to make exactly 1000 mL, and use this solution as the standard solution. Measure exactly 25 mL of the sample stock solution, add exactly 20 mL of the standard solution, then add water to make exactly 100 mL, and use this solution as the sample solution (2). Determine emission intensities of sodium using a flame photometer with the sample solution (1) and the sample solution (2) under the following conditions. Adjust the wavelength dial to 589 nm, atomize the sample solution (2) into the flame, then adjust the sensitivity so that the emission intensity $L_b$ shows 100 adjustment, and determine emission intensity $L_z$ of the sample solution (1). Then, make the other conditions identical, change the wavelength dial to 580 nm, determine emission intensity $L_b$ of the sample solution (1): the amount of sodium, calculated from the following equation, is not more than 0.05%.}$

$$\text{Amount (%) of sodium (Na) = } \frac{(L_z - L_b)/(L_z - L_b) \times M' \times M}{100}$$

$M$: Amount (mg) of the sample in 25 mL of the sample stock solution

$M'$: Amount (mg) of sodium in 20 mL of the standard solution

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
(13) Arsenic &lt;1.11&gta;—Prepare the test solution with 1.0 g of Lithium Carbonate, add 2 mL of water and 3 mL of hydrochloric acid, and perform the test (not more than 2 ppm).

Loss on drying &lt;2.41&gta; Not more than 0.5% (1 g, 105°C, 3 hours).

Assay Weigh accurately about 1 g of Lithium Carbonate, previously dried, add exactly 100 mL of water and 50 mL of 0.5 mol/L sulfuric acid VS, remove carbon dioxide by boiling gently, cool, and titrate &lt;2.50&gta; the excess sulfuric acid with 1 mol/L sodium hydroxide VS until the color of the solution changes from red to yellow (indicator: 3 drops of methyl red TS). Perform a blank determination in the same manner.

Each mL of 0.5 mol/L sulfuric acid VS = 36.95 mg of Li₂CO₃

Containers and storage Containers—Well-closed containers.

**Lobenzarit Sodium**

ロベンザリットナトリウム

\[
\text{C}_{14}H_{8}ClINa_{2}O_{2} \cdot 335.65
\]

Disodium 2-[(2-carboxylatophenyl)amino]-4-chlorobenzoate [64808-48-6]

Lobenzarit Sodium, when dried, contains not less than 98.0% and not more than 101.0% of lobenzarit sodium (C₁₄H₈ClINa₂O₂).

Description Lobenzarit Sodium occurs as a white to pale yellow-white crystalline powder.

It is soluble in water, and practically insoluble in ethanol (95).

Identification (1) A solution of Lobenzarit Sodium (1 in 50) responds to Qualitative Tests &lt;1.09&gta; (1) for chloride.

(2) Determine the absorption spectrum of a solution of Lobenzarit Sodium (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry &lt;2.24&gta;, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Lobenzarit Sodium, previously dried, as directed in the potassium bromide disk method under Infrared Spectroscopy &lt;2.24&gta;, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Lobenzarit Sodium (1 in 50) responds to Qualitative Tests &lt;1.09&gta; (2) for sodium salt.

Purity (1) Heavy metals &lt;1.07&gta;—Proceed with 1.0 g of Lobenzarit Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic &lt;1.11&gta;—Prepare the test solution with 2.0 g of Lobenzarit Sodium according to Method 3, and perform the test (not more than 1 ppm).

(3) Related substances—Dissolve 50 mg of Lobenzarit Sodium in 2.5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography &lt;2.06&gta;. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of tetrahydrofuran, water and triethylamine (50:15:8) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying &lt;2.41&gta; Not more than 1.0% (1 g, 105°C, 2 hours).

Assay Weigh accurately about 0.1 g of Lobenzarit Sodium, previously dried, dissolve in exactly 40 mL of water, add exactly 60 mL of a mixture of diethy ether and tetrahydrofuran (1:1), and titrate &lt;2.50&gta; with 0.1 mol/L hydrochloric acid VS while well shaking (indicator: 10 drops of bromophenol blue TS) until the blue color of the water layer changes to a persistent light blue-green. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L hydrochloric acid VS = 16.78 mg of C₁₂H₁₀Cl₂Na₂O₃

Containers and storage Containers—Tight containers.

**Lorazepam**

ロラゼパム

\[
\text{C}_{15}H_{16}ClN_{2}O_{2} \cdot 321.16
\]

(3RS)-7-Chloro-5-(2-chlorophenyl)-3-hydroxy-1,3-dihydro-2H-1,4-benzodiazepin-2-one [846-49-1]

Lorazepam, when dried, contains not less than 98.5% of lorazepam (C₁₅H₁₆ClN₂O₂).

Description Lorazepam occurs as a white crystalline powder. It is odorless.

It is sparingly soluble in ethanol (95) and in acetone, slightly soluble in diethyl ether, and practically insoluble in water.

It is gradually colored by light.

Identification (1) To 0.02 g of Lorazepam add 15 mL of dilute hydrochloric acid, boil for 5 minutes, and cool: the solution responds to Qualitative Tests &lt;1.09&gta; for primary aromatic amines.

(2) Determine the absorption spectrum of a solution of Lorazepam in ethanol (95) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry &lt;2.24&gta;, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of
Losartan Potassium / Official Monographs

Losartan Potassium

ロサルタンカリウム

C_{22}H_{22}ClKnO: 461.00
Monopotassium 5-[[4-(2-butyl-4-chloro-5-hydroxymethyl-1H-imidazol-1-yl)methyl]biphenyl-2-yl]-1H-tetrazol-1-ide
[124750-99-8]

Losartan Potassium contains not less than 98.5% and not more than 101.0% of losartan potassium (C_{22}H_{22}ClKnO), calculated on the anhydrous basis.

Description Losartan Potassium occurs as a white crystalline powder.

It is very soluble in water, and freely soluble in methanol and in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Losartan Potassium in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Losartan Potassium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Losartan Potassium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Losartan Potassium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Losartan Potassium responds to Qualitative Tests <1.09> (1) for potassium salt.

(4) Perform the test with Losartan Potassium as directed under Flame Coloration Test <1.04>, (2): a green color appears.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Losartan Potassium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Losartan Potassium in 100 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than the peaks of solvent and losartan from the sample solution is not larger than 1/10 times the peak area of losartan from the standard solution, and the total area of the peaks other than losartan from the sample solution is not larger than 3/10 times the peak area of losartan from the standard solution.

Lorazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Lorazepam as directed under Flame Coloration Test <1.04>, (2): a green color appears.

Absorbance <2.24> $E_{10}^{1.0}$ (229 nm): 1080 – 1126 (after drying, 1 mg, ethanol (95), 200 mL).

Purity (1) Chloride <1.03>—To 1.0 g of Lorazepam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Lorazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Lorazepam according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Lorazepam in 20 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, 1,4-dioxane and acetic acid (100) (91:5:4) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.3% (1 g).

Assay Weigh accurately about 0.4 g of Lorazepam, previously dried, dissolve in 50 mL of acetone, and titrate <2.50> with 0.1 mol/L tetrabutylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetrabutylammonium hydroxide VS

= 32.12 mg of C_{22}H_{21}ClN_{2}O_{2}

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

The JP Drugs are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices 5.)
Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Diluted phosphoric acid (1 in 1000).

Mobile phase B: Acetonitrile.

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 25</td>
<td>75 → 10</td>
<td>25 → 90</td>
</tr>
<tr>
<td>25 - 35</td>
<td>10</td>
<td>90</td>
</tr>
</tbody>
</table>

Flow rate: 1.0 mL per minute.

Time span of measurement: For 35 minutes after injection of the sample solution.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add methanol to make exactly 10 mL. Confirm that the peak area of losartan obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of losartan are not less than 10,000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of losartan is not more than 2.0%. Water <2.48> Not more than 0.5% (0.25 g, volumetric titration, direct titration).

Assay Weigh accurately about 25 mg each of Losartan Potassium and Losartan Potassium RS (separately, determine the water <2.48> in the same manner as Losartan Potassium), dissolve separately in methanol to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas, A_{T} and A_{S}, of losartan in each solution.

Amount (mg) of losartan potassium (C_{22}H_{22}ClKN_{6}O) $\neq M_{S} \times A_{T} / A_{S}$

M_{S}: Amount (mg) of Losartan Potassium RS taken, calculated on the anhydrous basis

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (3:2).

Flow rate: Adjust so that the retention time of losartan is about 6 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of losartan are not less than 5500 and not more than 1.4, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of losartan is not more than 1.0%.

Containers and storage Containers—Tight containers.

Losartan Potassium Tablets

ロサルタンカリウム錠

Losartan Potassium Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of losartan potassium (C_{22}H_{22}ClKN_{6}O: 461.00).

Method of preparation Prepare as directed under Tablets, with Losartan Potassium.

Identification To an amount of powdered Losartan Potassium Tablets, equivalent to 25 mg of losartan potassium, add 10 mL of methanol, shake well, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 25 mL, and use this solution as the sample solution. Separately, dissolve 25 mg of losartan potassium in 10 mL of methanol. To 5 mL of this solution add methanol to make 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and acetic acid (100) (75:25:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot from the standard solution show the same R_{T} value.

Uniformity of dosage units <6.02> Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Losartan Potassium Tablets add diluted 0.1 mol/L phosphate buffer solution (pH 8.0) (1 in 10) to make exactly 100 mL, and stir until the tablet is completely disintegrated. Pipet 5 mL of this solution, add diluted 0.1 mol/L phosphate buffer solution (pH 8.0) (1 in 10) to make exactly V mL so that each mL contains about 50 μg of losartan potassium (C_{22}H_{22}ClKN_{6}O), centrifuge, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of losartan potassium (C_{22}H_{22}ClKN_{6}O) $\neq M_{S} \times A_{T} / A_{S} \times V / 25$

M_{S}: Amount (mg) of Losartan Potassium RS taken, calculated on the anhydrous basis

Dissolution <6.10> When the test is performed at 50 revolutions per minute for 25-mg and 50-mg tablets and at 75 revolutions per minute for 100-mg tablet according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of 25-mg and 50-mg tablets, and in 30 minutes of 100-mg tablet are not less than \ldots
Losartan Potassium and Hydrochlorothiazide Tablets

Losartan Potassium and Hydrochlorothiazide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of losartan potassium \(\text{C}_{22}\text{H}_{22}\text{ClKN}_{4}O_{6}\) (461.00) and hydrochlorothiazide \(\text{C}_{9}\text{H}_{8}\text{ClN}_{2}O_{2}S_{2}\) (297.74).

Method of preparation

Prepare as directed under Tablets, with Losartan Potassium and Hydrochlorothiazide.

Identification (1)

Shake thoroughly a portion of powdered Losartan Potassium Tablets, equivalent to 50 mg of Losartan Potassium, with 10 mL of methanol, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 50 mL, and use this solution as the sample solution. Separately, add 25 mg of losartan potassium in methanol to make 10 mL. To 5 mL of this solution add methanol to make 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(\text{C}2.01\) with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and acetic acid (100) (75:25:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): one of the two spots obtained from the sample solution and the spot from the standard solution show the same \(R_f\) value.

(2)

Shake well a portion of powdered Losartan Potassium and Hydrochlorothiazide Tablets, equivalent to 12.5 mg of Hydrochlorothiazide, with 10 mL of methanol, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 50 mL, and use this solution as the sample solution. Separately, add 25 mg of hydrochlorothiazide in methanol to make 10 mL. To 5 mL of this solution add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(\text{C}2.02\). Spot 20 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and acetic acid (100) (75:25:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): one of the two spots obtained from the sample solution and the spot from the standard solution show the same \(R_f\) value.

Uniformity of dosage units \(\text{C}6.02\)

(1) Losartan potassium—Perform the Mass variation test, or the Content uniformity test according to the following method: it meets the requirement.

To 1 tablet of Losartan Potassium and Hydrochlorothiazide Tablets add \(\frac{P}{2}\) mL of a mixture of acetoni trile and sodium dihydrogen phosphate TS (pH 2.5) (3:2), and stir for 5 minutes, and then determine the mass variation. System repeatibility: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of losartan is not more than 1.0%.

Containers and storage

Containers—Tight containers.

Losartan Potassium and Hydrochlorothiazide Tablets

ロサルタンカリウム・ヒドロクロロロチアジド錠

Losartan Potassium and Hydrochlorothiazide Tablets are to be tested according to the provisions given in the pertinent monographs, General Notices, General Rules for Crude Drugs, General Rules for Preparations, and General Tests for their conformity to the Japanese Pharmacopoeia. (See the General Notices S.)
60 minutes to disintegrate the tablet, add sodium dihydrogen phosphate TS (pH 2.5) to make exactly V mL so that each mL contains about 0.5 mg of losartan potassium (C\textsubscript{22}H\textsubscript{22}ClKN\textsubscript{6}O). Pipet 10 mL of this solution, add 45 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 46 mg of Losartan Potassium RS (separately determine the water (C\textsubscript{22}H\textsubscript{22}ClKN\textsubscript{6}O) in the same manner as Losartan Potassium), and dissolve in 50 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and use this solution as the losartan potassium standard stock solution. Pipet 12 mL of the losartan potassium standard stock solution, add 44 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (C\textsubscript{22}H\textsubscript{22}ClKN\textsubscript{6}O). Pipet 10 mL of this solution, add 45 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (C\textsubscript{22}H\textsubscript{22}ClKN\textsubscript{6}O) according to the following conditions, and determine the peak areas, A\textsubscript{f} and A\textsubscript{s}, of losartan in each solution.

\[
\text{Amount (mg) of losartan potassium (C}_{22}\text{H}_{22}\text{ClKN}_6\text{O}) = M_s \times A_f / A_s \times 3 \times \sqrt{250}
\]

\[
M_s: \text{Amount (mg) of Losartan Potassium RS taken, calculated on the anhydrous basis}
\]

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in 900 mL of water, adjust to pH 2.5 with phosphoric acid, and add water to make 1000 mL. To 900 mL of this solution add 600 mL of acetone.

Flow rate: Adjust so that the retention time of losartan is about 5 minutes.

**System suitability—**

System performance: To 12 mL of the losartan potassium standard stock solution and 4 mL of the hydrochlorothiazide standard stock solution obtained in (2), add 42 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), and add sodium dihydrogen phosphate TS (pH 2.5) to make 100 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, hydrochlorothiazide and losartan are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of hydrochlorothiazide is not more than 1.0%.

**Dissolution <6.10> (1) Losartan potassium—When the test is performed at 100 revolutions per minute according to the Basket method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Losartan Potassium and Hydrochlorothiazide Tablets is not less than 85%.

Start the test with 1 tablet of Losartan Potassium and Hydrochlorothiazide Tablets, withdraw not less than 10 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard not less than 2 mL of the first filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 0.125 mg of hydrochlorothiazide (C\textsubscript{24}H\textsubscript{35}ClN\textsubscript{6}O\textsubscript{2}S\textsubscript{2}). Pipet 10 mL of this solution, add 45 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 35 mg of Hydrochlorothiazide RS (separately determine the loss on drying (C\textsubscript{24}H\textsubscript{35}ClN\textsubscript{6}O\textsubscript{2}S\textsubscript{2}) under the same conditions as Hydrochlorothiazide), and dissolve in 50 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and use this solution as the hydrochlorothiazide standard stock solution. Pipet 4 mL of the hydrochlorothiazide standard stock solution, add 48 mL of a mixture of acetone and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography (C\textsubscript{24}H\textsubscript{35}ClN\textsubscript{6}O\textsubscript{2}S\textsubscript{2}) according to the following conditions, and determine the peak areas, A\textsubscript{f} and A\textsubscript{s}, of hydrochlorothiazide in each solution.

\[
\text{Amount (mg) of hydrochlorothiazide (C}_{24}\text{H}_{35}\text{ClN}_6\text{O}_2\text{S}_2) = M_s \times A_f / A_s \times V/250
\]

\[
M_s: \text{Amount (mg) of Hydrochlorothiazide RS taken, calculated on the dried basis}
\]

**Operating conditions—**

Proceed as directed in the operating conditions in (1).
solution as the losartan potassium standard stock solution. Pipet 12 mL of the losartan potassium standard stock solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of losartan in each solution.

Dissolution rate (%) with respect to the labeled amount of losartan potassium (\( C_22H_32ClKNO_6 \))
\[
M_S: \text{Amount (mg) of Losartan Potassium RS taken, calculated on the anhydrous basis}
\]
C: Labeled amount (mg) of losartan potassium (\( C_22H_32ClKNO_6 \)) in 1 tablet

Operating conditions—
Proceed as directed in the operating conditions in the Uniformity of dosage units (1).

System suitability—
System performance: To 12 mL of the losartan potassium standard stock solution and 8 mL of the hydrochlorothiazide standard stock solution obtained in (2), add water to make 100 mL. When the procedure is run with 20 µL of this solution under the above operating conditions, hydrochlorothiazide and losartan are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of hydrochlorothiazide is not more than 1.0%.

Assay (1) Losartan potassium—To 10 Losartan Potassium and Hydrochlorothiazide Tablets add 21V/25 mL of a mixture of acetonitrile and sodium dihydrogen phosphate TS (pH 2.5) (3:2), stir for 60 minutes to disintegrate the tablets, add sodium dihydrogen phosphate TS (pH 2.5) to make exactly V mL so that each mL contains about 2 mg of losartan potassium (\( C_22H_32ClKNO_6 \)), and sonicate for 2 minutes. Pipet 10 mL of this solution, add 10 mL of acetonitrile, and add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 50 mL, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of Losartan Potassium RS (separately determine the water \( <2.48\% \) in the same manner as Losartan Potassium), and dissolve in 30 mL of a mixture of acetonitrile and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 50 mL, and use this solution as the losartan potassium standard stock solution. Pipet 10 mL of the losartan potassium standard stock solution, add 4 mL of a mixture of acetonitrile and sodium dihydrogen phosphate TS (pH 2.5) (3:2), add sodium dihydrogen phosphate TS (pH 2.5) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of losartan in each solution.

**Loxoprofen Sodium Hydrate**

ロキソプロフェンナトリウム水和物

\[
\text{C}_{24}\text{H}_{24}\text{NaO}_{3}\cdot\text{2H}_{2}\text{O}: 304.31 \\
\text{Monosodium 2-}[4\text{-}(2\text{-oxocyclohexylmethyl})\text{phenyl}]\text{propanoate dihydrate [80382-23-6]}
\]

Loxoprofen Sodium Hydrate contains not less than 98.5% of loxoprofen sodium \((\text{C}_{15}\text{H}_{15}\text{NaO}_{3}): 268.28\)

calculated on the anhydrous basis.

**Description**—Loxoprofen Sodium Hydrate occurs as white to yellowish white, crystals or crystalline powder.

It is very soluble in water and in methanol, freely soluble in ethanol (95), and practically insoluble in diethyl ether.

A solution of Loxoprofen Sodium Hydrate (1 in 20) does not show optical rotation.

The pH of a solution of 1.0 g of Loxoprofen Sodium Hydrate in 20 mL of freshly boiled and cooled water is between 6.5 and 8.5.

**Identification**—(1) Determine the absorption spectrum of a solution of Loxoprofen Sodium Hydrate (1 in 55,000) as directed under Ultraviolet-visible Spectrophotometry \( <2.24> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Loxoprofen Sodium Hydrate as directed in the potassium bromide disk method under the Infrared Spectrophotometry \( <2.25> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Loxoprofen Sodium Hydrate (1 in 10) responds to Qualitative Tests \( <1.09> \) for sodium salt.

**Purity**—(1) Clarity and color of solution—Dissolve 1.0 g of Loxoprofen Sodium Hydrate in 10 mL of water: the solution is clear and colorless or pale yellow. The color is not darker than that of diluted Matching Fluid A (1 in 2).

(2) Heavy metals \( <1.07> \)—Proceed with 2.0 g of Loxoprofen Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 1.0 g of Loxoprofen Sodium Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution operating conditions, hydrochlorothiazide and losartan are eluted in this order, and the number of theoretical plates of the peak of hydrochlorothiazide and the symmetry factor of the peak of losartan are not less than 4000 and not more than 2.5, respectively.

**Flow rate:** Adjust so that the retention time of losartan is about 20 minutes.

**Mobile phase**—

<table>

**Dissolution**  テーブルスに、ロキソプロフェンナトリウムを含有する錠剤を用意する。Tabletsに、ロキソプロフェンナトリウムを含有する錠剤を使用する。

**Dissolution rate (%) with respect to the labeled amount of loxoprofen sodium (C_{13}H_{17}NaO_{3})**

\[
M_5 = \frac{A_1}{A_3} \times V/V' \times 1/C \times 36 \times 1.089
\]

**Containers and storage**  Containers—Tight containers.
(C$_{13}$H$_{17}$NaO$_3$) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Loxoprofen Sodium Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 60 mg of loxoprofen sodium (C$_{13}$H$_{17}$NaO$_3$), add exactly 20 mL of the internal standard solution, and shake vigorously for 15 minutes. Centrifuge this solution, and to 2 mL of the supernatant add diluted methanol (3 in 5) to make 100 mL. Use this solution as the sample solution. Separately, weigh accurately about 30 mg of Loxoprofen RS, previously dried in vacuum at 60°C for 3 hours, and dissolve in exactly 10 mL of the internal standard solution. To 2 mL of this solution add diluted methanol (3 in 5) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q$_{1}$ and Q$_{2}$, of the peak area of loxoprofen to that of the internal standard.

Amount (mg) of loxoprofen sodium (C$_{13}$H$_{17}$NaO$_3$) = M$_{5}$ × Q$_{1}$/Q$_{2}$ × 2 × 1.089

M$_{5}$: Amount (mg) of Loxoprofen RS taken

*Internal standard solution*—A solution of ethyl benzoate in diluted methanol (3 in 5) (3 in 2000).

*Operating conditions*—
- Detector: An ultraviolet absorption photometer (wavelength: 222 nm).
- Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecysilicized silica gel (5 µm in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: A mixture of methanol, water, acetic acid (100) and triethylamine (600:400:1:1).
- Flow rate: Adjust so that the retention time of loxoprofen is about 7 minutes.

*System suitability*—
- System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, loxoprofen and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.
- System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of loxoprofen to that of the internal standard is not more than 1.0%. 

*Containers and storage*—Tight containers.

**L-Lysine Acetate**

L-リシン酢酸塩

![Chemical Structure of L-Lysine Acetate](Image)

C$_{6}$H$_{14}$N$_{2}$O$_{4}$: 206.24

(C$_{4}$H$_{2}$N)$_{2}$-2,6-Diaminohexanoic acid monoacetate

[5728-49-2]

L-Lysine Acetate, when dried, contains not less than 98.5% and not more than 101.0% of L-lysine acetate (C$_{6}$H$_{14}$N$_{2}$O$_{4}$, C$_{2}$H$_{2}$O$_{4}$).

**Description** L-Lysine Acetate occurs as white, crystals or crystalline powder. It has a characteristic odor and a slightly acid taste.

It is very soluble in water, freely soluble in formic acid, and practically insoluble in ethanol (99.5).

It is deliquescent.

**Identification (1)** Determine the infrared absorption spectrum of L-Lysine Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of L-Lysine Acetate (1 in 20) responds to Qualitative Tests <1.00> (2) for acetate.

**Optical rotation** <2.49> [α]$_D$$^2$ + 8.5 + ±10.0° (after drying, 2.5 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of L-Lysine Acetate in 10 mL of water: the pH of the solution is between 6.5 and 7.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of L-Lysine Acetate in 10 mL of water: the solution is colorless and clear.

(2) Chloride <1.03>—Perform the test with 0.5 g of L-Lysine Acetate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Perform the test with 0.6 g of L-Lysine Acetate. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium <1.02>—Perform the test with 0.25 g of L-Lysine Acetate. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of L-Lysine Acetate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron <1.10>—Prepare the test solution with 1.0 g of L-Lysine Acetate according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Weigh accurately about 0.5 g of L-Lysine Acetate, dissolve in 0.5 mL of hydrochloric acid and water to make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately 2.5 mmol amounts of L-aspatic acid, L-threonine, L-serine, L-glutamic acid, glycine, L-alanine, L-cystine, L-valine, L-methionine, L-isoleucine, L-leucine, L-tyrosine, L-phenylalanine, L-lysine hydrochloride, ammonium chloride, L-histidine and L-arginine, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the standard stock solution. Pipet 5 mL of this solution, add 0.02 mol/L hydrochloric acid to make exactly 100 mL. Pipet 4 mL of this solution, add 0.02 mol/L hydrochloric acid to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Based on the peak heights of the amino acids obtained from the sample solution and standard solution, determine the mass of the amino acids other than lysine contained in 1 mL of the sample solution, and calculate the mass percent: the amount of each amino acids other than lysine is not more than 0.1%.

*Operating conditions*—
- Detector: A visible spectrophotometer (wavelength: 570 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (Na type) composed with a sulfonated polystyrene copolymer (3 μm in particle diameter).

Column temperature: A constant temperature of about 57°C.

Chemical reaction bath temperature: A constant temperature of about 130°C.

Color developing time: About 1 minute.

Mobile phase: Prepare mobile phases A, B, C, D and E according to the following table, and to each phase add 0.1 mL of capric acid.

Changing mobile phases: Proceed with 20 μL of the standard solution under the above operating conditions: aspartic acid, threonine, serine, glutamic acid, glycine, alanine, cysteine, valine, methionine, isoleucine, leucine, tyrosine, phenylalanine, lysine, ammonia, histidine and arginine are eluted in this order. Switchover the mobile phases A, B, C, D and E in sequence so that the resolution between the peaks of isoleucine and leucine is not less than 1.2.

Reaction reagents: Dissolve 204 g of lithium acetate dihydrate in water, and add 123 mL of acetic acid (100), 401 mL of 1-methoxy-2-propanol, and water to make 1000 mL, gas with nitrogen for 5 minutes, and use this solution as the solution (I). Separately, to 979 mL of 1-methoxy-2-propanol, and water to make 1000 mL, gas with nitrogen for 10 minutes, and use this solution as the solution (II). To 1 volume of the solution (I) add 1 volume of the solution (II). Prepare before use.

Mobile phase flow rate: 0.20 mL per minute.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the resolution between the peaks of glycine and alanine is not less than 1.2.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak height of each amino acid in the standard solution is not more than 5.0%, and the relative standard deviation of the retention time is not more than 1.0%.

Loss on drying <2.4g> Not more than 0.3% (1 g, 80°C, 3 hours).

Residue on ignition <2.4g> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.1 g of L-Lysine Acetate, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 10.31 mg of C₆H₁₄N₂O₂·HCl

Containers and storage Containers—Tight containers.

L-Lysine Hydrochloride

L-リシン塩酸塩

C₆H₁₄N₂O₂·HCl: 182.65
(2S)-2,6-Diaminohexanoic acid monohydrochloride [657-27-2]

L-Lysine Hydrochloride, when dried, contains not less than 98.5% of L-lysine hydrochloride (C₆H₁₄N₂O₂·HCl).

Description L-Lysine Hydrochloride occurs as a white powder. It has a slight, characteristic taste. It is freely soluble in water and in formic acid, and practically insoluble in ethanol (95%). It shows crystal polymorphism.

Identification (1) Determine the infrared absorption spectrum of L-Lysine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.2S>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve L-Lysine Hydrochloride in water, evaporate the water to dryness at 60°C, and repeat the test with the residue.

(2) A solution of L-Lysine Hydrochloride (1 in 10) responds to Qualitative Tests <1.09g> for chloride.

Optical rotation <2.4g> [α]D²⁰: +19.0 – +21.5° (after drying, 2 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH <2.54g> Dissolve 1.0 g of L-Lysine Hydrochloride in 10 mL of water: the pH of this solution is between 5.0 and 6.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of L-Lysine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14g>—Perform the test with 0.6 g of L-Lysine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(3) Ammonium <1.02g>—Perform the test with 0.25 g of L-Lysine Hydrochloride. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4) Heavy metals <1.07g>—Proceed with 2.0 g of L-Lysine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.11g>—Prepare the test solution with 1.0 g of L-Lysine Hydrochloride according to Method 1, and per-
form the test (not more than 2 ppm).

(6) Related substances—Dissolve 0.10 g of L-Lysine Hydrochloride in 25 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.06>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-propanol and ammonia water (28:67:33) to a distance of about 10 cm, and dry the plate at 100°C for 30 minutes. Spray evenly the plate with a solution of ninhydrin in acetone (1 in 50) and heat the plate at 80°C for 5 minutes: the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.1 g of Lysine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 30 minutes. After cooling, add 45 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 9.132 mg of C₂H₄N₂O₇·HCl

**Containers and storage** Containers—Tight containers.

**Lysozyme Hydrochloride**

**リゾチーム塩酸塩**

\[
\text{C}_{656}\text{H}_{106}\text{N}_{129}\text{O}_{132}\text{S}_{10}\cdot x\text{HCl}
\]

[12659-88-3, egg white lysozyme]

Lysozyme Hydrochloride is the hydrochloride of lysozyme obtained from albumen of hen’s egg, and is a protein consisting of 129 amino acid residues. It contains not less than 0.9 mg (potency) of lysozyme per mg, calculated on the dried basis.

**Description** Lysozyme Hydrochloride occurs as white, crystals, or crystalline or amorphous powder. It is freely soluble in water, and practically insoluble in ethanol (99.5). It is hygroscopic.

The pH of a solution of 3 g of Lysozyme Hydrochloride in 200 mL of water is between 3.0 and 5.0.

**Identification** (1) To 5 mL of a solution of Lysozyme Hydrochloride in acetate buffer solution (pH 5.4) (1 in 500) add 1 mL of ninhydrin TS, and heat for 10 minutes: a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Lysozyme Hydrochloride in acetate buffer solution (pH 5.4) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity** (1) Clarity of solution—To 5 mL of a solution of Lysozyme Hydrochloride (3 in 200) add, if necessary, dilute hydrochloric acid to adjust the pH to 3: the solution is clear.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Lysozyme Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 8.0% (0.1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 2.0% (0.5 g).

**Nitrogen** Perform the test as directed under Nitrogen Determination <1.08>: the amount of nitrogen (N: 14.01) is between 16.8% and 18.6%, calculated on the dried basis.

**Assay** Weigh accurately an amount of Lysozyme Hydrochloride, equivalent to about 25 mg (potency), dissolve in phosphate buffer solution (pH 6.2) to make exactly 100 mL. Pipet 2 mL of this solution, add phosphate buffer solution (pH 6.2) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Lysozyme RS (separately determine its loss on drying <2.41> under the same condition as Lysozyme Hydrochloride), equivalent to about 25 mg (potency), and dissolve in phosphate buffer solution (pH 6.2) to make exactly 100 mL. Pipet 1 mL and 2 mL of this solution, add phosphate buffer solution (pH 6.2) to them to make exactly 50 mL, and use these solutions as the standard solution (1) and the solution (2), respectively. Keep the sample solution and the standard solutions in an ice-bath. Pipet 4 mL of substrate solution for lysozyme hydrochloride, previously warmed in a water bath of 35°C for about 5 minutes, add exactly 100 μL of the sample solution, previously warmed in a water bath of 35°C for about 3 minutes, and allow to stand at 35°C for exactly 10 minutes, then add exactly 0.5 mL of 1 mol/L hydrochloric acid TS, and immediately shake. Determine the absorbance under Ultraviolet-visible Spectrophotometry <2.24>, A₁, of this solution at 640 nm, using water as the blank. Determine the absorbances, A₅₁ and A₅₂, of the solutions obtained with the standard solution (1) and the standard solution (2) in the same manner as the sample solution.

Amount [mg (potency)] of lysozyme per mg, calculated on the dried basis

\[ M_f / 2M_T \times \left( (A_{51} - A_T) / (A_{51} - A_{52}) + 1 \right) \]

\( M_f \): Amount (mg) of Lysozyme RS taken, calculated on the dried basis.

\( M_T \): Amount (mg) of the sample taken, calculated on the dried basis.

**Containers and storage** Containers—Tight containers.
