

Change in Imported Foods

Changes in the number of food import notifications submitted, and the weight of imported foods and related items

Composition of imported foods and related items (FY 2023)

Agricultural products account for about 60% of imported foods

Our daily diet in Japan depends heavily on imports. To ensure food safety in Japan, the Ministry of Health, Labour and Welfare (MHLW) places particular emphasis on ensuring the safety of imported food products.

As shown in the line chart, the number of import notifications submitted in FY 2023 totaled 2,350,033, and the weight of imported foods was 29,866,575 tons. Among all the food items imported, the proportion of agricultural food was the highest at about 64%, followed by livestock food product and other foods including beverages also at about 12%, seafood at about 6%, apparatus and toys at about 3%, and food additives at about 2% (See the pie chart).

In FY 2023, 199,272 notifications from all food import notifications submitted were inspected and 763 of them were identified as violating relevant laws, resulting in reshipping or disposal. The MHLW also implements safety measures in exporting countries through bilateral discussions and negotiations as well as on site inspections. If any legal violation is detected, the ministry demands that the exporting country investigate the cause of the violation and take measures to prevent a recurrence.

Japan's Food Self-sufficiency Ratio

Food self-sufficiency ratios on a calorie basis in different countries

Note: figures for Japan are from FY 2023 data, while those for other countries are from 2021 data.

What did you eat for lunch today? If you ate hamburger steak, the food self-sufficiency ratio on a calorie basis was 14%; loaf of bread, 18%; curry and rice, 56%; and onigiri, 98% according to "Self-sufficiency Ratio Calculator", MAFF. When you choose rice as your lunch, which can be produced domestically, the self-sufficient ratio reaches much higher. However, if your lunch contains livestock products, such as meat, milk and eggs, even if they are produced in Japan, the self-sufficiency ratio becomes lower because feed to raise those livestock depends on imported raw materials.

Low food self-sufficiency of Japan is

explained as a shift in dietary habits, whereby consumption of rice has declined while consumption of livestock products and oils and fats has increased.

The self-sufficiency ratio is an index of the extent to which a country relies upon its own production resources. The self-sufficiency ratio on a calorie basis of Japan was 73% in FY 1965, decreased to 38% in FY 2023, which is relatively low among major advanced countries such as France, the United States, Germany and the United Kingdom. This means the ratio of imported food to domestic food is high.
