

## The Standards for Marketing Approval of Sanitary Napkins

### 1. Scope of the standards

The standards shall be applied to quasi-drugs designed to absorb and treat menstrual blood (hereinafter referred to as “sanitary napkins”).

### 2. Standards

The following standards are applied to sanitary napkins.

For sanitary napkins that do not meet these standards, the submission of necessary documents regarding the efficacy, safety, and quality of constituent materials, etc. shall be required for review.

- (1) Sanitary napkins shall meet the Quality Specifications for Sanitary Napkins specified in Exhibit 1.
- (2) The materials shall meet the Material Standards for Sanitary Napkins specified in Exhibit 2. Each material shall meet the specifications listed and the scope of use encircled in the matrix of Exhibit 2.
- (3) Sanitary napkins shall meet the following requirements for components and shape.
  - i. Each sanitary napkin shall consist of “surface material(s)”, “absorbent material(s)”, “leak-protection material(s)”, “binding material(s)”, “fixing material(s)”, “identification material(s)” and “other material(s)” listed in attached Table.
  - ii. Each sanitary napkin shall be formed as a single unit, which is not less than 140 mm in length, 45 mm in width, 1 mm in thickness and 2 g in weight.

(4) The dosage and administration shall be “appropriate number of napkins shall be used accordingly as need arises”.

(5) The indication shall be “for menstrual blood treatment.”

Attached Table: List of components

Surface material	Material that covers the absorbent material and is in direct contact with the body
Absorbent material	Material that absorbs menstrual blood
Leak-protection material	Material that protects against leakage of menstrual blood during menstrual blood absorption.
Binding material	Material that binds each component of the product when the materials are assembled.
Fixing material	Material intended to prevent dislocation of the product when the product is worn
Identification material	Material used in an area other than the intended surface of use to identify the intended surface of use
Others	Materials other than the above materials

## Quality Specifications for Sanitary Napkins

1. Sanitary napkins (hereinafter referred to as “the product”) shall be clean and shall be neither irritant nor harmful.
2. The product shall meet the requirements of the following tests. The specifications and test methods shall comply with the General Notices and the General Tests, Processes and Apparatus of the Japanese Pharmacopeia (hereinafter referred to as “JP”) unless otherwise specified.

### 1) Description

The product (except for the material that protects the fixing material) shall be white in color (except for the colored area that indicates the area is not the intended surface of use) and shall be almost odorless. It shall not contain any foreign matter.

### 2) Coloring matter

Weigh accurately the product (except for the material that protects the fixing material) and use it as the sample. Immerse the sample in freshly boiled and cooled water 60 times the mass of the sample for 5 minutes, then stir and filter. Use the filtrate as the sample solution. Transfer 25 mL of the sample solution into a test tube 15 mm in inside diameter and observe downward: almost no color develops.

If the addition of water 60 times the mass of the sample does not produce a necessary amount of the sample solution, take an adequate amount of all components of the product, weigh accurately them, use these as the sample, and prepare the sample solution in the same manner as directed above.

### 3) Acidity or alkalinity

To 25 mL of the sample solution obtained in the coloring matter test, add 2 drops of phenolphthalein TS: no red (deep pink) color develops.

Separately, to 25 mL of the same solution, add 1 drop of methyl orange TS: no red color develops.

#### 4) Fluorescence

##### Method 1

Irradiate the product (except for the material that protects the fixing material) with ultraviolet rays (wavelength: 350 to 370 nm) in a dark place: it shows no fluorescence or no more fluorescence than Fluorescence Reference Standard.

##### Method 2

If the product shows more fluorescence than Fluorescence Reference Standard with Method 1, cut the area that shows fluorescence into a piece of about 5 cm × 5 cm and use this as the sample. If the sample is not more than 25 cm<sup>2</sup>, combine more than one sample to obtain this area.

Add dilute ammonia water (28) (1 in 1000) to 100 mL of water to adjust the pH within the range of 7.5 to 9, elute the sample in this solution for about 10 minutes, and filter through glass wool.

Add dilute hydrochloric acid to the filtrate to adjust the pH within the range of 3 to 5, place gauze (2 cm × 4 cm) in this solution, and heat on a water bath for about 30 minutes. Wash the gauze with water, dry, and irradiate with ultraviolet rays (wavelength: 350 to 370 nm) in a dark place: it shows no fluorescence.

#### 5) Water absorption

Weigh accurately the product (except for the material that protects the fixation material) and use it as the sample. Place the sample on a tared wire mesh (size: 1700 μm) with its intended surface of use side up,

gently pour water over the whole surface until the whole sample is completely soaked. Continue pouring water until the water overflows, allow to stand for 1 minute, and measure the amount of water absorbed: the amount of water absorbed is not less than 10 times the mass of the sample.

#### **6) Exudation**

Place the product (except for the material that protects the fixation material) on a filter paper spread on a glass board with its intended surface of use side up and touch its center lightly with the tip of a burette containing Congo red TS. Release 10 mL of Congo red TS at a speed of 5 to 10 mL per minute, allow to stand for 1 minute and place a 1-kg weight with 50 mm in diameter onto that area: Congo red TS does not effuse from the leak-protection material within 3 minutes.

This does not apply to the products that have no leak-protection material.

#### **7) Formaldehyde**

##### **(1) Preparation of sample solution**

Weigh accurately the product (except for the material that protects the fixing material) and use this as the sample. Finely cut the sample, place in a hard glass container, exactly add water 60 times the mass of the sample, stopper tightly and extract in a water bath at 40°C for 1 hour with occasional shaking. Filter the solution through a glass filter while warm and use the filtrate as the sample solution.

If the addition of 60 times its weight of water does not produce a necessary amount of the sample solution, take an adequate amount of all components of the product, weigh accurately them, use these as the sample and prepare the sample solution in the same manner as directed above.

## **(2) Test**

### Method 1

Transfer exactly 15.0 mL of the sample solution into a Nessler tube, add 5.0 mL of acetylacetone TS, shake, heat in a water bath at 40°C for 30 minutes and cool immediately. Separately, transfer 20.0 mL of Potassium Chromate Matching Fluid into a Nessler tube and use this solution as the control solution. Then compare the colors of both solutions by viewing the tubes downward against a white background: the sample solution has no more color than the control solution.

### Method 2

Transfer exactly 15.0 mL of the sample solution into a Nessler tube, add 5.0 mL of acetylacetone TS, shake, heat in a water bath at 40°C for 30 minutes and cool immediately. Separately, transfer exactly 15.0 mL of Hexamethylenetetramine Matching Fluid into a Nessler tube, add 5.0 mL of acetylacetone TS, shake, heat in a water bath at 80°C for 30 minutes, cool immediately and use this solution as the control solution. Then compare the colors of both solutions by viewing the tubes downward against a white background: the sample solution has no more color than the control solution.

### Method 3

If the sample solution shows turbidity or if visual comparison is difficult, measure exactly 15.0 mL each of the sample solution and Standard Formaldehyde Solution. Then, add 5.0 mL of acetylacetone TS, shake, heat in a water bath at 40°C for 30 minutes and allow to stand for 30 minutes. Read the absorbance ( $A$ ) of the solution containing the sample solution and the absorbance ( $A_S$ ) of the solution containing Standard Formaldehyde Solution at the maximum wavelength between 412 and 415 nm, with a 1-cm cell, against a blank solution obtained by adding 5.0 mL of acetylacetone TS to 15.0 mL of water and treating it in the same manner as above. Separately, measure 15.0 mL of the sample

solution, add 5.0 mL of water instead of acetylacetone TS and proceed as directed above. Read the absorbance ( $A_0$ ) of this solution at the same wavelength as that used in the determination of  $A$  and  $A_S$ , using water as the blank:  $A - A_0$  is not more than 0.03, or the amount of formaldehyde eluted from 1 g of the sample is not more than 18  $\mu\text{g}$  if it is calculated using the following equation.

Amount ( $\mu\text{g}$ ) of eluted formaldehyde in 1 g of the sample =  $K \{(A - A_0) / A_S\} \times \text{Amount (mL) of water added for preparation of the sample solution} \times (1/\text{Weight (g) of sample})$

$K$ : Concentration ( $\mu\text{g/mL}$ ) of Standard Formaldehyde Solution

If the value " $A - A_0$ " exceeds 0.03, or if the amount of formaldehyde eluted from 1 g of the sample exceeds 18  $\mu\text{g}$  in the above test, perform either test (i) or (ii) below and confirm that the absorption at the same wavelength as that used for determination of absorbance  $A$  is attributed to formaldehyde.

(i) Dimedon method

Transfer 15.0 mL of the sample solution into a stoppered test tube, add 1.0 mL of dimedon-ethanol TS, shake, heat in a water bath at 40°C for 10 minutes. Then, add 5.0 mL of acetylacetone TS, shake, heat in a water bath at 40°C for 30 minutes and allow to stand for 30 minutes. Determine the absorption spectrum of this solution between 412 and 415 nm against a blank solution obtained by using 15.0 mL of water instead of the sample solution and treating it in the same manner as above: the absorption spectrum between 412 and 415 nm shall not exhibit similar intensities of absorption at the same wavelengths as those of the spectra obtained in the determination of absorptions  $A$  and  $A_S$ .

(ii) Liquid chromatography

Perform the test with 1  $\mu\text{L}$  each of the solution obtained by adding acetylacetone TS to the sample solution, and the solution obtained by adding acetylacetone TS to Standard Formaldehyde Solution, according to the following conditions. If the chromatogram of the solution obtained by adding acetylacetone TS to the sample solution shows a

peak at the same retention time as that of the reaction product of formaldehyde and acetylacetone from the solution obtained by adding acetylacetone TS to Standard Formaldehyde Solution, the peak area shall not be more than that of the reaction product of formaldehyde and acetylacetone from the solution obtained by adding acetylacetone TS to Standard Formaldehyde Solution.

Operating conditions

Detector: An ultraviolet-visible detector (wavelength: 412 to 415 nm)

Column: A stainless steel column about 4.6 mm in inside diameter and 150 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 35°C

Mobile phase: A mixture of water and acetonitrile (4:1 - 17:3)

Flow rate: 1.0 mL/minute

**8) Adhesion**

**(1) Pretreatment of sample**

Lay the product (including the material that protects the fixation material) flat, allow to stand at 30 - 31°C for not less than 2 hours and use this as the sample.

**(2) Test**

Method 1

Attach a piece of cotton cloth onto a glass board of Adhesion Test Device (see the illustrations in Separate Figure), previously warmed to 30 - 31°C, lay the pretreated sample flat, removing the material that protects the fixation material, on the cotton cloth with the adhesive side down, and clip the pulling tab with a pulling clip. Place a 750-g weight for attachment approximately in the center of the sample and allow the sample to attach to the cotton cloth for 1 minute. Remove the weight for attachment, place a 225-g weight for pulling on the sample, attach a

250-g load to the pulling string and pull immediately: the sample is not dislocated within 1 minute.

This does not apply to the products that have no fixation material.

### Method 2

Attach a piece of cotton cloth onto a glass board, previously warmed to 30- 31°C, lay the pretreated sample flat, removing the material that protects the fixation material, on the cotton cloth with the adhesive side down, and clip the pulling tab with a pulling clip. Place a 750-g weight for attachment approximately in the center of the sample and allow the sample to attach to the cotton cloth for 1 minute. Remove the weight for attachment, place a 225-g weight for pulling on the sample, pull immediately at a speed of about 3 to 5 cm per minute and measure the weight of the load using a spring balance when the sample starts moving: it is not less than 250 g.

This does not apply to the products that have no fixation material.

## **9) Reagents, test solutions (TS), reference standards, standard solutions, measuring instruments and appliances**

### **(1) Reagents and test solutions (TS)**

**Acetic acid (100)**  $\text{CH}_3\text{COOH}$  [K8355, Acetic acid, Special class]

**Acetonitrile**  $\text{CH}_3\text{CN}$  [K8032, Special class]

**Acetylacetone**  $\text{CH}_3\text{COCH}_2\text{COCH}_3$  [K8027, Special class]

**Acetylacetone TS** Dissolve 300 g of ammonium acetate in a sufficient quantity of water, add 6 mL of acetic acid (100) and 4 mL of acetylacetone, and add water to make 1000 mL. Prepare before use.

**Amidosulfuric acid (standard reagent)**  $\text{HOSO}_2\text{NH}_2$  [K 8005, Standard substance for volumetric analysis] or [K 8587, Special class]

**Ammonium acetate**  $\text{CH}_3\text{COONH}_4$  [K8359, Special class]

**Ammonia water (solution) (28)**  $\text{NH}_3$  [K8085, Ammonia Water, Special class, Specific gravity: about 0.90, Density: 0.908 g/mL, Content: 28-30%]

**Anhydrous sodium carbonate,**  $\text{Na}_2\text{CO}_3$  [K 8625, Sodium carbonate, Special class]

**Barium hydroxide octahydrate**  $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$  [K 8577, Special class]

Preserve in tightly stoppered containers.

**Bromothymol blue**  $\text{C}_{27}\text{H}_{28}\text{Br}_2\text{O}_5\text{S}$  [K 8842, Special class] Range of color change: pH (yellow) 6.0-7.6 (blue)

**Bromothymol blue TS** Dissolve 0.1 g of bromothymol blue in 100 mL of dilute ethanol, and filter if necessary.

**Congo red**  $\text{C}_{32}\text{H}_{22}\text{N}_6\text{Na}_2\text{O}_6\text{S}_2$  [K8352, Special class]

**Congo red TS** Add water to 0.2 g of Congo red to make 100 mL.

**Dilute hydrochloric acid** Add water to 23.6 mL of hydrochloric acid to make 100 mL (10%).

**Dilute sulfuric acid** Cautiously add 5.7 mL of sulfuric acid to 10 mL of water, cool and dilute with water to make 100 mL (10%).

**Dimedon**  $\text{C}_8\text{H}_{12}\text{O}_2$  White to pale yellow crystalline powder. Melting point: 145-149°C

**Dimedon-ethanol TS** Dissolve 1 g of dimedon in ethanol to make 100 mL. Prepare before use.

**Ethanol**  $\text{C}_2\text{H}_5\text{OH}$  [K8102, Special class]

**Fluorescent-24**  $\text{C}_{40}\text{H}_{44}\text{N}_{12}\text{Na}_4\text{O}_{16}\text{S}_4$  Delayed-staining stilbene fluorescent brightener. Color index name: C.I. Fluorescent brightener-24 (C.I. No. 40650). Chemical name: Tetrasodium 4,4'-bis[[4-[bis(2-hydroxyethyl)amino]-6-[(3-sulphonatophenyl) amino]-1,3,5-triazin-2-yl] amino] stilbene-2,2'-disulphonate (CAS No. 12224-02-1)

**Fluorescent-351**  $\text{C}_{28}\text{H}_{20}\text{Na}_2\text{O}_6\text{S}_2$  Stilbene fluorescent brightener. Color index name: C.I. Fluorescent brightener-351 (FWA-5) (C.I. No. 482200). Chemical name: Disodium 4,4'-Bis(2-sulfonatostyryl)biphenyl (CAS No. 27344-41-8)

**Formalin**  $\text{HCHO}$  [K8872, Formaldehyde Solution, Special class]

**Hexamethylenetetramine**  $(\text{CH}_2)_6\text{N}_4$  [K8847, Special class]

**Hexamethylenetetramine matching fluid** Weigh 186.7 mg of hexamethylenetetramine and add water to make 1000 mL. Add water to 5 mL of this solution to make 100 mL and use the solution as a stock matching fluid. Measure 5 mL of this stock solution and add water to make 200 mL and use the solution as Hexamethylenetetramine Matching Fluid. The concentration of formaldehyde in this matching fluid is 0.3 µg/mL.

**Hydrochloric acid**  $\text{HCl}$  [K 8180, Special class]

**Iodine** I [K 8920, Special class]

**Methyl orange**  $C_{14}H_{14}N_3NaO_3S$  [K 8893, Special class] Range of color change: pH (red) 3.1-4.4 (orange-yellow).

**Methyl orange TS** Dissolve 0.1 g of methyl orange in 100 mL of water, and filter if necessary.

**Ordinary water** [Water (JP monograph)]

**Octadecylsilanized silica gel for liquid chromatography** Prepared for liquid chromatography.

**Phenolphthalein**  $C_{20}H_{14}O_4$  [K 8799, Special class] Range of color change: pH (colorless) 8.3-10.0 (red)

**Phenolphthalein TS** Dissolve 1 g of phenolphthalein in 100 mL of ethanol (95).

**Potassium chromate**  $K_2CrO_4$  [K8312, Special class]

**Potassium chromate matching fluid** Weigh 261.7 mg of potassium chromate and add water to make exactly 1000 mL. Measure 10 mL of this solution, add water to make exactly 100 mL and use the solution as Potassium Chromate Matching Fluid.

**Potassium hydroxide** KOH [K 8574, Special class]

**Potassium iodate (standard reagent)**  $KIO_3$  [K 8005, Standard reagent for volumetric analysis]

**Potassium iodide** KI [K 8913, Special class]

**Sodium chloride** NaCl [K8150, Special class]

**Sodium thiosulfate pentahydrate**  $Na_2S_2O_3 \cdot 5H_2O$  [K 8637, Special class]

**Starch** [K8658, Special class]

**Starch TS** Triturate 1 g of starch with 10 mL of cold water, and pour the mixture slowly, with constant stirring, into 200 mL of boiling water. Boil the mixture until a thin, translucent fluid is obtained. Allow to settle, and use the supernatant liquid. Prepare before use.

**Sulfuric acid**  $H_2SO_4$  [K 8951, Special class]

**Water** [Purified Water (JP monograph)]

## **(2) Reference standards**

**Fluorescence reference standard (1)** Weigh exactly 7 mg of Fluorescent-24 in a brown volumetric flask, add water to make exactly 500 mL and store

protected from light. To 5 mL of this solution, add 0.1 g of sodium chloride and water to make 50 mL, immerse a filter paper (8 cm × 15 cm) into the resultant solution for 1 hour with occasional inverting and air-dry it on a filter paper.

**Fluorescence reference standard (2)** Weigh exactly 7 mg of Fluorescent-351 in a brown volumetric flask, add water to make exactly 500 mL and store protected from light. To 0.35 mL of this solution, add 0.1 g of sodium chloride and water to make 50 mL, immerse a filter paper (8 cm × 15 cm) into the resultant solution for 1 hour with occasional inverting and air-dry it on a filter paper.

**Gauze** Use medical gauze conforming to the requirements of Notification No. 0630001 of the Medical Devices Evaluation, the Evaluation and Licensing Division, Pharmaceutical and Food Safety Bureau, the MHLW (June 30, 2005).

**Piece of cotton fabric** Use white cloth conforming to the requirements of JIS L0803 “Standard Adjacent Fabrics for Staining of Color Fastness Test” (Type: Cotton, Nominal No.: 3-1).

### **(3) Standard solutions and volumetric standard solutions (VS)**

**Iodine VS, 0.05 mol/L** See Standard Solution for Volumetric Analysis in General Tests, Processes and Apparatus of the JP.

**Potassium hydroxide VS, 1 mol/L** See Standard Solution for Volumetric Analysis in General Tests, Processes and Apparatus of the JP.

#### **Standard formaldehyde solution**

Standardization: Weigh accurately about 1 g of formalin in a weighing bottle containing water and add water to make exactly 100 mL. Take exactly 10 mL of the solution, add 50 mL of 0.05 mol/L iodine VS and 20 mL of 1 mol/L potassium hydroxide VS and allow to stand at ordinary temperature for 15 minutes. Add 15 mL of dilute sulfuric acid to the solution and titrate an excessive amount of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Separately, perform a blank determination using 10 mL of water in the same manner.

Determine the content C (%) of formaldehyde in formalin using the following equation.

$$C (\%) = 1.5013 ((V_0 - V) F/1000) \times (100/10) \times (1/W) \times 100$$

$V_0$ : Volume (mL) of 0.1 mol/L sodium thiosulfate VS consumed in the blank determination

V: Volume (mL) of 0.1 mol/L sodium thiosulfate VS consumed for titration of the sample

F: Factor of 0.1 mol/L sodium thiosulfate VS

W: Weight (g) of formalin

Preparation: Weigh exactly 300/C g of formalin and add water to make 100 mL. Take exactly 10 mL of this solution and dilute with water to exactly 10 times the initial volume. Repeat the procedure 5 times and use the resulting solution as Standard Formaldehyde Solution.

Each mL of Standard Formaldehyde Solution = 0.3  $\mu$ g HCHO

**Sodium thiosulfate VS, 0.1 mol/L** See Standard Solution for Volumetric Analysis in General Tests, Processes and Apparatus of the JP.

#### **(4) Measuring instruments and appliances**

**Filter papers** Use the filter papers confirming to the specifications for filter papers for qualitative analysis (for chemical analysis) provided in P3801 of the Japanese Industrial Standards (hereinafter referred to as JIS).

**Glass filters** Use the glass filters provided in R3503 of the JIS. Use the filter plates 40 to 50  $\mu$ m in pore size.

**Glass wool** Use glass wool of special grade provided in K8251 of the JIS.

**Nessler tubes** Use colorless, glass-stoppered cylinders 1.0 to 1.5 mm in thickness, made of hard glass as shown in the figure below. The difference of the height of the graduation line of 50 mL from the bottom among cylinders does not exceed 2 mm.

The figures are in mm.

**Sieves** Use sieve No. 10 provided in Z8801 of the JIS. Use the sieve number of nominal size ( $\mu$ m) as the designation.

Sieve No	Nominal size (μm)	Specification of sieves				
		Sieve opening			Wire (mm)	
		Size (mm)	Permissible variation (%)		Diameter	Permissible variation
			Average	Maximum		
10	1700	1.70	± 0.051	0.17	0.80	± 0.025

**Volumetric measures** Use volumetric flasks and burettes conforming to the specifications under the JIS.

<Separate Figure> Adhesion Test Device

Fig. 1

Fig. 2

Fig. 3

	Thickness	Depth	Width	Height
(1) Box (Fig. 1) Veneer,	12 mm	250 mm × 400 mm × 300 mm (inside dimension)		
(2) Lid (Fig. 2) Acrylic board,	3 to 5 mm	250 mm × 400 mm × 150 mm (inside dimension)		
(3) Glass board	5 mm	260 mm × 410 mm		
(4) Aluminum foil (Fig. 3)		150 mm × 300 mm		

Lay flat a piece of aluminum foil at a distance of 100 mm from the underside of the glass board.

(5) Light bulb:

Place one 60W light bulb in the center of the box so that the distance between

the top of the light bulb and the aluminum foil is 50 mm.

(6) Thermometer:

Place a thermometer on the glass board parallel to and at a distance of 20 mm from the long side of the glass board so that the bulb of the thermometer is positioned approximately in the center of the side, and cover with an insulator (glass wool).

(7) Pulley Grooved

(8) Pulling string Kite string

(9) Pulling clip Chevron clip (Clipping width: 109 mm)

(10) Piece of cotton fabric

Use white fabric conforming to the requirements of JIS L0803 “Standard Adjacent Fabrics for Straining of Color Fastness Test” (Cotton No. 3-1).

Cut the white fabric into a piece 80 mm × 200 mm as designating the hem side of the original fabric as the long side of the fabric for the test.

(11) Weight for attachment 50 mm × 150 mm in size, 750 g in weight

(12) Weight for pulling 50 mm × 150 mm in size, 225 g in weight

Remarks

Definitions of Specification Codes

01: The Japanese Pharmacopoeia (JP)

24: Japanese Pharmaceutical Codex (JPC)

25: Japan Pharmaceutical Excipients (JPE)

31: The Japanese Standards for Food Additives

51: The Japanese Standards of Quasi-drug Ingredients (JSQI)

55: The Japanese Specifications of Sanitary Napkin Materials (JSNM)

74: Standards for Medical Guaze and Medical Absorbent Cotton

Notes

1) This material can be used only when the material does not directly contact to skin and mucosa.

2) This material can be used only when the material does not directly contact to mucosa.
