

# Change in Imported Foods

Changes in the number of food import notifications submitted, and the weight of imported foods and related items

## Agricultural products account for about 70% of imported foods

Our daily diet in Japan depends heavily on imports. To ensure food safety in Japan, the Ministry of Health, Labour and Welfare (MHLW) places particular emphasis on ensuring the safety of imported food products.

As shown in the line chart, the number of import notifications submitted in FY 2016 totaled 2,338,765, and the weight of imported foods was 32,302,113 tons. Among all the food items imported, the proportion of agricultural food was the highest at about 67%, followed by other foods and beverages also at about 11%, food made from livestock at about 10%, seafood at about 7%, food additives at about 2%, and tools and toys at about 3% (See the pie chart).

The ministry's border enforcement efforts to ensure the safety of imported foods include the inspection of submitted import notifications. In FY 2016, 195,580 notifications from all food import notifications submitted were inspected and 773 of them were identified as violating relevant laws, resulting in re-shipping or disposal. The MHLW also implements safety measures in exporting countries through bilateral discussions and negotiations as well as on-site inspections. If any legal violation is detected, the ministry demands that the exporting country investigate the cause of the violation and take measures to prevent a recurrence.

## List of offices where you can submit Food Import Notifications and receive consultations on relevant issues

### Where to submit a Food Import Notification and consult on issues regarding food import

A Food Import Notification must be submitted to a quarantine station each time food products are imported from overseas for sale in Japan. For notification and consultation about imports, contact a quarantine station below:

# Japan's Food Self-sufficiency Ratio

## Food self-sufficiency ratios (on a calorie basis) in different countries

Note: Figures for Japan are from FY 2016 data, while those for other countries are from 2013 data.

## Lowest food self-sufficiency among major advanced countries

What did you eat for lunch today? If you ate curry and rice, the food self-sufficiency ratio (on a calorie basis) was 56%; loaf of bread, 13%; zaru soba, 23%; okonomi-yaki, 17%; and onigiri, 98%; calculated by "Self-sufficiency Ratio Calculator", MAFF. If the lunch included rice, which is almost all domestically produced, the self-sufficiency ratio is much higher than if there was no rice. If your lunch included food made from livestock, such as meat, milk and eggs, even if they are produced in Japan, the self-sufficiency ratio becomes low because livestock feed depends on imported raw materials.

Low food self-sufficiency has been reported

to be attributed to a shift in the diets of people in Japan from those mainly based on fish, shellfish and rice to those rich in meats, oils and fats.

The self-sufficiency ratio is an index used to indicate the extent to which a country relies upon its own production resources. The self-sufficiency ratio (on a calorie basis) of Japan was 73% in 1965, but decreased to 38% in 2016, which is the lowest among major advanced countries such as France, the United States, Germany and the United Kingdom. This means the ratio of imported food is higher than domestic food.
